6. The combination, with an extensible tower consisting of a series of vertically-adjustable platforms having hatchways and lifting devices, as described, of a set of pulleys or rollers arranged at the top and bottom of the tower, and an endless belt with pockets passing around said rollers and through the hatchways for the safe lowering of goods and persons, as set forth.

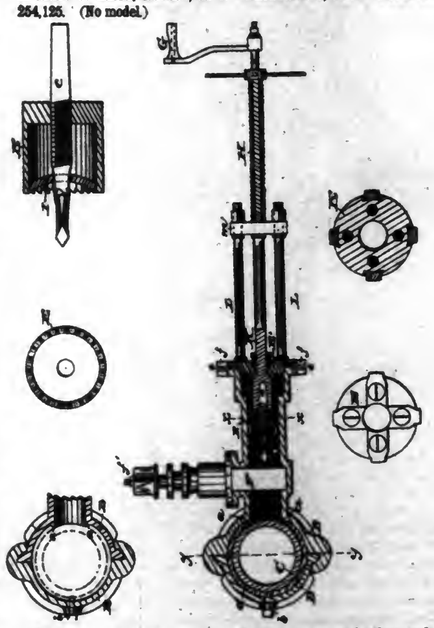
7. The combination, with an extensible tower consisting of a series of vertically-adjustable platforms and a series of toggle-levers arranged as lazy-tongs for raising and lowering them, of a set of bridges or gang planks having folding hand-rails adapted to be folded and rest between the platforms when lowered, substantially as shown and described.

396,176. ELECTRIC COUPLING FOR HOSE-PIPES. DAVID J. SIMPSON, Pittsburg, assignor of one-half to George C. Corken and Hawdon Marshall, Allegheny County, Pa. Filed Apr. 16, 1888. Serial No. 270,833. (No model.)

Claim.—1. In combination with the sections A B of a coupling such as described, provided with ring-seats and an interposed non-conducting gasket, a contact-electrode carried by one section of the coupling and connected with the line through the gasket, and an opposing contact secured to the other section of the coupling in position to engage the first-mentioned contact when the gasket is clamped between its seats, said contacts and connecting-wires being insulated from the metallic couplings, substantially as described.

2. In combination with the detachable sections of a hose-coupling such as described, an insulated conductor or contact carried by one section and projected upon the face of the gasket interposed between and forming the water-tight joint, and an annular contact or conductor forming the ring-seat on the opposite coupling-section, said ring-seat being insulated from the coupling-sections with circuit-wires connected to each of said contacts, substantially as and for the purpose set forth.

3. In combination with the separable sections of a hose-coupling such as described, an electric contact mounted upon but insulated from one section of the coupling and projected through the non-conducting elastic gasket, and an opposing electric contact mounted upon but insulated from the co-operating section of the coupling and engaging the first-mentioned contact and the gasket to close the circuit and protect the joint, substantially as and for the purpose set forth.



4. In combination with the separable metallic sections of a hose-coupling such as described, provided with clamping devices and an elastic non-conducting gasket interposed between seats within the two sections, a line-wire connected to the metallic sections of the couplings, and a second or return wire connected to contact plates or terminals insulated from and supported within the coupling-sections, one of said contacts forming part of the gasket-seat on one section and the other opposing contact projecting upon the side of the gasket facing the opposite section, so that when said coupling-sections are united one line will be closed through the coupling and the other between the gasket and its seat, substantially as and for the purpose set forth.

5. In combination with the sections A B, the hose attached thereto and the insulated wires D D′, forming parts of an electric circuit, the wire D′, attached to and connected through the metallic sections A B, the insulating-support inserted in section A and provided with annular contact 1, the gasket, and the contact 2, passing through said gasket, said contacts 1 and 2 being connected to wires D′, insulated from the metallic coupling-sections, as and for the purpose set forth.

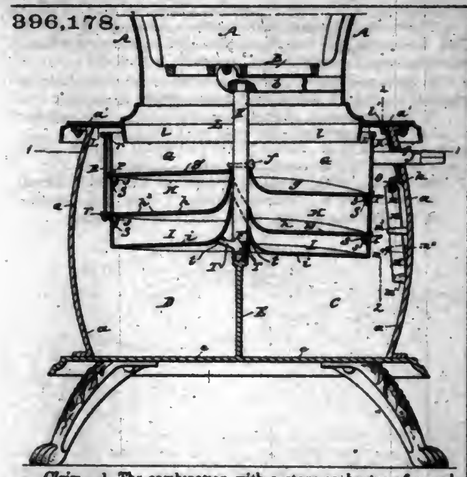
6. In a hose-coupling such as described, comprising separable sections A B, an interposed non-conducting gasket, and means for holding the two sections together and clamping them upon the gasket, a contact plate or ring, 1, insulated from but sectioned to one of said coupling-sections in line with the gasket and provided with an insulating lining or covering, a contact or conductor, 2, carried by the opposite coupling-section insulated from the latter and projected upon the exposed face of the gasket, said gasket co-operating with the insulated lining of contact 1 to form a tight joint and exclude water or other liquid-conducting medium from contacts 1 and 2, as set forth.

7. In a hose-coupling such as described, containing separable sections A B, the insulated ring bearing annular contact 1, inserted in section A, the wire D, passing through section A and attached to ring 1, the non-conducting elastic gasket fitting over the annular contact 1 and interposed between the sections, and the contact 2, passing through the gasket in position to engage contact 1 when the sections A B are connected, as and for the purpose set forth.

396,177. APPARATUS FOR TAPPING AND CONNECTING MAINS. ANTHONY P. SMITH, Newark, N. J. Filed Nov. 2, 1887. Serial No. 254,125. (No model.)

Claim.—1. A branch connection for water, gas, and other mains, combining therein a split sleeve adjusted around said main and held together by a clutch or grip joint, and a branch connected with one of the pipe-sections of said sleeve, and provided with a gate-valve chamber made integral therewith, substantially as and for the purposes set forth.

2. The combination of a split sleeve adjusted around a main and held together by a clutch or grip, a branch connected with one of the sections of said sleeve and provided with a stop or gate valve chamber made integral therewith, and a drilling and tapping apparatus secured to the end of said branch, substantially as and for the purposes set forth.



3. The combination of a branch pipe provided with a stop or gate valve chamber made integral therewith and having an annular seat, *a*, and packing *a′*, adapted to form a water-tight joint, and a drilling apparatus connected to the end of said branch, and operated substantially as and for the purposes set forth.

4. The combination of a sleeve adjusted around the main, composed of two sections, one of which is provided with a branch pipe projecting therefrom and carrying a stop or gate valve chamber made integral therewith, a rim surrounding the opening of said branch and carved to fit the contour of the main pipe, and a set-screw carried by the other section of said sleeve, and adapted to operate substantially as and for the purposes set forth.

5. The combination, with a main pipe, of a branch sleeve having an annular raised seat, *a*, adapted to fit on said main, so as to form a packing-chamber between said sleeve and main pipe, and a packing, *a′*, substantially as and for the purposes set forth.

6. An improved apparatus for drilling and tapping mains, consisting of a drill-frame, drill-holder, drill and cutting head or milling-tool, the shank of said drill having two series of screw-threads separated by a small intervening space, one of said series holding and carrying the cutting-head or milling-tool, and the other holding the piece to be removed, said apparatus being provided with any desired means for securing it to the main, all said parts being arranged and combined as herein shown and described, and for the purposes set forth.

396,178. ASH-SIFTER FOR STOVES. EDWARD E. SMITH, New York, N. Y. Filed May 17, 1888. Serial No. 274,120. (No model.)

Claim.—1. The combination, with a stove or heater, of an ash-sifter fitted therein below the fire-pot for horizontal oscillation, consisting of an upper ash-receiving section having an imperforate sloping floor and a lower sifting-section having a sloping perforated floor, and said sections relatively arranged to cause the upper section to discharge the mixed ashes and cinders onto the higher portion of the perforated floor of the lower section, substantially as herein set forth.

2. The combination, with a stove or heater, of an ash-sifter fitted below the fire-pot for horizontal oscillation, consisting of a sifting-section having a sloping perforated floor receiving the mixed ashes and cinders from the fire-pot, and with a lower ash-receiving section having an imperforate floor receiving the ashes from the sifting-section and discharging them at a place separate from the cinders falling from the sifting-section, substantially as herein set forth.

3. The combination, with a stove or heater, of an ash-sifter fitted below the fire-pot for horizontal oscillation, consisting of an upper ash and cinder receiving section having an imperforate sloping floor, an intermediate next lower sifting-section having a sloping perforated floor, receiving at its upper part the mixed ashes and cinders from the upper section, and a lower section having an imperforate floor receiving the ashes from the sifting-section and discharging them at a place separate from the cinders discharged from the sifting-section, substantially as herein set forth.

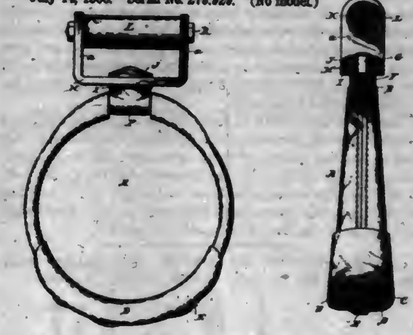
4. An oscillatory ash-sifter consisting of a supporting-shaft and three sifter-sections thereon, or an upper ash and cinder receiving section having an imperforate sloping floor, an intermediate next lower sifting-section having a sloping perforated floor receiving at its upper part the mixed ashes and cinders from the upper section, and a lower section having an imperforate floor receiving the ashes from the sifting-section and discharging them at a place separate from the cinders discharged from the sifting-section, and bolts R, holding the sifter-sections together vertically, substantially as herein set forth.

5. An oscillatory ash-sifter consisting of a supporting-shaft and three sifter-sections thereon, or an upper ash and cinder receiving section having an imperforate sloping floor, an intermediate next lower sifting-section having a sloping perforated floor receiving at its upper part the mixed ashes and cinders from the upper section, and a lower section having an imperforate floor receiving the ashes from the sifting section and discharging them at a place separate from the cinders discharged from the sifting-section, bolts R, holding the sections together vertically, and interlocking lugs and sockets at the section-joints preventing independent axial movement of the sections during their oscillation, substantially as herein set forth.

6. In a horizontally-oscillating ash-sifter having upper, middle, and lower sections, substantially as described, the section H, having a perforated sloping floor, *h*, provided with one or more steps or shoulders, h^4, substantially as herein set forth.

7. In a horizontally-operating ash-sifter having upper, middle, and lower sections, substantially as specified, the sifter-section H, having a sloping floor perforated at h^3 and provided with shoulders h^4, and having plain portions h^5 next its upper edge, *h′*, and the shoulders h^4, substantially as herein set forth.

8. The combination, in an ash-sifting apparatus for stoves, of a partition, E, at the base of the stove, forming compartments C D therein, a vertical spindle, F, having supports or shoulders, as T, sifter-sections I H G, supported on said shoulders and on each other, and said section G formed with an imperforate floor, *g*, and said section H formed with a floor, *h*, mainly perforated and having an imperforate portion, H′, next its edge discharging the cinders into the compartment D, and said section I having an imperforate floor, *i*, receiving ashes from the section H and discharging them into the compartment C, and all three sections held together for simultaneous horizontal oscillation, substantially as herein set forth.

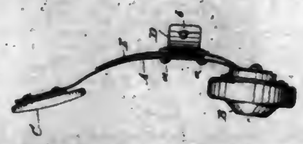


9. The combination, with a casing or frame having a slot and an oscillatory sifting device supported in said casing and provided with a shaker-bar entering the casing-slot, of a spring held to the casing, and against which the shaker-bar or a connection therewith may strike, substantially as described, whereby the resistance of the spring will prevent noisy contact of the shaker-bar at the ends of the slot in which its works, substantially as herein set forth.

10. The combination, with a casing or frame having a slot, and an oscillatory sifting device supported in said casing and provided with a shaker-bar entering the casing-slot, of a spring held to the casing and stop-lugs on the casing for the clamped end or part of the spring, substantially as described, whereby the spring will be held in a manner to have greater resistance against the movement of the bar in one direction than in the other direction, as and for the purposes set forth.

11. The combination, with the shaker-bar of an ash-sifting device passed through a slot in the sifter-support, of a dust-guard plate, K, on the bar at the slot and provided with shoulders *o o*, and a spring held to the sifter-support and in the path of said shoulders to be struck thereby, to prevent contact of the shaker-bar with the ends of the slot through which it works, substantially as herein set forth.

12. The combination, with the shaker-bar of an ash-sifting device passed through a slot in the sifter-support, of a dust-guard plate, K, on the bar at said slot and provided with shoulders *o o*, and a spring, M, held in lugs m' m^2 m^3 on the sifter-support and in the path of said shoulders, substantially as shown and described, whereby the resisting-power of the spring will be increased and diminished at opposite strokes of the shaker-bar, substantially as herein set forth.

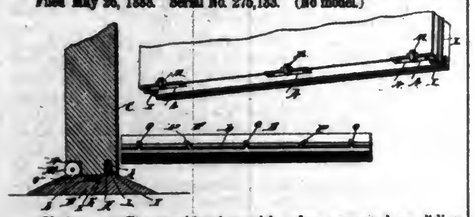


396,179. STIRRUP. JOHN C. TAYLOR, Springer, N. Mex. Filed July 14, 1888. Serial No. 279,929. (No model.)

Claim.—1. In a stirrup, the combination, with the foot-piece, of the sleeve fitted around the upper portion thereof, so that the foot-piece will be free to swing therein, and provided with the upwardly-extending stud or pin, and the strap-plate fitted loosely around said stud or pin, so that the foot-piece may turn freely at right angles to the direction in which it swings, substantially as and for the purposes set forth.

2. In a stirrup, the combination of the foot-piece, the sleeve fitted around the upper portion thereof, so that the foot-piece will be free to swing therein, and provided with the upwardly-extending pin or stud, the strap-plate fitted around said stud or pin, so that the stud may turn therein, and the washers or plates fitted around said stud or pin above and below the strap-plate, substantially as and for the purposes set forth.

396,180. TRUSS. JAMES A. TISDER, Rome, Ga. Filed June 9 1888. Serial No. 276,571. (No model.)

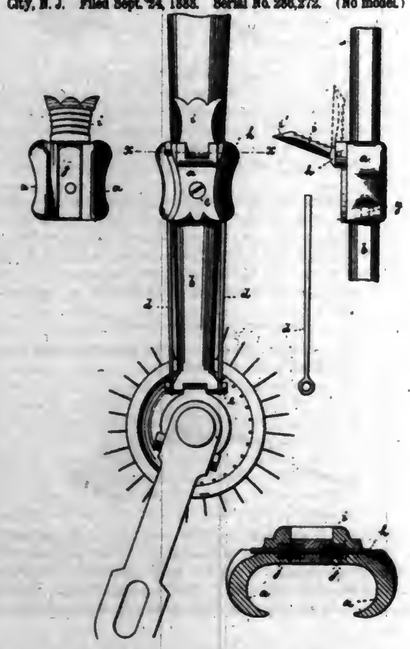


Claim.—1. A truss consisting in the vertically-ranging outwardly-bowed plate-spring A, having abdominal and hernial pads secured to its inner face at its upper and lower ends, respectively, and a transverse plate and a spring secured to the first-named spring below its center and above the upper end of the lower pad curved inwardly and

provided with strap-attaching devices at its ends, substantially as set forth.

2. The combination, with the two outwardly-bowed plate-springs A E, having upper and lower securing-bolts, *a a*, and an abdominal and a hernial pad, of the transverse inwardly-bowed spring B, held between the said two springs and their bolts below the centers of the springs but above the upper end of the lower pad, and provided at its ends with strap-attaching devices, substantially as set forth.

396,181. WEATHER-STRIP. JOSEPH WALKER, Belleville, Kans. Filed May 26, 1888. Serial No. 275,183. (No model.)



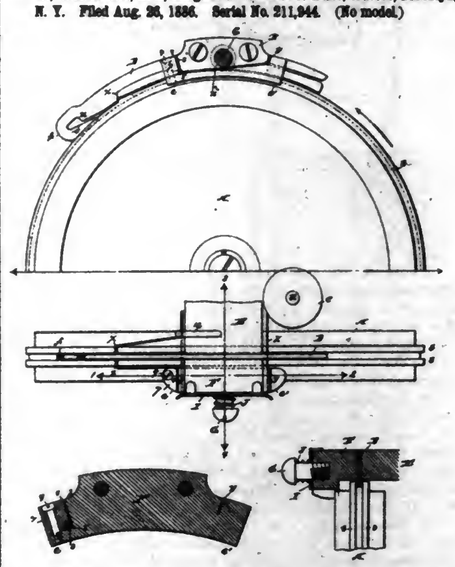
Claim.—1. The combination, with a door mounted on sliding joint-hinges, of the flexible strips attached to the edges of the door and the anti-friction rollers mounted on the bottom of the door, substantially as specified.

2. The combination, with a door having strips on its edges and mounted on sliding joint-hinges, of the anti-friction rollers mounted on the lower edge of the door and bearing on the sill, and adapted to be received in beveled sockets in the sill, substantially as specified.

3. The combination, with a door frame or casement and sill having a drip-groove, the channels leading from the groove, and the beveled sockets of the door, the sliding joint-hinges having projections on the lower ends of their movable knuckles to engage corresponding notches in the upper ends of lower stationary knuckles, whereby the door drops as its free edge strikes the casement, and the anti-friction rollers mounted on the lower edge of the door and bearing on the sill, and adapted to be received in the said sockets in the sill, all constructed and arranged to operate substantially as and for the purpose hereinbefore specified.

4. The combination, with a door provided with grooves in its edges, of the holders K, located in the grooves, and comprising the rolls *k*, formed by doubling the holder twice upon itself, and the flanges *k'*, bearing on the edge of the door and formed integral with the rolls, and the flexible strips arranged at their inner edges in the rolls and doubled on themselves therein, and projecting at their outer edges beyond the edge of the door, substantially as specified.

396,182. FOOT-REST FOR BICYCLES. HENRY WALTER, Jersey City, N. J. Filed Sept. 24, 1888. Serial No. 286,272. (No model.)



Claim.—1. The combination of clamp *a*, adapted to straddle the fork of a bicycle, with foot-piece *i*, pivoted to such clamp and having a beveled edge, *i'*, substantially as specified.

2. The combination of clamp *a*, with foot-piece *i*, pivoted thereto, and with a spring, *j*, and set-screw *c*, substantially as specified.

3. The combination of clamp *a*, having mortises *g*, with the bars *d*, set-screw *c*, pivoted foot-piece *i*, and spring *j*, substantially as specified.

396,183. THREAD-GRIPPING DEVICE. SIMON W. WARDWELL, Jr., Woonsocket, R. I., assignor to William P. Earle, trustee, Brooklyn, N. Y. Filed Aug. 26, 1886. Serial No. 211,944. (No model.)

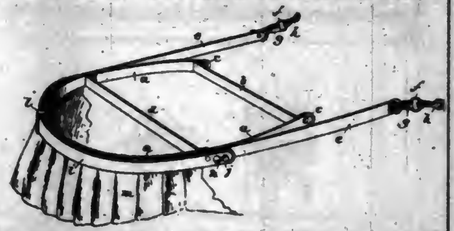
Claim.—1. The combination, in the take-up of a sewing-machine, of a part of the machine having a V-shaped notch adjacent to the normal path of the thread, a deflector whereby said thread is carried into said notch and there gripped as the thread is taken up, and a thread-releaser arranged to disconnect the thread from the deflector, substantially as described.

2. The combination of the stationary head F, a revolving shouldered thread-deflecting disk arranged adjacent thereto, a thread-gripping notch in said head at right angles to the disk, and a thread-releasing device, as D, substantially as described.

3. The combination of the thread-guides, the stationary V-shaped thread-grip adjacent to the normal path of the thread, a revolving take-up which deflects the thread into the thread-grip during its operation, and a releasing device which disengages said thread from the revolving take-up, substantially as set forth.

4. The combination, with the thread-guides, a stationary thread-receiving notch, and a revolving deflector which deflects the thread from its normal path into said notch, where it is positively held, of a cast-off or releasing device for disengaging the thread from the deflector and notch and a pressure device arranged to apply tension to the thread between the spool and notch, substantially as set forth.

5. The combination, with the take-up of a sewing-machine, of a head, F, arranged between the spool and take-up, having the ears *e e'*, one of said ears having formed in it a thread-guide slot and the other being provided with a detachable grip-block, 7, arranged to form a second guide-slot and beveled at the lower face to form a grip-notch, substantially as described.



6. The combination of the head provided with a thread-grip notch, a revolving take-up provided with a rib, a thread-releasing device, and a retaining-bar having a shoulder against which the thread is held until the rib has passed the shoulder, substantially as described.

7. The combination of the take-up, consisting of the revolving ribbed and shouldered disk and retaining-bar having an inclined edge and shoulder, and a bracket or head having a V-shaped notch arranged to receive the thread when deflected by the take-up, substantially as set forth.

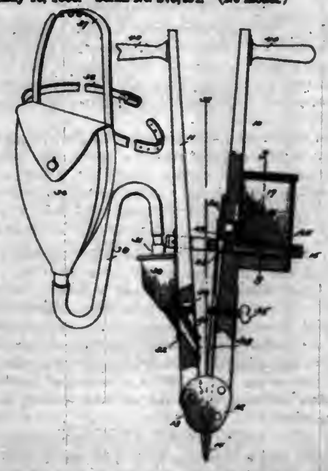
8. The combination, with a sewing-machine, of a stationary head, F, provided on one side with a thread-guiding slot and on the other with a thread-gripping notch, a revolving shouldered disk, and a bar, D, supported by said head and having an inclined edge and shoulder, substantially as described.

9. The combination, in a sewing-machine, of a stationary head, F, having a thread-guiding slot and a thread-gripping notch, a tension device intermediate of said slot and notch, a revolving shouldered disk arranged to deflect the thread into said thread-gripping notch, and a device carried by the head for releasing the deflected thread from the shoulders of the disk, substantially as described.

396,184. DRESS-SUPPORTING STEEL. MARY E. WHALEN, New York, N. Y., assignor, by mesne assignments, to Mary Agnes Whalen, same place. Filed Feb. 23, 1888. Serial No. 264,931. (No model.)

Claim.—1. A dress-steel consisting of a bow having metallic straps secured thereto and forming a bow with double ends, substantially as described.

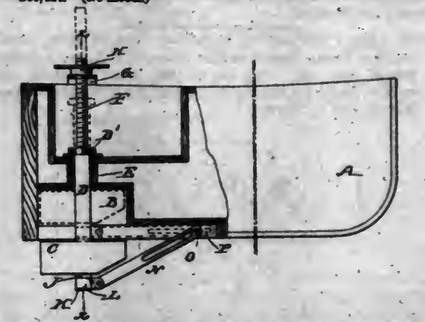
2. A dress-steel consisting of a bow having metallic straps secured thereto and projecting beyond the ends of the bow, substantially as described, whereby a bow with double ends is formed, as and for the purpose set forth.



3. The combination, in a dress-steel, of a main member, a connecting-strap for the ends thereof for maintaining it in a bowed position, and metallic extensions united thereto at or near the ends and carrying rings at their free ends, substantially as described.

4. The combination, in a dress-steel, of a main member, a connecting-strap for the ends thereof for maintaining it in a bowed position, a supplemental brace-strap inward from said end connecting-strap, and extensions united to the main member at or near the ends and forming a medium for attaching the steel to a skirt, substantially as described.

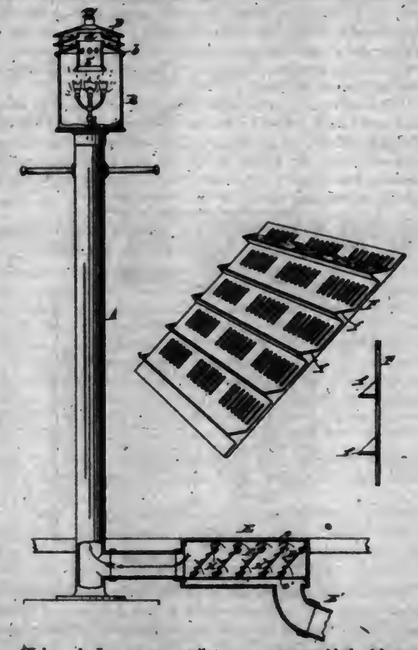
5. A dress-steel consisting of a bow provided with double ends a catch at one side, and a band secured to the side opposite the catch and having its free end engaging the said catch and clamping the folds of the skirt between said band and bow, substantially as herein shown and described.



6. In a dress-steel, the combination of a main member or bow having a connecting-strap at its ends, a band on the outside at the back secured at one end to said main member and free at the other end to engage said member by a suitable catch, and rings at the forward ends of the steel, substantially as described, whereby the steel may be detachably secured to the skirt at its rear and at two independent parts at its front, as specified.

396,185. HAND-PLANTER. WILBUR S. WHELS, Union, W. Va. Filed May 10, 1888. Serial No. 273,491. (No model.)

Claim.—In a hand-planter, the combination, with vertical parallel arms hinged at their lower ends, one of which arms is provided with a diagonal bore, and a receptacle secured to the outer side of one arm communicating with said bore, of a bag adapted to contain fertilizer, a flexible tube connecting said bag and receptacle, a spring-actuated valve hinged to the inner side of one arm, covering the inner end of the bore therein, and a set-screw passing through the opposing arm and adapted for engagement with said valve, as and for the purpose specified.

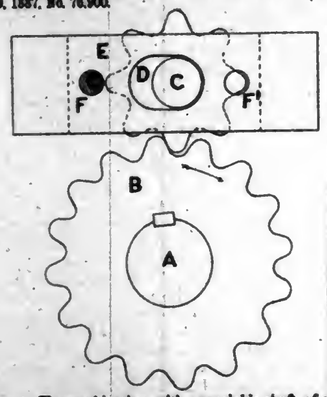


396,186. AUXILIARY STEERING DEVICE FOR VESSELS. CHARLES D. WOOLEY, Walden, N. Y. Filed Apr. 3, 1888. Serial No. 269,414. (No model.)

Claim.—1. The combination, with the round rudder-post D, screw-threaded at its upper end and having a rudder on its lower end, of the adjusting-nut on said threaded portion, and the tiller D', fixedly secured to the post at the juncture of the threaded and non-threaded portions.

2. The combination, with a marine vessel having downwardly-opening rudder and brace-receiving recesses in its bottom, of a vertically-adjustable rudder-post carrying a rudder and projecting below the same, a loose sleeve on the said projecting end of the rudder-post, and a brace pivotally connected to said sleeve and to a pin or part within the brace-recess, substantially as described.

396,187. SEWER-VENTILATOR. THOMAS P. WORTHINGTON, Southshore, Blackpool, County of Lancaster, England. Filed Mar. 19, 1888. Serial No. 267,641. (No model.)



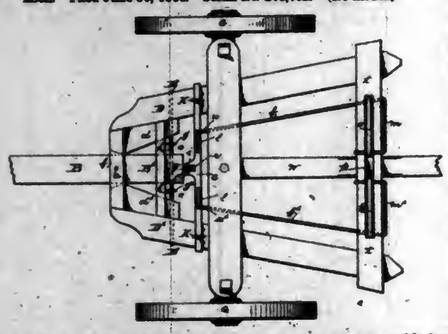
Claim.—1. In a sewer-ventilator, a grate provided with a series of ledges, forming pans for holding disinfectants, and apertured between the ledges, substantially as described.

2. In a sewer-ventilator, the combination, with a tubular lamp-post, of a chamber arranged between the lamp and the sewer, and a series of grates arranged in the chamber and provided with a series

of ledges, forming pans for holding disinfectants, substantially as herein shown and described.

3. The combination, with a tabular lamp post, standard, or pillar, a lamp provided with an apertured cap, and the burner of said lamp, of an exterior disinfectant-chamber connected at one end with the post and adapted for connection at the opposite end to a sewer provided with perforated partitions above the sewer-connection, and a series of grates and supporting-ledges forming pans or receptacles projected from the partition adapted to retain disinfectants, substantially as shown and described.

396,188. REVERSIBLE RACK-STOP. LUKE ANDERSON, London, County of Surrey, England, assignor of one-half to Leicester Bradney Stevens, same place. Filed Aug. 21, 1888. Serial No. 283,380. (No model.) Patented in England Feb. 23, 1887, No. 2,787, and in Belgium Mar. 29, 1887, No. 76,900.

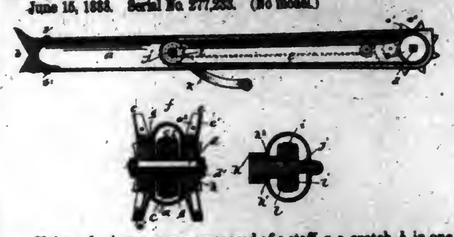


Claim.—1. The combination, with a revoluble shaft, of a toothed wheel secured on the shaft, a laterally-movable pinion gearing into the toothed wheel, and a stop adapted to engage with the said pinion and prevent the back motion of the shaft, substantially as set forth.

2. The combination, with a revoluble shaft, of a toothed wheel secured on the shaft, a laterally-movable pinion gearing into the toothed wheel, a fixed bracket provided with a hole on each side of the pinion, and a removable stop adapted for insertion into either of the said holes for arresting the motion of the pinion, substantially as and for the purpose set forth.

3. The combination, with a revoluble shaft, of a toothed wheel secured on the shaft, a fixed bracket provided with a central slot and a hole upon each side of the slot, a laterally-movable pinion gearing into the said wheel and guided by the said slot, and a stop adapted for insertion into either of the said holes for arresting the motion of the pinion, substantially as and for the purpose set forth.

396,189. WAGON-TONGUE LOCK. CHANCY C. ANDREWS, Nottawa, Mich. Filed June 30, 1888. Serial No. 278,702. (No model.)

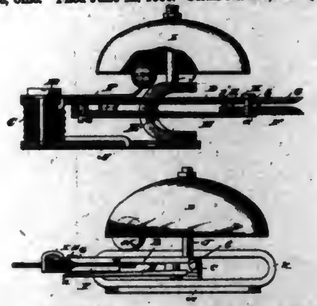


Claim.—1. In a wagon-lock, a pivoted tongue and movable bar engaged thereby, in combination with a rock-shaft having one end engaged by said bar and the other end provided with a locking-latch, substantially as described.

2. In a wagon-lock, a fifth-wheel and pivoted tongue, in combination with rock-shafts provided with locking-latches, substantially as described.

3. The combination of a fifth-wheel provided with a pivoted tongue, a horizontal bar passing through the tongue and provided with stops upon opposite sides thereof, a reciprocating bar, a pair of rock-shafts engaged by said bar, and locking-latches operated by said shafts, all arranged and adapted to operate substantially as described.

4. In combination with the fifth-wheel and tongue, a pair of rock-shafts having locking-latches pivoted thereon, and having their heavier free ends also pivotally connected to the bent ends of the shafts, substantially as described.



396,190. CAR-MOVER. CLARENCE I. BARNHART, Flint, Mich. Filed June 15, 1888. Serial No. 277,233. (No model.)

Claim.—1. A car-mover composed of a staff, *a*, a crotch, *b*, in one end of such staff to engage a car, a gripper, *f*, supported upon a shaft which is borne by the other end of said staff, said gripper being composed of dished halves *e*, provided with hubs to receive the shaft, and with fingers *d'*, having biting-edges d^2 thereon, which halves are independently and detachably fixed to the shaft, and gearing for imparting rotary motion to said gripper, substantially as and for the purpose described.

2. A rotary gripper composed of dished halves *e*, provided with hubs *g*, and having the fingers *d'*, with knives d^2 fastened thereon, combined with a hollow staff having openings in its sides forming bearings for said hubs, a shaft to which said halves are independently and detachably fixed, and operating-gearing for imparting rotary motion to said gripper, substantially as described.

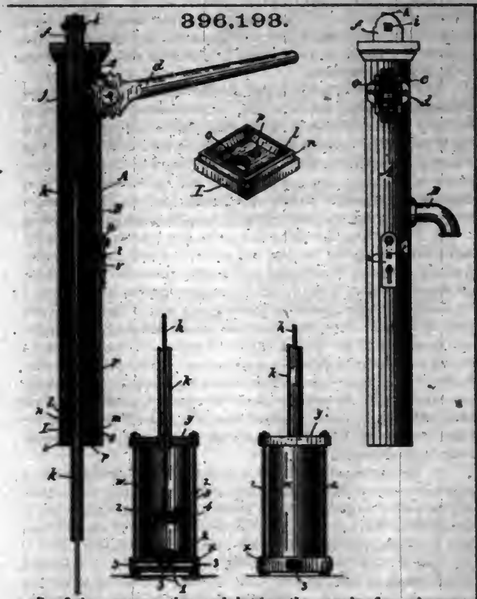
396,191. CORD-TENSION ALARM FOR GRAIN-BINDERS. MILFORD H. BIEBERBACH, Upper Sandusky, and NELSON M. BIEBERBACH, Melmore, Ohio. Filed June 12, 1888. Serial No. 276,851. (No model.)

Claim.—1. The combination, with the attaching-plate having a loop, as described, and a gong arranged thereon, of a pivoted arm having clamping-jaws at its outer end and connected with the plate at its opposite end by means of a spring, and a pivoted hammer mounted on but moving with the pivoted arm and having a limited play thereon, substantially as specified.

2. The combination, with the attaching-plate having a loop, as described, of a gong arranged thereon, a pivoted arm having adjustable clamping-jaws at one end and pivoted on the plate at the other end and playing in the loop, and a spring connecting the arm with the plate, and a pivoted hammer for the gong mounted on the same pivot as the arm and moved by the said arm, substantially as specified.

396,192. COMPOSITION FOR CLEANING THE TEETH. CHARLES R. CLARK, New Britain, Conn., assignor of one-half to Henry C. Burton, U. S. Army. Filed Nov. 7, 1887. Serial No. 254,560. (No specimens.)

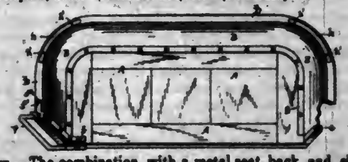
Claim.—1. A composition for a dentifrice, consisting of menthol and abrading substance, substantially in the proportions specified.



2. A composition for a dentifrice, consisting of menthol, glycerine, and abrading substance, substantially in the proportions specified.

3. A composition for a dentifrice, consisting of menthol, glycerine, abrading substance, flavor, and odor, substantially in the proportions specified.

396,193. PUMP. WILLIAM H. CLOUD, Kokomo, Ind., assignor of one-half to William Styer, same place. Filed Mar. 15, 1888. Serial No. 267,212. (No model.)



Claim.—In a pump, the combination, with the upper and lower sections of the pump-stock, of the above-described coupling-block, consisting of a rectangular block adapted to fit into grooves in the

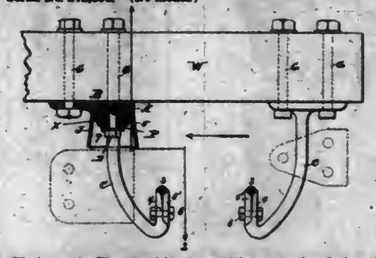
396,193.

walls of the upper section, and having the annular flange *l*, screw-threaded opening *o*, and drainage-opening *p*, and the annular packing *s*, all arranged substantially as specified.

396,194. VEHICLE-SEAT. FRANK A. COMSTOCK, Columbus, Ohio. Filed Sept. 3, 1888. Serial No. 284,388. (No model.)

Claim.—The combination, with a metal seat back and sides, of the strengthening-fillet *b*, of wood, in the form of a parallelogram, bent to conform to the line of the upper flanged edge of the seat back and sides to which it is secured, the wooden end and connecting-pieces *c*, into which are made to extend the ends of said back and side piece, handles F, having perforated extension-arms *f'*, and strengthening perforated corner-plates A, substantially as and for the purpose specified.

396,195. ARMATURE FOR DYNAMO-ELECTRIC MACHINES. LEO DAFT, Plainfield, N. J. Filed Nov. 12, 1885. Renewed May 4, 1888. Serial No. 272,855. (No model.)

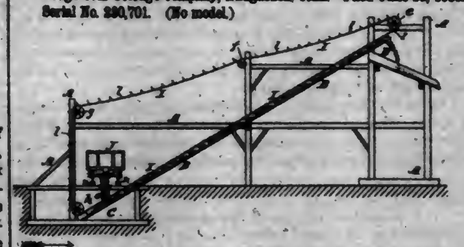


Claim.—1. An armature consisting of a cylindrical core, rings connected to the core and having outwardly-extending arms, and spiders connected to said arms, substantially as described.

2. The combination, with the core, of a ring, another intermediate ring interposed between the core and the said ring, a spider, and arms joining the spider and intermediate ring, substantially as described.

3. The combination, with the core, of a ring having notches, an intermediate ring having laterally-projecting arms fitting said notches, and spider-arms supporting the latter, substantially as described.

4. In an armature, the combination, with the core, of a ring of diamagnetic material, over which the wires may be wound, an intermediate ring having integral arms, also of diamagnetic material, and spider-arms connected to the intermediate ring supporting the core, substantially as described.



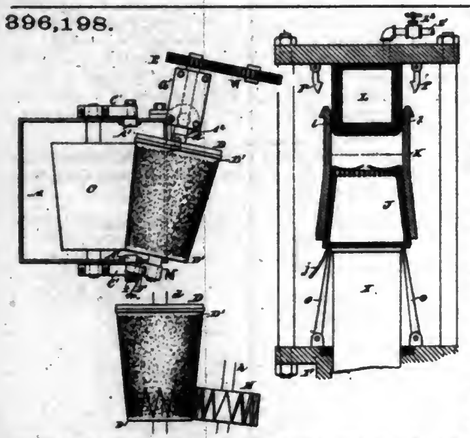
396,196. INSULATOR-SUPPORT FOR ELECTRIC CONDUCTORS. LEO DAFT, Plainfield, N. J. Filed Dec. 29, 1886. Renewed May 4, 1888. Serial No. 272,856. (No model.)

Claim.—1. The combination, with an overhead electrical conductor, and with a bracket supporting the same, of an overhead support, a bonnet secured to said support and receiving a cross-head of the bracket, and fastenings extending through the cross-head into the bonnet and through insulating material between the fastenings and the cross-head and between the latter and the bonnet, substantially as set forth.

2. The combination of the support, pendent bonnet, bracket supporting a conductor and provided with a cross-head having openings *x*, bolts passing through said openings into the bonnet, an insulating material between the heads of the bolts and the cross-head and between the cross-head and the bonnet, substantially as set forth.

396,197. CHAIN CONVEYER FOR UNLOADING CARS. JAMES M. DODGE, Philadelphia, Pa., assignor, by mesne assignments, to the Dodge Coal Storage Company, Naugatuck, Conn. Filed June 23, 1888. Serial No. 280,701. (No model.)

Claim.—In an apparatus or contrivance for transisting coal from the dumping-cars of a surface railroad to a higher elevation, the combination, with the usual pit located beneath the surface track and adapted to accommodate the lowermost portion of the chain-conveyer trough and to receive the coal as discharged from the dumping-cars located on said track, of, first, the obliquely-arranged conveyer-trough having its lowermost end located within said pit and its upper end at a higher elevation, and, second, the flighted endless conveyer-chain having its lower run arranged to operate in conjunction with said trough, and having its upper run arranged to encompass the track and the dumping-car which may be located thereon, the whole constructed and operating in substantially the manner hereinbefore described, for the purposes set forth.



396,198. MANUFACTURE OF PAILS, &c., FROM PAPER-PULP. HENRY FAIRBANKS, St. Johnsbury, Vt. Filed June 1, 1887. Serial No. 239,943. (No model.)

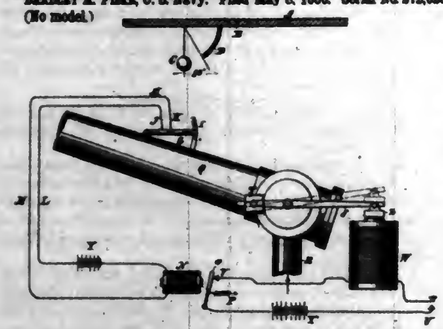
Claim.—1. That improvement in the manufacture of articles from paper-pulp that consists in admitting live steam properly confined to press directly upon the surface of fluid pulp to force the water out, lay the fiber, and keep the semi-solid mass of the partly-formed vessel flexible while the pressing-dies are being brought into action, as herein specified.

2. The method herein described of softening and drying, in connection with shaping, articles of paper-pulp by compressing mechanically between properly-formed perforated dies and also forcing steam from one die to the other through the article, substantially as herein specified.

3. The within-described method of manufacturing pails and analogous articles of paper-pulp by tearing partially-hardened pulp, applying the torn edges nearly together, flowing thin pulp between and

396,198.

causing it to saturate and become incorporated with the said edges, and subsequently draining, heating, softening, and partially drying by steam and pressing the compound mass, all substantially as herein specified.



4. The bearing A^3 A^2 and vertical shaft G, supported therein, said shaft having the head G', in combination with the shaft *d*, journaled in said head at approximate right angles to said vertical shaft G, the conical roll D, mounted on said shaft *d*, with its smaller end remote from said head, the tank A, and rolls for supplying a coating of pulp to said conical roll D, substantially as herein specified.

5. A machine for the manufacture of articles from paper-pulp, comprising the bearings A^2 A^3 and vertical shaft G, supported therein, said shaft having the head G', in combination with the shaft *d*, journaled in said head at approximate right angles to said vertical shaft G, the conical roll D, mounted on said shaft *d*, with its smaller end remote from said head, the box M, in which the free end of said shaft *d* is journaled, the hook *m* upon said box, the tank A, standard A', and pin *a* upon said tank, lever F, pivoted at one end upon said standard and adapted to engage said hook and pin, for the purpose set forth, and rolls for supplying a coating of pulp to said conical roll D, substantially as herein specified.

6. In the manufacture of articles from paper-pulp, the pail-former J, having a finely-perforated top to receive the truncated cone of partially-hardened pulp, in combination with the removable piece K, of which the conical lower part fits over said truncated cone and the cylindrical upper part is adapted to receive a quantity of thin pulp to join the edges and form the bottom, substantially as herein specified.

7. In an apparatus for manufacturing articles from paper-pulp, the combination of the conical former J, having a finely-perforated top, the cylindrical box L, having finely-perforated bottom, the removable piece K, comprising a conical lower part fitting said former and a cylindrical upper part fitting said box, hooks *m* on said cylinder K, and dogs P for engaging said hooks and supporting said cylinder in elevated position, for the purpose set forth, and means for forcing said former upward, substantially as herein specified.

396,199. ELECTRIC APPLIANCE FOR DISCHARGING GUNS. BRADLEY A. FISKE, U. S. Navy. Filed May 3, 1888. Serial No. 273,023. (No model.)

Claim.—1. The combination of a gun, an electrode supported so as to be free to move under the action of gravity, an electrode partaking of the motion of elevation and depression of said gun and arranged in the path of said first electrode, an electrical firing apparatus for said gun, a source of electricity, and a circuit including said firing apparatus, source of electricity, and electrodes, the said second electrode being adjustable nearer to or farther from said first electrode, substantially as described.

2. The combination of a gun, an electrode free to move under the action of gravity and controlled by the elevation or depression of said gun, a second electrode rigidly connected to said gun and partaking of the motion thereof, an electrical firing apparatus for said gun, a source of electricity, and a circuit including said firing apparatus, source of electricity, and electrodes, the said second electrode being disposed in the path of motion of said first electrode and adjustable nearer to or farther from said first electrode, substantially as described.

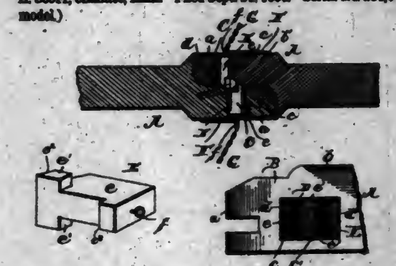
3. The combination, with a pneumatic gun, a source of air-supply, and a valve interposed between said source and said gun, of an electro-magnet having its armature mechanically connected to said valve, an electrode free to move under the action of gravity and controlled by the elevation or depression of said gun, a second electrode in the path of motion of said first electrode rigidly connected to said gun and partaking of the motion thereof, a source of electricity, and a circuit including said electro-magnet, source of electricity, and electrodes, said elements being combined and operating so that when the gun reaches a certain predetermined elevation the movable electrode shall make contact with the fixed electrode, and the electro-magnet being energized shall through its armature open said valve, substantially as described.

4. The barrel or air-tube of a pneumatic gun movable about a center in a vertical plane, a valve regulating the air-supply to said tube, and an electro-magnet having an armature controlling said valve, in combination with a level containing a conducting-liquid disposed parallel to the longitudinal axis of the tube, movable about a center in the same vertical plane as and partaking of the motion of said tube, circuit-terminals entering said level, a source of electricity, and circuit-connections including said terminals and said electro-magnet, the aforesaid parts being constructed and disposed so that said electro-magnet shall be energized or de-energized by the making or breaking of circuit at said terminals by said liquid under the action of gravity, substantially as described.

5. The barrel or air-tube of a pneumatic gun movable about a center in a vertical plane, a valve regulating the air-supply to said tube, and a motor operating said valve, in combination with a vessel containing a conducting-liquid and movable about a center in the same vertical plane as and partaking of the motion of said tube, circuit-terminals entering said vessel, a source of electricity, and circuit-connections, the aforesaid parts being constructed and disposed so that the said motor shall be governed by the making or breaking of circuit at said terminals by said liquid under the action of gravity, substantially as described.

6. The combination of the barrel Q of a pneumatic gun, a valve regulating the air-supply therefor, a lever, S, controlling said valve to open or close the same, a level, G, containing a conducting-liquid supported by said barrel and adjustable in a vertical plane at an angle to the longitudinal axis of the bore, circuit-terminals J K, entering said level, battery Y and magnet N in circuit with said terminals, and a motor controlled by the armature of magnet N, for moving said lever S to open said air-valve, substantially as described.

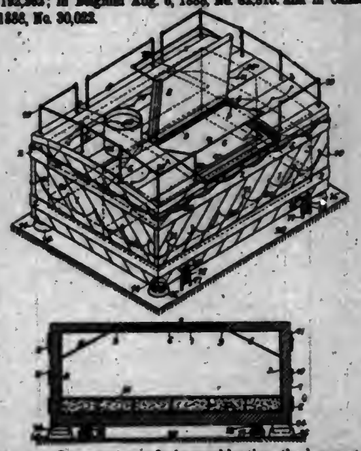
7. The combination of the barrel Q of a pneumatic gun, a valve regulating the air-supply therefor, a counterweighted lever, S, controlling said valve, a level, G, containing a conducting-liquid and pivoted on said gun and adjustable in a vertical plane at an angle to the longitudinal axis of the bore, circuit-terminals J K, entering said level, battery Y, magnet N, armature O, and in circuit with said armature the battery Y', contact-stop V, magnet W, and armature Z of said magnet W, the said armature communicating with the lever S, substantially as described.



8. The combination of the barrel Q of a pneumatic gun, a valve regulating the air-supply therefor, a counterweighted lever, S, controlling said valve, a level, G, containing a conducting-liquid and pivoted on said gun and adjustable in a vertical plane at an angle to the longitudinal axis of the bore, circuit-terminals J K, entering said level, battery Y, magnet N, armature O, and in circuit with said armature the battery Y', contact-stop V, magnet W, armature Z, communicating with lever S, and circuit-closing key U, arranged between said electro-magnet and battery Y, substantially as described.

396,200. DIE USED IN MAKING DECORATIVE NAILS. HENRY P. FISKE, Waterbury, Conn., assignor to the American Ring Company, same place. Filed June 25, 1888. Serial No. 278,122. (No model.)

Claim.—The die *a*, having a hole for the passage of a wire which forms the shank of the nail, said hole opening into a conical recess in the die to form the cup or rest that connects the sheet-metal head to the shank, and said die having a circular shoulder or offset at 2, in combination with the matrix *b*, having a recess corresponding in shape to the exterior of the sheet-metal nail-head, and a circular opening into which the shoulder 2 fits tightly, so as to confine the sheet metal of the nail-head and render the head true and perfect by the pressure of the die upon the same, the metal being confined between the die and matrix, substantially as set forth.

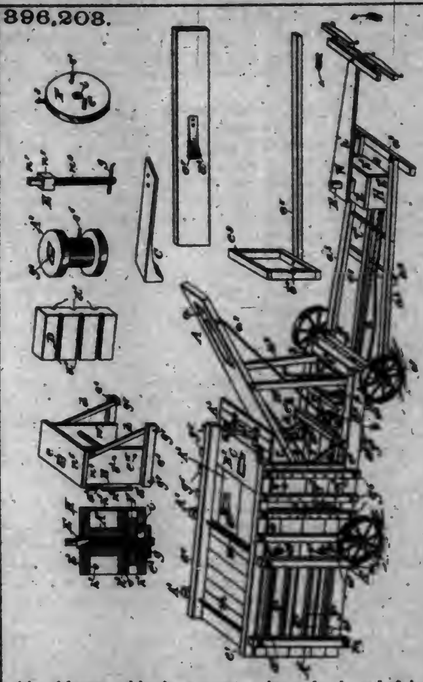


396,201. CAR-COUPLING. JOHN W. FORNEY, Thayer, and SAMUEL H. SCOTT, Chanute, Kans. Filed Sept. 21, 1888. Serial No. 286,044. (No model.)

Claim.—1. The combination of the draw-heads, each having a recess, B, and a projection, *a*, the projection *a* being provided with a transverse opening having a rectangular portion, *c*, and a T-shaped portion, *c'*, and the locking-block having a rectangular portion fitting in the portion *c* of the opening, and the flanges *c'*, fitting in the T-shaped portion thereof, as specified.

2. In a car-coupler, the combination, with the draw-head provided with the recess B, the opening C, and recess D, of the locking-block E, provided with the flanges *c'*, beveled point c^3, and shoulder c^2 on its inner edge, the spring-rod F, and the chain G, substantially as specified.

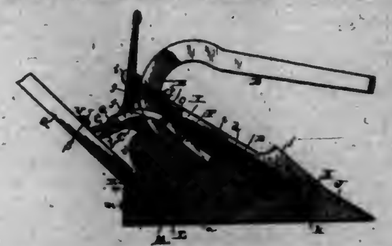
396,202. MARINE SAFE. WILLIAM W. FORNEY, Havelet, Guernsey, England. Filed Aug. 17, 1888. Serial No. 282,956. (No model.) Patented in England July 19, 1888, No. 10,480; in France Aug. 6, 1888, No. 192,963; in Belgium Aug. 6, 1888, No. 82,510, and in Canada Oct. 20, 1888, No. 30,022.



Claim.—1. In a marine safe, in combination, the buoyant water-tight casing 1, strengthened with surrounding bands 2, and adapted with life-lines 10, top railing, 19, cylinder 12, and contained buoy 13, and water-tight doors 8, with an inner partitioned water-tight lining, 3, partitioned off into a ballasting-compartment, 21, buoyant compartments 5, and water-tight compartments for reception of mail or other matter, and adapted with water-tight doors 7, as set forth.

2. The combination, with the buoyant and water-tight casing, of the conical feet 14, fitting into like-shaped recessed sockets 16, the staples 15 17, and the lashing-cord 18, substantially as set forth.

396,203. HAY-PRESS. ALFONSO A. GARNER, Waverland, Iowa. Filed May 14, 1888. Serial No. 273,901. (No model.)



Claim.—1. A baling-press windlass consisting of the frame H, the spool A^3, the wheel F, provided with the pins c^3, the driving-rod E, provided with the pin *g*, and which passes through the spool and wheel, the sweep *w*, mounted upon the driving-rod, and the lever c^4, provided with a fulcrum and having one end resting under the end of the driving-rod, all combined substantially as described.

396,208.

2. The press-box K, the car B, the ram A, pivoted to the car and provided with the pulley *a*, the arms a^3, pivoted to the ram, the frame H, the spool A^3, supported in the frame, the wheel F, supported in the frame and having the pins c^3, the driving-rod E, provided with the pin *g*, and which passes through the spool A^3 and wheel F, the sweep *w*, mounted upon the driving-rod, the lever c^4, provided with a fulcrum and having secured to one end the frame c^5, the rope *n*, secured at one end to the car and at the other end to the wheel F, and the chain a^2, which passes over the pulley *a* and is secured at one end to the frame of the press and at the other to the spool, all combined substantially as described.

396,204. PLOW. ANDERS HAGVERT, South Bend, Ind. Filed July 26, 1888. Serial No. 281,153. (No model.)

Claim.—1. In a plow, the combination of a mold-board adapted to be shifted to right or left of the landside with a plow-beam adapted to be retracted to permit turning of the mold-board over the landside, substantially as specified.

2. The combination, in a plow, of a shifting mold-board turning over the landside with a retractible plow-beam, and connections between the beam and mold-board whereby the mold-board is turned by the shifting of the beam, substantially as described.

3. The combination, in a plow, of a shoe, a retractible plow-beam thereon, and the mechanism for shifting said beam with a mold-board pivotally connected to the shoe and connected to the beam and adapted to be shifted to right or left of the beam over the shoe, substantially as described.

4. The combination of the landside and mold-board adapted to be shifted over and to right and left of said landside with the shifting-quadrant pivoted to said landside and bracing the mold-board and the laterally-adjustable handles, substantially as described.

5. The combination, with the shoe having a socket and the plow-beam having a foot sliding in said socket, of a mold-board adapted to be shifted over the shoe beneath the handle and the devices for retracting and shifting the beam while the mold-board is being turned, substantially as set forth.

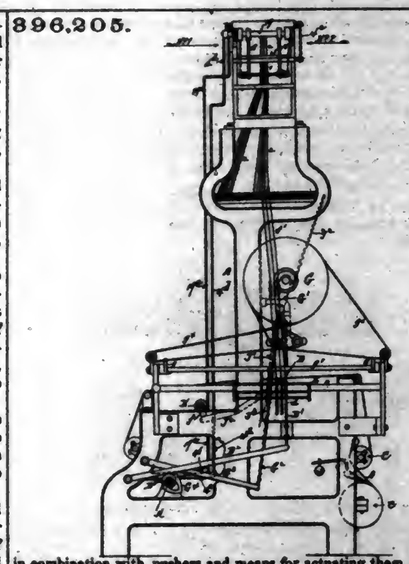
6. In a plow, a shoe having a landside, a mold-board pivotally connected to and turning over said shoe, a pivoted shifting bracing quadrant for the mold-board, and a longitudinally-shifting plow-beam, all combined and arranged substantially as described.

7. The combination of the shoe, the mold-board pivotally attached thereto, the retractible plow-beam mounted thereon, and the adjustable handles with the lever-and-link connections, whereby the beam and mold-board are shifted and the handles locked simultaneously, substantially as described.

8. The combination of the shoe having an inclined socket, the shifting plow-beam having a foot engaging said socket, and the double-faced mold-board pivoted on said shoe and turning to right or left over the same with the short shaft journaled in the rear portion of the shoe, its arm and link-connection between the same and plow-beam, and the link-connection between said beam and mold-board, whereby the beam is shifted and the mold-board turned upon the the oscillation of said shaft, substantially as described.

9. The combination of the slotted and channeled shoe and the shifting plow-beam having a foot engaging in the socket of the shoe with a transverse key attached to said beam and engaging in slots in the walls of the channel to prevent the escape of the beam from the shoe, substantially as specified.

10. In a plow, an angular-pointed shoe having an inclined slot and a channel slotted at the sides and ending in arms at the rear upper portion of the shoe, a mold-board adjustable to right or left of the shoe and pivotally attached thereto, a quadrant-brace pivoted to the shoe and supporting the wings of the mold-board, an adjustable beam having a foot mounted in the socket and channel of the shoe and keyed in the slots of said channel, a lever pivoted to a shaft journaled in the arms of said shoe, the link-connections between said shaft and beam, the link-connection between said beam and mold-board, and the adjustable handles, all combined and constructed substantially as set forth.



11. The combination of the shoe A and the mold-board I, having point J, pivoted to the front end of the shoe and provided with a brace-piece, O, with the angular brace *l*, pivoted in a slot in the rear of the shoe, the arc-shaped rod N, secured to the arms of said brace, and the eyes *n*, attached to brace O and engaging bar N, all substantially as specified.

12. The combination of the shoe with the mold-board I, having wings *i i* and point J, and brace O, provided with eyes *o o*, with the brace *l*, pivoted in a slot in said shoe and having its arms on opposite sides of the same, and the rod N, passing through eyes *o o* and attached to the ends of brace *l*, and the handles attached to said shoe in rear of the brace, substantially as and for the purpose set forth.

13. The combination of the shoe A, having landside *a* and inclined socket B, channel *b*, and arms C C, and the shifting mold-board pivotally mounted on said shoe, with the slotted beam D, having foot *d*, engaging socket B, the shaft G, journaled in arms C C, the lever *g*, the arm *f* and link F, connecting the shaft and beam, and the key H and slots *h*, all substantially as and for the purpose set forth.

14. The combination, in a hillside-plow, of a foot, A, having inclined socket B and channel *b*, arms C C, the beam D, having foot *d*, engaging socket B, and the shaft G, lever *g*, arm *f*, and link F, for shifting the beam, with the mold-board I, having share J, formed with shoulder K on its under side and pivoted on the front end of the shoe, the quadrant L, pivoted to the shoe and supporting the wings of said mold-board, the link P, connecting said mold-board and beam, and the adjustable handles and their locking devices operated by lever *g*, all constructed and arranged substantially as set forth.

396,205. LOOM FOR WEAVING CHENILLE AND FRINGE. KEDAR HAZELEY, Philadelphia, Pa., assignor, by direct and mesne assignments, of one-half to Joseph Hanson, same place. Filed Apr. 23, 1887. Serial No. 236,728. (No model.)

Claim.—1. The combination, with a Jacquard mechanism, of a series of thread-holders, each being provided with a hinged holding or tension arm, and each having independent connection with the Jacquard mechanism and capable of vertical adjustment thereby, and a laterally-adjustable carriage in which said holders are supported, as set forth.

2. A thread-holder and connections to a Jacquard mechanism by which the same is raised, in combination with said Jacquard mechanism, a supporting-stick, and means, substantially as described, for raising it under the holder and supporting said holder thereby, as set forth.

3. A thread-holder and sliding carriage in which said thread-holder is mounted, and means for vertically adjusting them therein, in combination with pushers and means for actuating them, substantially as described, for adjusting said carriage laterally.

4. A series of thread-holders, a sliding carriage, and means, substantially as described, for raising the holders separately, in combination with the pushers for centering the elevated holder and carriage, and means, substantially as described, for advancing the said pushers from the sides to the center, as set forth.

5. The combination, with a series of thread-holders, means for vertically adjusting them, a stick for sustaining a raised holder in an elevated position, means for actuating said stick, pushers, and actuating devices therefor for centering a holder when raised, of an arm with nippers on one end, and means, substantially as described, for projecting the said arm from the opposite side of the warp-threads for seizing the thread and drawing it through between the said warp-threads.

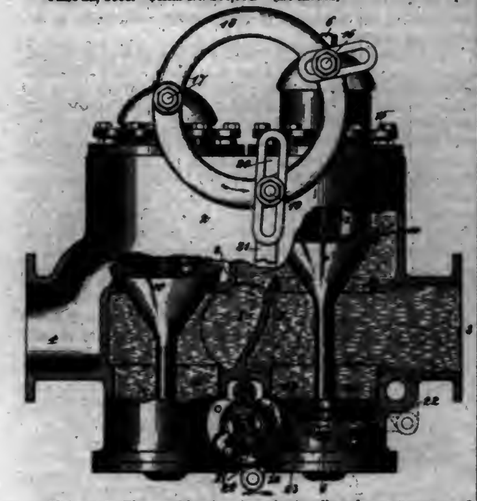
6. The combination, with a series of thread-holders and means for elevating them separately, a stick to hold the raised holder elevated, and means for actuating the stick, of the nippers for carrying the thread across through the warp, means for actuating the nippers, a knife and guides in which it works, connections and pivoted lever, and a cam for elevating the knife by acting on the lever and releasing the lever to let the knife drop, as set forth.

7. The combination, with a Jacquard mechanism and the vertically-movable thread-holders and laterally-sliding carriage in which they are held, of levers pivoted to the carriage and extended through the stems of the holders, and connections to the Jacquard harness from said levers for raising the said holders separately, as set forth.

8. The combination, with a Jacquard mechanism, vertically-movable thread-holders, and sliding carriage in which they are held, of levers pivoted at one end to a part of the carriage-frame and inserted through the stem of the holders, connections from the said levers to the Jacquard harness, pushers, and means for actuating them, substantially as described, for centering the sliding carriage and the elevated thread-holder, as set forth.

9. The combination, with the laterally-adjustable carriage, thread-holders held therein, and means whereby they are raised and dropped therein, of the pushers, cords connected to said pushers, a drum to which the cords are connected at the other end, and means, substantially as described, for giving the drum a partial rotation and then returning it to the normal position, whereby the pushers are operated, as set forth.

10. The combination, with the pushers, the cords connected thereto, the drum to which the cords are connected at the other end, the crank-pitman, lever, and cam for partially rotating the drum, and the rod and spring for returning the drum to the proper normal position, of the thread-holders and means for raising them and sliding carriage, substantially as set forth.



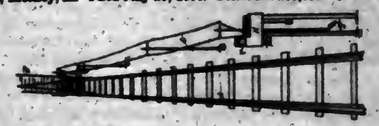
11. A thread-holder for looms, consisting of stem and grooved projection, as described, and having an opening or hole through the head thereof, and a pivoted arm which rests in the groove, substantially as set forth.

12. A pattern-card and supporting and feeding devices therefor, and shield with line of perforations lying back of said card, and means, substantially as described, for moving the said parts sidewise, as set forth.

13. The combination of a pattern-card, supporting and feeding devices therefor, and a shield having a line of perforations, with the needles, needle-cords and cord-lifting devices, and cam-bars actuated by said needle-cords for moving the pattern supporting and feeding devices and the card and shield sidewise, substantially as set forth.

14. The combination, with a laterally-movable card-carriage, card and feeding devices therefor, and shield having the line of perforations, of the needles, needle-cords and cord-lifting devices, and sliding bars having wedges or cams thereon for moving the card-carriage and attached parts, said bars being connected to the needle-cords, as set forth.

396,206. HYDRAULIC VALVE. TRADDEUS W. HERRMANN, Chicago, Ill., assignor to The Crane Elevator Company, of Illinois. Filed June 22, 1888. Serial No. 277,204. (No model.)



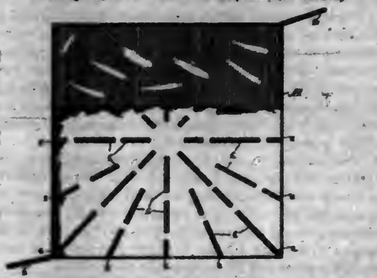
Claim.—1. The combination, in a hydraulic-valve apparatus, of two valves, a lever-fulcrum to both said valves, a pilot-valve, and a floating lever having a movable fulcrum and operating the pilot-valve and connected to the first-named lever, substantially as described.

2. The combination of two valves, one controlling the inlet and the other the exhaust opening, pistons connected to said valves, a lever fulcrumed to both said valves, a pilot-valve controlling the admission of water to said pistons, and a floating lever having a movable fulcrum and operating said pilot-valve and connected to the first-named lever, substantially as described.

3. The combination of the casing 2, divided by the partitions 7 and 8 into three chambers communicating with the inlet 3, cylinder-opening 5, and exhaust 4, respectively, the valves 9 and 10, seating in said partitions, the pistons 11, connected to said valves, the pilot-valve 25, admitting water to said pistons, the lever 18, connected to pistons 9 and 10, the floating lever 21, connected to the lever 18 and the valve-arm 24, and having the movable fulcrum 34, substantially as described.

4. In a hydraulic motor for elevators, the combination, with the inlet and exhaust valves and fluid-motors for operating them and an oscillating pilot-valve for controlling the flow of fluid to said motors, of a lever having suitable pivoted connections with said inlet and exhaust valves, said connections serving alternately as fulcrums for the lever as the valves are moved, a floating lever pivoted at one end to the piston-valve to oscillate it and connected at its other end to the first-named lever by a pivotal connection constructed to permit an independent longitudinal movement of said floating lever, and a connecting-rod to which power is applied, attached to the floating lever between the ends of the floating lever and engaging stops connected to the pilot-valve and the floating lever to limit their relative movements, substantially as described.

396,207. ELECTRIC SIGNALING APPARATUS. WILLIAM HENRY, Ritchey, Ill. Filed July 25, 1888. Serial No. 281,053. (No model.)



Claim.—1. In the electric signaling apparatus shown and described, in combination with the vibrating lever *a* of the electric instrument, the shaft S, adapted to be rotatable by means of a cord-and-weight mechanism and having the oppositely-arranged arms *c* and *c'* for alternately engaging said lever, the oppositely-arranged arms on the outer end of said shaft respectively having different-colored targets R W on their outer ends, the housing H for alternately exposing said signals to view, rod L, having one end protected to be a non-conductor and arranged to be within sleeve F, sleeve F, secured to the slide-rail B, clip E, for securing the opposite unprotected end of said rod to main rail A, non-conductor strip G, rail A, and line-wires *e*, arranged to connect the opposite poles of the electric instrument, respectively, with said rails and with each other through the medium of bolt L, clip E, and sleeve F, to form an electric circuit, substantially as and for the purpose set forth.

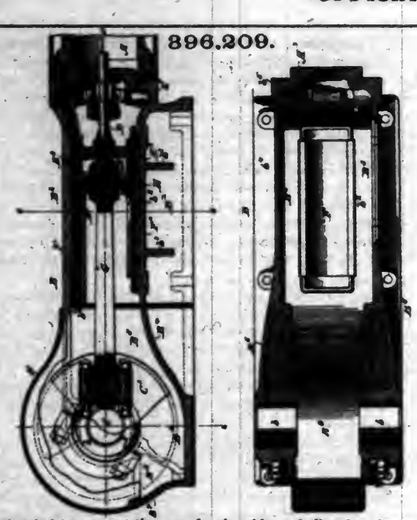
2. In the electric signaling apparatus shown and described, in combination with the vibrating lever *a* of the electric instrument, the shaft S, having the arms *c c'*, and arms S', having respectively different colored targets arranged on their outer ends, the cord-and-weight mechanism, the housing H, having the colored opposite lights V V, the line-wires *e*, and the permanent rail A and slide-rail B, connected so as to open and close the electric circuit, substantially as and for the purpose set forth.

3. In an electric signaling apparatus, in combination with the electric instrument having the vibrating lever *a*, the rotating shaft S, having the oppositely-arranged arms *c c'* for alternately engaging said lever, the oppositely-arranged arms S', respectively carrying on their outer ends the different-colored targets, and the housing H, arranged to cause said targets to be alternately exposed to view, substantially as and for the purpose set forth.

4. In an electric signaling apparatus, in combination with an electric instrument, line-wires, and main and slide rails of a railroad, the rod L, having one end protected to be a non-conductor and secured at its opposite end to one of said rails in such manner as to be separated therefrom by a non-conductor, and the sleeve F, secured to the opposite rail in such manner as to receive the non-conductor end of said rod, so that it may reciprocate therein and alternately bring it in contact with the conductor and non-conductor parts of said rod to open and close the electric circuit, substantially as and for the purpose set forth.

396,208. WATER BANDAGE. GEORGE P. HERNDON, Washington, D. C. Filed Apr. 2, 1888. Serial No. 269,316. (No model.)

Claim.—A water bandage formed of impervious material and having its walls stayed against inflation by means of tubes, said tubes being arranged within the covering of the bandage and having communication with the inclosed space of the bandage, substantially as and for the purpose specified.



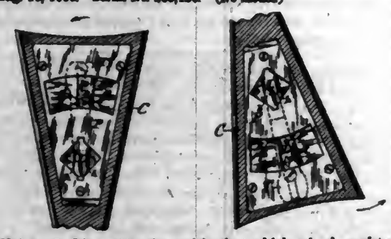
396,209. ENGINE-FRAME. ALBERT L. IDE, Springfield, Ill. Filed Feb. 20, 1888. Serial No. 264,607. (No model.)

Claim.—1. An engine-frame constructed for the attachment of a cylinder at one end and having two shaft-bearings at its opposite end, said frame comprising a straight tubular part adjacent to the cylinder, constructed to support the cross-head guides and having two vertical walls at each side of the frame, which form continuations of the side walls of the said tubular part, and which are connected with each other to form two hollow girders connecting the shaft-bearings with said tubular part of the frame, substantially as described.

2. An engine-frame constructed for the attachment of a cylinder at one end and having two shaft-bearings at its opposite end, said frame comprising a straight tubular part adjacent to the cylinder, constructed to support the cross-head guides, a hollow base located beneath said tubular part, and two vertical walls at each side of the frame, which are connected with each other to form hollow girders continuous with the side walls of said tubular part, and which are constructed to support the shaft-bearings, substantially as described.

3. An engine-frame constructed for the attachment of a cylinder at one end and having two shaft-bearings at its opposite end, said frame comprising a straight tubular part adjacent to the cylinder,

896,209.



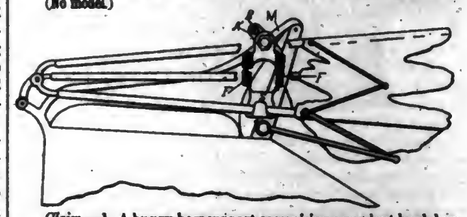
constructed to support the cross-head guides, a hollow base beneath said tubular part, vertical side walls continuous with the side walls of the tubular part and supporting the shaft-bearings, and a bottom wall or plate, B^4, extending downwardly from the lower wall of the tubular part to a point beneath the crank-shaft bearings and connected at its side margins with the said vertical side walls, substantially as described.

4. An engine-frame comprising a cylindric part adjacent to the cylinder, a hollow base beneath said cylindric part, two connected vertical walls at each side of the frame forming hollow girders continuous with the side walls of the said tubular part and supporting the shaft-bearings, and a bottom plate or wall, B^4, extending from the bottom of the tubular part to a point beneath the shaft-bearings and extending between and connecting the said vertical side walls, substantially as described.

5. The combination, with an engine-frame provided with a tubular part adjacent to the cylinder and having vertical side walls forming continuations of the sides of said tubular part for supporting the shaft-bearings, and having a bottom plate, B^4, extending from the bottom wall of the tubular part between said vertical walls beneath the shaft-bearings, of a hood or cover fitted to the adjacent margins of the said side walls, bottom plate, and tubular part for covering the crank-disks, substantially as described.

6. The combination, with an engine-frame comprising a tubular part adjacent to the cylinder, vertical side walls forming continuations of the tubular part for supporting the shaft-bearings, a bottom wall, B^4, between said side walls, and a transverse wall, B^7, connected at its side margins with the said side walls, of a cover or hood, H, fitted at its margins to the said tubular part, the side walls and the upper margin of the cross-wall B^7, substantially as described.

896,210. ODOMETER. GEORGE W. JOHNSON, Geneva, N. Y. Filed Aug. 18, 1888. Serial No. 283,126. (No model.)



Claim.—1. In combination, with the vehicle-wheel, registering mechanism, and the supporting-frame of the latter secured to said wheel, a ratchet-wheel secured to one of the shafts of the registering mechanism, a gravitating lever pivoted at one end to said frame, a pawl on said lever engaging the ratchet-wheel, and a gravitating tumbler provided with catches adapted to alternately engage and release the aforesaid lever during the revolution of the vehicle-wheel, as set forth.

2. In combination with the vehicle-wheel, registering mechanism, and the supporting-frame of the latter secured to said wheel, the ratchet-wheel R, secured to one of the shafts of the registering mechanism, the lever L, pivoted at one end to the aforesaid frame and weighted at the opposite end, the pawl *a*, connected to the lever, and the gravitating tumbler T, arranged movable laterally and longitudinally and provided with catches adapted to alternately engage and release the lever L during the revolution of the vehicle-wheel, as specified.

3. In combination with the wheel W, frame A, and registering mechanism connected to said frame, the ratchet-wheel R, secured to one of the shafts of the registering mechanism, the lever L, pivoted at one end to the frame A at a point between the ratchet-wheel and hub of the wheel and having its free end extending across the ratchet-wheel and weighted, the pawl *a*, connected to said lever, pins *l l*, projecting from the lever L, the gravitating tumbler T, provided with the longitudinal slot *b*, and connected oscillatory and movably longitudinally to the frame by the screw *c* in the said slot, and the lug *d*, projecting from the tumber and adapted to alternately engage and release the pins *l l* during the movement of the tumbler, substantially as described and shown.

4. In combination with the frame A and registering mechanism connected thereto, the ratchet-wheel R, secured to one of the shafts of said mechanism, the gravitating lever L, pivoted at one end to the frame A and having its free end extending across the ratchet-wheel, the pawl *a*, connected to said lever, the plate P, secured to the frame over the ratchet-wheel and lever and provided with the elongated aperture *e* and the quadrilateral aperture *f*, which latter is arranged diagonally in relation to the lever L, the tumbler T, provided with the longitudinal slot *b* and connected oscillatory and movably longitudinally to the plate P by the screw *c*, passing through the said slot, the lug *d*, projecting from the tumbler into the aperture *e*, the pins *l l*, projecting from the lever into the said aperture, and the guide A, projecting from the tumbler into aperture *f*, substantially as described and shown.

896,211. BUGGY-BOW SUPPORT. JONATHAN F. KOLB, HOMER H. ALLEN, and CHARLES F. ST. CLAIR, Oceanside, Cal.; said Allen and said St. Clair assignors to said Kolb. Filed July 24, 1888. Serial No. 280,947. (No model.)

Claim.—1. A buggy-bow support comprising a pendent hook having a spiral spring-support, and means for securing the spring-support to the buggy-seat with the point of the hook upward.

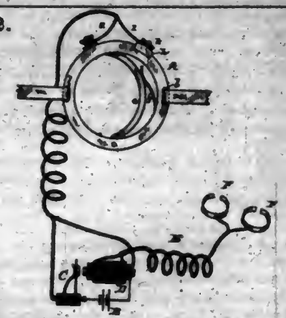
2. The combination of the clamp, the pivot-bolt projecting therefrom, the hanger secured thereon, the pendent hook, and spiral springs connecting the hook with the hanger.

3. The combination of the clamp A A', the bolts B, the pivot-bolt C, secured to and projecting from the clamp, the hanger D, the spiral springs F, secured thereto by their upper ends, and the hook H, secured to the lower ends of such springs.

4. The combination of the clamp, the pivot-bolt C, the hanger D, the spiral springs F F, secured thereto by their upper ends, and the hook H, comprising the loops I J K, secured to the lower ends of the springs.

5. In a buggy-bow support such as described, the hook and springs formed of a single piece of wire having a spring-coil, F, near each end and being bent upon itself between the springs A to form the loops I J K and the hook H.

6. The combination of the clamp, the pivot-bolt C, the nut E, the hanger D, the spiral springs F F, secured thereto by their upper ends, and the hook H, comprising the loops I J K, secured to the lower ends of the springs.



7. The combination of the clamp, the pivot-bolt C, the nut E, the hanger D, the spiral springs F F, secured thereto by their upper ends, and the hook H, comprising the loops I J K, secured to the lower ends of the springs, and the sheath S.

896,212. ELECTRICAL BODY-WEAR. JOHN V. LOSE, Jersey City, N. J. Filed Feb. 28, 1888. Serial No. 265,566. (No model.)

Claim.—1. In a circuit-controller, the combination of a supporting-body so formed and constructed as to be capable of being supported in the situation hereinbefore indicated, and relatively-movable contacts carried within said body, substantially as set forth.

2. The combination, with a circuit-controller consisting, essentially, of a supporting-body so formed and constructed as to be capable of being supported in the situation hereinbefore indicated, and relatively-movable contacts carried within said body, of devices in a circ-

896,212.

cuit connected with said contacts for awakening the user from sleep, substantially as set forth.

3. In a circuit-controller, the combination of a supporting-body so formed and constructed as to be capable of being supported in the situation hereinbefore indicated, and relatively-movable contacts carried within said body and having their extent of movement adjustable, substantially as set forth.

4. The combination, with a circuit-controller consisting, essentially, of a supporting-body so formed and constructed as to be capable of being supported in the situation hereinbefore indicated, and relatively-movable contacts carried within said body, of an induction-coil whose primary is in the circuit controlled by said contacts and whose secondary has terminals adapted to be placed in contact with the user's body, substantially as set forth.

5. In a circuit-controller, the combination of a ring or collar of insulating material and relatively-movable contacts supported within the same, substantially as set forth.

6. In a circuit-controller, the combination of the ring or collar of insulating material, the contact-making arm pivoted upon and within said collar, and the stationary contact carried by said collar, substantially as set forth.

7. In a circuit-controller, the combination of the ring or collar of insulating material and the relatively-movable contacts supported within the same, the normal relative position of said contacts being adjustable, substantially as set forth.

8. In a circuit-controller, the combination of the ring or collar of insulating material, the contact-making arm pivoted upon and within said collar, and the adjustable stationary contact carried by the collar, substantially as set forth.

9. In a circuit-controller, the combination of the ring or collar of insulating material, the circuit-terminals upon the same, the arm pivoted within the collar, and the contact carried by said arm flexibly to one of said terminals and adapted to be moved into connection with the other, substantially as set forth.

896,213. SECONDARY BATTERY. ORAMEL LOSE, New York, N. Y. Filed June 20, 1888. Serial No. 277,673. (No specimens.)

Claim.—1. The described process of preparing spongy or divided material for use in secondary or polarization batteries, which consists in mixing two metallic salts, then putting them in solution, and finally subjecting zinc to the action of this solution, substantially as described.

2. The described process of preparing spongy or divided lead for use in secondary or polarization batteries, which consists in mixing chloride of sodium with acetate of lead, then putting them in solution, and finally subjecting zinc to the action of this solution, substantially as described.

3. The described process of preparing a substance for occluding or absorbing the gases evolved in charging a secondary or polarization battery, which consists in superposing two finely-divided elements upon each other, substantially as described.

4. The described process of preparing a substance for occluding or absorbing the gases evolved in charging a secondary or polarization battery, which consists in superposing two finely-divided metals, substantially as described.

5. The described process of preparing a substance for occluding or absorbing the gases evolved in charging a secondary or polarization battery, consisting in creating a finely-divided or spongy mass of material, then superposing a second material upon or throughout the mass of the first-named material, substantially as described.

896,214. SECONDARY BATTERY. ORAMEL LOSE, New York, N. Y. Original application filed June 20, 1888, Serial No. 277,673. Divided and this application filed Sept. 4, 1888. Serial No. 284,550. (No specimens.)

Claim.—1. The described gas-absorbent for use in storage or polarization batteries, consisting of superposed allotropic materials, substantially as described.

2. An absorbent or occluding substance for use in secondary or polarization batteries, consisting of finely-divided or allotropic metals superposed upon each other, substantially as described.

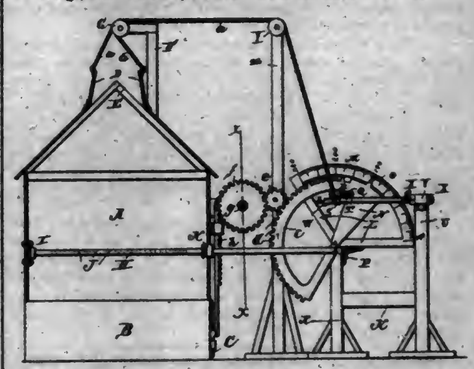
3. The described absorbent or occluding substance for polarization or secondary batteries, consisting of finely-divided material of atom-like nature, each atom or divided portion being entirely covered by a coating of an independent material, substantially as described.

4. The described absorbent or occluding substance for the gases generated in secondary or polarization batteries, consisting of finely-divided or allotropic or spongy lead, each particle of which is coated or covered with allotropic or finely-divided or spongy copper, substantially as described.

5. An electrode for a secondary or polarization battery, consisting of atom-like material adapted to absorb or occlude the gases evolved in charging, substantially as described.

6. A secondary or polarization battery having electrodes composed of atom-like material adapted to occlude or absorb the gases evolved in charging, substantially as described.

7. A secondary or polarization battery having electrodes of atom-like material immersed in an electrolytic fluid, substantially as described.



8. A secondary or polarization battery having electrodes of disintegrated atom-like material adapted to absorb or occlude the gas evolved during the process of charging, substantially as described.

9. A secondary or polarization battery having electrodes of atom-like material packed around conducting plates or surfaces and immersed in an electrolytic fluid, substantially as described.

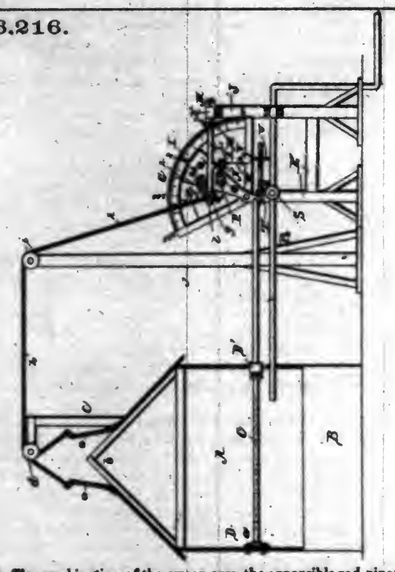
10. A secondary or polarization battery having electrodes of atom-like material packed in porous jars or cups located in an electrolytic fluid, substantially as described.

11. A secondary or polarization battery having electrodes composed of atom-like material packed around conducting plates or surfaces contained in porous jars, said jars being immersed in an electrolytic fluid, substantially as described.

896,215. TEMPERATURE-REGULATOR. HENRY J. LUTCHER, Orange, Tex. Filed July 20, 1888. Serial No. 280,581. (No model.)

Claim.—1. The combination of the sweep-arm, the expansible rod pivoted thereto, the vertical arm U, the rod W, adjustably supported thereon, the tappet-arm carried by the sweep-arm and moving on the rod W, the doors D, and the cord extending therefrom and having a ring engaging the rod W and adapted to be disengaged therefrom by the tappet-arm, as set forth.

2. The combination of the sweep-arm, the expansible rod pivoted thereto, the door C, gearing between the same and the sweep-arm, the tappet-arm carried by the sweep-arm, the doors D, and intermediate devices whereby said doors D are closed by the tappet-arm, substantially as set forth.



3. The combination of the sweep arm or lever, the expansible rod pivoted to said sweep-arm, the door C, provided with rack-bars, and gearing between said rack-bars and the sweep-arm, as set forth.

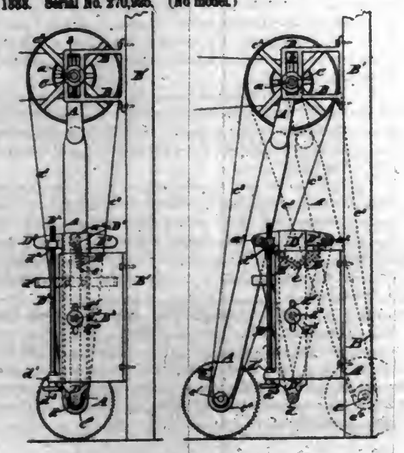
4. The combination of the sweep-arm provided with an integral toothed sector, the expansible rod pivoted to the sweep-arm, the door C, having the rack-bars, and gearing between the rack-bars and the sector, as set forth.

896,216. FIRE-EXTINGUISHER. HENRY J. LUTCHER, Orange, Tex. Filed July 20, 1888. Serial No. 280,582. (No model.)

Claim.—1. The combination of the sweep-arm, the expansible rod having one end pivoted to the sweep-arm, the steam-pipe provided with a cut-off valve, and the weight normally supported in an elevated position by the sweep-arm and adapted to be released thereby to open the valve, as set forth.

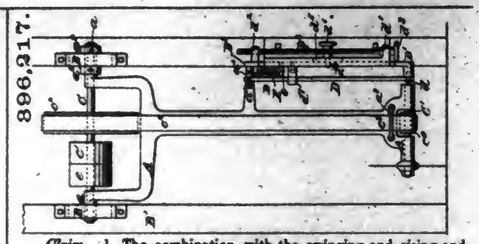
396,216.

2. The combination of the sweep-arm, the expansible rod pivoted thereto, the steam-pipe having a cut-off valve provided with a lever, and the weight supported by the sweep-arm over the lever and adapted to be released by the same to drop upon the lever and operate the valve, as set forth.



3. The combination of the sweep-arm, the expansible rod pivoted thereto, and the adjustable rod carried by the sweep-arm, the weight normally suspended from said rod, and the steam-pipe having a valve adapted to be operated by the weight, as set forth.

4. The combination of the expansible rod, the sweep arm or lever pivotally connected thereto, the horizontal rod L, the doors *a*, the cord connected to said doors and to the rod L, and adapted to be disengaged from said rod L by the sweep arm or lever, as set forth.



5. The combination of the sweep arm or lever, the expansible rod having one end pivoted to the sweep arm or lever, the tappet-arm carried by the sweep-arm, the rod L, the doors *a*, the cord connected to said doors, and the ring secured to said cord and slipped on the rod L, and adapted to be disengaged therefrom by the tappet-arm, as set forth.

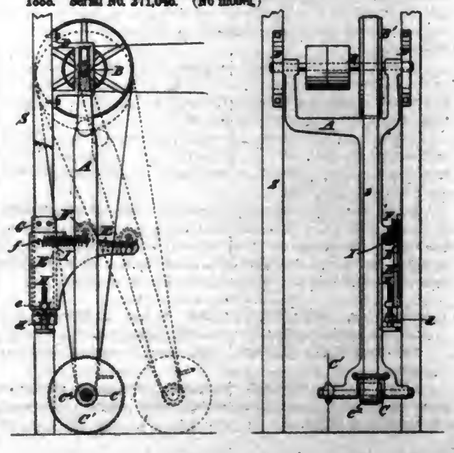
6. The combination of the expansible rod, the sweep arm or lever pivotally connected thereto, the horizontal rod L, the doors *a*, the cord connected to said doors and to the rod L, and adapted to be disengaged from said rod L by the sweep-arm, the steam-pipe provided with a cut-off valve, and the weight supported normally in an elevated position by the sweep-arm and adapted to be released thereby to open the valve, as set forth.

396,217. SWING-SAW MACHINE. EDWARD D. MACKINTOSH, Brooklyn, assignor to Paul Pryhil, New York, N. Y. Filed Apr. 17, 1888. Serial No. 270,925. (No model.)

396,217.

Claim.—1. The combination, with the swinging and rising and falling frame, the driving-shaft about which said frame swings and which rises and falls therewith, and a shaft for a saw or rotary cutter carried in the lower part of said frame, of a guide-link pivoted at its upper part to the said frame, at about the middle of the length of the latter, and a fixed pivot to which the lower part of said link is connected at a point substantially in line with the line of the rising and falling motion of the frame and opposite the path described by the axis of said shaft in the swinging of the frame, substantially as and for the purpose herein described.

2. The combination, with the rising and falling and swinging frame, the driving-shaft about which said frame swings and which rises and falls therewith, and a shaft for a saw or rotary cutter carried by said frame, of a guide-link pivoted at its upper part to said frame, a fixed pivot to which the lower part of said link is pivoted, and an adjustable support for said fixed pivot, whereby the adjustment of said pivot is made to adjust the height of said frame and its shafts and the saw or cutter, substantially as herein described.

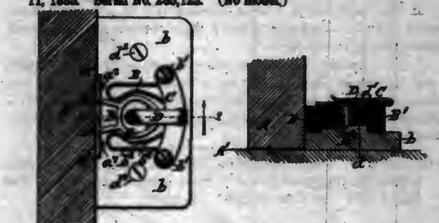


3. The combination, with the swinging and rising and falling frame, the driving-shaft rising and falling therewith, the fixed pivot on one side of the lower part of said frame, the guide-link swinging on said fixed pivot, and the upper pivot a^3, connecting said link with the said frame, of a fixed lateral guide-bearing, D^3, for said frame near said upper pivot, substantially as herein described.

4. The combination, with the swinging and rising and falling frame A, the driving-shaft upon which said frame swings and which rises and falls with it, and the pivoted guide-link D, of the fixed guide-yoke d^7 and a support therefor embracing the said link, substantially as and for the purpose herein described.

5. The combination, with the swinging frame which is capable of moving in both directions beyond a vertical position, and the upper part of which is free to rise and fall to permit the guiding of the lower part, of a spring connected with said frame and a fixed support for said spring, upon which the latter is self-reversing, to pull the frame in either direction toward a vertical position, substantially as herein described.

6. The combination, with the swinging frame which is capable of moving in both directions beyond a central vertical line, and the upper part of which is free to rise and fall to permit the guiding of the lower part, of a spring attached to the said frame and a fixed support for said spring on one side of said line, upon which the said spring is self-reversing, to pull the said frame in either direction toward a vertical position, but to exert a greater force upon the said frame in one direction than in the other, substantially as herein described.

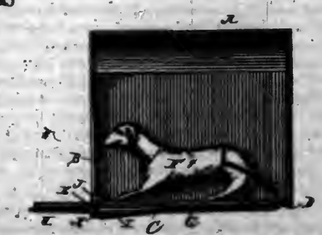


396,218. SWING-SAW MACHINE. EDWARD D. MACKINTOSH, Brooklyn, assignor to Paul Pryhil, New York, N. Y. Filed Apr. 18, 1888. Serial No. 271,046. (No model.)

Claim.—1. The combination, with the swinging and bodily rising and falling frame, the driving-shaft about which said frame swings, and the shaft for the saws or rotary cutter carried by said frame, of a guide-rail for supporting said frame and guiding it in its swinging movement, a fixed support for said guide-rail, and means of adjusting said guide-rail on said support, all substantially as herein described, whereby the frame and shafts are all adjusted with said guide-rail, as herein set forth.

2. The combination of the swinging saw-frame, the adjustable guide-rail E, and the spring I, connecting the said frame with the said rail and adjustable along with said rail and frame, substantially as herein described, and for the purpose set forth.

396,219. DOOR-CHECK. JACOB MAIER, Warsaw, Ind. Filed Sept. 11, 1888. Serial No. 285,122. (No model.)



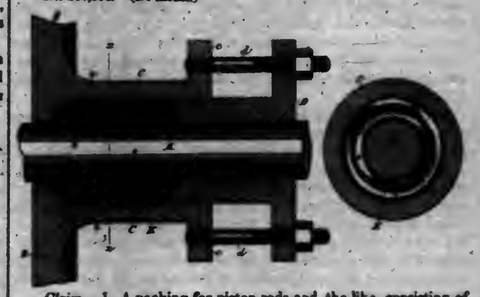
Claim.—1. In a door-check, the combination, with the member B, consisting of the head or ring *a*, the foot-bar *a'*, and the arms a^2, of the member B', adapted to receive and loosely engage the companion member, and the base-block *b*, provided with a raised inclined surface, b^4, substantially as and for the purpose set forth.

2. In a door stop and lock, the combination, with the head or ring *a*, provided on the inner side with a lip or swell, *a'* of the bar C, the latch D, and the locking-pin *d*, engaging with said lip, substantially as and for the purpose set forth.

396,220. PROCESS OF STAMPING DESIGNS IN METAL LEAF. MARK J. MASTERS, New York, N. Y., assignor of three-fourths to Basil D. Vassiliades, Constantine D. Vassiliades, and Alexander D. Vassiliades, all of same place. Filed Nov. 1, 1887. Serial No. 254,015. (No specimens.)

Claim.—The process of stamping designs in metal leaf upon materials having a hard smooth surface—such as celluloid, ivory, or pasteboard—which consists in first applying to the surface of such materials a dry powder composed of gum-sandarac and best golden yellow shellac fused together in equal parts, then placing upon said powder a leaf of metal, and finally subjecting said leaf to the pressure of a die of the desired design heated to a point sufficient to insure the melting of said powder, substantially as described.

396,221. MECHANICAL TOY. JOHN MORROW, London, County of Middlesex, England. Filed July 10, 1888. Serial No. 279,492. (No model.)



Claim.—1. A mechanical toy comprising a base, an elastic figure secured thereon, a trip arranged in advance of the figure, and a cord secured to the figure, extending forward under the base, and controlled by the trip, whereby upon raising the trip the figure will automatically spring up, as set forth.

2. A mechanical toy comprising the base, the elastic figure secured thereto, the trip arranged in advance of the figure, the trigger secured to the base and connected to the trip, the cord secured to the figure and extending past the trigger, and the detent secured to said cord and engaging the trigger, as set forth.

3. A mechanical toy comprising the base having a vertical opening near its rear end and a transverse slot near its front end, the trigger consisting of a leaf-spring having its rear end secured to the under side of the base and its front end bent upward through the transverse slot, the trip secured to the extremity of said upturned end, the elastic figure secured on the base, the cord secured to the figure extending through the rear opening in the base and thence forward past the trigger, and the detent secured to the cord and resting against the trigger, as specified.

396,222. PACKING. SILAS H. MOSHER, Chicago, Ill., assignor of one-half to Charles F. Elmes, same place. Filed Mar. 19, 1888. Serial No. 267,598. (No model.)

Claim.—1. A packing for piston-rods and the like, consisting of soft-metal pipe or tubing surrounding the same, provided with perforations, and filled with a non-fluid lubricant, substantially as described.

2. A packing for piston-rods and the like, consisting of soft-metal pipe or tubing surrounding the same, having perforations, and provided with a fibrous filling saturated with a lubricating substance, all substantially as described.

396,228. SPRING-VEHICLE. HARVEY A. MOYER, Syracuse, N. Y. Filed Sept. 27, 1888. Serial No. 286,543. (No model.)

Claim.—1. In combination with the running-gear and side springs, reaches extending to the central portions of the side springs and lying on the under side thereof, body-supporting bars extending across the under side of the reaches at their junction with the side springs, and clips embracing the springs and underlying reaches and fastened to the body-supporting bars, substantially as set forth and shown.

2. In combination with the running-gear and side springs, the front end portions, R" R", of the reaches contiguous to the under side of the central portions of the springs, the body-supporting bars *a a*, extending across the under side of said portions of the reaches, and clips embracing the springs and underlying portions of the reaches and fastened to the bars *a a*, substantially as described and shown.

3. In combination with the running-gear and side springs, the front end portions, R" R", of the reaches lying contiguous to the under side of the central portions of the springs and fastened thereto and having their front extremities passing under the front axle, and the king-bolt passing through them, substantially as described and shown.

4. In combination with the running-gear and side springs, the front end portions, R" R", of the reaches lying contiguous to the under side of the central portions of the springs and secured thereto and having their front extremities lapping one upon the other underneath the front axle, and the king-bolt passing through the lapping portions of the reach portions R" R", substantially as described and shown.

5. In combination with the running-gear and side springs, the front end portions, R" R", of the reaches lying contiguous to the under side of the central portions of the side springs and secured thereto, and having the front extremities lapping one upon the other and extending under the axle and forward therefrom, and the king-bolt and brace *b*, passing through said lapping portions of the reach portions R" R", substantially as described and shown.

6. In combination with the running-gear and side springs, two reaches, each formed in one piece, with the central portion, R, lying on the under side of the central portion of one of the springs and secured thereto, the rear end portion, R', secured to the end portion of the rear axle, and the front end portion, R", secured to the center of the front axle, substantially as described and shown.

7. In combination with the running-gear and side springs, two reaches, each formed in one piece, with the central portion, R, lying on the under side of the central portion of one of the springs and secured thereto, the rear end portion, R', secured to the end portion of the rear axle, and the front end portion, R", extending under the axle, said reaches having their front ends lapping one upon the other

and the king-bolt passing through the same, substantially as described and shown.

8. In combination with the running-gear and side springs, two reaches, each formed in one piece, with the central portion, R, contiguous to and parallel with the under side of the central portion of one of the springs, the rear end portions, R', secured to the end portion of the rear axle, the front end portion, R", extending under the front axle and forward therefrom, said reaches having the front ends lapping one upon the other, and the king-bolt and brace *b*, passing through the lapping portions of the reaches, substantially as described and shown.

9. In combination with the running-gear and side springs, two reaches, each formed in one piece, with the central portion, R, contiguous to and parallel with the under side of one of the springs, the rear end portion, R', secured to the end of the rear axle, and the front end portion, R", extending under the axle and forward therefrom, said reaches having their front ends lapping one upon the other, the king-bolt and brace *b*, passing through the said lapping portions of the reaches, body-supporting bars *a a*, extending across the under sides of the central-portions of the two reaches, and clips embracing the springs and underlying portions of the reaches and secured to the bars *a a*, substantially as described and shown.

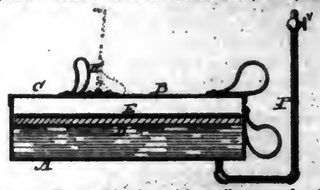
396,224. ADVERTISING-LID FOR BEER-GLASSES. MAXIMILIAN L. MUELLER, Schandau, Saxony, Germany. Filed Mar. 12, 1888. Serial No. 267,052. (No model.)

Claim.—1. A cover for goblets, beer-glasses, and the like, comprising, in combination, an under plate, D, forming a cover to said goblet or the like, a pin, K, thereon, adapted to receive advertising-sheets, and a plate, C, adapted to cover and retain said advertising-sheets.

2. A cover for goblets, beer-glasses, and the like, comprising, in combination, an under plate, D, forming a cover to said goblet or the like, a pin, K, thereon, adapted to receive advertising-sheets, and a cover-plate, C, attached to said plate D and projecting over said pin K, so as to hold the sheets thereon, substantially as set forth.

3. The combination, with a plate, D, adapted to form a cover to a goblet, beer-glass, or the like, of slots in said plate, a plate, *z*, tongues on said plate *z*, engaging in said slots, a projecting pin, K, on said plate *z*, and a plate, C, integral with said plate *z*, and extending over the same and over the said pin K, substantially as and for the purpose set forth.

4. The combination, with a plate, D, adapted to form a cover to a goblet, beer-glass, or the like, of slots *i* in said plate, a spring-bow formed, substantially, by two parallel plates, *z* C, tongues H on said plate *z*, adapted to engage in said slots *i*, a pin, K, projecting from said plate *z*, and a recess, *k*, in the plate C, adapted to cover said pin, substantially as and for the purpose set forth.



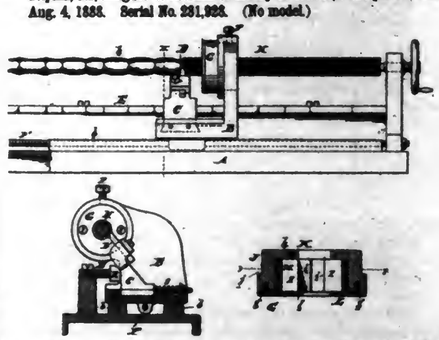
396,225. ART OF MANUFACTURING ARTIFICIAL MARBLE. LEWIS NATHAN, New York, N. Y., assignor to the Cuba Marble Company, same place. Filed June 4, 1888. Serial No. 276,040. (No specimens.)

Claim.—1. The improvement in the art of manufacturing artificial marble hereinbefore set forth, which consists in subjecting the marble before applying the polishing material to the action of heat to draw the alum contained in the marble material to the surface and then removing the alum.

2. The improvement in the art of manufacturing artificial marble hereinbefore set forth, which consists in honing down the face of the marble, then applying a mastic to fill the pores, then subjecting the marble to the action of heat in order to draw the alum contained in the marble material to the surface, then removing the alum, and finally applying the polishing material.

3. The improvement in the art of manufacturing artificial marble hereinbefore set forth, which consists in honing down the face of the marble, then applying a mastic to fill the pores, then smoothing the mastic, then subjecting the marble to the action of heat in order to draw the alum contained in the marble material to the surface, then removing the alum by means of a fine abrading material and a volatile fluid, and finally applying the polishing material.

396,226. HYDROCARBON-BURNER. JAMES L. NEWTON, Cleveland, Ohio. Filed Feb. 3, 1888. Serial No. 262,894. (No model.)



Claim.—1. The combination, with an oil-receptacle, of a float and perforated plate carried upon the same, substantially as described.

2. The combination, with an oil-receptacle, of a float and a perforated plate supported upon and at a slight distance above said float, substantially as described.

3. The combination, with an oil-receptacle, of the float D, plate E, and the hinged cover C, having a handle on its upper side constructed to act as a stop when the cover is thrown back, whereby it performs two functions—first, as a stop, and, secondly, as a handle—substantially as described.

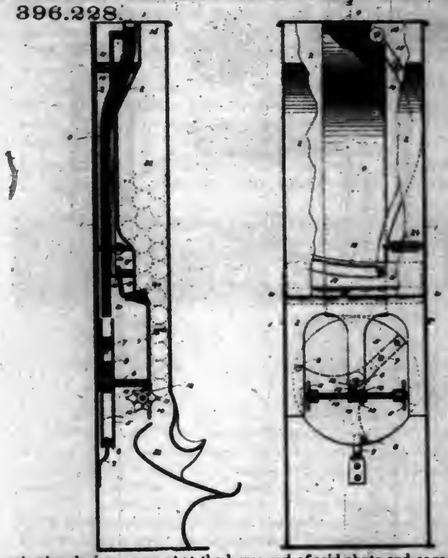
396,227. WOOD-TURNING LATHE. LEANDER N. NORCROSS, Philadelphia, Pa., assignor of one-half to Henry B. Graves, same place. Filed Aug. 4, 1888. Serial No. 281,923. (No model.)

Claim.—1. A guide support or holder for wood-turning lathes, consisting of a box having a circular recess and an opening on each side thereof, in combination with two or more sections or jaws contained within said recessed box, and having their outer faces curved and inner faces shaped so that when they are put in place they shall form a polygonal aperture.

2. A guide support or holder for wood-turning lathes, consisting of a box having a circular recess and an opening on each side thereof, in combination with two or more sections or jaws contained within said recessed box, having their outer faces curved and inner faces shaped so that when they are put in place they shall form a polygonal aperture, and an encircling band surrounding said sections or jaws and between them and the curved face of the recessed box.

3. A guide support or holder for wood-turning lathes, consisting of a box having a circular recess and an opening on each side thereof, in combination with two or more sections or jaws contained within said recessed box, having their outer faces curved and inner faces shaped so that when they are put in place they shall form a polygonal aperture, and an encircling spring to hold said sections or jaws together and allow of slight variations in the size of the polygonal aperture.

4. The combination of the box J, having a circular recess, S, and flange *k*, cap L, and sections I, having curved outer faces and polygonal-shaped inner faces, *i*.



5. The combination of the box J, having circular recess S, and flange *k*, cap L, and sections I, having curved outer faces, polygonal-shaped inner faces, *i*, and the circular spring-band M, interposed between the sections I and curved wall of the recessed part of the box.

6. The combination of the lathe having the longitudinal reciprocating frame B and laterally or transversely reciprocating tool-holder C, carried by the frame B, and the wood-holder G, having a revolving center formed of two or more sections or jaws with a polygonal aperture.

396,228. AUTOMATIC VENDING APPARATUS. JAMES M. O'KELLY, New York, N. Y., assignor of eleven-twentieths to George D. Bayard same place. Filed July 19, 1888. Serial No. 280,419. (No model.)

Claim.—1. In an automatic vending apparatus, the combination, with the casing having a coin-slot, of a tilting coin-receptacle, an escapement connected therewith, a merchandise-chute, and a merchandise-

396,228.

ejecting device arranged at the lower end of said chute and engaged by said escapement, substantially as set forth.

2. In an automatic vending apparatus, the combination of a coin-receptacle, an escapement attached to and operated by said receptacle, a chute for containing the merchandise, a shaft provided with fluted disks arranged in said chute, and stops on said shaft adapted to be engaged by the said escapement, substantially as and for the purpose set forth.

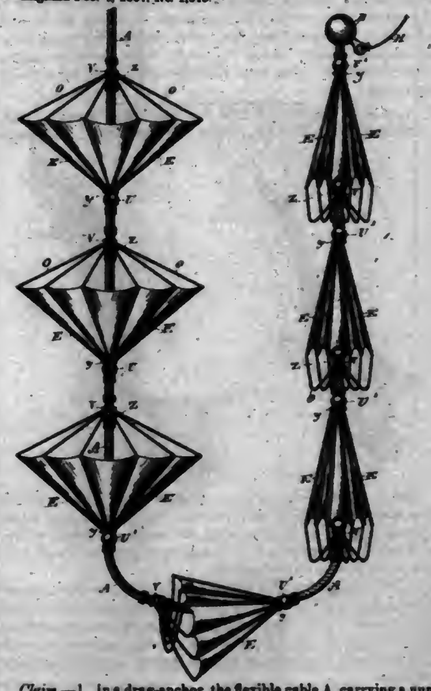
3. The combination, with the shaft 6 and the coin-feeding tube, of a tilting coin-receptacle mounted on said shaft, an escapement, 12, on said shaft, adapted to be operated by said receptacle, the shaft 10, and a merchandise-ejecting device having stops 13 mounted on said shaft and adapted to be engaged by said escapement, substantially as and for the purpose set forth.

4. In an automatic vending apparatus, the combination, with the casing having a coin-slot, of a tilting coin-receptacle, a merchandise-chute, a merchandise-ejector having fluted disks, and stops 13, arranged at the lower end of said chute, and an escapement connected to and operated by said receptacle and adapted to engage said stops, as set forth.

5. In an automatic vending apparatus, the combination of a coin-receptacle, an escapement attached to and operated by said receptacle, a chute for containing the merchandise, an ejector arranged in said chute under the merchandise and adapted to be operated by the weight of the latter, and said ejector having stops adapted to be engaged by said escapement, substantially as set forth.

6. In an automatic vending apparatus, the combination of the tilting coin-receptacle, an escapement attached to and operated by said receptacle, a vertical chute for containing the merchandise, a shaft, fluted disks on said shaft projecting into the lower part of said chute and adapted to be revolved by the weight of said merchandise, and stops on said shaft adapted to be engaged by said escapement substantially as set forth.

7. In an automatic vending apparatus, the combination, with the coin-feeding passage and the shaft 6, of a tilting coin-receptacle mounted upon said shaft, a merchandise-chute, a merchandise-ejecting device consisting of fluted disks having points projecting into said chute, adapted to support the articles of merchandise between them, stops for locking said disks against rotation, and an escapement on shaft 6 for releasing said stops, substantially as set forth.



8. In an automatic vending apparatus, the tilting coin-receptacle consisting of a flanged wheel, 5, mounted on shaft 6 and having pins 8 8, in combination with a fixed stop, 9, substantially as set forth.

9. In an automatic vending apparatus, the tilting coin-receptacle consisting of flanged wheel 5, having pins 8 8 and weight 7, in combination with a fixed stop, 9, substantially as set forth.

10. The combination, with the merchandise-feeding chute 22 and coin-feeding tube 4, of an agitator, 20, projecting into the merchandise-chute, and the lever 14, having operating-connection with said agitator at one end and projecting into the coin-feeding tube at the other end, substantially as and for the purposes set forth.

11. The combination, with the merchandise-feeding chute 22 and coin-feeding tube 4, of a pivoted agitator, 20, projecting into the merchandise-chute and connected with wing 19, having slot 18, and a pivoted lever, 14, having a pin entering said slot and itself entering the coin-feed tube at its other end, substantially as set forth.

396,229. DRAG-ANCHOR. EMILE J. PAGAN, Paris, France. Filed Mar. 23, 1888. Serial No. 268,208. (No model.) Patented in France Jan. 8, 1887, No. 180,773; in Belgium Jan. 21, 1887, No. 76,089, and in England Feb. 4, 1887, No. 1,815.

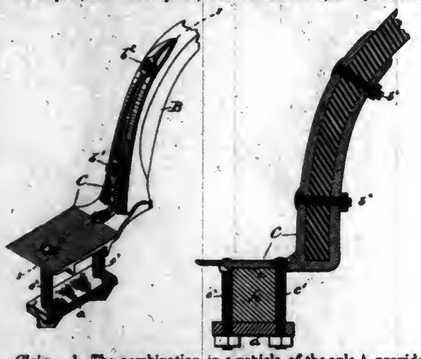
Claim.—1. In a drag-anchor, the flexible cable A, carrying a number of balls, combined with the parachutes E, having ribs that are secured to the cable at one end contiguous to said balls and with the flexible connections O, that are secured to said ribs and also to the cable contiguous to other balls, whereby the parachutes are held in position on the cable, substantially as described.

2. In a drag-anchor, the flexible cable A, combined with a series of parachutes, E, that are arranged along said cable, and with the separate weight B at the end of the cable, substantially as described.

396,230. WIRE GATE. JAMES W. PALMER, North Springfield, Mo. Filed July 23, 1888. Serial No. 281,206. (No model.)

Claim.—1. A gate-forming device for wire fences, consisting of a supporting-arm adapted to be secured to a post, a cross-bar adapted to be secured to the wires of the fence, and a locking-lever connected to said cross-bar and adapted to engage the supporting-arm, said lever being provided with a retaining or locking hook adapted to engage a wire of the gate, substantially as described.

2. In a wire fence, the combination, with parallel wires constituting a portion of the fence, of a cross-bar secured to said wires, a supporting-arm secured to a post, and a locking-lever attached to said cross-bar and engaging the supporting-arm, said lever being provided with a retaining-hook adapted to engage one of the said parallel wires, substantially as described.



3. In a wire fence, the combination, with parallel wires, of a supporting-arm provided with a stud and secured to a post, a cross-bar attached to said parallel wires, and a lever having one end pivotally attached to said cross-bar and having a projection intermediate its ends to engage a stud on the supporting-arm, the free end of the lever being provided with a locking-hook to engage a fence-wire, the wire-engaging portion of which is below the horizontal plane of the main body of the lever, substantially as described.

4. The combination, with a wire gate, of an arm adapted to support one end of the same, and an angular lever having one end attached to said gate and provided with a projection to engage a stud on said

supporting-arm, the free end of said lever being bent downward and provided with a locking-hook adapted to engage one of the parallel wires, the wire-engaging portion of said hook lying below the plane of the lever, substantially as described.

5. The combination, with a wire fence, of posts, one of which is provided with retaining-hooks and the other with a supporting-arm, a gate consisting of parallel wires engaging the retaining-hooks and provided with a cross-bar, and a lever having one end attached to said cross-bar and provided with a projection to engage the supporting-arm, the free end of said lever being provided with a locking-hook adapted to engage one of the parallel wires, the wire-engaging portion of said hook lying below the plane of the lever, substantially as described.

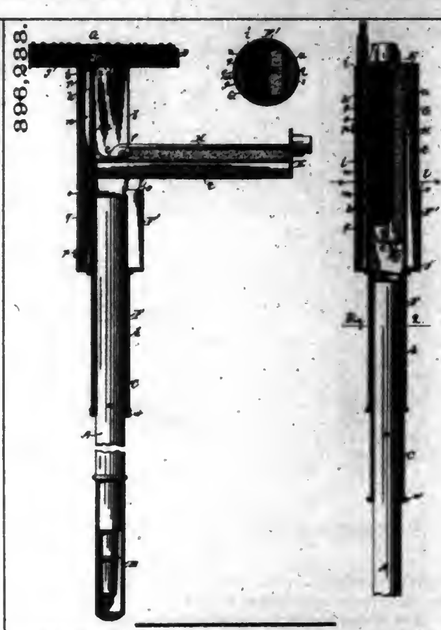
396,231. SHAFT-COUPLING FOR VEHICLES. DAVID M. FARRY, Indianapolis, Ind. Filed Apr. 10, 1888. Serial No. 270,207. (No model.)

Claim.—1. The combination, in a vehicle, of the axle A, provided with a cavity, and the coupling C, provided with a projection, *c*, which is adapted to enter said cavity when the coupling is placed on the axle, whereby said coupling is held securely in position on said axle, substantially as shown and described.

2. The combination, in a vehicle, of the axle, the shaft, a coupling, formed as described, between the two forward arms whereof the shaft is secured and to the under side of the rearwardly-extending portion whereof the axle is secured, the top of said rearwardly-extending portion being roughened or serrated to form a step, substantially as set forth.

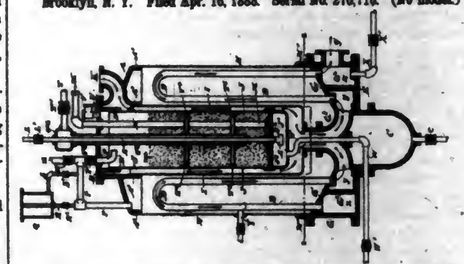
396,232. BOB-SLEIGH. JAMES F. PLATT, Sterling, Ill. Filed Sept. 28, 1888. Serial No. 286,664. (No model.)

Claim.—1. The combination of the bolster D, provided with the recess G, the beam E, provided with the recess H, the metallic box J, provided with the upwardly-extending flanges L and the downwardly-extending flanges M, and the reach A, whereby the latter through the medium of said box holds said beam and bolster in a vertical position, substantially as shown.



2. The combination of the bolster D, provided with the recess G, the beam E, provided with the recess H, the metallic box J, provided with the upwardly-extending flanges L, the downwardly-extending flanges M, and the horizontal projections N, and the reach A, whereby said box is held in place, substantially as shown, and for the purpose described.

396,233. RUBBER STAMP. EDWIN REYNOLDS, Providence, R. I. Filed Aug. 29, 1887. Serial No. 248,217. (No model.)

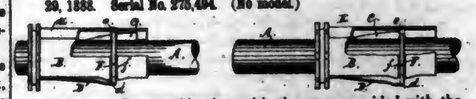


Claim.—1. In combination, the spring-operated die-holder pivoted to the shank, the spring-operated ink-pad holder, also pivoted to the shank, and the case adapted by its sliding movement upon the shank to cause the opening or closing of the die and pad, substantially as described.

2. In combination, the spring-operated die-holder pivoted to the shank, the spring-operated ink-pad holder, also pivoted to the shank, and the slotted case provided with a pen-slide and adapted to cause the opening or closing of the die and pad, substantially as described.

396,233.

396,234. WATER HEATER AND FILTER. JOHN S. ROAKE, Brooklyn, N. Y. Filed Apr. 16, 1888. Serial No. 270,716. (No model.)



Claim.—1. The water heater and filter described, having the chamber I, inclosing the filter J, with a space between for the passage of steam, in combination with provisions for filtering the water in the interior vessel and for supplying and taking away such water continuously, substantially as herein specified.

2. In a water heater and filter, the wash-pipe T, with its perforated branches T^4 T^5, in combination with the filter-case J and with the exterior casing, I, and provisions for circulating steam between, adapted to serve at will for filtering the water by a downward current and for cleaning the filter by an upward current through the filtering material, substantially as herein specified.

3. In a water heater and filter, in combination with the filter J and the surrounding casing I, and with provisions for passing steam through the same, the vessel Q, adapted to receive a chemical, and the pipes R S, arranged for introducing the chemical gradually into the water during its transition from the heating-chamber I to the filter, as herein specified.

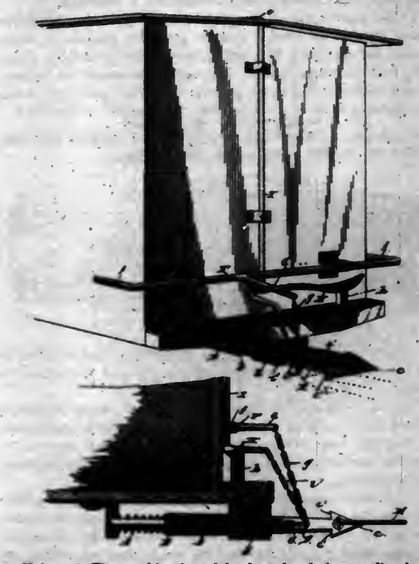
4. The combined water heater and filter described, having filtering material, *m*, and provisions for passing water through it, inclosed in a casing, J, in combination with a larger casing, I, in which it is inclosed, with provisions for passing steam through the space between, and with a larger casing, H, with provisions for heating the water in the space between I and H previous to its introduction to the filter, as herein specified.

396,235. UMBRELLA. DAVID ROSE, Lancaster, Pa. Filed May 29, 1888. Serial No. 275,494. (No model.)

Claim.—1. The combination, with the stem provided with the catches C C, of the runner having the perforated hollow rib E and angular recess *f*, the spring D, secured by one end to the runner, and the collar F, encircling the end of the runner and attached to the vibrating end of the spring, all constructed and operating substantially as specified.

2. The combination, with the stem having the catches C C, of the runner, the collar F, encircling said runner, and the spring connected with the runner and the collar, substantially as and for the purpose specified.

396,236. RAILWAY-RAIL-JOINT FASTENER. HIRAM ROWE, Rockvale, Colo. Filed June 1, 1888. Serial No. 276,706. (No model.)

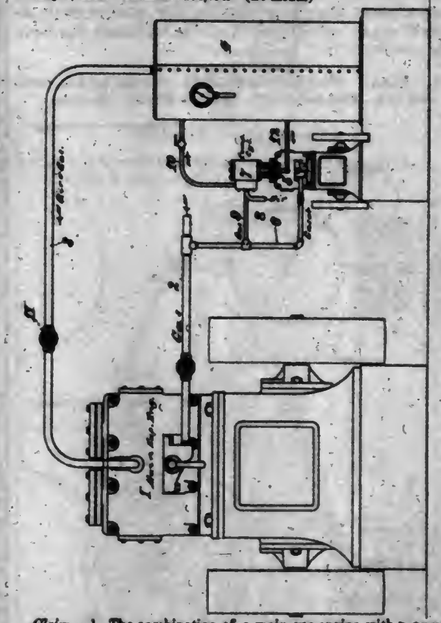


Claim.—1. The herein-described fastening, consisting of the bolt having a hook at one end and the cam-lever journaled on the bolt and adapted to have its end bent to engage with the rail or timber, substantially as described, for the purpose specified.

2. The combination, with a series of bolts having hooked ends, of the cam-levers having the end of one lever extending beneath the head of the next lever, whereby the levers mutually lock each other, substantially as described.

3. The combination, with the rail having elongated openings in its web and the fish-plate having corresponding elongated openings, of the bolts passed through the openings and having hooked ends, and cam-levers mounted on the hooked ends of the bolts, the said levers mutually locking each other, and the last lever of the series being bent over the fish-plate, substantially as set forth.

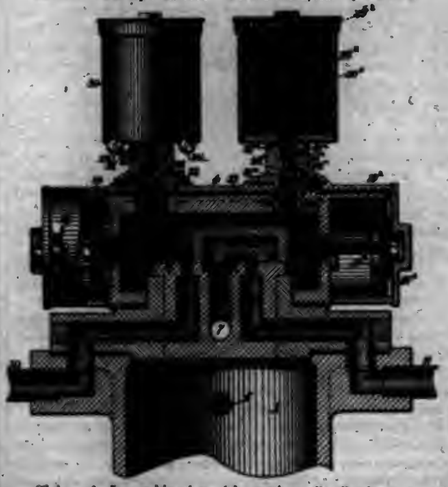
396,237. CAR-COUPLING. JOHN C. ROSE and REUBEN BROWN, Northumberland, Pa. Filed Sept. 20, 1888. Serial No. 286,781. (No model.)



Claim.—1. The combination of the draw-head, the coupling-hook pivoted thereto and having the triangular head, and the V-shaped link having its ends pivoted to the opposite sides of the said triangular head, as set forth.

2. The combination of the draw-head, the coupling hook pivoted thereto, the arm D, projecting laterally from the side of the coupling-hook, the rock-shaft arranged above the coupling-hook and having an arm, G, and the chain connecting the arms D G, as set forth.

3. In a car-coupler, the combination, with the draw-heads having the lateral ears *b*, the pivoted coupling-hooks having the triangular heads *c* and lateral arms D, and the supporting-brackets, of the double-armed lever H, pivoted on the support A, the vertical rod I, having the handle *f* above the car, and the chain *i*, connecting the arm D and the adjacent arm of the lever H, substantially as specified.

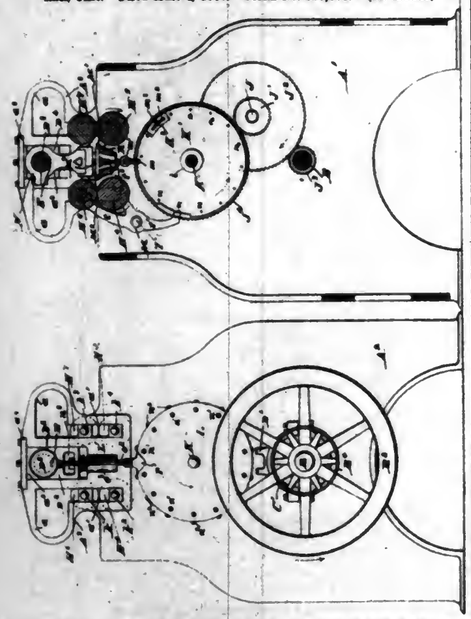


396,238. GAS-ENGINE. ALBERT SIPHER, Pittsburg, Pa. Filed May 2, 1887. Serial No. 236,756. (No model.)

Claim.—1. The combination of a main gas-engine with a pumping-engine provided with gas and air supply ports and having a suitable connection with the explosion-chamber of the main engine, whereby a sufficient amount of combined gas and air may be forced into the main engine to effect on the explosion thereof one or more revolutions of the main engine, substantially as set forth.

2. The combination of a main gas-engine, a pumping-engine provided with gas and air supply ports, and a reservoir having a pipe-connection with the pump, the pumping-engine, and the main engine, whereby a sufficient supply of gas may be stored in said reservoir to effect on its admission into and explosion in the chambers of the main and pumping engines one or more revolutions thereof, substantially as set forth.

396,239. FLUID-PRESSURE ENGINE. JESSE G. SOMERSIDE, Swissvale, Pa. Filed Apr. 26, 1888. Serial No. 272,102. (No model.)



Claim.—1. In combination with a main or distributing-valve of a fluid-pressure motor, pistons connected therewith and operated by

fluid-pressure on opposite ends thereof, and electrically-actuated valves, each valve controlling the exhaust from one end of said pistons and the admission of fluid-pressure to the opposite end thereof substantially as set forth.

2. In combination with a main or distributing valve, pistons connected therewith for shifting said valve in opposite directions, electrically-actuated valves 23 23^a, passages 19 19^a, ports 20 20^a 22 22^a, valves 27 and 27^a, exhaust-ports 32 and 32^a, and passage 33, substantially as set forth.

396,240. PERFORATING-MACHINE. CHARLES SEYBOLD, Cincinnati, Ohio. Filed Mar. 4, 1887. Serial No. 229,673. (No model.)

Claim.—1. In a perforating-machine, the combination of the shaft B, eccentric-rods, punch-bar D^4, provided with a key which engages with said eccentric-rods, cam p', and wheel L_4, and connecting and operating parts, substantially as set forth.

2. In a perforating-machine, the shaft B, eccentrics, eccentric-rods having notches b^3, and punch-bar D^4, having the key E, in combination with mechanism, substantially as set forth, for causing parts b and b' of said key E to engage and disengage with the notches in the eccentric-rods, substantially as set forth.

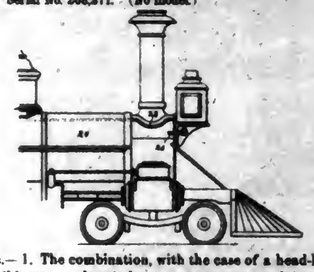
3. In a perforating-machine, the combination of the bar D^4, carrying key E, rods D, having notches b^3, box D^4 being recessed, plunger L^4, having the concave and convex heads S and S', and mechanism for automatically raising and lowering said plunger at determinate periods, substantially as set forth.

4. In a perforating-machine, the yoke H, rods i^3, disks G and G', gears G^3 and E^3, pins A' and d, springs i^3 and G^2, and block d', in combination with wedge or segment e and suitable mechanism for operating said segment backward and forward, substantially as set forth.

5. In a perforating-machine, the combination of shaft B, eccentric-rods having notches b^3, punch-bar D^4, provided with key E, composed of parts b and b', box D^4, plunger L^4, provided with means for moving the parts of key E into and out of said notches, arm L^5, rod o^4, spring o^4, cam p', and wheel L_4, with pins n', substantially as set forth.

6. In a perforating-machine, the combination of yoke H, disks G, G', and E^4, and mechanism, substantially as set forth, for operating said disks, substantially as set forth.

7. In a perforating-machine, the cam K', pawl M, having fingers f f^2, rod T, pawl M^2, lever M', and gage M^3, in combination with feed-rolls, substantially as set forth.



8. In a perforating-machine, the cam K' and block K^2, in combination with finger m, pin H', yoke H, disks G G', and E^4, and means for operating said yoke and disks, substantially as set forth.

9. In a perforating-machine, the combination of the shaft B, eccentric-rods, punch-bar D^4, provided with a key which engages with said eccentric-rods, and means, substantially as set forth, for enabling said key to engage and disengage with said eccentric-rods, and wheel L_4, and connecting and operating parts, substantially as set forth.

10. In a perforating-machine, the combination of shaft B, gear-wheels C and E^3, friction-disks E^4, G, and G', gear g^3, gears H^3 and H^5, attached to rollers H^4 and H^6, and rollers H^2, H^3, H^4, and H^7, substantially as set forth.

11. In a perforating-machine, the mechanism shown and described for automatically stopping the feed while the perforating is being accomplished, and consisting of the rod D, block d^4, lever k^2, having slot d^5 and wedge or segment e, and suitable mechanism for operating said rod D, substantially as set forth.

396,241. HEAD-LIGHT. JABEZ F. SHAWHAN, Dayton, Ohio, assignor of one-half to James W. Carpenter, same place. Filed Mar. 23, 1888. Serial No. 268,271. (No model.)

Claim.—1. The combination, with the case of a head-light, of an ordinary oil-lamp, an electric lamp, a generator supplying current to said lamp, and a motor for operating the generator, the whole being inclosed within the case of the head-light, substantially as described.

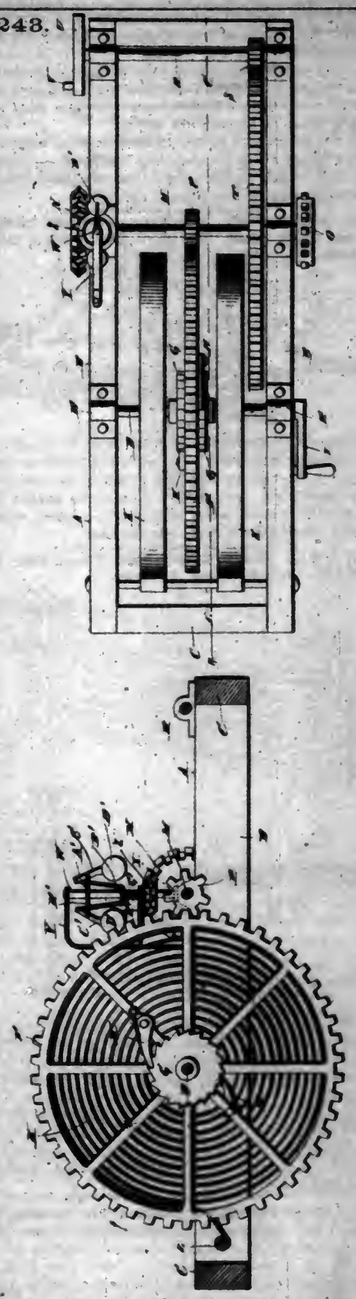
2. The combination, with the case of a head-light, of a base-board, the whole being inclosed within the case of the head-light supporting an electric lamp, a generator for said lamp also supported on the base-board, and a motor for driving said generator also mounted on said base-board, substantially as described.

3. In a head-light, a base-board having a standard supporting the parabolic reflector, an oil-lamp attached to said base-board, the burner of which extends through the lower opening of said reflector, an electric lamp supported on the base-board having one electrode extending through the upper opening of the reflector, a generator for said lamp, and a motor driving said generator, the whole being inclosed within the head-light case, substantially as described.

4. The combination, with a locomotive-engine, of a head-light mounted thereon, an electric lamp, a generator therefor, a motor operating the generator, all being inclosed in the head-light, a pipe leading from said head-light to the source of power on the locomotive, and another exhaust-pipe leading from said head-light to the smoke chest or drum of the locomotive, substantially as described.

396,242. FIRE-ESCAPE. JACOB P. SIMON, Grigsby's Bluff, Tex. Filed Oct. 16, 1888. Serial No. 288,197. (No model.)

Claim.—1. In a fire-escape, the cushion provided with flexible sides and having an inlet-valve and outlet-openings G, substantially as specified.



2. In a fire-escape, the pneumatic cushion A, having its bottom provided with an inlet-valve and outlet-openings G, the secondary bottom arranged under the said cushion, and the springs disposed between the secondary bottom and the bottom of the cushion, substantially as specified.

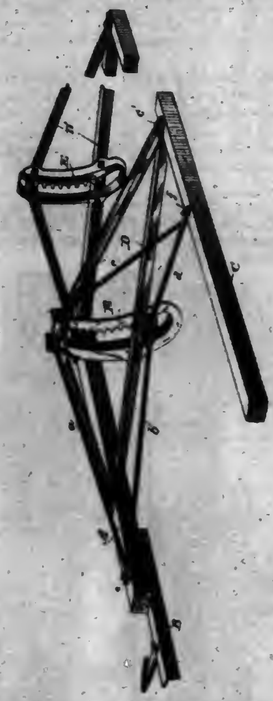
3. In a fire-escape, the combination, with the pneumatic cushion comprising the top B, provided with a pad or cushion, L_4, the bottom provided with an inlet-valve, E, and outlet-openings G, and the flexible sides connecting the said top and bottom, of the rings or loops attached to the top and adapted to engage hooks at the bottom of the cushion, whereby it may be held in a compressed position, substantially as specified.

396,243. SPRING-MOTOR. CHARLES H. SMITH, Beaumont, Kans. Filed July 31, 1888. Serial No. 281,514. (No model.)

Claim.—The combination of the frame, the shaft M, journaled therein, the gear-wheel N on the end of said shaft, the spring-actuated driving-wheel geared to said shaft M, the vertical shaft W, arranged at one side of the frame, the pinion on said shaft meshing with the wheel N, the curved arm Y, erected on the frame and receiving

396,243.

the upper end of the shaft W, the arm F', projecting from the frame, the disk B', movable on the shaft W, the spring around said shaft between the arm F' and the disk B', the yoke A', the governor-arms pivoted in the ends of the yoke, and the links E', connecting the governor-arms with the disk B', as specified.



396,244. INTERMITTENT GRIP DEVICE. HENRY A. SMITH, Atlanta, Ga. Filed Apr. 16, 1888. Serial No. 270,999. (No model.)

Claim.—In an intermittent grip device, the driven disk C, secured to the shaft A, in combination with clutch-lever D, provided with gripping-jaws d d', spur e, and slot d'', spring b, and driver-disk B, provided with a pin, substantially as shown and described.

396,244.

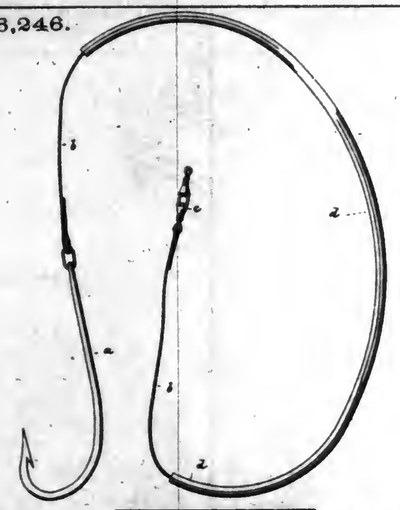
396,245. HARVESTER-FRAME. JOHN F. STEWARD, Chicago, Ill. Filed May 19, 1888. Serial No. 274,413. (No model.)

Claim.—1. In a harvester-frame, the front and rear sills, A C, and the connecting-truss D, in combination with the four diagonal braces extended grainward from the truss and connecting the same at top and bottom with the sills.

2. In a harvester-frame, the truss and the front sill, in combination with the front braces, a b, extending forward and grainward from the top and bottom of the truss to the sill.

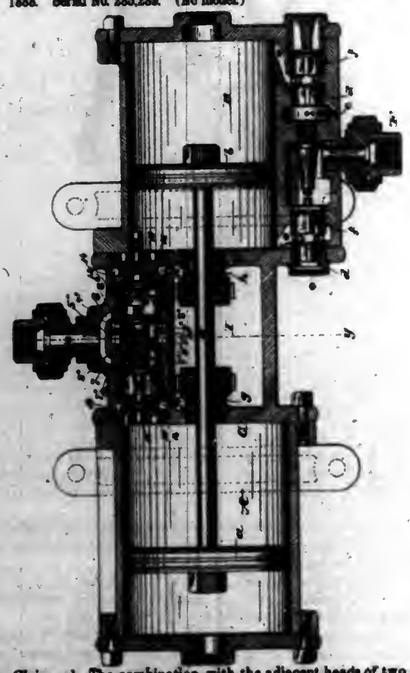
3. In a harvester-frame, the truss and the rear sill, C, secured thereto, in combination with the braces c d, extending rearward and grainward from the top and bottom of the truss to said sill.

4. In a harvester-frame, the front and rear sills and the connecting-truss, in combination with the four diagonal braces extended grainward from the truss and connecting the same at the top and bottom with the respective sills and each adapted for independent longitudinal adjustment.



396,246. SHELL. EDWARD C. VON HOYE, Brooklyn, N. Y. Filed Nov. 20, 1886. Serial No. 201,238. (No model.)

Claim.—1. As a new article of manufacture, a fishing-shell composed of a line, b, and a surrounding rubber tube, d, substantially as specified.



2. The combination of hook a and line b, with a flexible tube, d, surrounding said line and held thereon by frictional contact, the tube being adapted to slip upon the line under tension, substantially as specified.

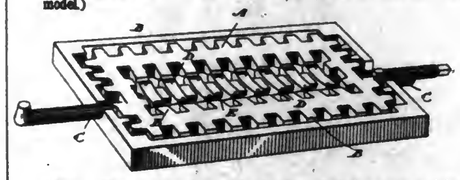
3. The combination of hook a and line b, with tube d shorter than such line, a part of line b being exposed between hook and tube, substantially as specified.

396,246.

396,247. STEAM-PUMP. HENRY A. WAHLERT, St. Louis, Mo., assignor to the American Brake Company, same place. Filed Sept. 13, 1888. Serial No. 285,239. (No model.)

Claim.—1. The combination, with the adjacent heads of two cylinders, of a third interposed cylinder which connects said heads and forms the cylinder of a piston-valve as well as a bridge, substantially as and for the purposes specified.

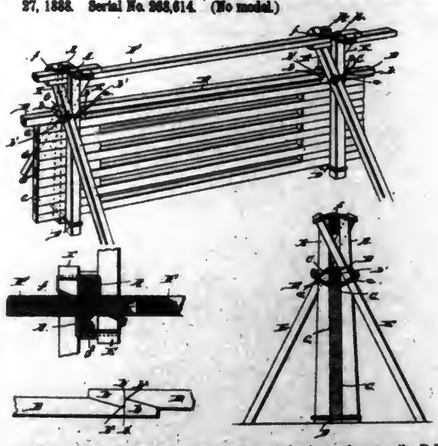
2. The combination of two cylinders having connected pistons, an intermediate valve-chamber, and a tappet-valve provided with tappet-rods adapted to enter the cylinders in the path of the pistons, substantially as and for the purposes specified.



3. The combination, with two cylinders having connected pistons, of an intermediate valve-chamber, combined tappet and steam-actuated valves having tappets arranged to be struck by the pistons, and a main valve arranged to be actuated by the final movement of the tappet-valves, substantially as and for the purposes specified.

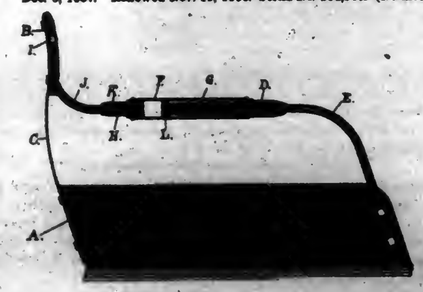
4. The combination, with the valve-chamber having suitable live-steam and exhaust ports, of two piston tappet-valves connected to move in unison and an intermediate valve arranged loosely on the rod which connects the two tappet-valves, adapted to be moved at or near the close of the stroke of the tappet-valves, substantially as and for the purposes specified.

5. The combination, with the valve-chamber, of the end bushings having the caps 11, annular steam-chambers 12, and ports 13, of two connected tappet piston-valves and an intermediate piston-valve, substantially as and for the purposes specified.



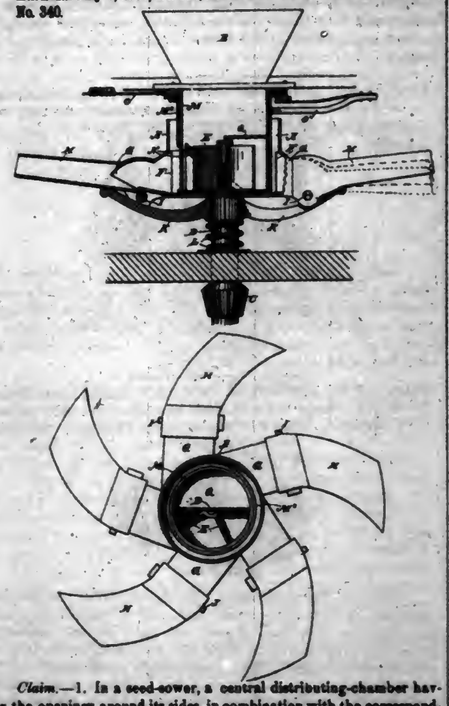
6. The combination of two adjacent heads of independent cylinders, a tubular bridge for connecting said heads, and plugs for closing the ends of said tubular bridge to convert it into a valve-cylinder, substantially as and for the purposes specified.

396,248. GRATE. JOHN WAKEHAM and JOHN CUNNINGHAM, Toronto, Ontario, Canada. Filed Apr. 5, 1888. Serial No. 269,744. (No model.)



Claim.—The combination, with the frame, of the grate A, journaled therein on trunnions C, set to one side of the center and formed with fingers B, projecting inside and outside of the same and with a central opening, and the spindle E, formed with angular fingers D, working in the central opening of the grate A, and all arranged and operating substantially as shown and described.

396,249. FENCE. DANIEL WARNER, Bronson, Mich. Filed Mar. 27, 1888. Serial No. 268,614. (No model.)

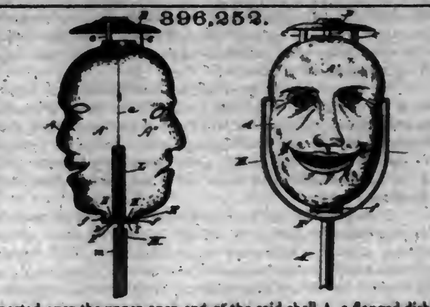


Claim.—In a fence, the combination of the lapped top rails, B B, provided with the notches b' and the shoulders b^2 on contacting sides, which engage with each other, the wire loop C, loosely encircling the joint between the top rails, the tapering posts A A, extending through opposite ends of the said loops and connected together at their lower ends by the wire loops D, whereby the adjacent sides of the said posts are held parallel, the inclining braces E E, bearing on and crossing above the top rails and connected to the adjacent posts by wire loops e e, and the panel-rails lapped between the posts A, substantially as and for the purpose specified.

396,250. VEHICLE-SEAT. JOSEPH A. WEST, San Rafael, Cal. Filed Dec. 6, 1887. Renewed Nov. 19, 1888. Serial No. 291,305. (No model.)

Claim.—In combined seat-rail and spring-braces for buggies, the combined seat-rail and back, composed of the rods E and J, connected by the couplings H and D, the sleeve F, and spring G, in combination with the spring-back B and spring-supporting braces C, constructed and operated substantially as and for the purposes set forth.

396,251. ROTARY SEED-SOWER. JAMES H. ADAMSON, North Melbourne, Victoria, Australia. Filed Sept. 21, 1888. Serial No. 286,090. (No model.) Patented in Victoria Mar. 20, 1884, No. 3,637; in South Australia July 7, 1887, No. 814, and in New South Wales Nov. 17, 1887, No. 340.

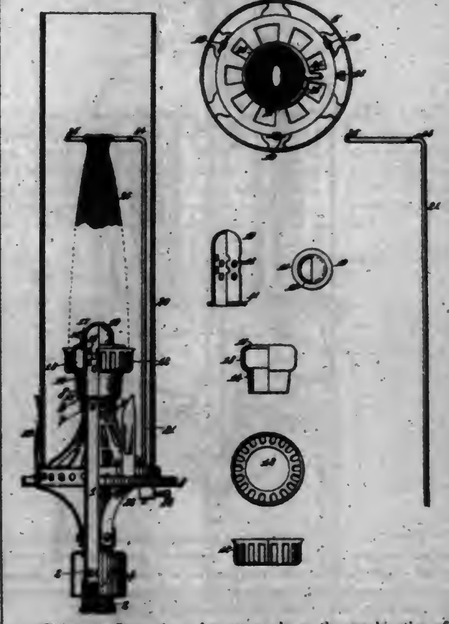


Claim.—1. In a seed-sower, a central distributing-chamber having the openings around its sides, in combination with the correspondingly-arranged tubes or spouts hinged or supported in line with these openings, so that their outer ends will rise or be depressed with the varying velocity of rotation and the area of seed-distribution be regulated, substantially as herein described.

2. A series of distributing spouts or tubes having their lower sides pivoted or flexibly attached to the seed-distributing chamber, in combination with springs by which the outer ends of the tubes are raised when at rest or moving slowly, said springs having such a tension that as the speed increases the centrifugal force will depress the outer ends of the spouts, substantially as herein described.

3. The central chamber receiving seed from the hopper or source of supply, and the rotary feed-wheel by which the seed is discharged through the openings in the side of the chamber, in combination with the series of corresponding discharge and distributing arms having their lower sides supported by springs or spring-actuated arms, so that when moving slowly the discharge will be in a direction above the horizontal plane, while a rapid rotation will cause the mouths of the tubes to be depressed in a degree corresponding to the speed at which they are rotating, substantially as herein described.

4. The cylindrical chamber with the discharge-openings, the hinged distributing-pipes automatically adjustable by centrifugal movement, and the feed-wheel by which the seed is ejected from the chamber, in combination with one or more adjustable cylinders placed within the chamber A, and having openings whereby the direction in which the seed is discharged is controlled, substantially as herein described.



396,252. JACK-A-LANTERN. GEORGE A. BEISLER, Middletown, Pa. Filed Feb. 17, 1888. Serial No. 264,404. (No model.)

Claim.—1. In a jack-a-lantern or campaign-torch, the combination of the body or shell A, constructed of two halves, A' A'', united at their vertical edges, one of the said halves, A', being formed into the shape of a human face and provided with openings for the passage of the light through its eyes, mouth, and nostrils, and the other half, A'', being provided with a central bull's-eye, C, a hood, D, supported over the upper open end of the said shell A, a flanged disk, F, secured over the lower open end of the shell, this disk carrying an illuminating device, and a bail pivoted to the shell A, substantially as herein described.

2. In a campaign-torch or jack-a-lantern, the combination of the shell composed of two sections, A' A'', united at their vertical edges, the said sections being provided with openings for the passage of the light, a hood supported over the upper open end of the said shell, and a flanged disk secured over the lower opening of the said shell, this flanged disk carrying an illuminating device, substantially as herein described.

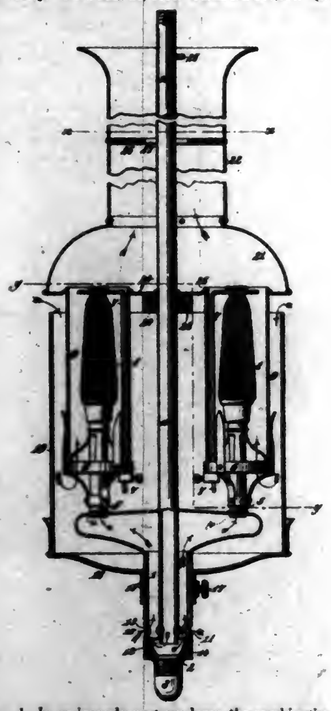
396,253. INCANDESCENT GAS-BURNER. HAROLD J. BELL, Woodbury, N. J., assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed Mar. 3, 1888. Serial No. 266,504. (No model.)

Claim.—1. In an incandescent gas-lamp, the combination of a burner-tip provided with lateral gas-exits, a cap, 13, surrounding said exits and forming with the burner-tip an annular flame-passage, 17, and a mantle placed above and around said burner-tip and cap, substantially as described.

2. In an incandescent gas-lamp, the combination, with a burner-tip having lateral gas-exits, of a cap surrounding said exits and provided with a flame-passage, and a cup held in place by said cap, substantially as described.

3. In an incandescent gas-lamp, the combination, with a burner, of a perforated cup surrounding the burner, and a mantle placed above and around the burner, with its lower end surrounded by said perforated cup, substantially as described.

4. In an incandescent gas-lamp, the combination, with a burner-tube and a detachable burner-tip, of a detachable cap surrounding the burner-tip, and a detachable collar to hold said burner-tip and cap in place on the burner-tube, substantially as described.



5. In an incandescent gas-lamp, the combination, with a burner-

tube and a detachable burner-tip, of a detachable cap surrounding the burner-tip, a detachable collar to hold said burner-tip and cap in place on the burner-tube, and a detachable cup held in place by said collar and cap, substantially as described.

6. In an incandescent gas-lamp, the combination of a burner-tube, a chimney-gallery supported on said tube, a detachable collar supported on and projecting above the gallery and burner-tube, a detachable burner-tip, a detachable cap supported in said collar between the collar and burner-tip, a mantle, and a cup supported by the collar and cap and surrounding the lower end of the mantle, substantially as described.

7. An incandescent gas-lamp comprising an atmospheric-gas tube, a chimney-gallery supported on said tube, a collar supported on and projecting above the gallery and burner-tube, a detachable burner-tip, a detachable open-top cap, and detachable mantle-protecting cup held in place by said collar, a mantle, a straight mantle-supporting rod, and a straight chimney cylindrical throughout its entire length, substantially as described.

396,254. INCANDESCENT GAS-BURNER. HAROLD J. BELL, Woodbury, N. J., assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed Mar. 21, 1888. Serial No. 267,967. (No model.)

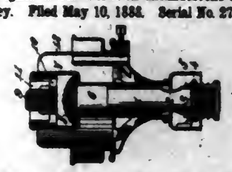
Claim.—1. In an incandescent gas-lamp, the combination, with a gas and air mixing chamber and a number of gas-burners supported on and communicating with said chamber, of a central gas-tube passed vertically through said chamber, and a perforated disk surrounding the open lower end of said tube, substantially as described.

2. In an incandescent gas-lamp, the combination, with a number of atmospheric gas-burners arranged in a group or cluster and a corresponding number of incandescent devices suspended above said burners, of a chimney surrounding each incandescent device, a vertically-adjustable globe surrounding the entire group or cluster of burners and incandescent devices, and a vertically-adjustable metallic hood and chimney supported above the several incandescent devices and their surrounding chimneys and globe, but penetrated by said chimneys, substantially as described

3. In an incandescent gas-lamp, the combination of a number of atmospheric gas-burners, a corresponding number of incandescent devices suspended above said burners, chimneys surrounding said incandescent devices, a globe surrounding all the burners and chimneys, and a globe-holder having a closed or imperforate bottom, substantially as described.

4. In an incandescent gas-lamp, the combination of a gas and air mixing chamber, a number of burners supported by said chamber, a central tube having an adjustable collar, and a metal hood supported on said collar above the gas-burners, substantially as described.

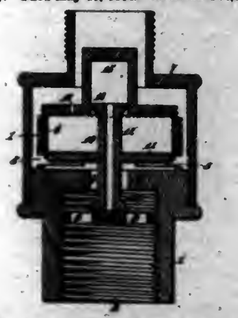
5. In an incandescent gas-lamp, the combination, with a group of gas-burners and incandescent devices and their chimneys, of a central tube having a collar, 20, and pin 28, and a hood, 21, supported on said collar, and having a slotted bar, 26, adapted to engage the pin 28, whereby the hood can be raised and supported clear of the burner-chimneys, substantially as described.



6. In an incandescent gas-lamp, the combination of a gas and air mixing chamber, a number of gas-burners supported by said chamber, incandescent devices suspended above the burners and surrounded by chimneys, an adjustable globe surrounding the entire group of burners and incandescents, and an adjustable metal hood suspended above but penetrated by the burner-chimneys, substantially as described.

396,255. ATMOSPHERIC GAS-BURNER. HAROLD J. BELL, Gloucester City, N. J., assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed May 10, 1888. Serial No. 273,455. (No model.)

Claim.—The combination, with an atmospheric gas-burner tube having lateral air-inlets 2 and provided with an externally screw-threaded or spiral-grooved base, 7, of a vertically-adjustable bell-shaped shield having a spiral ring, 5, to engage the external spiral groove on the base of the burner-tube, and a neck, 8, to cover or uncover the lateral air-inlets, substantially as described.



396,256. ATMOSPHERIC GAS-BURNER. HAROLD J. BELL, Gloucester, N. J., assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed May 10, 1888. Serial No. 273,457. (No model.)

Claim.—1. The combination, with an atmospheric gas-tube having lateral air-inlets, of a vertically-adjustable bell-shaped shield movably supported on the base of said tube and a vertically-adjustable burner-tube supported on the shield and movable therewith to cover and uncover the lateral air-inlets, substantially as described.

2. The combination of an atmospheric gas-tube having lateral air-inlets and an externally-screw-threaded base, a vertically-adjustable bell-shaped shield having an internal spiral ring to engage the said externally-screw-threaded base, and a vertically-adjustable burner-tube supported on the shield and movable therewith, substantially as described.

396,257. GAS-REGULATING BURNER. HAROLD J. BELL, Gloucester, N. J., assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed May 10, 1888. Serial No. 274,261. (No model.)

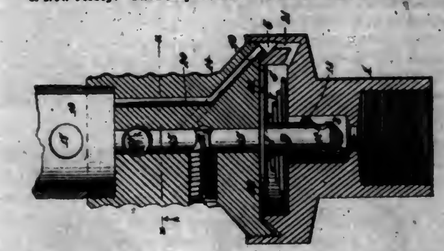
Claim.—1. In a gas-governor or gas-regulating burner, the combination of a shell, 1, having a contracted central gas-passage, 4, and provided with lateral gas-passages 5, located above said central passage, an adjustable cap, 6, to control the quantity of gas flowing through said lateral gas-passages, the shell 7, surrounding said cap and lateral gas-passages, and a float-valve, 10, comprising a valve, 14, beneath the central gas-passage, 4, and a disk-float, 11, above said passage to control the pressure of gas at the burner, substantially as described.

2. In a gas-governor or gas-regulating burner, the combination

of the shell 1, having a central gas-passage, 4, and lateral gas-passages 5, the adjustable cap 6, adapted to control the quantity of gas flowing through the lateral gas-passages, said cap being provided with a central upper chamber or guideway, 15, and a perforation, 16, the shell 7, surrounding said cap and lateral gas-passages 5, and the float-valve 10, having a tubular stem, 12, carrying a valve, 14, beneath the central gas-passage, 4, and a disk-float, 11, above said passage, substantially as described.

3. In a gas-governor or gas-regulating burner, the combination of the shell 1, having a partition, 3, provided with central gas-passage, 4, and lateral gas-passages 5, located in the shell above said partition, the adjustable cap 6, to control the lateral gas-passages, a float-valve, 10, to control the central gas-passage, an adjustable support, 8, for said float-valve, and a shell, 7, surrounding the cap 6 and lateral gas-passages 5, said shell being adapted to connect with a burner, substantially as described.

396,258. GAS-REGULATING BURNER. HAROLD J. BELL, Gloucester, N. J., assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed May 10, 1888. Serial No. 274,262. (No model.)

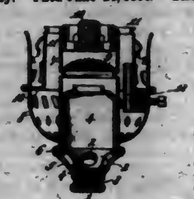


Claim.—1. In a gas-governor or gas-regulating burner, the combination, with a shell having a partition, 3, provided with gas-passage 4, and a cap, 7, having a central chamber, 15, and separate vertical gas-passages 18, of a float-valve, 10, comprising a disk, 11, and a tubular stem, 12, carrying a valve, 14, substantially as described.

2. In a gas-governor or gas-regulating burner, the combination of the shell 1, having a partition, 3, provided with gas-passage 4, the cap 7, having chamber 15 and separate vertical gas-passages 18, the float-valve 10, the perforated disk 19, and the tube 16, leading from the chamber 15 and through the disk 19, substantially as described.

3. In a gas-governor or gas-regulating burner, the combination of the shell 1, having central gas-passage, 4, the disk 8, having perforations 9, the cap 7, having chamber 15 and separate vertical gas-passages 18, the float-valve 10, the disk 19, having gas-passage 20 and screws 21, controlling said passage, and the tube 16, leading from the chamber 15 and through said disk 19, substantially as described.

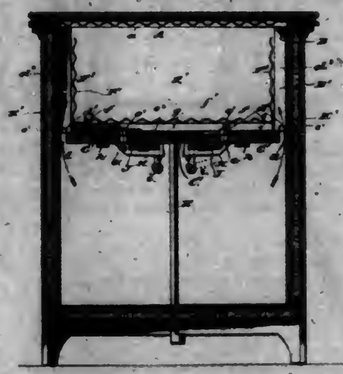
396,259. GAS-REGULATING BURNER. HAROLD J. BELL, Gloucester, N. J., assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed May 10, 1888. Serial No. 274,263. (No model.)



Claim.—1. In a gas-governor or gas-regulating burner, the combination of a base having a central gas-passage, a valve-seat, and a float-chamber, a cap or pillar attached to the upper end of said base and having a central gas-passage provided with an adjustable screw or screws for regulating the quantity of gas admitted to the burner, a float-valve consisting of a disk having a tubular stem perforated near its lower end and carrying a valve on its lower end, and a spring located in the float-chamber to normally support said float-valve, substantially as described.

2. In a gas-governor or gas-regulating burner, the combination of a base adapted to be attached to a gas-fixture and having a central gas-passage with a contracted valve-seat and an expanded float-chamber, said float-chamber being surrounded by an annular recess, a cap or pillar engaged in said recess and having a central gas-passage provided with an adjusting screw or screws to control the quantity of gas admitted to a burner, said base and pillar being provided with vents communicating with the annular recess, and a normally spring-supported float-valve located between the base and pillar and having a hollow laterally-perforated stem and valve operating in the passage of the base above the valve-seat to automatically regulate the pressure of gas, substantially as described.

3. In a gas-governor or gas-regulating burner, the combination of a base having a central gas-passage, a valve-seat, and a float-chamber, a cap or pillar having a central gas-passage provided with means for controlling the quantity of gas admitted to the burner, and a normally spring-supported float-disk located in the float-chamber between the central gas-passage of said base and cap, said float being provided with a central perforation and a tubular laterally-perforated stem carrying on its lower end a valve to seat downward in the valve-seat of the gas-passage in the base, whereby gas admitted through said tubular stem will expand on the upper face of the float-disk and said disk be forced down by an excessive pressure to lower the valve and diminish the flow of gas, substantially as described.



4. In a gas-governor or gas-regulating burner, the combination of the base 1, having central gas-passage, 3, valve-seat 4, float-chamber 5, annular recess 6, and vent 21, the cap or pillar 14, having a central gas-passage, 15, provided with an adjusting screw or screws and vent 20, the float-valve 8, consisting of a centrally-perforated disk, 10, and perforated tubular stem 9, having valve 11, gas-inlets 12, and shoulder 13, and the spring 7 for normally supporting said float-valve, substantially as described.

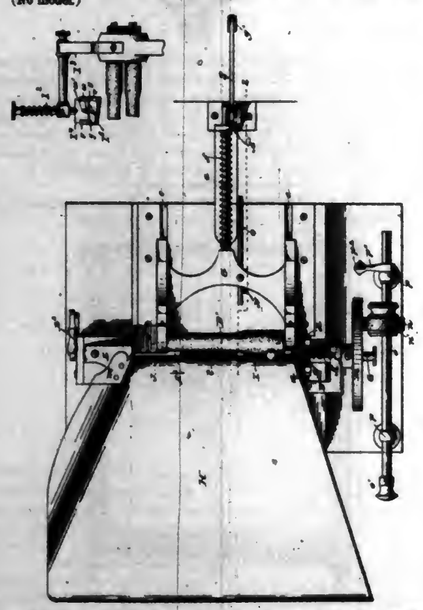
396,260. INCANDESCENT GAS-BURNER. HAROLD J. BELL, Gloucester City, N. J., assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed June 21, 1888. Serial No. 277,715. (No model.)

Claim.—The combination of the burner-base 1, having a flaring upper end provided with a series of air-inlets, 2, the rotatable shell 4, open around said base and projecting above the same, the lower portion of said shell being provided with a series of air-inlets corresponding with the air-inlets of the base, and a combined burner-tube and gallery supported on and closely surrounding the upper portion of the shell 4 above the air-inlets, substantially as described.

396,261. REFRIGERATOR. JOHN C. BERGER, Michigan City, Ind. Filed May 17, 1888. Serial No. 274,153. (No model.)

Claim.—1. In a refrigerator, the combination, substantially as described, of the ice-chamber having an inclined bottom provided with flanged openings, fixed supports for the bottom of the ice-chamber, an ice-tray of corrugated metal provided with upwardly-projecting ends, and strips secured vertically in the corners of the ice-chamber to support the upwardly-projecting ends of the tray against outward pressure.

2. In a refrigerator, the combination, substantially as described, of the metal-lined ice-chamber occupying the entire upper part of the refrigerator and having its bottom provided with flanged openings, a removable metal ice-tray having openings in its bottom and upwardly-projecting ends extending to near the top of the ice-chamber, strips arranged vertically in the corners of said chamber to support the upwardly-projecting ends of the tray at a little distance from the ends thereof, and triangular strips connecting the upper ends of the vertical strips and serving to deflect any air-currents that may rise through

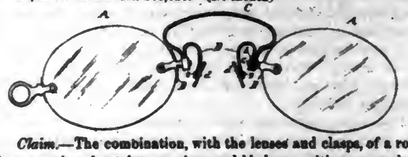


the spaces between the ends of the ice-chamber and the upwardly-projecting ends of the ice-tray.

396,262. WHEEL. HAMILTON BOLAND, Columbus, Ga. Filed Mar. 15, 1888. Serial No. 267,230. (No model.)

Claim.—In a wheel, the combination of the hub formed with the end apertures, the rim having the inwardly-extending flange provided with the apertures, and the spokes formed each of a single length of wire doubled and twisted together in opposite directions, substantially as described.

396,263. CIGAR WRAPPING OR ROLLING MACHINE. CLARK W. BORAN, New York, N. Y. Filed Sept. 8, 1888. Serial No. 284,918. (No model.)

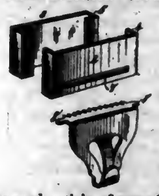


Claim.—1. The combination of the cigar-receiving rolls divided into two sets, D D', the movable carriage C, for one of said sets, and the cigar-supporter actuated from or by said carriage at the times and in the manner substantially as hereinbefore set forth.

2. The combination of the cigar-receiving rolls D D', the movable carriage C, in which the set of rolls D' is mounted, the two-part thimble having one of its parts attached to and movable with said carriage, and the cigar-supporter actuated from or by said carriage at the times and in the manner substantially as hereinbefore set forth.

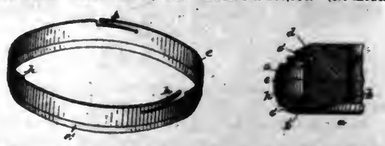
3. The combination, with cigar-receiving rolls, of the compound tucker provided with the toothed blade I^a and clearer-blade I^b, capable of limited vertical movement independently of one another, and the spring whereby the clearer-blade is held normally with its spring-edge below the toothed edge of the other blade, substantially as and for the purpose hereinbefore set forth.

396,264. EYEGLASSES. HENRY BORSCH, Chicago, Ill. Filed Mar. 20, 1888. Serial No. 268,229. (No model.)



Claim.—The combination, with the lenses and clasps, of a round-wire nose-piece bent into an inverted-U shape, with one arm longer than the other, the outer extremities of the arms being free of each other and the shorter arm secured to the clasp with the free end of the longer arm extended below the end of the shorter arm and carrying a facing, substantially as described.

396,265. FIFTH-WHEEL. WILLIAM T. CHEATHAM, Pulaski, Tenn. Filed Oct. 5, 1888. Serial No. 287,264. (No model.)



Claim.—The combination of the axle, the circle secured rigidly thereon, the king-bolt secured to the axle and projecting upward therefrom, the head-block composed of a T-shaped casting having the cross-bar E and the coupling-plate F, the said cross-bar being provided with a vertical opening for the reception of the king-bolt, and the coupling-plate being provided on its upper side with vertical ribs arranged in diverging pairs, and the guide for the circle secured to the under side of the coupling-plate, as specified.

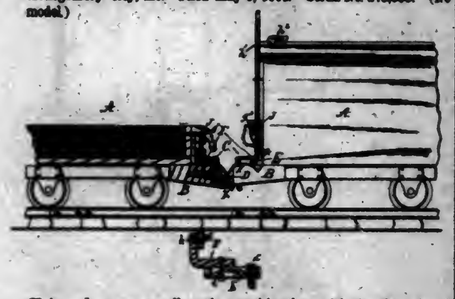
396,266. BUCKLE. CHARLES D. CHESEBRO, Birmingham, Conn. Filed Oct. 31, 1888. Serial No. 289,662. (No model.)

Claim.—As an improved article of manufacture, the herein-described buckle, composed of the slotted front plate carrying a swinging clamping-lever and having bent ends, and the separate back plate having its end portions bent substantially at right angles, rigidly connected with the front plate, and then extended toward each other to overlie and rest against the inner end portions of the body of the stationary front plate for taking up or bearing the strain of the clamping-lever, substantially as described.

396,267. DUST-BAND FOR WATCHES. DUANE H. CHURCH, Newton, Mass. Filed June 23, 1888. Serial No. 277,968. (No model.)

Claim.—1. A dust-band for watches, having an elastic seating or bearing at one edge, whereby a yielding pressure is imparted to the band when it is incased, as set forth.

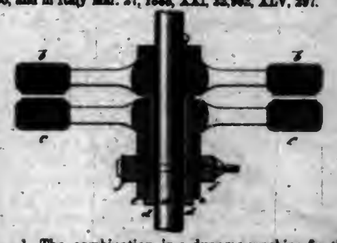
2. A dust-band for watches, having an elastic seating or bearing at one edge and a beveled portion or flange at its other edge, as set forth.



3. A dust-band for watches, having elastic tongues or springs at one edge, as set forth.

4. A dust-band for watches, having elastic tongues or springs at one edge and a beveled surface or flange at the other edge, as set forth.

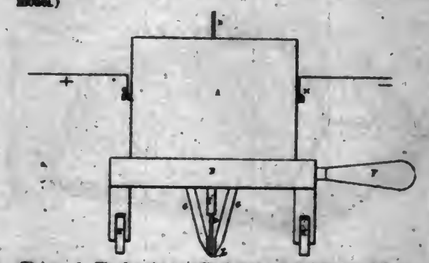
5. The combination of a watch-movement, a case having flanges c' d, a dust-band surrounding the movement between the flanges of the case, and means whereby an edgewise pressure is imparted to the dust-band, as set forth.



6. The combination of a watch-movement, a case having flanges c' d, and a dust-band surrounding the movement between said flanges, and provided at one edge with elastic bearings or springs and at the other edge with an inclined portion or flange, which is pressed by said springs against the case-flange, as set forth.

396,268. CAR-COUPLING. ANTHONY COMLY and JAMES H. MOUNTS, Montgomery City, Mo. Filed May 9, 1888. Serial No. 273,363. (No model.)

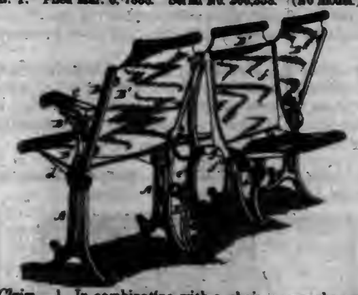
Claim.—In a car-coupling, the combination, with the draw-head B, pin C, and link D, of the link guard and holder composed of a spring steel rod, K, secured at one end to the end of the car, curved upward at k', and then at right angles at k^2, and head K', secured at the outer end of said spring-bar and formed with a curved top, j, and beveled end j', as described, for the purposes specified.



396,269. ELECTRO-DYNAMIC MACHINE. CARL COEPPER, Cologne, Prussia, assignor to the Helios Actien-Gesellschaft für Elektrisches Licht und Telegraphenbau, Ehrenfeld, Germany. Filed Feb. 15, 1888. Serial No. 264,077. (No model.) Patented in Belgium Jan. 12, 1888, No. 949; in England Jan. 14, 1888, No. 633; in France Feb. 4, 1888, No. 188,555, and in Italy Mar. 27, 1888, XXI, 23,902, XLV, 397.

Claim.—1. The combination, in a dynamo-machine for the electrical transmission of power, of a shaft or axle, an armature and field-magnets on said shaft or axle, one of the elements of the dynamo-machine, either the armature or field-magnets, being loosely mounted on the shaft or axle, and a brake or other check mechanism applied to the loosely-mounted element and capable of locking the same in a position of rest, substantially as set forth.

2. In a dynamo-machine for the electrical transmission of power, the combination, with a shaft or axle, of a field-magnet mounted rigidly on said shaft or axle, an armature applied loosely on the shaft or axle, and a brake or other check mechanism applied to the armature and capable of locking the same in a position of rest, substantially as set forth.



396,270. PROCESS OF ELECTRIC WELDING. CHARLES L. COFFIN, Detroit, Mich. Filed June 19, 1888. Serial No. 277,513. (No model.)

Claim.—1. The herein-described process of electric welding, consisting in forming a voltaic arc between two conductors extending outward from said conductors and submitting the joint to be welded to the action of said arc.

2. The herein-described process of electric welding, consisting in forming a voltaic arc between two conductors extending beyond the points thereof, feeding a strip of metal into the arc between the conductors, and submitting the joints to be welded and said strip of metal simultaneously to the action of said arc.

396,271. FOLDING CHAIR. CORNELIUS R. DEMAREST, Brooklyn, N. Y. Filed Mar. 6, 1888. Serial No. 266,332. (No model.)

Claim.—1. In combination with a chair, a secondary chair having the upper end of its back pivoted to the back of the primary chair, and its seat having a hinge-connection with the back of the secondary chair, and also a sliding hinge-connection with the frame of the primary chair.

2. The combination of a chair having a seat and sides supporting the back thereof and secured to the rear of said sides, and a frame, E, having grooves therein, with a secondary chair-back having its sides pivoted to said frame and a seat having its supports pivoted to said sides, and lugs on the ends of said supports received within the grooves of the frame E, substantially as and for the purpose described.

396,272. VEHICLE-SPRING. JOHN DIEHL, Franksville, Wis. Filed Aug. 24, 1888. Serial No. 283,053. (No model.)

Claim.—1. A vehicle-spring comprising a bar, a semi-elliptic spring secured to the central portion of the bar, and sockets adjustably secured to the ends of said bar and provided with lugs designed to come on opposite sides of bolster-stapdards, substantially as set forth.

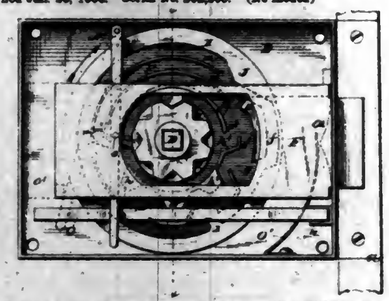
2. A vehicle-spring comprising a bar, a semi-elliptic spring recessed at its ends and secured to the central portion of the bar, and sockets adjustably secured to the ends of said bar and provided with lugs designed to come on opposite sides of bolster-standards, substantially as set forth.

3. A vehicle-spring comprising a bar, a semi-elliptic spring secured to the central portion of the bar and having upwardly and outwardly curved ends, and lugs depending from said bar to come upon said ends of the semi-elliptic spring, substantially as set forth.

4. A vehicle-spring comprising a bar, a semi-elliptic spring secured to the central portion of the bar and having upwardly and outwardly curved ends, and sockets adjustably secured to the ends of said bar and provided with lugs having downward extensions, substantially as set forth.

5. A vehicle-spring comprising a bar, the semi-elliptic spring F, secured to the bar to have its ends rest upon the vehicle-bolster, and the springs L, arranged to depend from the bar and be normally out of contact with said semi-elliptic spring, substantially as set forth.

6. A vehicle-spring comprising a bar, a single semi-elliptic spring secured to the central portion of the bar, and two spiral springs of different lengths arranged to depend from each end of said bar, whereby one of the spiral springs in each pair is always in contact with the semi-elliptic spring and the other normally out of contact therewith, substantially as set forth.



7. A vehicle-spring comprising a bar, a single semi-elliptic spring secured to the central portion thereof, two spiral springs of different lengths arranged to depend from each end of the bar, and short spiral springs depending from beneath said semi-elliptic spring, whereby one

of the spiral springs in each pair is always in contact with the semi elliptic spring and the other normally out of contact therewith, substantially as set forth.

8. A vehicle-spring comprising a bar provided at each end with the recesses B C, the semi-elliptic spring F, the spiral springs K, arranged in the recesses C of the bar and impinged against the ends of said semi-elliptic spring, the springs L, arranged in the recesses B of said bar and having their upper ends provided with eyes L', the plates D, and the rivets M, connecting said eyes and plates, substantially as set forth.

9. A vehicle-spring comprising the bar A, adjustable sockets P, arranged on the ends thereof and provided with lugs T, having extensions T', the semi-elliptic spring F, having the upwardly and outwardly curved ends F', and the spiral springs K L, of different lengths, suspended from said bar, substantially as set forth.

396,273. PERMUTATION-LOCK. BYRON J. DOUDS, Canton, Ohio. Filed Jan. 28, 1888. Serial No. 262,905. (No model.)

Claim.—1. In a lock, the combination, with a disk having cams and stops, of a movable device provided with a pin adapted to be engaged by the cams, and a spring adapted by its engagement with the stops to yieldingly hold the disk for the purpose of indicating the position of the pin on the face of the disk.

2. In a lock, the combination, with a disk having a series of cams thereon, of a pendulum-lever engaged by the cams on the disk, and a bolt engaged and operated by said lever.

3. In a lock, the combination, with a disk having a series of cams and passages on one face, of a pendulum-lever engaged by the said cams, a sliding bolt operated by said lever, and a spring exerting pressure on the bolt in one direction, substantially as set forth.

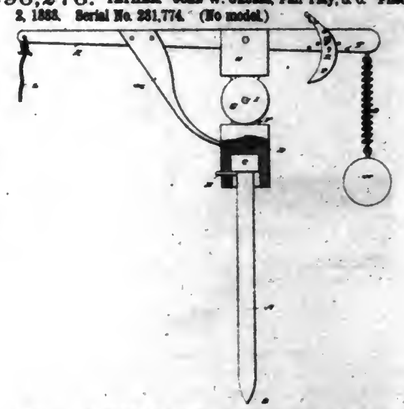
4. In a lock, the combination, with a disk having a series of cams and passages on one face and a series of stops, of a pendulum-lever having a laterally-projecting pin adapted to traverse said passages and engage said cams, and a spring-arm located in position to engage the stops on the disk, substantially as set forth.

5. In a lock, the combination, with a casing and a disk having a series of cams and passages on one face thereof, of a movable device having a pin adapted to traverse the passages and engage the cams, a spring bearing upon the device, and mechanism for operating the disk, substantially as set forth.

396,274. FERTILIZER. HERMANN ENDEMANN, Brooklyn, N. Y. Filed Apr. 6, 1888. Serial No. 269,963. (No specimens.)

Claim.—As a new article of manufacture, the above-mentioned fertiliser or product produced from tobacco, having the characteristics that it is of brown color, that the larger part of it is soluble in acidulated water, that when warmed with a solution of caustic soda it develops the characteristic odor of dry tobacco-leaf, and that it is free from cellulose and contains salts of the mineral acid used in making the product.

396,275. PROCESS OF MAKING A LEAD PIGMENT. AMBROSE G. PELL, New York, N. Y. Filed Mar. 1, 1887. Renewed June 14, 1888. Serial No. 277,066. (Specimens.)



Claim.—1. The herein-described method of producing the new pigment herein described, which consists in forming a solution of a salt of lead, forcing sulphurous acid through the said solution, whereby the lead is converted into normal sulphite, separating said sulphite from the liquid, steaming it, and drying it.

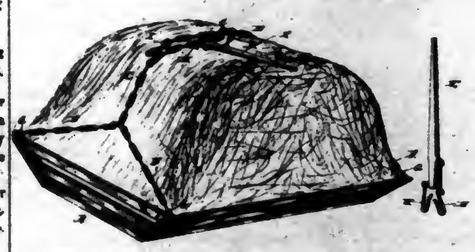
2. The herein-described process of treating sulphite of lead for the production of a lead pigment, which process consists in subjecting the sulphite to the action of steam or its equivalent, for the purpose and in the manner described.

3. The method of producing the new pigment herein described, which consists in forming a solution of acetate of lead, forcing sulphurous acid through the said solution, whereby the lead is converted into normal sulphite, separating said sulphite from the liquid, steaming it, and drying it, substantially as set forth.

4. As a new manufacture, a lead pigment consisting, substantially, of a lead sulphite white in color and distinguished by yielding a blue streak and by the other properties and characteristics herein set forth.

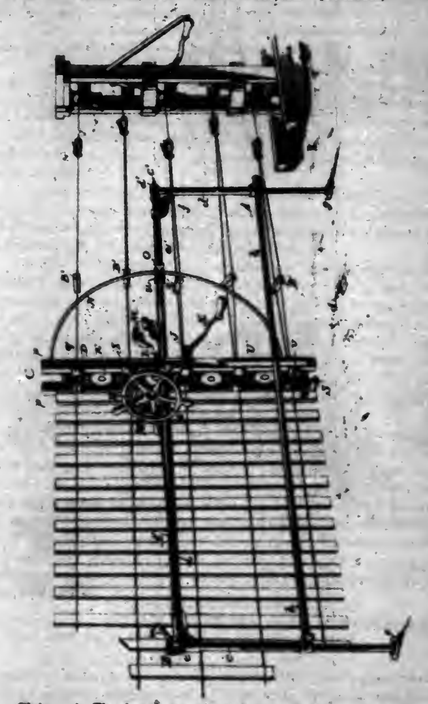
396,276. TETHER. JOHN W. GRUBB, Fair Play, S. C. Filed Aug. 2, 1888. Serial No. 281,774. (No model.)

Claim.—A tether for animals, consisting of the post, the block swiveled thereto, the lever pivoted to the block, the stop M on one side of the pivot-point, the weight N on the other side of the said point, and the adjustable stop P between the said pivot and weight, substantially as specified.



396,277. ADJUSTABLE CULTIVATOR-SHOVEL. HENRY C. HART, Wannakee, assignor to the Fuller & Johnson Manufacturing Company, Madison, Wis. Filed Oct. 2, 1888. Serial No. 286,970. (No model.)

Claim.—1. In an adjustable cultivator-shovel, the combination of the shovel, a grooved base adjustably secured thereto, a standard, and studs secured to the said standard for engaging the grooves in the base, substantially as described.



2. In an adjustable cultivator-shovel, the combination of the standard, a base adjustably secured thereto and provided at its forward and rear ends with transverse grooves, a standard, and studs secured to the standard for engaging the forward transverse grooves, a yoke fitting on the standard, and a clip pivoted to the yoke and engaging the rear transverse groove of the base, substantially as and for the purpose specified.

396,278. HAY-BINDER. ALEXANDER W. HENDRICK, Paw Paw, Mich. Filed Sept. 22, 1888. Serial No. 286,122. (No model.)

Claim.—A hay-binder comprising the central chains, C C, the chains D D, extending from the ends of the chains C C and adapted to engage the corners of a hay-rack, and the operating-lever provided with hooks near one end which are adapted to engage the chains C C, as set forth.

396,279. FENCE-MACHINE. MIRAJAH C. HEDLEY, Richmond, Ind. Filed Nov. 12, 1886. Serial No. 218,711. (No model.)

Claim.—1. The herein-described fence-weaving apparatus, consisting of frame A, having an elevated track or rail, *a*, and a loom or twister frame pivotally supported at or about its middle to tip forward and backward upon the track or rail and arranged to traverse the same, substantially as set forth.

2. In combination with a supporting-frame having an elevated track or rail, a pivotally-supported loom or twister provided with wheels or pulleys at or about its mid-length to rest upon the track or rail and carry the loom or twister, said loom or twister being adapted to be tipped forward and backward.

3. In combination with a loom or twister frame provided with supporting-wheels at or near its mid-length, a supporting-frame provided with an elevated track or rail, said track or rail passing through the loom or twister and beneath the supporting-wheels thereof.

4. In combination with a supporting-frame provided with an elevated rail or track, a carriage mounted and movable upon said track, and a loom or twister frame pivoted at or about its mid-length to the carriage, whereby it is adapted to be tipped to and to stand at any desired inclination.

5. In combination with a supporting-frame provided with an elevated track or rail, a carriage mounted and movable upon said track, a loom or twister frame pivotally attached at or about its mid-length to said carriage, a brace for holding the loom-frame at any desired angle to the carriage and track, and a clamping device bearing upon and serving to hold the brace.

6. In combination with a supporting-frame having upper track, *a*, and lower rod or brace, *b*, a loom or twister frame mounted upon the track and provided with a strap or bar to hold the frame to the lower brace or rod and prevent lateral movement of said frame.

7. In combination with a supporting-frame having a track or bar, *a*, a carriage mounted and movable upon said track, a loom or twister frame pivotally attached to said carriage, a sleeve or block movable upon the track, a brace extending from the loom or twister frame to the block, and a clamping device, substantially as shown and described, for clamping the brace and block together to hold the loom at any desired angle to its track.

8. In combination with a supporting-frame having a track or rail, a carriage mounted and movable upon said frame, a loom or twister pivotally attached to said carriage, a sleeve movable along the track, a brace extending from the loom or twister to the sleeve, and a set-screw or clamping device adapted to clamp the sleeve to the track, whereby the loom may be held stationary at any desired point on the track.

9. In combination with frame A, having track or rod *a*, and with a loom or twister frame carried thereby, a clamp, B, attached to the frame and serving to secure the frame to a picket of the fence.

10. In combination with a loom or twister, a supporting-frame consisting of longitudinal rods or bars *a'* and *b*, uprights *c* and *d*, and a clamping device consisting of a curved bearing-plate, *i*, carried by the frame, a lug, *l*, in rear of said plate, a threaded stem, *k*, passing through said lug, a clamping-head, *j*, carried by said stem, and a clamping-lever applied to the stem and serving to draw the head toward plate *i*.

11. The combination, with a supporting-frame having a track or rail, of a loom or twister mounted upon and arranged to traverse the rail, said frame being provided at either or both ends with an adjustable foot, whereby the inclination of the track or rail may be varied.

12. In combination with track *a*, carriage L M, loom or twister C, pivotally attached to said carriage, sleeve *u*, mounted upon track *a*, curved brace N, attached to the loom or twister and passing through an eye of said sleeve, and a set-screw or clamping device, O, serving to bind the brace to the sleeve.

13. In combination with frame A, having elevated track *a*, loom or twister C, provided with cross-plates *q r*, twister heads or disks D, intermediate gear-wheels, E, and small pinions F G, the latter serving to connect the other gear-wheels and disks of the series, but affording space for the passage of track *a* through the loom or twister frame.

14. In combination with a supporting-frame having an elevated track, *a*, a loom or twister frame provided with a lug, *i'*, and an adjustable foot-piece, *f'*, whereby the frame is adapted to be supported upon its foot and to form a support for the frame as the latter is moved back.

15. In combination with a loom or twister frame for fence-weaving, a yielding foot or support carried thereby to support the lower end of the picket.

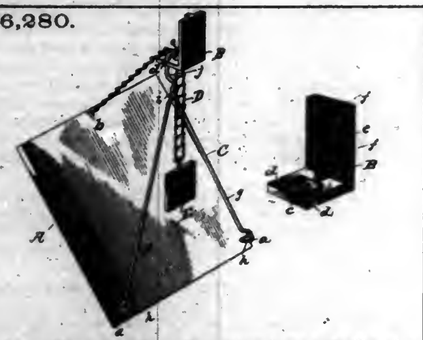
16. In combination with a fence loom or twister frame, a gage at or near the upper end thereof to control the height of the picket, and a yielding foot or support at or near the lower end of the loom to support the base of a picket, the yielding foot permitting pickets of more than the prescribed length to be dropped down to bring their heads beneath the top gage.

17. In combination with a loom or twister frame, a foot rest or support adapted to be swung or pressed back to permit the foot of a picket to pass below it.

18. In combination with a loom or twister provided with lugs *v*, a foot or support for pickets, consisting of stems or rods Q, springs R, plate S, and clamping devices, substantially as described and shown, for securing the rods Q at any desired height.

19. In combination with a supporting frame or track, and with a band extending from end to end thereof, a loom or twister frame mounted upon said track, a wheel carried by said loom or frame and engaging with the band, and a lever applied to said wheel or its shaft and serving to rotate the same, and thereby to move the twister-frame along the track.

20. In combination with a frame having an elevated track, *a*, a carriage, L, mounted thereon, a loom or twister, C, supported by said carriage, a shaft, *z*, provided with wheel M to run upon the track, a band running from end to end of the frame, a wheel, V, engaging with said band, and a hand wheel or lever by which to rotate the wheel V to move the carriage and twister.

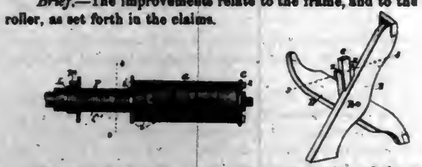


21. In combination with a frame having a track, *a*, a carriage, L, provided with wheels M to run upon the track, a loom or twister supported by said carriage, a shaft, *z*, extending from the side of the carriage, a band-wheel, V, and a notched hub, W, mounted upon said shaft, a band extending lengthwise of frame A and engaging with the band-wheel V, and a hand wheel or lever provided with a locking-dog, whereby it may be connected with or disconnected from the notched hub at will.

22. The combination, substantially as set forth, of a supporting-frame provided with a track, a carriage having wheels mounted upon said track, a loom or twister supported by said carriage, a shaft, *z*, projecting from the side of the carriage, a band-wheel, V, and notched hub W, mounted upon said shaft, a hand-wheel, X, mounted upon the shaft and provided with bolt Y to engage with hub W, hand-piece Z, connected with and serving to operate the bolt, and a band extending lengthwise of frame A and in engagement with band-wheel V, whereby the loom may be moved back and forth regularly and gradually or suddenly, as desired.

23. In combination with a supporting-frame having track *a*, carriage L M, mounted thereon and provided with band-wheel V, and band A', attached permanently to frame A at one end and at the other end to an adjustable stem, *c*.

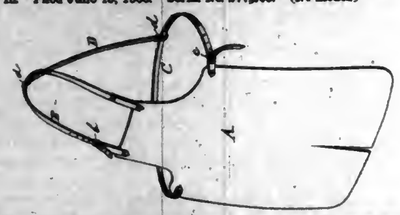
396,280. AUTOMATIC ADJUSTABLE PICTURE-HANGER. OTTO JABNER and ALEXANDER JABNER, Philadelphia, Pa. Filed Apr. 23, 1888. Serial No. 271,599. (No model.)



396,280.

Claim.—The combination, with a picture-frame or the like, of an L-shaped bracket formed with an opening in its vertical portion and provided on opposite sides of said opening with the ribs *f f*, and having in the horizontal portion thereof the hole *e*, and notches *d d* on its edges, the bifurcated brace twisted at *i* to form the loop *j* and bent at its ends into hooks, and the chain provided with the pendant E, substantially as described.

396,281. HAND-LOOM. WILLIAM H. KYBERT, Battle Creek, Mich. Filed May 24, 1887. Serial No. 239,270. (No model.)



Brief.—The improvements relate to the frame, and to the warp-roller, as set forth in the claims.

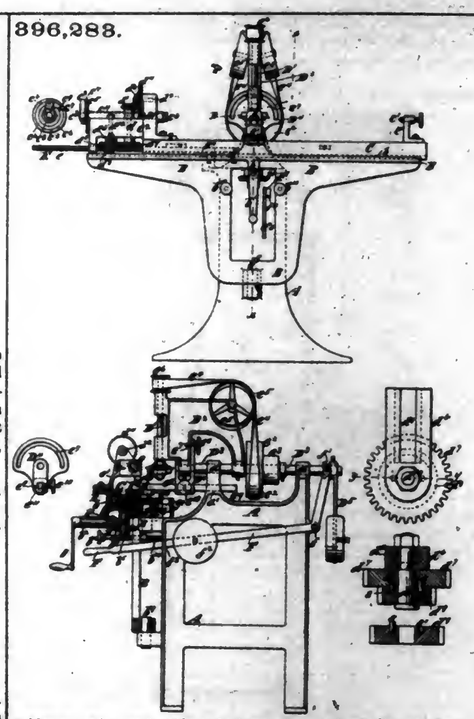
Claim.—1. In a loom-frame, the combination of the crossed pivoted legs, said legs provided with the gains in their contiguous sides, and the adjustable keys for insertion in said gains to hold the loom-frame at different heights, substantially as set forth.

2. In a loom, a warp-roller having the radial grooves for the reception of the pins, a fixed head at one end of said roller, a head at the other end adapted to slide thereon, and a set-screw to fix the movable head at given points of adjustment, substantially as set forth.

396,282. LUMBERMAN'S APRON. ALEXANDER LEVIN, Chicago, Ill. Filed June 18, 1888. Serial No. 277,263. (No model.)

Claim.—1. The combination, with a lumberman's apron having neck-strap B and waist-strap C, of an elastic back-strap, D, connecting both straps B and C, substantially as and for the purpose set forth.

2. The combination, with a lumberman's apron having neck-strap B and waist-strap C, of an elastic back-strap, D, provided with loops to its ends for coupling the straps B and C, substantially as and for the purpose set forth.



396,283. LATHE FOR TURNING SPIRAL FORMS. EDWARD D. MACKINTOSH, Brooklyn, assignor to Paul Fryhil, New York, N. Y. Filed Mar. 10, 1888. Serial No. 266,792. (No model.)

Claim.—1. The combination, with a work-frame mounted on a vertical pivot which occupies a fixed position, of a work-table carrying work-spindles and movable lengthwise in guides in said frame and a rotary spindle carrying a cutter-head and cutters for operating on the work between said spindles, substantially as herein described.

2. The combination, with a work table or bed provided with centers for carrying a piece of work, a frame or guideway therefor, and gearing for traversing the table or bed along the said frame or guideway, of a swinging spindle-frame having the axial line on which it swings in the same plane with said centers, and a spindle journaled in said spindle-frame in a position transverse to the fulcrum and carrying a cutter-head, substantially as herein described.

3. The combination, with a work-frame having a rectilineal guideway and a work table or bed carrying work-spindles and movable lengthwise in said guideway, of a cutter-spindle carrying a cutter-head and movable toward and from the work and a former on the table or bed which governs the approach of the cutter-spindle toward the work, substantially as herein described.

396,288.

4. The combination, with a longitudinally-movable work table or bed provided with work-centers, of a spindle-frame, a fulcrum-bar therefor extending transversely to the table or bed and loaded to carry it and the frame toward the work, a rotary cutter-head and a spindle therefor journaled in said frame, and a former for governing the approach of the cutter and spindle-frame toward the work, substantially as herein described.

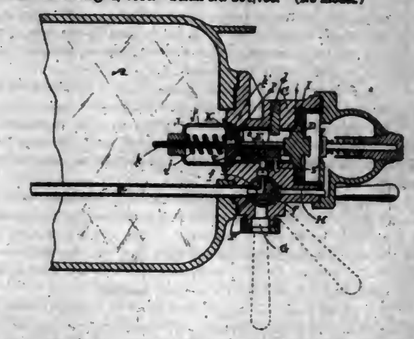
5. The combination, with a work-frame mounted on a vertical pivot to swing horizontally, of a work table or bed movable lengthwise in said frame and carrying work-spindles, a cutter-spindle and a cutter-head thereon, and a steady-block mounted upon the work-frame and receiving the work through it, the cutter-head cutting its way to the work through the block, and the block serving to steady the work opposite the cutter-head, substantially as herein described.

6. The combination, with a longitudinally-movable work table or bed having centers for work, of the spindle-frame D^3 and its fulcrum-bar D^2, the guide-bar d^3, and the holding-frame D^4, receiving the guide-bar through it and having an arc-shaped adjustable connection with the spindle-frame, bearings for the fulcrum-bar, and a guide in the main frame for the guide-bar, and a spindle, D', journaled in the spindle-frame and carrying a rotary cutter-head, substantially as herein described.

7. The combination, with a work table or bed provided with centers for holding work and a frame whereon the table or bed is movable lengthwise, and which is supported by vertical pivots, of a swinging spindle-frame and a fulcrum-bar therefor in substantially the same vertical plane as said vertical pivots and transverse to the line of said work-centers, and a cutter-spindle journaled in said spindle-frame and arranged at substantially right angles to said fulcrum-bar, substantially as herein described.

8. The combination, with the main stationary frame A and the work-frame B, supported thereon by circular bearings which provide for swinging it in a horizontal plane, of adjustable stops, as screws b^{10}, to lock said work-frame against swinging, the work table or bed provided with centers for work and gearing for traversing it along said work-frame, the spindle-frame D^3 and its fulcrum-bar D^2, and the cutter-spindle D', journaled in said spindle-frame, substantially as herein described.

9. The combination, with work-spindles, of a cutter-head and a cutter-spindle, D', and the spindle-frame D^3, wherein it is journaled, and the fulcrum-bar D^2, on which said frame is mounted, and which is movable lengthwise in its bearings to carry the cutter-head toward and from the work, substantially as herein described.



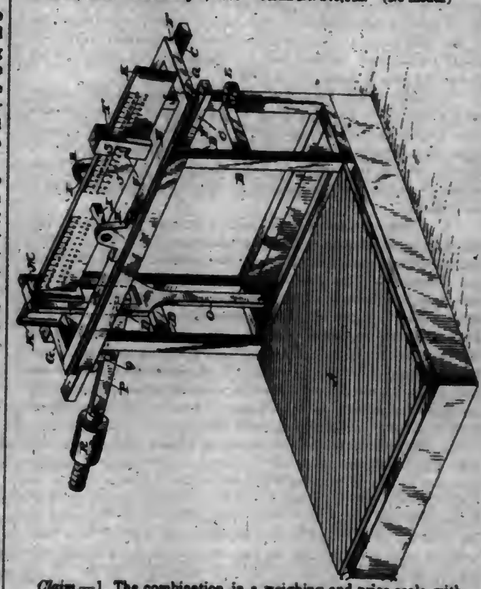
10. The combination, with a swinging spindle-frame and a cutter-spindle journaled therein, of a work-frame and a work table or bed movable on said work-frame, a rack on the table or bed, and gearing on said work-frame for driving into said rack and traversing said table or bed, a head-spindle and a tail-spindle or center on the table or bed, a fixed rack on the work-frame, and gearing whereby the head-spindle is geared with a wheel engaging said rack and the head-spindle and work driven as the table or bed is moved lengthwise, substantially as herein described.

11. The combination, with the rack-bar E and change-wheels for engaging therewith, of the support d^9, having a stud for supporting the change-wheels and adapted to be slid lengthwise and turned on its securing-bolt d^{10}, substantially as herein described.

12. The combination, with a spindle-frame and a cutter-spindle journaled therein, of a work-frame and a sliding work table or bed thereon and supporting head and tail spindles, gearing for traversing the table or bed along the work-frame, two racks on said work-frame facing in opposite directions, gearing for imparting motion to the head-spindle, and which includes a change-wheel and a bearing or support for the change-wheel secured to the work table or bed and adjustable to hold said wheel in engagement with either of said two racks, substantially as herein described.

13. The combination, with a spindle-frame and a cutter-spindle journaled therein, of a work-frame and a sliding table or bed thereon and head and tail spindles on the table or bed, gearing for traversing the table or bed, a rack on said work-frame, a transmitting gear-wheel in permanent geared engagement with the head-spindle, change-wheels gearing one into the rack and the other into said transmitting-wheel and connected together to rotate as one by pins secured one in each wheel and entering a hole in the other wheel, and a bearing or support for the change-wheels on said table or bed, substantially as herein described.

396,284. AUTOMATIC AIR-BRAKE. GEORGE W. MARSH, Oakland, Cal. Filed Aug. 1, 1888. Serial No. 281,706. (No model.)

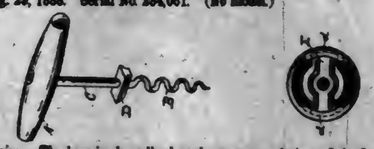


Claim.—1. In the automatic air-brake herein described, having the auxiliary reservoir, the brake-cylinder, the train-pipe connection, and the valve chest or chamber, with its grooved piston-valve, ported slide-valve, and port e, the spring *j*, for throwing the valves back when the pressure within the auxiliary reservoir equals the pressure in front of the piston-valve, and the exhaust-port e^3 in the valve-chest, which is opened by the ported slide-valve when thrown back, substantially as and for the purpose herein described.

2. In the automatic air-brake herein described, having the auxiliary reservoir, the brake-cylinder, the train-pipe connection, and the valve chest or chamber, with its grooved piston-valve, ported slide-valve, and port *e*, the ported inner valve bearing against the inner end of the slide-valve and the grooved inner end of the stem of the piston-valve, the spring acting against said inner valve for causing it to move forward to its seat and throw the piston-valve and slide-valve back when the pressure within the auxiliary reservoir equals the pressure in front of the piston-valve, and the exhaust-port e^3 in the valve-chest, which is opened by the ported slide-valve when thrown back, substantially as herein described.

3. In the automatic air-brake herein described, having the auxiliary reservoir, the brake-cylinder, the train-pipe connection, and the valve chest or chamber, with its grooved piston-valve, ported slide-valve, and port *e*, the ported cap on the inner end of the valve-chest, the ported inner valve within said cap and bearing against the end of the slide-valve and the grooved inner end of the stem of the piston-valve, the spring within the cap and acting against the inner valve for causing it to move forward to its seat and throw the piston-valve and slide-valve back when the pressure within the auxiliary reservoir equals the pressure in front of the piston-valve, and the exhaust-port e^3 in the valve-chest, which is opened by the ported slide-valve when thrown back, substantially as and for the purpose herein described.

4. In the automatic air-brake herein described, having the auxiliary reservoir, the brake-cylinder, the train-pipe connection, and the valve chest or chamber, with its grooved piston-valve, ported slide-valve, port *e*, and exhaust-port *e'*, a cock for closing and opening the exhaust-port *e'*, a spring for throwing the valves back when the pressure within the auxiliary reservoir equals the pressure in front of the piston-valve, and the supplementary exhaust-port e^3 in the valve-chest, which is opened by the ported slide-valve when thrown back, substantially as herein described.



396,285. WEIGHING AND PRICE SCALE. JOHN G. MCNEILL, Ottawa, Kans. Filed May 7, 1888. Serial No. 273,112. (No model.)

Claim.—1. The combination, in a weighing and price scale, with the frame, of a sliding frame thereon having end pieces and a scale-beam fulcrumed upon the sliding frame, the ends of which are limited in the vertical movement by the end pieces of the sliding frame, substantially as set forth.

2. The combination, in a weighing and price scale, of a sliding frame and a scale-beam fulcrumed thereon, the ends of which are semi-cylindrical and provided with cylindrical bores, substantially as set forth.

396,286. CORKSCREW. LEVI S. MCWHORTER, Chicago, Ill. Filed Aug. 23, 1888. Serial No. 284,061. (No model.)

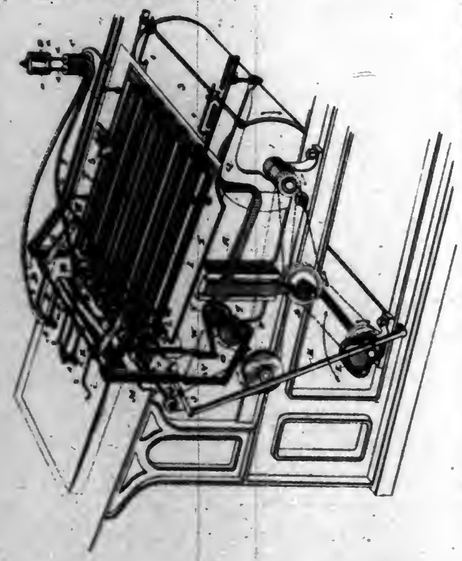
Claim.—The herein-described corkscrew, consisting of the handle A, spiral screw B, shank C, and the cross-bar D upon the shank just above spiral screw B, forming a key adapted to engage the raised portions *b b'* of the cap E when the corkscrew is inserted, all substantially as shown and described.

396,287. FILTER. LEWIS W. MONROE and ISAAC STIERS, Kansas City, Mo. Filed Oct. 2, 1888. Serial No. 286,986. (No model.)

Claim.—1. A filter comprising a casing, intersecting transverse and longitudinal partitions within the single casing, dividing the interior thereof into four compartments, a bucket pivoted in the upper end of one of the compartments formed by the partitions, a valve in the lower end of the next adjacent compartment, and connections between the valve and the bucket, as set forth.

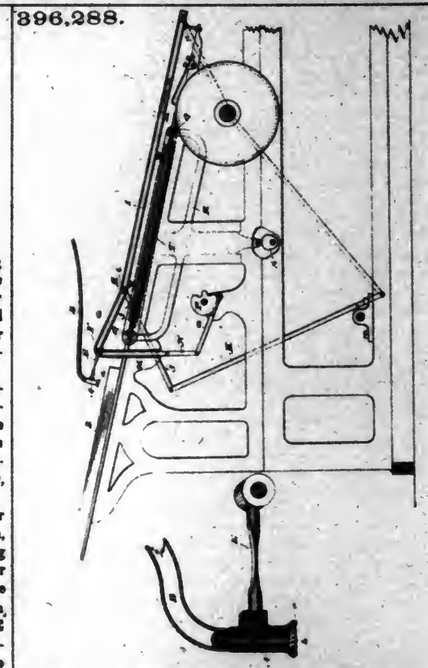
2. A filter comprising a single casing, vertical partitions within the casing arranged at right angles to each other and dividing the

396,287.



interior of the casing into the compartments H I J K, the water being received in the upper end of the compartment H, and passing thence successively through the compartments I J K back into the lower end of the first compartment, H, the bucket pivoted in the upper end of the compartment H to receive the water, and the valve in the lower end of the adjacent compartment, I, controlled by the bucket to discharge the surplus water, as set forth.

3. A filter having the compartments H I at one end, the compartment H, having an escape-opening, Y, in its bottom, and the compartment I, having a discharge-opening, D, in its bottom, the bucket in the upper end of the compartment H, having an escape-opening, Z, in its bottom, and the valve in the lower end of the compartment I, controlled by said bucket, and adapted to close the discharge-opening D, as set forth.



4. A filter comprising the casing, the transverse partition E, near the rear end of the same, having perforations in its lower portion, the imperforate partition G between the partition E and the casing and forming the compartments H I, the supply-opening being over the upper end of the compartment H and the discharge-opening in the lower end of the same, the compartment I, having an opening, D, in its bottom, the longitudinal partition extending from the partition E to the front end of the casing and having a perforated upper portion and forming the compartments J K, the perforated shelves in the said compartments J K, adapted to support filtering material, and the horizontal imperforate partition in the lower end of the compartment H, over the discharge-opening, as set forth.

5. The combination of the casing having the compartments H I near one end, the compartment I, having an opening in its bottom, the valve O, adapted to close said opening, the bucket pivoted in the upper end of the compartment H, the arm M, projecting from the bucket over the upper end of the compartment I, the valve-rod rising from the valve O and having its upper end secured to an intermediate point of the arm M, the transverse rod R, the weighted lever playing through said rod, and the link connecting the end of said lever with the end of the arm M, as specified.

396,288. FEEDING APPARATUS FOR PRINTING-MACHINES. WILLIAM HUBER, Toronto, Ontario, Canada. Filed Dec. 24, 1887. Serial No. 258,886. (No model.)

396,288.

Claim.—1. One or more cups suitably connected to an air-exhauster and driven by mechanism so timed and arranged that the cup or cups shall travel as each sheet of paper is lifted by the suction of the exhaust, and the horizontal spring-arms E, attached to said cups, substantially as and for the purpose specified.

2. In a printing-press, a cup, A, connected by a flexible tube, B, to the air-pump C or other exhauster, and supported by the spring-arms E, connected to the rod F, carried in guideways I, in combination with mechanism by which the rod F is conveyed away from the pile of blanks Z, on which the cups A rest, substantially as and for the purpose specified.

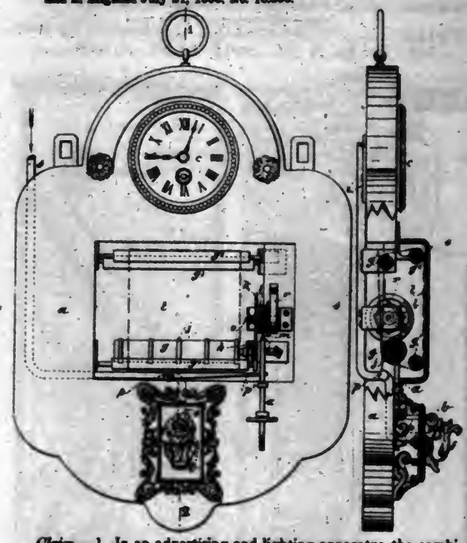
3. In a printing-press, a cup, A, connected by a flexible tube, B, to the air-pump C or other exhauster, and supported by the spring-arms E, attached to the rod F, connected by the arm G to the rod H, the rods F and H being supported in guideways I, and an arm, J, connected to the pivoted lever K, in combination with the cam L, arranged substantially as and for the purpose specified.

4. In a printing-press, a cup, A, connected by a flexible tube, B, to the air-pump C or other exhauster, and supported by a rod carried in suitable guideways and caused to travel from the pile of blanks Z, with the top blank adhering to the cup, in combination with the bracket R, carrying the axles Q, upon which the endless traveling tapes revolve, the said bracket being supported by a cam, S, designed and timed to lower the bracket R so as to deposit the sheet onto the rollers T, substantially as and for the purpose specified.

5. In a printing-press, the rollers T, geared together by the wheels U, connected to the rack V, in combination with the cam Y, connected to and operating the rack V, substantially as and for the purpose specified.

6. In a printing-press, the bar M, fitting into the guideways I, so as to support the rod F, in combination with the cam P, designed to operate the bar M, substantially as and for the purpose specified.

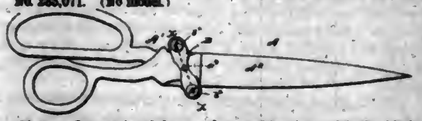
396,289. METALLIC BRUSH. STEPHEN PORTER, Boston, Mass., assignor, by mesne assignments, to the Eagle Manufacturing Company, of Maine. Filed Dec. 31, 1887. Serial No. 258,988. (No model.)



Claim.—1. In metallic brushes, a continuous integral metallic ring struck from a blank and provided with a series of fastening-lips, also integral therewith, arranged around its lower edge or contour, said lips being disposed transversely of said edge, substantially as and for the purposes described.

2. In metallic brushes composed of a back portion and a flexible piece of material studded with a massed series of wires attached thereto, a series of fastening devices inserted in said back, combined with a metallic ring having transversely-disposed fastening-lips adapted to engage the fastenings on the brush, substantially as set forth.

3. In metallic brushes, the combination, with the back 2 and the fastenings 8, a massed series of wires, 4, and the flexible material 3 with its fastenings 5, of the integral continuous metallic ring 6, concavo-convex in cross-section, adapted to rest upon the back 2 and overlap the projecting edge of the material 3, and the series of holding-lips 7, integral with and bent transversely of said ring, all co-operating as herein set forth and described.



396,290. ADVERTISING DEVICE. VITO M. POSSE, Paris, France. Filed Aug. 17, 1888. Serial No. 283,963. (No model.) Patented in France Mar. 6, 1888, No. 186,185; in Belgium Mar. 3, 1888, No. 80,988, and in England July 21, 1888, No. 10,566.

Claim.—1. In an advertising and lighting apparatus, the combination, with the igniting device and a button or handle for operating the same to produce or increase the flame or spark, of movable advertisements carried by suitable supports, mechanism for moving the same to bring different inscriptions into view, and connections between said handle and mechanism whereby the movement of the handle for lighting purposes is communicated to said mechanism to move the advertisements, substantially as set forth.

2. In an advertising and lighting apparatus, the combination, with a gas-burner and a handle for regulating the supply of gas to the same, of movable advertisements carried by suitable supports, mechanism for moving the same to bring different inscriptions into view, and connections between said handle and mechanism whereby the movement of the handle for lighting purposes is communicated to said mechanism to move the advertisements, substantially as set forth.

396,291. SHEARS. WILLIAM RICHARD, Moorville, Ohio, assignor of one-half to Martin Koller, same place. Filed Aug. 18, 1888. Serial No. 283,071. (No model.)

Claim.—In a pair of shears, the combination, with the blade A', provided with the stationary pivot a^2, and the integral internally-threaded ears a' a', arranged obliquely to each other on opposite edges of said blade A', of the blade A^3, moving on the pivot a^2, the clamp B, resting upon the blade A^3 and having apertured lugs at its ends, and the adjusting-screws b^3-b^3, engaging the apertured lugs of the clamp and the integral ears of the blade A', substantially as specified.

396,292. ROOF. ROBERT C. RANTOUL, Shelburne Falls, Mass. Filed Apr. 14, 1888. Serial No. 270,677. (No model.)

Claim.—1. As an improved article of manufacture, the building material herein described, comprising a flexible water-proof sheet and shingles or strips applied to both faces thereof.

2. A roof, wall, or similar structure comprising a lower layer of shingles overlapping each other substantially in the manner shown, an upper layer of shingles or slate, also overlapping each other, and an interposed water-proof covering.

3. In a roof, wall, or similar structure, the combination, with the two layers of shingles C and E, of the interposed water-proof material, D, projecting below the lower edges of the upper layer of rows of shingles, all substantially as shown.

4. In a roof, wall, or similar structure, the combination of the two layers of shingles and the interposed water-proof sheet, the upper layer of shingles or strips being cemented together along their edges, substantially as shown and described.

396,293. TETRAZO DYE-STUFF. CHRISTIAN RUDOLPH, Offenbach-on-the-Main, Germany, assignor to K. Oehler, same place. Filed Sept. 3, 1888. Serial No. 284,466. (No specimens.)

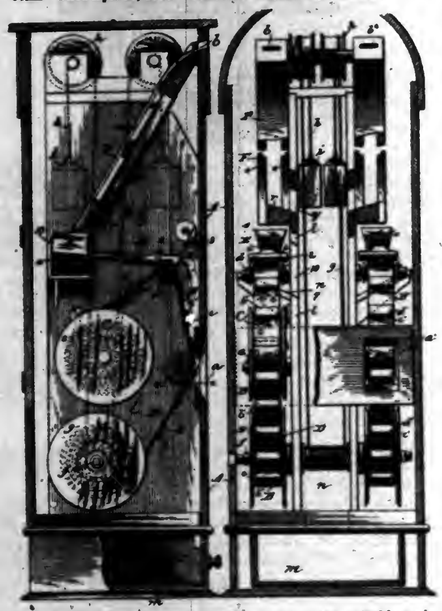
Claim.—The tetrazo dye-stuff herein described, which is produced from the sulpho-acids of the amido-cresols by their combination with naphthylamine, the diazotation of the compound thus obtained and its combination with naphtholdisulpho-acid, and which is a black-brown powder with a bronze luster having the following properties, viz: forming when dissolved in water a blue-violet solution, which by the addition of ammonia is changed to pure blue, showing a green reaction with concentrated sulphuric acid, and dyeing wool from violet-blue to blue-black, according to its strength, substantially as herein specified.

396,294. YELLOW COLORING-MATTER. CHRISTIAN RUDOLPH and BERNHARD PRIEBS, Offenbach-on-the-Main, Germany, assignors to K. Oehler, same place. Filed June 13, 1888. Serial No. 276,970. (No specimens.)

Claim.—The yellow azo dye-stuff herein described, produced from benzidin or tolidin, cresotinic acid and salicylic acid, and which is a brown-yellow powder easily soluble in hot water and dissolves in sulphuric acid with a violet-red color, substantially as herein set forth.

396,295. TOY. JOHN SEDGFIELD, New Haven, Conn. Filed Apr. 20, 1888. Serial No. 271,372. (No model.)

Claim.—1. In combination, the tubular support A, formed into a whistle, the movable device, as the wind-wheel, and a movable deflector for preventing the sounding of the whistle without cutting off the current of air to the wind-wheel, substantially as described.



2. In combination, the tubular support A, having a notch formed therein, the beveled block inserted within said tubular support, with its larger end at the notch, the movable device, as the wind-wheel, and the movable deflector for preventing the sounding of the whistle without cutting off the current of air to the wind-wheel, substantially as described.

3. In combination, the tubular piece A, having the whistle formed therein, movable device supported thereby, and the deflector pivoted to the piece A, for preventing the sounding of the whistle without cutting off the current of air to the wind-wheel, substantially as described.

4. In combination, the tube having the opening 3 formed therethrough, a whistle-block arranged with its edge extending across said opening, and thus providing a blast-opening, *a*, for the escape of the air, and an opening, *b*, of the sounding-chamber, and a freely-movable

deflector to be operated by hand and to lie between the air-blast opening *a* and the opening *b*, substantially as described.

396,296. VENDING APPARATUS. JOHN SCHOFIELD, New Haven, Conn. Filed Apr. 30, 1888. Serial No. 272,313. (No model.)

Claim.—1. In an automatic vending apparatus, a suitable casing provided with an opening for the delivery of the articles, a flexible carrier having pockets for holding the articles, supporting-reels for said carrier, a weight, a locking-lever, a coin-slide, and a bearing for the flexible carrier at the delivery-opening and approximately in line with the wall of the casing, whereby the carrier with the articles is directed to the opening and such articles rendered accessible to the hand of the purchaser, substantially as described.

2. In combination, a suitable casing with a delivery-opening, the flexible carrier having pockets for holding the articles, the reels C D, having the ends of the carrier thereon and adapted to wind and unwind the carrier, the weight, and the locking-lever, substantially as described.

3. In an automatic vending-machine, a flexible carrier supported therefor, a weight, said carrier having pockets to receive the articles to be sold, stops on said carrier, a locking-lever adapted to check the movement of said carrier by engagement with said stops, and a coin-slide arranged with its lower end above said lever, whereby the lever is operated by the dropping in of a coin to release the carrier and to allow it to move, substantially as described.

4. In combination, the flexible carrier for the articles, the reel C, carrying one end of the carrier and adapted to receive and hold the carrier when wound upon it, suitable bearings adapted to support and direct said carrier to an opening in the wall of the case, a second reel carrying the other end of the carrier and for receiving the carrier as it is moved from the first reel, a weight in connection with the reels for moving them, and a locking-lever, substantially as described.

5. In an automatic vending-machine, a flexible carrier provided with pockets and having stops or projections on its surface, a spool or reel, C, from which the carrier is unwound, a supporting-spool, *d*, a pivoted lever, E, having a hooked end in line with the studs on said carrier, a coin-slide in line with the end of said lever for operating the same to release the carrier, and a bearing approximately in line with the opening in the wall of the case, and a receiving spool or reel, *d*, with a weight, substantially as described.

6. In an automatic vending-machine, a carrier provided with pockets, supports for the same, a weight, a locking-lever, E, having a hooked end engaging with projections on said carrier, a coin-slide, the said lever E having a box, 4, with an inclined bottom arranged beneath the coin-slide adapted to receive the coin and to deflect it to the cash-box, substantially as described.

7. In an automatic vending-machine, the vertical partition, a coin-slide arranged on one side thereof having an open bottom with a passage formed between the same and an inclined plate, *p*, and the cash-box located on the opposite side of the partition, said partition having an opening for directing small coins to the cash-box, substantially as described.

8. In a vending-machine, a coin-slide having an open bottom with a passage beneath the same and an inclined plate, *p*, for directing the smaller coins into the cash-box, substantially as described.

9. In an automatic vending-machine, a flexible carrier having pockets, a number of studs, *d' d'*, arranged on the carrier between the pockets, a locking-lever, E, and a coin-slide in line with said lever, substantially as described.

10. An apparatus comprising a suitable inclosing-case, the two partitions forming an intermediate chamber, *n*, the cash-box in communication with the said chamber, the flexible carriers B B', their reels, locking-levers, and coin-slides upon the outer sides of said partitions, said partitions being provided with openings to the chamber *n*, and the deflectors to direct the coin from both sides to the chamber *n*, substantially as described.

11. In combination, the flexible carrier having pockets for holding the articles, the supports for said carrier, the weight for moving the carrier, a locking-lever, stop-pins to be engaged by said lever positioned at a distance apart to allow the carrier movement equal to the space between the pockets, intermediate stop-pins between those first mentioned, and a coin-slide, substantially as described.

396,297. VENDING APPARATUS. JOHN SCHOFIELD, New Haven, Conn. Filed Apr. 30, 1888. Serial No. 272,314. (No model.)

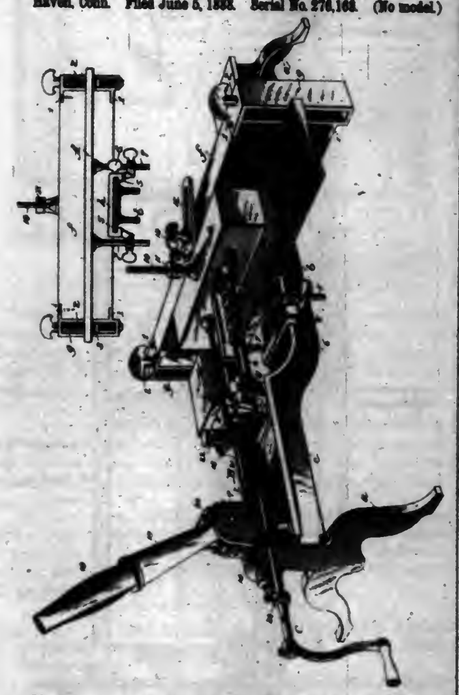
Claim.—1. In combination, in an automatic vending apparatus, a reservoir for storing the articles, a rotary carrier-wheel arranged directly below the reservoir and provided with recesses entirely around its periphery to receive the articles from the mouth of the reservoir, and a weight for giving the carrier-wheel forward movement to bring said recesses successively and separately into line with mouth of the reservoir upon the introduction of coins, substantially as described.

2. In combination, in an automatic vending apparatus, a reservoir for storing the articles, said reservoir being circuitous in form, a rotary carrier-wheel, C, arranged directly below the reservoir, provided with recesses entirely around its periphery to receive the articles from the mouth of the reservoir, and having a step-by-step movement to bring said recesses successively into position beneath the reservoir and a toothed wheel, D, the pivoted lever 3, the coin-slide, and a weight tending constantly to move the carrier, substantially as described.

3. In combination, a vertically-arranged reservoir for holding the articles, having a single continuous circuitous passage, with walls on each side of said passage situated at a distance apart, to confine the articles and direct them one after the other in proper order, and a carrier having recesses adapted in size to one of the articles, arranged directly below the mouth of the single passage, said carrier having a step-by-step movement to bring the recesses separately and successively in line with the mouth of the single passage, substantially as described.

4. In a vending-machine, a reservoir formed of two parts, one of said parts being adjustably supported to adapt the reservoir to different-sized articles, substantially as described.

5. In an automatic vending apparatus, a reservoir, a carrier beneath the same, a toothed wheel in connection with the carrier, a weight, a pivoted lever having a single catch to engage directly with the toothed wheel, a spring for pressing said catch into engagement, and a coin-slide in line with the rear end of the pivoted lever, substantially as described.



6. In an automatic vending-machine, a coin-slide having a channel adapted in size to a certain-sized coin, provided with a deflector, as 13, extending across and above the channel, whereby coins too large for the channel will be detected above the same, substantially as described.

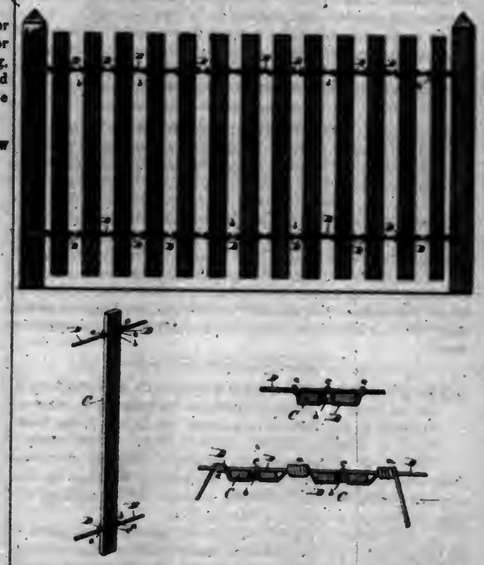
7. In an automatic vending-machine, a coin-slide formed of two parts, one of which is adjustable toward and from the other, whereby the machine may be adapted for use with different sizes of coins, substantially as described.

8. In an automatic vending apparatus, a reservoir, a carrier, a weight, a toothed wheel having adjustable teeth, and a pivoted lever having a rear extension extending beneath the coin-slide, substantially as described.

9. A vending apparatus comprising the reservoir, the carrier arranged directly beneath the same and provided with recesses for receiving the articles, a pocket to one side in the wall of the casing, an incline between said pocket and the carrier, and a spring arranged between the reservoir and the incline for applying pressure to the articles, substantially as described.

396,298. WOOD-WORKING MACHINE. JOHN SCHOFIELD, New Haven, Conn. Filed June 5, 1888. Serial No. 276,163. (No model.)

Claim.—1. In combination, the supporting-frame, the work-supporting table consisting of the cross-piece *f*, the brackets supporting a piece, A, the screws for adjusting the brackets vertically, and pins supported by the frame and arranged to bear upon the under side of the piece A, said pins also being vertically adjustable, whereby the table may be raised or lowered and supported in any position by the brackets and pins, substantially as described.



2. In combination, a tool-holder, a supporting-frame cast in one piece and in elongated form, the said tool-holder being arranged longitudinally of the frame, the said frame being adapted in width to the tool-holder and having the raised portion *c*, for supporting the tool-holder, and a lower portion, *b*, and a piece, *f*, and table extending at right angles to the elongated frame and across the lower portion, substantially as described.

3. In combination, the cross-piece *f*, supported on the frame and having the screw-rods at its ends extending vertically and having bearings at the top and bottom of the piece *f*, the piece A, the brackets secured to the said piece and extending rearwardly therefrom, and having screw-threaded nuts in engagement with the screw-rods at points intermediate of the bearings, the said parts—viz., the screw-rods and brackets—constituting the supporting means for the piece A, and also the adjusting means for the same, substantially as described.

4. In a wood-working machine, a reciprocating tool-holder, an adjustable table, A, and a supplemental work-support having an angular bearing-face and a notch for the end of the work, substantially as described.

5. In combination, the table A, supported adjustably on the cross-piece *f*, said cross-piece being adjustable longitudinally, an adjustable bracket supporting adjustable pins for the under part of the table, an adjustable arm and pin for preventing vertical displacement of the work, and horizontally-adjustable pins for preventing forward displacement, substantially as described.

396,299. FENCE. JOSEPH M. SHERIFF, Mercer, Pa. Filed Oct. 19, 1888. Serial No. 288,555. (No model.)

Claim.—The combination, with a fence rail and picket, the latter being bored or punctured horizontally, as at *b*, of a wire fastener, D, secured to the fence-rail at its ends and provided with a loop, *c*, said loop passing through the hole in the picket and embracing the fence-rail, substantially as described.

396,300. PLASTIC MINERAL COMPOSITION, &c. JOHN L. STEWART and JAMES L. HASTINGS, Philadelphia, Pa., assignors, by mesne assignments, to the Welsbach Incandescent Gas Light Company, Jersey City, N. J. Filed Sept. 25, 1885. Serial No. 178,206. (No specimens.)

Claim.—1. A composition for forming a refractory crystalline compound, consisting of magnesia oxide or carbonate, caustic strontia, calcium fluoride, feldspar, and glycerine, hydrocarbon oil, or their equivalent.

2. A refractory crystalline compound composed of magnesia oxide or carbonate, caustic strontia, calcium fluoride, and feldspar, said compound being white or opalescent, rough on the surface, and practically infusible.

396,301. PLASTIC MINERAL COMPOSITION, &c. JOHN L. STEWART and JAMES L. HASTINGS, Philadelphia, Pa., assignors, by mesne assignments, to the Welsbach Incandescent Gas Light Company, Jersey City, N. J. Filed Sept. 25, 1885. Serial No. 178,207. (No specimens.)

Claim.—1. A composition for forming a refractory crystalline compound, consisting of magnesia oxide or carbonate, caustic strontia or carbonate, alumina oxide or carbonate, calcium fluoride, (fluor-spar,) feldspar, and hydrocarbon oil, glycerine, or their equivalents.

2. A refractory crystalline compound composed of magnesia oxide or carbonate, caustic strontia or carbonate, alumina oxide or carbonate, calcium fluoride, (fluor-spar,) and feldspar, said compound being white or opalescent, rough on the surface, and practically infusible

396,302. PLASTIC MINERAL COMPOSITION, &c. JOHN L. STEWART and JAMES L. HASTINGS, Philadelphia, Pa., assignors, by mesne assignments, to the Welsbach Incandescent Gas Light Company, Jersey City, N. J. Filed Sept. 26, 1885. Serial No. 178,308. (No specimens.)

Claim.—1. A composition for forming a refractory crystalline compound, consisting of calcium oxide or carbonate, magnesia oxide or carbonate, caustic strontia or carbonate, alumina oxide or carbonate, calcium fluoride, (fluor-spar,) feldspar, and hydrocarbon oil, or its equivalent.

2. A refractory crystalline compound composed of calcium oxide or carbonate, magnesia oxide or carbonate, caustic strontia or carbonate, calcium fluoride, (fluor-spar,) and feldspar, said compound being white or opalescent, rough on the surface, and practically infusible.

396,303. PLASTIC MINERAL COMPOSITION, &c. JOHN L. STEWART and JAMES L. HASTINGS, Philadelphia, Pa., assignors, by mesne assignments, to the Welsbach Incandescent Gas Light Company, Jersey City, N. J. Filed Oct. 31, 1885. Serial No. 181,473. (No specimens.)

Claim.—1. A composition for forming a refractory crystalline compound, consisting of calcium oxide or carbonate, magnesia oxide or carbonate, strontia oxide or carbonate, alumina oxide or carbonate, cryolite, and glycerine, hydrocarbon oil, or their equivalent.

2. A refractory crystalline compound composed of calcium oxide or carbonate, magnesia oxide or carbonate, strontia oxide or carbonate, alumina oxide or carbonate, and cryolite, said compound being white or opalescent, rough on the surface, and practically infusible.

396,304. PLASTIC MINERAL COMPOSITION, &c. JOHN L. STEWART and JAMES L. HASTINGS, Philadelphia, Pa., assignors, by mesne assignments, to the Welsbach Incandescent Gas Light Company, Jersey City, N. J. Filed Oct. 31, 1885. Serial No. 181,474. (No specimens.)

Claim.—1. A composition for forming a refractory crystalline compound, consisting of calcium oxide or carbonate, magnesia oxide or carbonate, strontia oxide, strontia carbonate, feldspar, aluminite or ammonia alum, and a suitable fluid to make the composition plastic.

2. A refractory crystalline compound composed of calcium oxide or carbonate, magnesia oxide or carbonate, strontia oxide, strontia carbonate and feldspar, and aluminite or ammonia alum, said compound being white or opalescent, rough on the surface, and practically infusible.

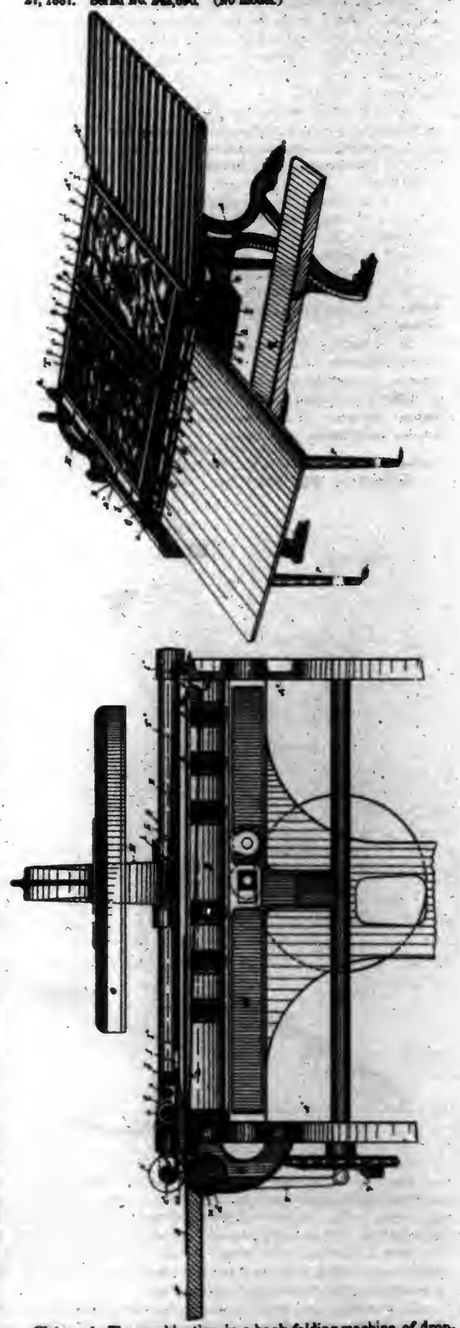
396,305. PLASTIC MINERAL COMPOSITION, &c. JOHN L. STEWART and JAMES L. HASTINGS, Philadelphia, Pa., assignors, by mesne assignments, to the Welsbach Incandescent Gas Light Company, Jersey City, N. J. Filed Nov. 12, 1885. Serial No. 182,611. (No specimens.)

Claim.—1. A composition for forming a refractory crystalline compound, consisting of arragonite or the caustic lime from arragonite, magnesia oxide, celestine or strontia sulphate, barium sulphate, calcium fluoride, and a suitable moistening-fluid.

2. A refractory crystalline compound composed of arragonite or the caustic lime from arragonite, magnesia oxide, celestine or strontia sulphate, barium sulphate, and calcium fluoride, said compound being white or opalescent, rough on the surface, and practically infusible.

396,306. PLASTIC MINERAL COMPOSITION, &c. JOHN L. STEWART and JAMES L. HASTINGS, Philadelphia, Pa., assignors, by mesne assignments, to the Welsbach Incandescent Gas Light Company, Jersey City, N. J. Filed Nov. 12, 1885. Serial No. 182,612. (No specimens.)

Claim.—1. A composition for forming a refractory compound, consisting of celestine or strontia sulphate, magnesia carbonate, silica or silicic acid, carbonates of soda and potassa, and a suitable moistening-fluid.



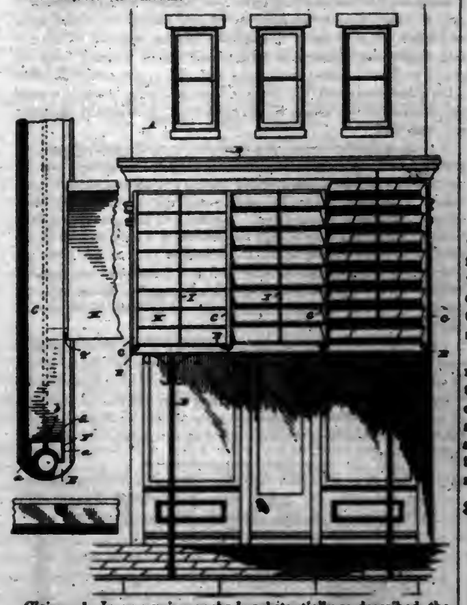
2. A refractory crystalline compound composed of celestine or strontia sulphate, magnesia carbonate, silica or silicic acid, and carbonates of soda and potassa, said compound being white or opalescent, rough on the surface, and practically infusible.

396,307. PLASTIC MINERAL COMPOSITION, &c. JOHN L. STEWART and JAMES L. HASTINGS, Philadelphia, Pa., assignors, by mesne assignments, to the Welsbach Incandescent Gas Light Company, Jersey City, N. J. Filed Dec. 26, 1885. Serial No. 187,000. (No specimens.)

Claim.—1. A composition for forming a refractory compound consisting of magnesia oxide or carbonate, strontia oxide, strontia carbonate, strontia sulphate, calcium oxide or carbonate, glucinium oxide or carbonate with or without zirconium oxide, fluor-spar as a flux, and a suitable moistening-fluid.

2. A refractory crystalline compound composed of magnesia oxide or carbonate, strontia oxide, strontia carbonate, strontia sulphate, calcium oxide or carbonate, glucinium oxide or carbonate with or without zirconium oxide, and fluor-spar as a flux, said compound being white or opalescent, rough on the surface, and practically infusible.

396,308. COMBINED POINT-FEED AND DROP-ROLL-FEED BOOK-FOLDING MACHINE. JOHN H. STONEBRAKER, Millbury, Mass., assignor to the Stonemetz Printer's Machinery Company, same place. Filed June 27, 1887. Serial No. 242,690. (No model.)



Claim.—1. The combination, in a book-folding machine, of drop-roll-feed and carrier-tape mechanism with point-feed mechanism in the tables thereof, by means whereof two sheets fed from different feed-tables at the same time can be folded together, substantially as set forth.

2. The combination, in a book-folding machine, of drop-roll-feed and carrier-tape mechanism for feeding and conveying sheets from a feed-table at one side of the machine to the first folding-rolls, with removable tables on said machine, having point-feed mechanism thereon arranged to feed from a feed-table at the end of the machine, whereby said machine is adapted to operate either as a drop-roll-feed machine or as a point-feed machine, as desired, substantially as set forth.

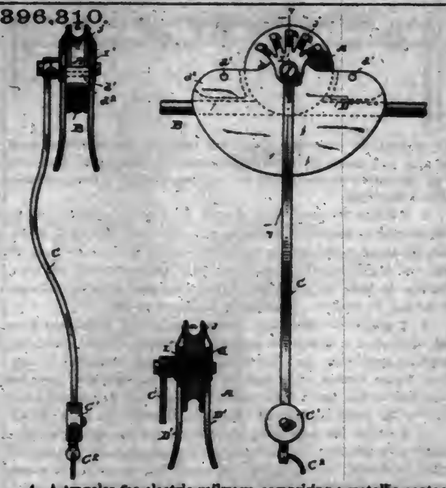
3. The combination, in a book-folding machine, of the feed-table N, the drop-roll-feed mechanism *d d' d' y y'*, the guides v^2 v^3, and the feed-roll *d*, and the carrier-tapes *n*, and sheet-stop *s*, with the feed-table M, the machine-tables T T', having points *l* therein, the folding-blade *e*, and the folding-rolls B B, substantially as and for the purpose set forth.

396,309. AWNING. FRANK TRIPP, Louisville, Ky. Filed Feb. 18, 1887. Renewed Jan. 23, 1888. Again renewed Dec. 22, 1888. Serial No. 293,863. (No model.)

Claim.—1. In an awning or shade substantially as described, the combination, with forwardly-extending supports having seats for slats, of overlapping slats pivotally seated therein, and a trough arranged beneath the said supports and the transverse edges of the slats and adapted to receive the drip-water and conduct the same away from a building, substantially as specified.

2. In an awning, the combination of the forwardly-extending metallic boxes having their lateral vertical walls provided with notched seats, the slats having their journals bearing in said seats, the central longitudinal division-wall therein, and the removable cap, substantially as specified.

3. In an awning, the combination, with the forwardly-extending pipes, of the metallic boxes having their bottoms circularly recessed to receive the said pipes longitudinally therein and their lateral walls notched, and the slats bearing in said notches, substantially as and for the purposes specified.



396,310. TRAVELER FOR ELECTRIC RAILWAYS. CHARLES J. VAN DEPOELE, Chicago, Ill. Filed June 6, 1888. Serial No. 276,267. (No model.)

Claim.—1. A traveler for electric railways, comprising a metallic contact wheel or wheels arranged to travel upon the conductor, a metallic frame inclosing the wheel or wheels, and contact devices electrically connecting the exterior of the wheel or wheels and the frame, substantially as described.

2. A traveler for electric-railway conductors, comprising a contact wheel or wheels adapted to move upon the conductor, a metallic frame inclosing the contact-wheels, contact devices electrically connecting the exterior of said contact-wheels and the said frame, and a downwardly-extending electrical connection, substantially as described.

3. A traveler for electric-railway conductors, comprising metallic contact wheel or wheels moving upon the conductor, and a downwardly-depending pendulum in electrical connection with the exterior of said contact-wheel, and provided with a weight at its lower extremity for retaining the contact devices in substantially perpendicular position, substantially as described.

396,310.

4. A traveler for electric railways, comprising a metallic contact wheel or wheels arranged to move upon the conductor, a metallic frame inclosing the contact wheel or wheels and extending downwardly below the periphery thereof on each side, contact devices electrically connecting the wheels and frame, and a downwardly-extending arm or pendulum provided with an adjustable weight at or near its lower extremity, substantially as described.

5. A traveler for electric-railway conductors, comprising one or more contact-wheels, an inclosing-frame extending downwardly below the contact wheel or wheels, and a metallic arm or pendulum pivotally connected to and extending downwardly from the contact device, and adapted to maintain the same in a substantially perpendicular position and to swing forward or backward without affecting the relation between the contact wheel or wheels and the conductor, substantially as described.

396,311. HOOKED SUSPENDER FOR ELECTRIC-RAILWAY CONDUCTORS. CHARLES J. VAN DEPOELE, Lynn, Mass. Filed Nov. 7, 1888. Serial No. 290,176. (No model.)

Claim.—1. A suspending device for electric conductors, consisting of a metallic hook having a downwardly-extended part adapted for attachment to a conductor to be supported and a laterally-extending supporting wire or cable connected to the hook, substantially as described.

2. The combination, with a suitable conductor, of a suspending device therefor, comprising a metallic hook provided with a downwardly-extending part adapted to engage and be attached to the conductor to be supported, and an arched portion extending laterally therefrom and downward into the plane of its support, and a laterally-extending supporting wire or cable connected to the hook, substantially as described.

3. In combination with a suitable conductor and a supporting-ear attached thereto, a suspender device therefor, consisting of a metallic hook having a downwardly-extending part adapted for attachment to said ear, substantially as described.

4. In combination with a suitable conductor and a supporting-ear attached thereto, a suspending device therefor, consisting of a metallic hook having a downwardly-extending part detachably secured to said ear, substantially as described.

5. In combination with a suitable conductor and a supporting ear or ears attached thereto, a suspending device therefor, consisting of a metallic hook having a downwardly and laterally extending part connected to said ear or ears, substantially as described.

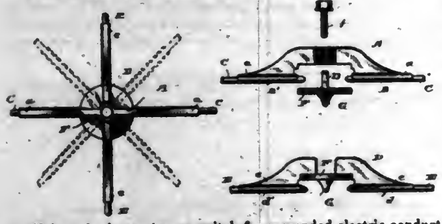
396,312. SUSPENSION DEVICE FOR ELECTRIC-RAILWAY CONDUCTORS. CHARLES J. VAN DEPOELE, Lynn, Mass. Filed Nov. 7, 1888. Serial No. 290,177. (No model.)

Claim.—1. A device for suspending electric conductors, consisting of an arch secured to a transverse support or supports, and an ear or bail connected to the conductor to be suspended and adjustably secured to the arch, substantially as described.

2. A device for suspending electric conductors, consisting of an

396,312.

arch secured to transverse supports, and an ear or bail depending from said arch and connected to the conductor to be suspended, said arch being adjustably secured to the ear and insulated therefrom, substantially as described.



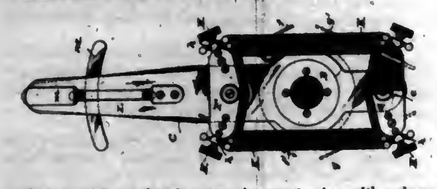
3. A device for suspending electric conductors, consisting of an arch secured to transverse supports, an ear or bail depending therefrom, the upper end of said ear forming a bearing upon which the arch rests, and a bolt secured to said ear and passing through the arch, whereby the same may be adjusted, and insulating material between the ear and its support, substantially as described.

4. A device for suspending electric conductors, consisting of an arch secured to a transverse support or supports, an ear depending therefrom supporting the electric conductor, said ear having a horizontal flange formed at or near its upper part upon which the arch is adapted to rest, and a bolt passing through said flange and arch, whereby the same is rendered adjustable, substantially as described.

5. A device for suspending electric conductors, consisting of a metallic arch spanning the conductors to be supported, an ear attached to said conductor, insulating material secured to the arch, and means securing the conductor-supporting ears to the said insulating material, substantially as described.

6. A device for supporting electric conductors, consisting of an arch supported so as to present its opening below, an ear secured to the conductor to be carried, means for connecting the ear and arch, and an insulating medium interposed between the ear and the arch to prevent the passage of the main current to the supporting devices, substantially as described.

396,313. ADJUSTABLE CROSSING AND SWITCH FOR OVERHEAD CONDUCTORS. CHARLES J. VAN DEPOELE, Lynn, Mass. Filed Nov. 14, 1888. Serial No. 290,832. (No model.)



Claim.—1. A crossing or switch for suspended electric conductors, comprising two or more adjustably-connected members adapted for attachment to the respective conductors, substantially as described.

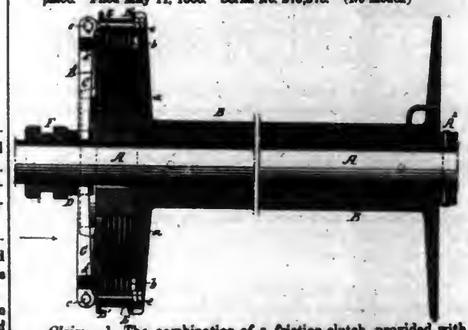
2. A crossing or switch for suspended electric conductors, comprising two or more adjustably-connected members and electric conductors secured to the said members, substantially as described.

3. A crossing or switch for electric conductors, comprising a contact or surface, members connected in adjustable relation thereto and extending from the surface, and ribs or extensions upon the members to which the conductors are attached, substantially as described.

4. An adjustable switch for electric conductors, comprising two or more adjustably-connected members, each adapted to receive and be attached to a terminal of the conductor, and each provided with a depending rib to guide the contact-wheel, and a pivot uniting the members, substantially as described.

396,314. COMMUTATOR-BRUSH CARRIER FOR ELECTRIC MOTORS. CHARLES J. VAN DEPOELE, Lynn, Mass. Filed Feb. 8, 1887. Renewed Nov. 24, 1888. Serial No. 291,801. (No model.)

Claim.—1. In an electric motor, the combination, with a circumferentially-movable lever, insulated commutator-brush-carrying frames pivotally mounted with respect to said lever, insulated connections extending between the pivoted frames for moving both simultaneously, and a double set of commutator-brushes secured in said frames and adapted to be interchangeably brought into operative relation with the commutator-cylinder by the movement of either one of said frames, and to be moved about the commutator, as desired, by the movement of the hand-lever, substantially as described.



2. In an electric motor, the combination, with a circumferentially-movable lever, insulated commutator-brush-carrying frames pivotally mounted with respect to said lever, insulated connections extending between the pivoted frames for moving both simultaneously, a double set of commutator-brushes secured in said frames, and an adjusting-lever connected to one of said frames and arranged to be adjustably secured with respect to the pivoted lever, whereby said brushes may be interchanged upon any desired portion of the commutator-cylinder, substantially as described.

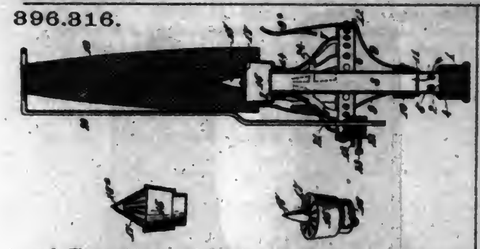
3. In an electric motor, the combination, with a fixed support, of a commutator-brush-carrying hand-lever radially movable thereon, a pair of commutator-brush-carrying frames pivotally mounted upon said lever, a double set of commutator-brushes secured to each of said frames, and connections between said frames, whereby when one set of brushes is placed in contact with the commutator the other set is lifted therefrom, the brushes when set being movable around the commutator by means of the hand-lever, substantially as shown and described.

4. In an electric motor, the combination of the hand-lever C, radially movable upon the bearing B and around the armature-shaft, the pivoted commutator-brush-carrying frames F G, secured to said lever, links K, extending between the said pivoted frames, an auxiliary hand-lever, L, extending upward from the frame G and provided with a latch-spring arranged to engage the notches of a rack carried by the bar C, whereby when the handle L is moved to right or left of the bar C the brush-carrying frames will be rocked and the set of commutator-brushes controlling the desired direction of rotation be brought into operative position upon the commutator, substantially as shown and described.

5. In an electric motor, the combination of the lever C, pivoted upon one of the main bearings thereon and provided with the rack M, of the pivoted frames F G, secured to the lever C on opposite sides of said support, binding-posts I, extending from said frames, and links K, extending between the opposite sides of the binding-posts, and thereby mechanically connecting said frames, substantially as shown and described.

396,315. FRICTION-CLUTCH. THOMAS A. WESTON, Stamford, Conn., assignor to The Yale & Towne Manufacturing Company, same place. Filed May 11, 1888. Serial No. 273,570. (No model.)

Claim.—1. The combination of a friction-clutch, provided with disk-formed friction-faces, with two or more pressing-levers, each fulcrumed at the pulley-rim, and thence extending toward the pulley-axis, and a sliding collar embracing the free ends of all of said levers, substantially as set forth.



2. The combination, in a friction-clutch, of the pulley or drum, the friction-disks, the presser-plate, a series of radiating levers fulcrumed at their outer ends to the pulley or drum, and each having a projection adapted to bear against the presser-plate, and a central sliding collar adapted to act upon the converging ends of the levers, substantially as set forth.

3. The combination, in a disk friction-clutch, of the series of radiating levers, the central sliding collar acting upon the converging ends of the said levers, and a pulley or drum carrying adjustable fulcrums for the levers, substantially as set forth.

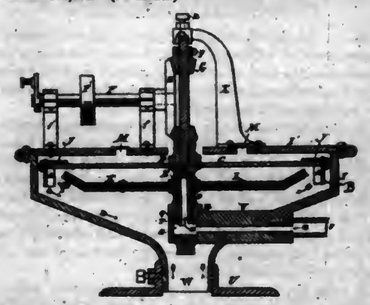
396,316. INCANDESCENT GAS-BURNER. FREDERICK DE L. WILLIAMS, London, England, assignor to the Welsbach Incandescent Gas Light Company, Jersey City, N. J. Filed Mar. 31, 1888. Serial No. 269,173. (No model.)

Claim.—1. The combination, with a gas-burner, of a chimney-gallery having converging ribs 7, connected by a horizontal rib, 24, substantially as described.

396,316.

2. The combination of a gas-burner, a mantle or hood for incandescent illumination, a chimney-gallery supported on the upper end of the burner-tube, and a cap supported on the gallery above said burner-tube and provided at its top with a conical grating, substantially as described.

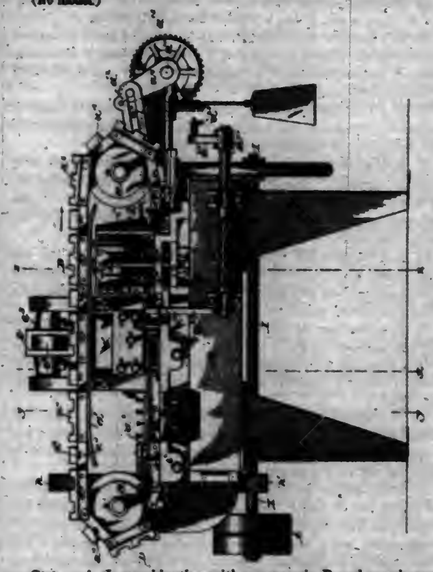
396,317. VEHICLE-SPRING. JOHN A. WITNER, Wabarun, Ind. Filed Nov. 5, 1888. Serial No. 290,313. (No model.)



Claim.—1. In combination with a side-bar vehicle, the springs D, coiled centrally and provided with forwardly-projecting arms which are attached to the under side of the body and to the side bars, so that the arms will extend in the line of draft, substantially as shown, and for the purpose set forth.

2. The combination, in a side-bar vehicle, of the springs D, having a curved upper arm, *d*, coils *c*, and a straight lower arm, *d'*, with a horizontally-bent end, *f*, said arms diverging from the coils, substantially as shown.

3. The combination, in a side-bar vehicle, of the coiled springs D D D D, having forwardly-projecting and laterally-diverging arms attached to the under side of the vehicle-body and to the under side of the side bars, the coils of said springs being located rear of the points of attachment to the body and side bars, substantially as shown, and for the purpose set forth.



396,318. WATER-MOTOR. HARVEY R. WOLFE, Louisville, Ky., assignor of one-half to John R. Bascom, same place. Filed June 13, 1888. Serial No. 277,001. (No model.)

Claim.—1. In a water-motor having two concentric wheels, the combination, with the frame I, having the top I', of the bracket X, the set-screw *x*, the vertical shaft N, the boss O on the wing V, the bevel-pinion G, and the set-screw *g*, substantially as set forth, and for the purpose specified.

2. In a water-motor, the combination, with the case I, having a removable top, I', provided with holes M, and a wing, V, provided with a boss, O, of an inlet-opening, *v*, through the wing V, a recess or bore, S, in the wing under the boss O, a screw-plug, T, a vertical shaft, N, hollow in its lower part, a piston-head, P, a turbine wheel having its conduit-arms provided with stop-cocks L and inclined upward at their extremities, a modified overshot wheel having floats A and shrouding J, a bevel-pinion, D, a bevel-wheel, H, and a bevel-pinion, G, having a set-screw, *g*, substantially as set forth, and for the purpose specified.

396,319. MACHINE FOR BENDING HINGE-BLANKS. MCCLINTOCK YOUNG, Frederick, Md. Filed Nov. 15, 1888. Serial No. 290,942. (No model.)

Claim.—1. In combination with a reservoir, B, and a reciprocating feed-slide at its base, the upwardly-yielding detent c^6, overlying the slide at the delivery side of the reservoir, whereby the outgoing blank is prevented from carrying those above.

2. In a machine for bending hinge-blanks, the reservoir comprising the wall c^{11}, the laterally-adjustable walls c^{10}, and the adjustable uprights c^{10}.

3. In a machine for bending hinge-blanks, the reservoir, a reciprocating feed-slide at its base, an actuating-slide, *c*, the arm c^3, connected to the slide *c*, a cam, c^2, to move the feed-slide rearward, and a spring, c^4, to move the slide forward.

4. In a machine for bending hinge-blanks, the reservoir having two chambers and laterally-adjustable walls, in combination with a slide, *c*, the mechanism for reciprocating said slide a constant distance, and the feed-slides C, connected to the slide *c*, and adjustable both longitudinally and laterally thereon, whereby the mechanism is adapted to receive and deliver blanks of different shapes and sizes.

5. In a machine for bending hinge-blanks, as a means of carrying the blanks, a bed or table in combination with an endless chain traveling thereover and provided in its edge with recesses to receive the blanks.

6. In combination with the endless chain having notches or recesses to receive the blanks, the reservoir, and a feed-slide moving at right angles to the chain, whereby the blanks are transferred from the reservoir to the chain.

7. In combination with the reservoir, a reciprocating feed-slide, an endless notched chain lying at right angles to the path of the feed-slide, and an operating mechanism, substantially as described, for advancing the slide and the chain alternately.

8. In a machine for bending hinge-blanks, the carrier-chain provided with reversible plates d^4, notched in their two edges, whereby the chain may be adapted to carry blanks of different forms.

9. In combination with the carrier-chain, the transverse locking-bolt d^{17}, adapted to engage said chain.

10. The notched endless carrier-chain and the locking-bolt d^{17}, in combination with operating devices adjusted to advance the bolt and the chain alternately.

11. The endless carrier-chain, in combination with the slide d^9, the chain-actuating dog attached thereto, the weighted cord to advance the slide and dog, the slotted pitman d^{10}, and the crank d^{16}, whereby the chain is advanced with an intermitting movement.

12. In combination with the notched carrier-chain and the reciprocating pawl for advancing the same, the chain-locking bolt d^{17}, the spring to advance the same, the cam d^{16}, and the intermediate connections for retracting the bolt, whereby the chain is advanced intermittingly and locked during its periods of rest.

13. The combination, in a machine for bending hinge-blanks, of a bed or support for the blank, a clamp to confine the blank thereon, with its edge exposed, and a concave die, *f*, arranged to act upon the

exposed edge of the blank, whereby the blank is given a primary curvature.

14. The combination, with an anvil or support, c^3, of a clamping-slide, c', a concave die, f, and a pivoted die-carrying lever, f'.

15. In a machine for bending hinge-blanks, the anvil or support for the blank, the slide c, provided with a clamping-face, c', its actuating-lever c^6, the concave die f, its supporting-lever f', and the shaft H, provided with the cams c^4 and f^4.

16. In a machine for bending hinge-blanks, the combination of a fixed anvil or support, and a movable die, g, having a concave surface to act upon the exposed edge of the blank.

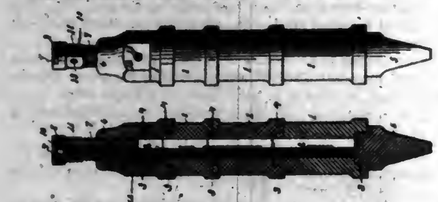
17. In a machine for bending hinge-blanks, the combination of an anvil or support, c^3, adapted to sustain a blank with its edge exposed beyond the anvil, the die g, having the concave face to act upon the exposed edge of the blank, the die-supporting slide g', and the eccentric and pitman for moving said slide.

18. In a machine for bending hinge-blanks, the anvil c^3, to sustain the blank, the concave die g, its supporting-slide g', the eccentric g^5, the pitman g^6, and adjustable connections, substantially as shown, between the pitman and slide.

19. In a machine for bending hinge-blanks, the combination of an anvil to support the flat blank, and a bending-die, g, having a concave face arranged to reciprocate in a line parallel with the faces of the blank, whereby the die is adapted to act directly against the edge of the blank.

20. In a machine for bending hinge-blanks, the combination, substantially as described, of a bed or table, an endless carrier-chain, and two bending mechanisms arranged adjacent to the chain in position to act successively on the blanks carried thereby.

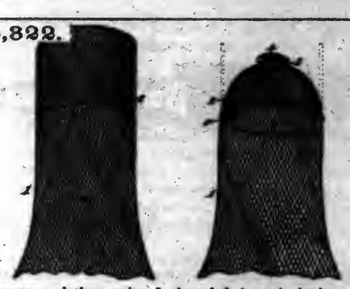
21. In a machine for bending hinge-blanks, the combination of a reservoir for the blanks, a feed-mechanism to deliver the blanks successively therefrom, a primary bending mechanism, a secondary bending mechanism, and a carrier-chain extended past the reservoir, and the two bending mechanisms, whereby the blanks are delivered from the reservoir to the chain and presented by the latter to the action of the two bending mechanisms successively.



396,320. SASH-FASTENER. GEORGE H. AYLWORTH, Brighton, Ill. Filed July 30, 1888. Serial No. 280,551. (No model.)

Claim.—1. In a sash-lock, the combination of a case having in its bottom a curved guide slot or groove, and a curved bolt having at its inner end a pin which projects into said guide-slot and governs the movement of the inner end of the bolt when the latter is projected.

2. In a sash-lock, the combination, with the case having in its bottom a curved guide slot or groove, a^3, of a curved bolt, B, having at its inner end a pin which projects into said guide-slot, and a spring, C, for projecting the bolt, substantially as shown and described.

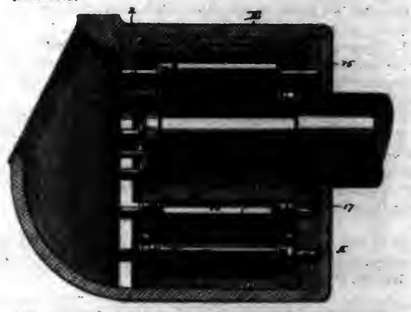


396,321. SECTIONAL JACK. JOSEPH H. BAIRD, Oakville, Conn. Filed June 2, 1888. Serial No. 275,882. (No model.)

Claim.—As a new manufacture, a lifting-jack comprising interchangeable sections of varying lengths, each section having a socket and hub, as shown, and a top section adapted to engage any section of the series and provided with a lifting-screw of ordinary construction.

396,322. GAS-INCANDESCENT. HAROLD J. BELL, Gloucester City, assignor to the Welsbach Incandescent Gas Light Company, Jersey City, N. J. Filed July 2, 1888. Serial No. 278,736. (No model.)

Claim.—The combination, with a mantle or tubular incandescent device having a turned-in or re-enforced upper portion, of a platinum gathering-wire, 3, threaded through the upper part of the re-



enforcement, a platinum wire, 5, threaded through the lower part of said re-enforcement in a circular direction, a number of doubled and diverging platinum suspending-wires, 6, attached at equidistant points to and around the circularly-arranged wire 5, and a circular support for said suspending-wires, substantially as described.

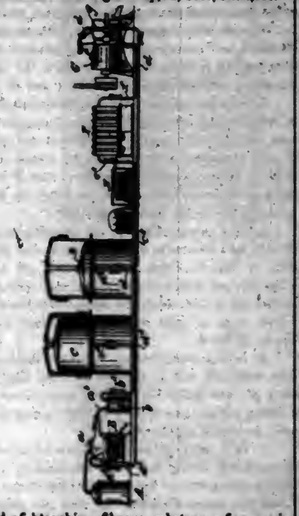
396,323. FASTENING FOR WHIP-SOCKETS. FRANCIS R. BENTON, Stoughton, Mass. Filed May 22, 1888. Serial No. 274,635. (No model.)

Claim.—A whip-socket fastener made of a strip of spring metal with one end turned back and riveted at b, the nut-block C, and the screws D E, holes for said screws being made at b' b^2 b^3 in the metallic strip, as and for the purpose described.

396,324. ROLLER-BEARING FOR CAR-AXLES. WILLIAM J. BREWER, London, England. Filed Mar. 13, 1888. Serial No. 267,065. (No model.)

Claim.—1. In roller-bearings for journals, the combination, with a connected series of rollers addpted to contact with only a portion of the journal at one time, of a stripping guide or guides for directing the series of rollers away from the journal after they have passed their effective bearing-point, substantially as described.

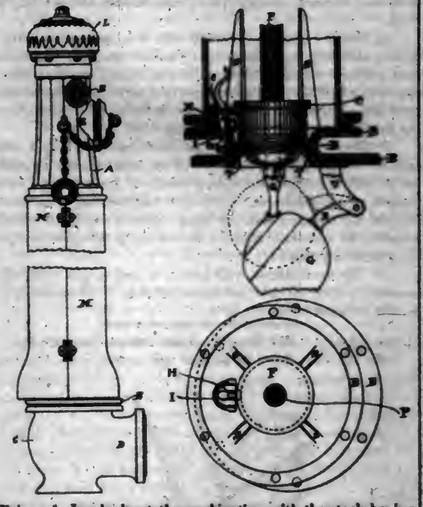
2. In roller-bearings for journals, the combination, with a connected series of rollers adapted to contact with only a portion of the journal at one time, of a stripping guide or guides for directing the series of rollers away from the journal after they have passed their effective bearing-point, and an idle-roll, 13, substantially as described.



3. The combination, with a journal, a series of rollers, 10, and links 12, connecting said rollers in an endless series and affording a bearing for said journal, of a bushing, 9, connecting the ends of two adjacent links together, substantially as described.

4. In roller-bearings for journals, the combination, with a connected series of rollers adapted to contact with only a portion of the journal at one time, of a fixed rest, G, to take the vertical thrust of the axle-box and provided with a recess for an absorbent of the lubricant, substantially as described.

5. In roller-bearings for journals, the combination, with a connected series of rollers adapted to contact with only a portion of the journal at one time, of a bearing-shell, E, interposed between the rollers and the wall of the box, and a stripping guide or guides for directing the series of rollers away from the journal after they have passed the effective bearing-points between said journal and the shell, substantially as described.



6. In roller-bearings for journals, the combination, with a connected series of rollers adapted to contact with the journal and having projecting journals 11, of a bearing-shell, E, provided with flanges 15 for contact with the journals of the rollers, substantially as described.

396,325. METHOD OF BLEACHING FIBROUS SUBSTANCES. ARTHUR BERK, 89 Brompton Crescent, County of Middlesex, England, and LÉON G. BERK, Paris, France. Filed Aug. 16, 1887. Serial No. 247,074. (No model.) Patented in England Apr. 2, 1887, No. 4,982.

Claim.—The method of bleaching fibrous substances for use in paper-making by, first, forming a mixture of oxygen and chlorine gases; second, subjecting said gases to the action of electricity, and, third, subjecting the fibrous substances to the action of such gases, substantially as described.

396,326. HYDRANT. CHARLES CARR, Boston, Mass. Filed May 22, 1886. Serial No. 203,046. (No model.)

Claim.—1. In a hydrant, the combination, with the stock having a flange at its bottom, of the base having a flange at its top, and the intermediate casting, B, having a central valve-opening, and guides for the main valve projecting from its upper surface, and having a flange at its top adapted to receive the stock, and of sufficient width on top to form a base for the waste-valve seat within the stock, and a flange at its bottom for bolting it to the hydrant-base, the waste-valve seat, waste-valve, and main valve, substantially as described.

2. In a hydrant, the combination, with the stock and base, of the intermediate main-valve seat having a flange at its top adapted to support the stock and a flange at the bottom for bolting it to the base, said flange at the top being provided with a vertical waste-valve orifice and the main and waste valves, substantially as described.

3. In a hydrant, the combination, with the stock and base, of the intermediate valve-seat, B, having a central main-valve opening and a supplementary-float-valve opening, waste-valve opening, and provided with upper and lower flanges to receive the stock and base and with upwardly-projecting main-valve guides and depending hangers, a supplementary float-valve hinged in said hangers, a main valve, and a waste-valve, substantially as described.

4. The combination of a main flanged plug-valve, an adjustable waste-valve, the described supplementary float-valve, and intermediate valve-frame, B, constructed with vertically-projecting main-valve guides and attached supplementary-valve hangers, and upper flange forming a base for a waste-valve, the main-valve guides, and the stock, substantially as described.

5. In a hydrant, the combination of the stock having a lower flange, an intermediate valve-frame having a corresponding upper flange, and a lower flange eccentric thereto, valve-opening concentric with the upper flange, and the main and hinged supplementary valves and base, substantially as described.

6. In a hydrant, the combination, with the stock and base, of an intermediate valve-frame constructed with upper and lower flanges adapted to be bolted to said stock and base, respectively, and with upwardly-projecting main-valve guides, and with vertical waste-orifice in the upper flange discharging upon the lower flange, and the main and waste valves, substantially as described.

7. In a hydrant, the combination, with a stock having a flange at its bottom, of a base having a flange at its top, the intermediate valve-frame having upper and lower flanges corresponding to said flanges on the stock and base and having suitable valve seats and guides, a stop for the waste-valve, the main valve, the waste-valve, and the supplementary valve hinged to the valve-frame, substantially as described.

8. The combination, in a hydrant, of the stock, the shouldered screw N, connected to the valve to operate it, the loose stop-collar g thereon above the shoulder, the valve F and stem F, and stop-cap L, secured to the stock and surrounding the screw above the collar, substantially as described.

9. In a hydrant, a waste-valve having an adjustable tilting arm attached to the valve by a friction-clutch joint, substantially as described.

10. In a hydrant, the combination of a tilting waste-valve operated within a cage and clamped to a journaled wrist having an operating-arm by means of a screw friction-clamp, the cage-arm, and main valve, substantially as described.

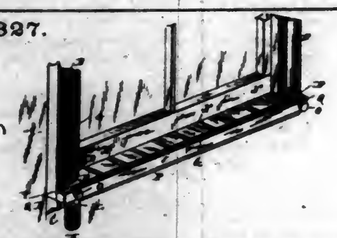
11. In a hydrant, the combination of the main-valve guiding-rim and standing guides, the tilting waste-valve, having an arm operated by said rim to open the waste-valve and adjust said arm relatively to the wearing down of the main valve, and also upon and in relation to the waste-valve, and another arm operated also by said rim to readjust the other arm when the main valve is taken out, and the main valve, said adjustment of arms being effected by means of a friction-clamp, substantially as described.

12. In a hydrant, the combination of two arms rigidly fixed to each other, but adjustable upon and in relation to the waste-valve, the waste-valve, main valve, guides, and guiding-rim, substantially as described.

13. In a hydrant, the combination of a tilting waste-valve having an operating-arm connected thereto by a friction-clamp, and a stop with a waste-valve seat provided with a stop arranged to engage the stop on the waste-valve, and a main valve having a portion which engages the operating-arm of the waste-valve, substantially as described.

14. The combination of a valve-seat cast with upwardly-projecting fingers on one side and journal-bearings on the other, and the valve hinged in the journal-bearings, and a stop to prevent its tilting above the fingers, substantially as described.

15. The combination, in a hydrant, of the double-flanged valve-frame bearing a waste-valve seat, main-valve seat, hinged float-valve seat, and main-valve guides, the stock seated thereon, said seats, their valves, guides, and the base, substantially as described.



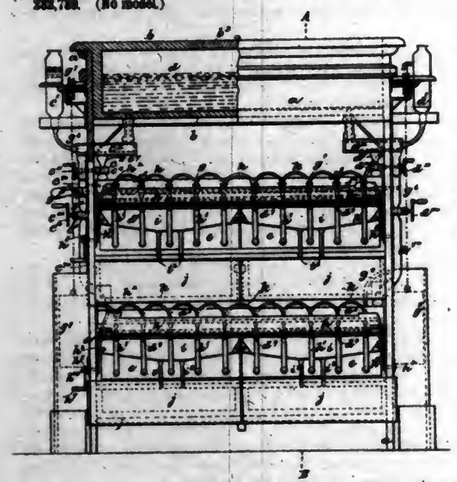
16. In a hydrant, the combination of the eccentrically-flanged valve-frame having the attached curved hanger beneath, said curved hanger, the base upon which it rests, and the stock which rests upon it, and the swinging supplementary valve hinged to said hanger, substantially as described.

17. In a hydrant, the combination of the double-collar-headed screw N, the sleeve O, inclosing said double-collared head, and having the extension-rod connected to the valve, said rod, the nut, and main valve, substantially as described.

396,327. PROTECTOR FOR CARPETS, CURTAINS, &c. JULIAN A. CRANE, Vining, Kans. Filed Mar. 19, 1888. Serial No. 267,724. (No model.)

Claim.—A protector for carpets, curtains, and like articles, adapted to be secured to the lower portion of a window-frame, consisting of a board formed with a longitudinal groove communicating with an aperture, and with short grooves intersecting the longitudinal groove at right angles, in combination with a can or receptacle, a hollow ex-

896,827.



teriorly-screw-threaded tenon open at its lower end and provided with a flange or collar at its upper end, by means of which it is secured by screws or other suitable fastening devices to the under side of the board and registering with the said aperture, and an interiorly-screw-threaded socket secured upon the top of the can or receptacle and encircling the aperture therein, substantially as set forth.

896,828. QUILTING-FRAME FOR SEWING-MACHINES. HENRY T. DAVIS, New York, N. Y. Filed Sept. 26, 1887. Serial No. 250,737. (No model.)

Claim.—The combination, with the bearing-rail composed of sections 3 4, of the wedge-shaped bearing-bar, the bolt 8, passing through one section of said rail and the bar, the screws 6, passing through the bar and into the other section of rail, clamps 9, secured to the ends of said bar, and the bolts 7, passing through the bar and rail and said clamps, as set forth.

896,829. GALVANIC BATTERY. PAUL R. DE F. D'HUMY, Clapham Rise, County of Surrey, England. Filed Aug. 15, 1888. Serial No. 282,789. (No model.)

Claim.—1. In a galvanic battery, the frame *a*, cistern *b*, divided into two compartments, *a d*, provided with gages or levels *c' d'*, a series of cells, c^3 d^3, formed with openings c^4 d^4, leading into compartments c^5 d^5 of a receiver, c^6 d^6, having overflow-notches c^{100} d^{100}, corresponding with grooves or channels i^3 of a lip or ledge, i', discharging into a trough, *i*, furnished with conducting-pipes i^5, leading into removable trays *j*, the means for filling the cells, consisting of conduits c^8 d^8, c^9 d^7, c^{10} d^{10}, and c^{11} d^{11}, compressors c^{10} c^{100} d^{10} d^{100}, for cutting off or admitting the supply of liquid to the cells, the means for emptying the cells, consisting of pipes *k'*, leading from the cells to a conduit, *k*, carried by an arm, k^2, and capable of being raised and lowered by means of a crank-handle, k^7, and retained in its raised position by means of a pawl, k^8, and ratchet-wheel k^9, or their equivalent, the means for counterbalancing and raising and lowering the metal electrodes *g*, consisting of shaft g^3, upon which the metal electrodes *g* are fixed, levers g^4, fixed upon shaft g^3, rod g^5, fixed to covers g^{10}, to which the electrodes *g* are bolted, connecting-link g^{11}, for coupling the two series of metal electrodes of two groups of cells so that they shall move in unison, and counterbalance-weights g^6, connected by cords or chains g^7 to the levers g^4, all arranged and operating in manner substantially as hereinbefore shown and described, as and for the purpose stated.

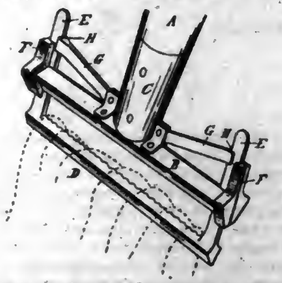
2. In a galvanic battery, the combination, with a suitable frame or support, of a cistern divided into two compartments, a series of cells beneath the cistern comprising two elements, each with separate compartments, receivers arranged on opposite sides of the cells and having compartments corresponding and communicating with the compartments in the cells, communication between the compartments of the cistern and the respective receivers, and receivers mounted without the cells and connected to the bottoms thereof by means of flexible tubes, said outer receivers being mounted on hinged arms, whereby they may be lowered or raised to allow the liquid to flow into or from the same, substantially in the manner and for the purpose specified.

3. In a galvanic battery, the combination, with a cistern, a series of cells located beneath the cistern, communication between the cistern and the cells, and a reservoir or trough, *h*, mounted on arms h^2, and connected with the cells by means of a flexible tube, *h'*, said arms h^2 being mounted on shafts or axes h^4 h^{40}, one of said axes having a pawl and ratchet and a crank-handle for controlling the arms, substantially in the manner specified.

4. In a galvanic battery, the combination, with two or more series of cells, and electrodes fitting said cells and pivoted at one side to the cells, of rods to which the electrodes are connected at their other sides, pivoted arms carrying one of said rods, a lifting cord and weight connected to said arms, and connections between the rods for the different series of cells, whereby they move in unison, substantially as herein set forth.

5. In a galvanic battery, substantially as described, the combination, with the cell or cells, of pivoted electrodes *g*, pivoted guide-arms g^4, connection between the guide-arms and the electrodes, and a lifting weight and cord, g^5 g^4, for raising said electrodes out of the cells, as herein explained.

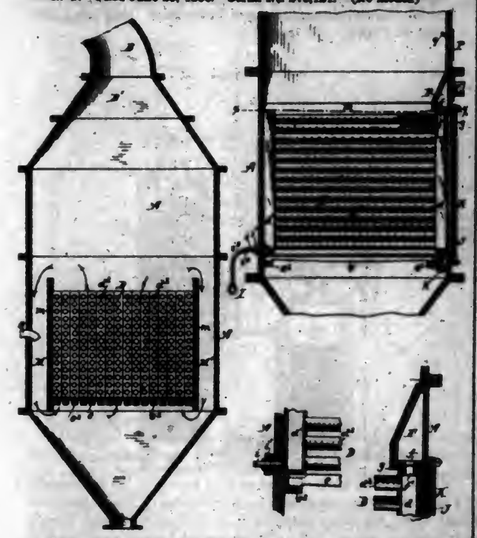
6. In a galvanic battery, the combination, with the cells *c*, of the electrodes *f*, fitting said cells, substantially as set forth, and forming the compartments d^9 between the sides of the cell *c* and the electrodes *f*, and the compartments c^9 between the electrodes *f*, the former for receiving the other electrode and the latter for forming the porous cap for the depolarizing-liquid, substantially in the manner explained.



7. The combination, with the cell or cells of a galvanic battery, of an emptying and filling device consisting of troughs *h*, mounted on arms h^2, having tubes *h'* communicating between the trough and each compartment of the cells, and means, substantially as described, for controlling the elevation of said trough, whereby it may be raised to fill and lowered to empty the compartments, substantially as set forth.

8. The combination, with the cells of a galvanic battery comprising each two compartments, of a pair of troughs mounted on pivoted arms on each side of the cells and having communication, respectively, with the different compartments of the cells, and suitable controlling mechanism for raising and lowering the troughs, whereby the compartments may be emptied and filled at will.

9. The combination, with a galvanic battery having a series of cells, of troughs fixed at the sides of the cells and having communication with the respective compartments of the cells, and swinging troughs, substantially as described, communicating with the fixed troughs and having means for fixing them in any desired elevation, whereby the amount of liquid in the cells may be regulated at will, in the manner explained.



10. The combination, with cells *c*, of the troughs *h*, having communication with the cells, and elevating-arms h^2, substantially as and for the purposes herein set forth.

896,830. MOP-HOLDER. JAMES DUNCAN, Coshocton, Ohio. Filed Mar. 20, 1888. Serial No. 267,865. (No model.)

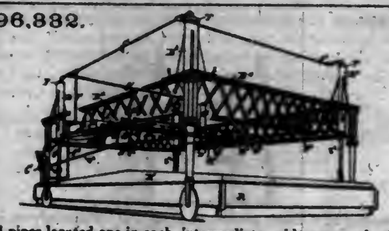
Claim.—In a mop-holder, the combination, with the fixed part of the mop-head, consisting of the cross-bar B, slotted upon its outer ends and provided with the guide-bearings F, of the sliding part of the mop-head, consisting of the cross-bar D, provided with the arms E, projecting at right angles therefrom and slidingly engaging with the fixed part of the mop-head, and a locking device, as the clamping-levers G, adapted to engage with the arms E, substantially as described.

896,831. EVAPORATING-PAN. JOSEPH M. DUNCAN, Silver Springs, N. Y. Filed June 26, 1888. Serial No. 278,121. (No model.)

Claim.—1. The combination, with an evaporating-pan, of flat heating-sections, each composed of a row of heating-pipes and manifolds with which the pipes are connected, the several sections being independent of each other and arranged with their flat sides adjacent to each other, and the pan being provided in one of its upright walls with an opening through which each section can be removed, substantially as set forth.

2. The combination, with an evaporating-pan, of flat removable heating-sections, each composed of a row of heating-pipes and manifolds with which the pipes are connected, the several sections being independent of each other and arranged with their flat sides adjacent to each other, and a supply-manifold secured to the pan and communicating with each heating-section, substantially as set forth.

3. The combination, with an evaporating-pan, of flat removable heating-sections, each composed of a row of heating-pipes and manifolds with which the pipes are connected, the several sections being independent of each other and arranged with their flat sides adjacent to each other, and circulating-passages arranged outside of the heating-sections and connecting the portions of the pan above and below the heating-sections, substantially as set forth.



4. The combination, with the evaporating-pan, of removable vertical sections of heating-pipes arranged side by side within the pan, and guide-bars arranged in the pan underneath the sections, substantially as set forth.

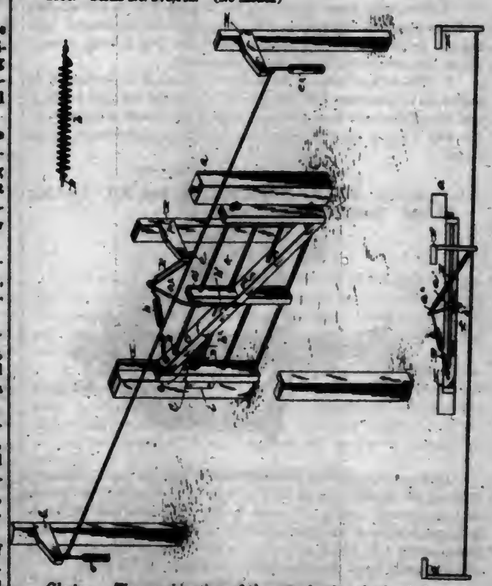
5. The combination, with the evaporating-pan, of removable vertical sections of heating-pipes arranged side by side within the pan, each composed of end manifolds and connecting-pipes, and beveled guide-bars arranged in the pan and entering grooves in the lower ends of the manifolds, substantially as set forth.

6. The combination, with the evaporating-pan, of removable vertical sections of heating-pipes arranged side by side within the pan, each composed of end manifolds and connecting-pipes, a horizontal supply-manifold communicating with the supply-manifolds of the sections, drip-pipes attached to the discharge-manifolds of the sections, and packing-boxes in the wall of the pan through which the drip-pipes pass, substantially as set forth.

7. The combination, with the evaporating-pan, the sections of heating-pipes, each provided with an end manifold, and a main manifold extending across the ends of the section-manifolds and secured in the pan, of adjusting-screws attached to the pan and bearing against the section-manifolds, whereby the latter are pressed against the main manifold, substantially as set forth.

896,832.

said pipes located one in each intermediate said pump and said cylinders, and rods for operating said valves individually, substantially as and for the purpose set forth.



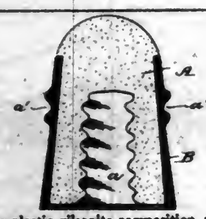
2. In an apparatus for elevating the cover of a gas-purifier, the combination, with several cylinders mounted on the cover-carriage and having the rods of their several pistons attached, respectively, to the corners of the purifier-cover, together with a pump for operating said pistons mounted on said carriage, of pipes extending longitudinally of the carriage and connected, respectively, to said cylinders and to pipe-sections extending laterally of the carriage, a stand-pipe uniting said lateral pipe-sections, a pipe connecting said stand-pipe and the pump, and valves, located one in each of the longitudinal pipes, having rods reaching to and provided individually with operating-levers on that side of the carriage-frame on which the said pump is located, all substantially as and for the purpose set forth.

3. In an apparatus for elevating the cover of a gas-purifier, the combination, with several cylinders mounted on the cover-carriage and having the rods of their several pistons attached, respectively, to the purifier-cover at the corners thereof, together with a pump for operating said pistons, of a tank mounted on said carriage and having connection with said pump, and pipes leading severally from an aperture in the upper head of each cylinder to said tank, substantially as described, and for the purpose set forth.

896,882. APPARATUS FOR ELEVATING THE COVERS OF GAS-PURIFIERS. JAMES R. FLOYD, New York, N. Y. Filed June 2, 1888. Serial No. 275,811. (No model.)

Claim.—1. In an apparatus for elevating the cover of a gas-purifier, the combination, with the several described cylinders connected to the carriage B^4 and having the rods of their several pistons attached to the purifier-cover at various points thereon, respectively, together with a pump, C, for operating said pistons, of the described pipes severally connecting said pump with said cylinders, valves in

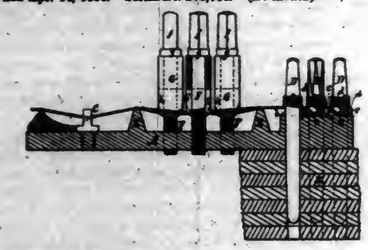
896,833. GATE. MILTON C. PEIFER, La Harpe, Ill. Filed June 13, 1888. Serial No. 276,912. (No model.)



Claim.—The combination of the gate having the latch formed with a horizontal rearwardly-projecting portion or arm which is weighted or downwardly acted upon and a downwardly and forwardly projecting portion, the latch-operating rod pivoted upon the gate and having an arm at its upper end, and near its lower end an arm connected to a rod secured to the downwardly-projecting portion of the latch, a chain or its equivalent having applied thereto a spring connected to the gate and to the upper arm or end of the latch-operating rod, and the gate-manipulating lines, also connected to the upper arm or end of the latch-operating rod, substantially as set forth.

896,834. OVERHEAD INSULATOR. SAMUEL H. GILES, Salt Lake City, Utah. Filed Sept. 26, 1888. Serial No. 286,703. (No model.)

Claim.—1. As a new article of manufacture, an overhead insu-

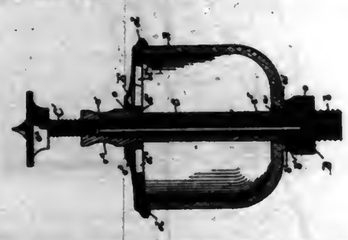


396,334.

lator composed of a plastic silicnite composition, substantially as described.

2. As a new article of manufacture, an overhead insulator composed of a plastic silicnite composition, and a surrounding band, substantially as and for the purposes described.

396,335. STRINGING AND TUNING DEVICE FOR PIANOS. GEORGE M. GUILD, Boston, Mass., assignor to H. R. Guild, same place. Filed Apr. 14, 1888. Serial No. 270,661. (No model.)

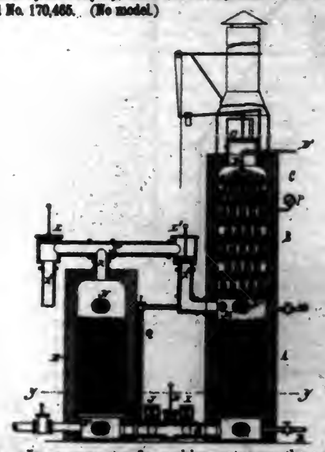


Claim.—1. The string-frame provided with the teeth *c*, having the undercut, as described, in combination with the straining-pins D, having the pins *e*, as set forth.

2. The string-frame A, having the bridges E E, in combination with the pins F, having the integral heads *f*, and the followers G, having the projections *h*, with the grooves *h'*, the pins F being smooth where they are in the followers G, as set forth.

3. The string-frame A, having the bridges E E perforated as shown, in combination with the pins F, having the integral heads *f*, and the followers G, having a hooked projection with the groove *h'*, the pins F being smooth where they are in the followers G, as set forth.

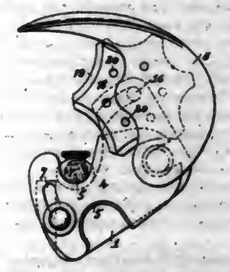
396,336. OIL-CUP. JOHN S. HALL, New York, N. Y. Filed July 16, 1888. Serial No. 280,056. (No model.)



Claim.—In an oil-cup, the combination, with the cup A and valve-tube, of the skeleton frame D, fitted and rigidly attached to the rim of the cup and uniting the same to the valve-tube, and the lid E, adapted to close down upon and cover said frame, and provided with the aperture *c*, by which said cover is free to move vertically and be tilted laterally upon the valve-tube, substantially as set forth.

396,337. TANNING PROCESS. JEREMIE LALER, Independence, Iowa. Filed Nov. 14, 1887. Serial No. 255,155. (Specimens.)

Claim.—1. The hereinbefore-described process of tanning, which consists in first removing the hair and grease from the hides, then immersing the hides in a bath of soot, salt, and water, in about the proportions stated, and then squeezing and drying the hides, substantially as set forth.



2. The hereinbefore-described process of tanning, which consists in first removing the hair and grease from the hides, then immersing the hides in a bath of soot, salt, and water, then squeezing and drying the hides, then giving the hides a dressing of ordinary tanner's oil, then again immersing the hides in a bath of soot, salt, and water, and then again squeezing and drying the hides, substantially as set forth.

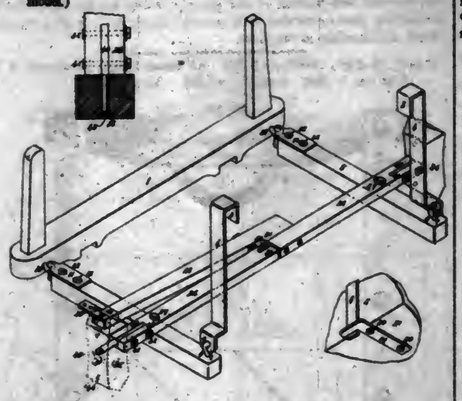
396,338. APPARATUS FOR THE MANUFACTURE OF GAS. THADDEUS S. C. LOWE, Norristown, Pa., assignor to the Guarantee Trust and Safe Deposit Company, trustee, of Pennsylvania. Filed July 2, 1885. Serial No. 170,465. (No model.)

Claim.—In an apparatus for making water-gas, the combination of a main generator comprising the fuel-chamber A, the steam-superheater B, and the steam-generator C, all inclosed by a single upright shell having an ash-pit and steam-inlet at the bottom, an air-blast inlet at the upper part of the fuel-space, and a valve, O, and water-spraying device D above the steam-generator, a separate generator or fuel-chamber, E, a flue, G, connecting the ash-pits of the chambers A and E, the valve H and valved air-inlets I J, located in the flue G the valved flues K K' K², connecting the chambers A and E at the top, and a steam-pipe, Q, connecting the flues K² and G, substantially as described.

396,339. CIGAR-CUTTER. FREDERICK C. MILLER, Newport, Ky. Filed June 26, 1888. Serial No. 278,290. (No model.)

Claim.—1. A cigar-cutter constructed with a grooved bed or support for the cigar, an upper cutting-blade and a lower concave blade having means of vertical adjustment relatively to the bed, to adapt it to cigars of different taper, substantially as set forth.

2. A cigar-cutter constructed with a grooved bed or support for the cigar and a pair of cutting-blades having concave edges, and the lower blade having means of vertical adjustment relatively to the bed, to adapt it to cigars of different taper, substantially as set forth.



3. In a cigar-cutter, the combination, with the upper cutter and carrier on which it is mounted, the lower cutter having a notch at one end and a slot concentric with said notch near the other end, and a screw occupying said slot, substantially as set forth.

4. In a cigar-cutter, the combination of the upper movable vertical cutter and the lower reversible vertical cutter having concave knife-edges on opposite sides, the curves of which are of different radii, whereby different edges may be used for different-sized cigars, as and for the purpose set forth.

5. In a cigar-cutter, the combination of the upper movable vertical cutter having concave knife-edges the curves of which are of different radii, and the lower reversible vertical cutter having concave knife-edges on opposite sides, the curves of which are of different radii, whereby different edges may be used for different-sized cigars, substantially as shown and described.

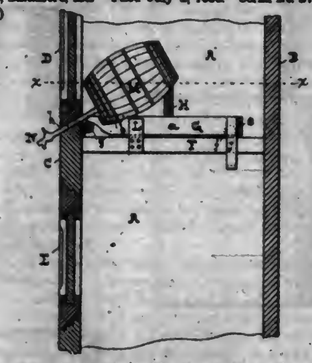
6. In a cigar-cutter, the combination, with the upper-cutter carrier on which it is mounted, and axis of the carrier, of the lower-cutter plate having a notch at one end bearing against said axis, and means for adjustment at the other end, substantially as set forth.

396,340. ATTACHABLE BRAKE FOR WAGON-BEDS. STEPHEN R. RUPLE, Foley, Mo. Filed July 9, 1888. Serial No. 279,490. (No model.)

Claim.—1. In a wagon-brake, a hanger-frame that carries the brake-bars, which frame is secured to the stationary bolster in the rear and by pendent hooks to the wagon-bed in front, substantially as and for the purpose set forth.

2. In a wagon-brake, the combination of the carrier-bars that support the brake-bars, the strap-hooks secured to the rear end of said bars, and the eyelet-bolts in which they engage, said bolts being secured to the stationary bolster, the pendent straps whose hooks saddle over the side-boards of the wagon-bed, and the hook-bolts that secure the front ends of the carrier-bars to said pendent straps, substantially as and for the purpose set forth.

3. In a wagon-brake, the combination of the hanger-frame that carries the brake-bars, the strap-hooks and eyelet-bolts that secure said frame to the stationary bolster, and pendent strap-hooks that secure it to the wagon-bed, the operative brake-bar that spans the carrier-bars, and the pivot-pin that secures it to one of said bars, the said bar being formed in two sections bolted together near the middle in a form to provide an offset and recess, the said recess providing room for the attachment of the subsidiary section of the brake-bar, substantially as and for the purpose set forth.



4. In a wagon-brake, the combination of the hanger-frame that carries the brake-bars, secured from adverse longitudinal movement while braking by attachment to the stationary bolster, and the hanger-strap hooks by which it is suspended from the wagon-bed, and the angle-hooks secured to the bottom of said wagon-bed and that engage with said hanger-straps that lock said bed from an adverse slide on a downgrade, substantially as and for the purpose set forth.

5. In a wagon-brake, the combination of the attachable and detachable hanger-frame, the sectional operative brake-bar that spans from one carrier-bar of the frame to the other and is pivoted near one end to one of said carrier-bars of the hanger-frame, the bolted attachment of the sections of said brake-bar in a position to form a recess at said junction, the subsidiary brake-bar whose attachment end is located in said recess, the triplicated fork at said end of said bar that provides cross-slots in its end, the T screw-bolt that passes through the horizontal slot between said forks, whose T-head is seated in the vertical slot and whose screw-bolt is secured in its perforated seat in the operative brake-bar, and the screw-nuts on said bolt that adjust the relative attachment of the subsidiary brake-bar to the operative bar in line with said bar, and pivot-pin that secures the subsidiary bar to the carrier-bar that supports it, substantially as and for the purpose set forth.

6. In a wagon-brake, the combination of the hanger-frame that carries the brake-bars, secured to the stationary bolster in the rear and in front by pendent bars to the wagon-bed above, the sectional operative brake-bar formed with a recess in which is jointed the subsidiary brake-bar, the metal straps that are seated in the slots at the terminals of said brake-bars, with screw-bolt extensions for the attachment of the rubbers and the screw-bolts that pass through said brake-bars, and metal straps to secure them together, substantially as and for the purpose set forth.

7. In a wagon-brake, the combination of the hanger-frame that carries the brake-bars, the sectional brake-bars they carry, the metal bolted straps and screw-bolts secured in slots at the terminals of said bars, the wooden reversible rotating rubbers arranged with the grain end on for friction service, the metal tie-straps inside and outside of said rubbers, through the central perforations in which the attachment bolts on the terminals of the brake-bars pass and in the outer one of which they have a locking-screw attachment, the said rubbers on their friction-surfaces cut with a curve to correspond with the periphery of the tire and bevel-edged at top and bottom to best take on friction at top and prevent splitting with the grain at bottom, substantially as and for the purpose set forth.

396,341. ICE-BOX FOR HOLDING BEER-KEGS. CHARLES C. RUMPF, Baltimore, Md. Filed July 2, 1888. Serial No. 278,821. (No model.)

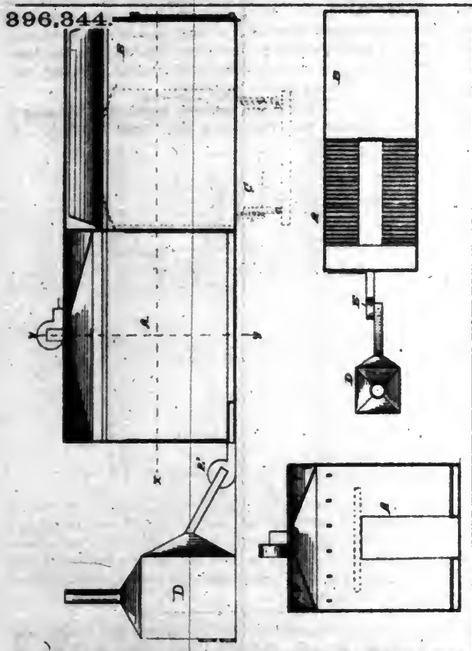
Claim.—In an ice-box for holding kegs of beer, the combination of the stringers F in the said box, the carriage G, and the rollers *f* and *g*, the same being placed, respectively, on the front of the box and the rear of the said carriage, and the said carriage having the keg-supports *b* and H, and its lower front ends carved, substantially as and for the purpose specified.

396,342. GALVANIC BATTERY. BERNHARD SCHEITHAUER, Halle-on-the-Saale, Germany. Filed Dec. 5, 1887. Serial No. 257,012. (No model.)

Claim.—1. In a galvanic battery, the combination of a receptacle having a horizontal perforated wall, negative and positive plates above said wall, and a mixture adapted to evolve chlorine below said wall, with a liquid or liquids suitable for exciting said battery and production of chlorine, substantially as set forth.

2. The combination of a receptacle having a horizontal perforated wall, negative and positive plates above said wall, asbestus fiber about the negative plate or plates, and a mixture adapted to evolve chlorine below said wall, with liquid or liquids for exciting said battery and production of chlorine, substantially as and for the purpose set forth.

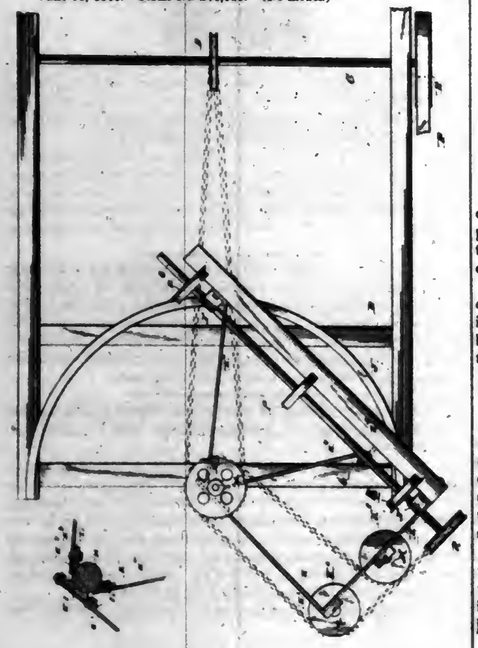
396,343. PROCESS OF MAKING SOAP. HERMANN F. D. SCHWABE, Kansas City, Mo. Filed Mar. 9, 1888. Serial No. 266,734. (Specimens.)



Claim.—The described method of making soap, consisting of melting the fat, mixing therewith the lye while at a temperature of about 120° Fahrenheit, mixing with this the described soap solution while at a temperature of about 150° Fahrenheit, and then raising the temperature to about 180°, substantially as set forth.

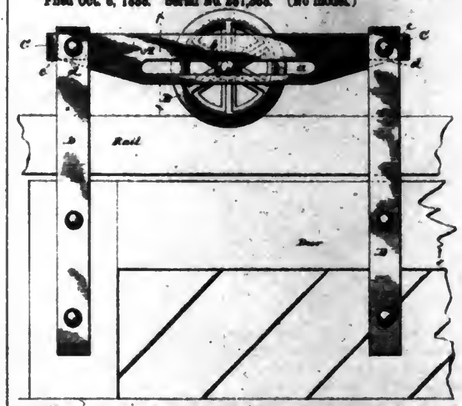
396,344. PREPARING MEATS FOR TRANSPORTATION. JOHN W. STERRY, Chicago, Ill. Filed Mar. 20, 1886. Serial No. 197,001. (No specimens.)

Claim.—1. The herein-described process of preparing meat, it consisting in subjecting it immediately after slaughtering and while inclosed in an apartment to the action of currents of air forced through the said apartment and heated to a temperature between 70° Fahrenheit and the degree at which cooking occurs, and maintaining said treatment until the products of normal waste have been eliminated, and subsequently cooling it to arrest the further elimination and escape of materials therefrom, substantially as set forth.



2. The herein-described process for preparing slaughtered beef

396,844.



for transportation, it consisting in first subjecting the said beef immediately after slaughtering and while inclosed in an apartment to the action of currents of air heated to a temperature between 70° Fahrenheit and that at which cooking occurs, said air having its humidity reduced before bringing it in contact with the meat, and maintaining such treatment until the products of normal waste have been eliminated, then inclosing said meat in a transporting-vehicle containing refrigerating or cooling apparatus, and therewith arresting further elimination and escape of materials from the meat, substantially as set forth.

396,845. STRAW-CARRIER. FREDERICK STROBEL, Marion, Ohio, assignor to the Marion Manufacturing Company, same place. Filed June 30, 1888. Serial No. 278,623. (No model.)

Claim.—The combination, with a frame projecting from the rear end of the thrashing-machine and a short vertical shaft journaled in the forward end thereof, of the pivoted frame having its forward-projecting pieces provided with recessed blocks for engaging the said shaft, substantially as set forth.

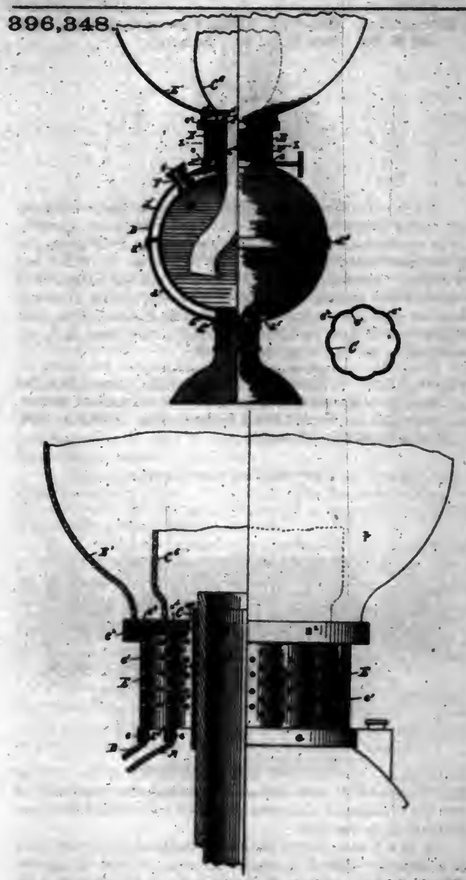
396,846. DOOR-HANGER. LE GRAND TERRY, Horseheads, N. Y. Filed Oct. 6, 1888. Serial No. 287,263. (No model.)

Claim.—1. In a door-hanger, the combination, with rider-plates and spacing-blocks, of bracket-arms supported alike upon the edges of the rider-plates and on the spacing-blocks, substantially as set forth.

2. The combination, with rider-plates and spacing-blocks having a flange on the outer end extending flush with the outer faces of the plates, of L-shaped bracket-arms resting on the upper edges of the rider-plates and secured in place by a rivet or bolt extending through the plates, blocks, and bracket-arms, substantially as set forth.

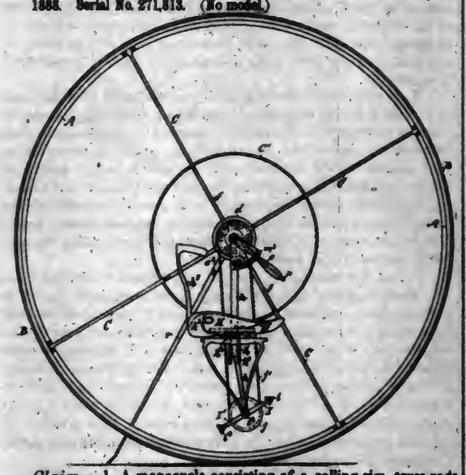
396,847. METHOD OF RE-ENFORCING MANTLES OF REFRACTORY INCANDESCING EARTHS. CARL A. VON WELSBACH, Vienna, Austria-Hungary, assignor to the Welsbach Incandescent Gas Light Company, Jersey City, N. J. Filed Mar. 31, 1888. Serial No. 269,201. (No model.)

Claim.—1. The method of strengthening or re-enforcing mantles or hoods of refractory incandescing material at the point where a suspending-wire is inserted, which consists in applying to that part of the mantle or hood a strengthening-fluid of the salts of refractory earths in solution, substantially as described.



2. The method of strengthening or re-enforcing mantles or hoods of refractory incandescing earth at the point where a suspending wire is attached, which consists in applying to that part of the mantle or hood a solution of magnesium nitrate and aluminum nitrate, substantially as described.

396,848. LAMP. JAMES W. WILLIAMS, Brooklyn, N. Y. Filed Apr. 30, 1888. Serial No. 271,256. (No model.)



Claim.—1. In a lamp, the combination, with the reservoir A, provided with the described jacket D, and the burner C, with its perforated wall c', surmounted by a flange, c^3, having concentric grooves c^4, of the perforated sleeve E, carried by said jacket and surrounding said burner and provided with the top flange, e^3, adapted to fit snugly to the flange on the burner, substantially as and for the purpose specified.

2. In a lamp, the combination, with the reservoir A, provided with the described jacket D, and the burner C, with its perforated wall c', surmounted by the flange c^3, having the concentric grooves c^4 in its upper exposed face, of the perforated sleeve E, carried by said jacket and surrounding said burner, and provided with the top flange, e^3, adapted to fit snugly to the flange on the burner, and having the concentric grooves e^4 in its upper exposed face, substantially as and for the purpose set forth.

396,848.

396,849. VELOCIPEDE. HERMANN BEER, Philadelphia, Pa., assignor of one-half to G. William Friedgen, same place. Filed Apr. 26, 1888. Serial No. 271,813. (No model.)

Claim.—1. A monocycle consisting of a rolling rim, truss-rods connected with said rim and an axle-box and located on one side beyond the vertical median line of the rim, stay-rods connected with said box and truss-rods, an axle in said box, and a depending bracket carrying an adjustable seat on the opposite side beyond said vertical median line, cranks supported beneath said seat, and means connected with said box and cranks for causing motion to be imparted to said vehicle, substantially as described.

2. A monocycle consisting of a rolling rim, rods connected with said rim and a box and located on one side beyond the vertical median line of said rim, an axle passing through said box, a depending bracket formed integral with said axle and having a slotted projection, in which an adjustable seat is mounted, and cranks journaled in the depending arm, and an arm depending from said projection, and means connected with said box and cranks, whereby motion may be imparted to said vehicle, substantially as described.

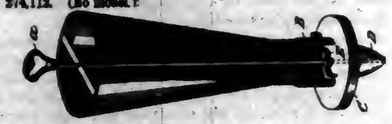
3. A monocycle consisting of a rolling rim or wheel, truss-rods connected with said rim and a box, stay-rods connected with said rods and box, a hollow axle and a spindle mounted in said box and located on one side beyond the vertical median line of said rim, a depending bracket mounted on said spindle having a slotted projection, a seat mounted therein and located beyond said vertical median line, cranks supported beneath said seat, and means connected with said box and cranks, whereby motion may be imparted to said vehicle, all arranged as shown and described.

4. The herein-described monocycle provided with rods attached to a rolling rim and an axle-box, stay-rods attached to said rods and box, a hollow axle and a spindle mounted in said box, a depending arm pivotally connected with one extremity of said spindle, and means, as described, connected with the opposite extremity of said spindle, whereby said depending rod may be actuated, as shown and for the purpose set forth.

5. A monocycle consisting of a rolling rim and truss-rods attached to said rim and an axle-box, stays connected with said rods and box, a hollow axle and a spindle mounted in said box, a depending arm pivotally connected with one extremity of said spindle and with said hollow axle by means of a rod hinged thereto, a lever pivotally connected with the opposite extremity of said spindle, a latch-bar pivoted to said lever, and a sector with a rack formed integral with said hollow axle, substantially as and for the purposes set forth.

6. A monocycle provided with truss-rods attached to the rolling rim and to an axle-box, stays secured to said box and truss-rods, a ring secured to said truss-rods for strengthening them, a hollow axle and a spindle mounted in said box, a depending bar connected with said spindle, and means connected with said axle and spindle for actuating and holding said bar in a desired position and located beyond the vertical median line of said rolling rim, a depending bracket formed integral with said axle and extending beyond the median line on the opposite side of said rolling rim and provided with a slotted projection, an adjustable seat held therein, cranks supported beneath said seat, and means connected with said cranks and box, whereby motion may be imparted to said vehicle, substantially as and for the purposes set forth.

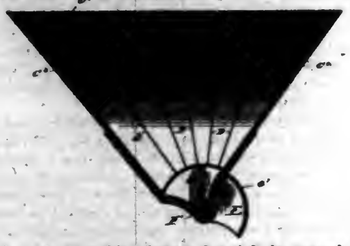
396,850. NEEDLE-CLAMP FOR SEWING-MACHINES. CHARLES P. BOSTIAN, Milton, assignor of one-half to John F. Meekly, Watsontown, Pa. Filed Feb. 24, 1888. Serial No. 265,179. (No model.)



Claim.—1. A sewing-machine needle-clamp consisting of two parts formed with a needle-groove in each of their inner faces, a hinge-pin to hold the parts together, said hinge-pin having its upper part extended across and between the inner faces of the clamp and constituting the needle-holding bar, a spring to hold the needle-holding bar in engagement with the needle, and a locking-pin to lock the parts together, substantially as described.

2. A sewing-machine needle-clamp consisting of two parts formed with a needle-groove in each of their inner faces and each having a transverse groove, 5, across its face, a hinge-pin to hinge the parts together, said hinge-pin having its upper part extended across and between the parts and arranged in the transverse grooves 5, a spring, 4, fixed in the face of one of the parts to throw the arm of the hinge-pin in engagement with a needle, and a locking-pin, 14, having an angular part, 15, to lock the parts together, substantially as described.

3. A sewing-machine needle-clamp consisting of two parts hinged together and formed with a needle-groove in each of their inner faces, and a locking-pin projected through the free edges of the parts, substantially as and for the purpose specified.



396,851. IMPLEMENT FOR DROPPING FERTILIZER. BRAUMAN BUTLER, St. Johnsbury Centre, Vt. Filed May 16, 1888. Serial No. 274,112. (No model.)

Claim.—1. The combination, with a vessel adapted to hold and drop fertilizing material, of side openings near its lower end and a handle having corrugated wings attached at its lower end, adjusted to press the fertilizer through the side openings, as and for the purpose set forth.

2. The combination, with a vessel adapted to hold and drop fertilizing material, substantially as described, of a sliding band near the lower end of the vessel, for the purpose of opening or closing said side openings, as and for the purpose set forth.

396,852. SAND-BOX FOR RAILWAY-CARS. WILLIAM H. CLARK, Chicago, Ill., assignor to Horace G. Bird, same place. Filed Apr. 16, 1888. Serial No. 271,089. (No model.)

Claim.—1. A sand-box hopper-shaped in its general outline, having an orifice at or near its bottom, and provided with one or more plates secured in the sand-space within said hopper, whereby to permit sand to pass on both sides of said plate or plates and thereby prevent the packing or clogging of the same, substantially as described.

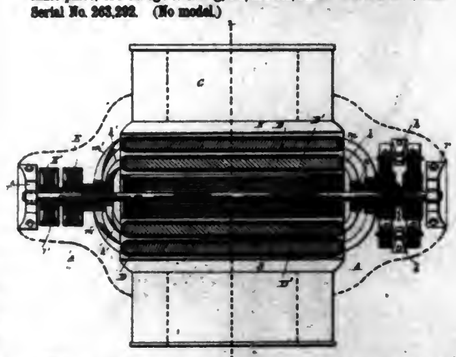
2. In a sand-box, the combination, with the hopper-shaped sand-receptacle having an opening in its bottom, of a series of plates located transversely in said receptacle, whereby to permit the sand to pass on both sides of said plates, substantially as and for the purpose described.

3. The combination, with a hopper-shaped sand-box having an opening in its bottom, of a series of plates secured therein, radially arranged with reference to said opening, substantially as described.

4. In a sanding apparatus, the combination, with the sand-receptacle having an opening at or near its bottom, of a feed-cup fitted to said opening and provided with a pocket and a solid portion, and adapted to be rocked to bring said pocket and said solid portion alternately beneath said opening, substantially as described.

5. The combination, in a sanding apparatus, with a hopper-shaped receptacle having an opening in its bottom, of a series of plates secured therein and a feed-cup provided with a pocket and a solid portion adapted to said opening and to be rocked, whereby to bring said pocket and said solid portion alternately to said opening, substantially as and for the purpose specified.

396,853. VAPOR-BURNER. JOHN H. CLAYTON, Ypsilanti, Mich., assignor of one-half to Joshua Lambert, John R. Lambert, Charles R. Lambert, and Bert L. Lambert, all of same place. Filed Aug. 6, 1888. Serial No. 282,082. (No model.)



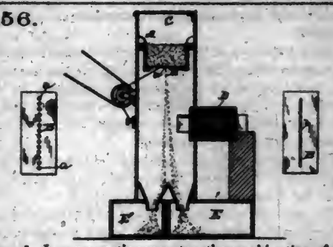
Claim.—A vapor-burner consisting of the plate A, having at one end the valve-shell B, provided with the vapor-orifice E and valve J, the hood C, secured to the under side of the plate to constitute a combustion-chamber between the latter and the side and rear end walls of said hood, with its front open for the discharge of the flame, a combining-tube, D, opening through the rear wall of the hood opposite the vapor-orifice, and the vaporizing-pipe L, having means to connect with the fuel-supply and extending in a curved path around and bearing against the under side of the plate in the combustion-chamber and connected with the valve-shell to form a flame-guard at the mouth of the combustion-chamber, substantially as and for the purposes described.

396,854. PIPE-JOINT. PATRICK V. DWYER, St. Paul, Minn. Filed Oct. 22, 1888. Serial No. 288,704. (No model.)

Claim.—The combination, with a water-closet trap or other piping having flanged adjacent ends, of a coupling consisting of semicircular overlapping sections D' D^2 D^3 D^4, said sections D^2 D^4 having pins g', adapted to enter inclined slots g^2 in the sections D' D^3, and said sections D' D^2 united by one end on one side, and said sections D^3 D^4 united on the opposite side, whereby when said sections are drawn together around the piping the pins and inclined slots coact to cause said sections to draw the ends of the piping toward each other, substantially as and for the purpose set forth.

396,855. DYNAMO-ELECTRIC MACHINERY. ISAAC T. DYER, Chicago, Ill., assignor of five-eighths to Peter Fish and Gustav Mourath, same place, and George C. Ewing, Jr., Enfield, Mass. Filed Feb. 7, 1888. Serial No. 263,292. (No model.)

Claim.—1. In a dynamo-electric machine, the combination of two sets of magnets and movable armatures, one set within the other, substantially as described.



2. In a dynamo-electric machine, in combination with the frame A, a stationary shaft, B, a magnet, C, having its poles on opposite sides of the shaft, a magnet, C', secured on the shaft between the poles of the magnet C, and movable armatures D and D', supported from the shaft B and actuated, respectively, in front of the poles of the magnets C and C', substantially as described.

3. In a dynamo-electric machine, in combination with the frame A, a stationary shaft, B, a magnet, C, having its poles on opposite sides of the shaft, a magnet, C', secured on the shaft between the poles of the magnet C, and hollow cylindrical rotary armatures D and D', supported one within the other around the shaft and actuated, respectively, in front of the poles of the magnets C and C', substantially as described.

4. In a dynamo-electric machine, in combination with the frame A, a shaft, B, rigidly supported on the frame, a magnet, C, having its poles on opposite sides of the shaft, a magnet, C', secured on the shaft between the poles of the magnet C, loose rotatory sleeves n and n', near opposite ends of the shaft, carrying between them a hollow cylindrical armature, D, surrounding the shaft and magnet C' and extending between the poles of the magnet C, and loose rotatory sleeves l and l', near opposite ends of the shaft, carrying between them a hollow cylindrical armature, D', inside the armature D, surrounding the magnet C', substantially as described.

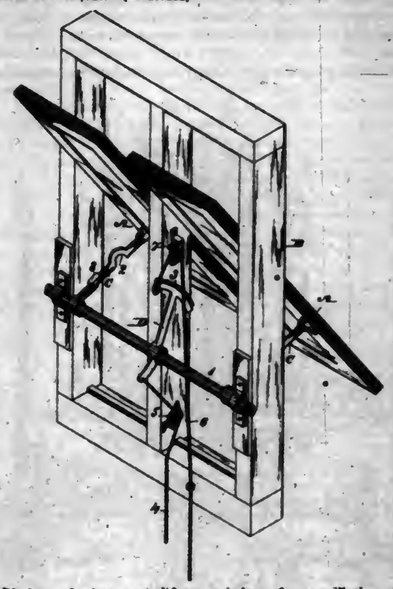
5. In a dynamo-electric machine, in combination with the frame A, a shaft, B, rigidly supported on the frame, a magnet, C, having its poles on opposite sides of the shaft, a magnet, C', secured on the shaft between the poles of the magnet C, loose rotatory sleeves n and n', near opposite ends of the shaft, having arms m and m', carrying between them a hollow cylindrical armature, D, surrounding the shaft and magnet C' and extending between the poles of the magnet C, and loose rotatory sleeves l and l', extending through the sleeves n and n' on the shaft, and having arms k and k', carrying between them a hollow cylindrical armature, D', inside the armature D, surrounding the magnet C', substantially as described.

396,856. MAGNETIC SEPARATOR. THOMAS A. EDISON, Llewellyn Park, N. J., assignor to the Edison Ore Milling Company, (Limited,) New York, N. Y. Filed Mar. 20, 1888. Serial No. 268,749. (No model.)

Claim.—1. In a magnetic separator, the combination of a hopper having a flat bottom and an opening therein, with a magnet below said hopper for altering the trajectory of magnetic material falling therefrom, substantially as set forth.

2. In a magnetic separator, the combination of a hopper having vertical sides and a flat bottom with an opening therein, with a magnet below said hopper for altering the trajectory of magnetic material falling therefrom, substantially as set forth.

3. In a magnetic separator, the combination of a hopper having a flat bottom and a row of small holes therein, with a magnet below said hopper for altering the trajectory of magnetic material falling therefrom, substantially as set forth.



4. In a magnetic separator, the combination of a hopper having a thin metal bottom plate with an opening therein, with a magnet below said hopper for altering the trajectory of magnetic material falling therefrom, substantially as set forth.

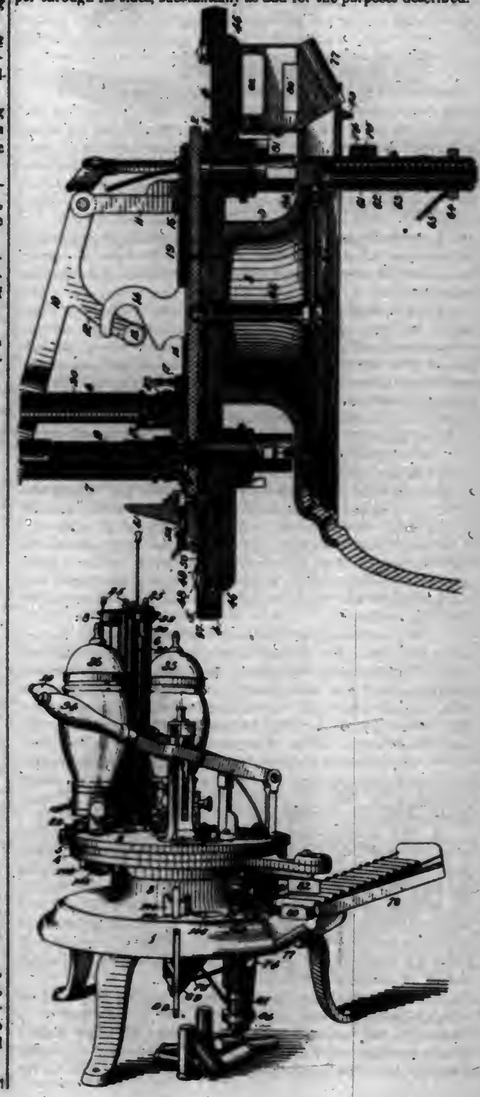
5. In a magnetic separator, the combination of a hopper having a thin metal bottom plate with a row of small holes therein, with a magnet below said hopper for altering the trajectory of magnetic material falling therefrom, substantially as set forth.

6. In a magnetic separator, the combination, with a hopper having a flat bottom with an opening in it and means for vibrating it, of a magnet below said hopper for altering the trajectory of magnetic material falling therefrom, substantially as set forth.

7. In a magnetic separator, the combination, with a hopper having a flat bottom with a row of small holes in it and means for vibrating it, of a magnet below said hopper for altering the trajectory of magnetic material falling therefrom, substantially as set forth.

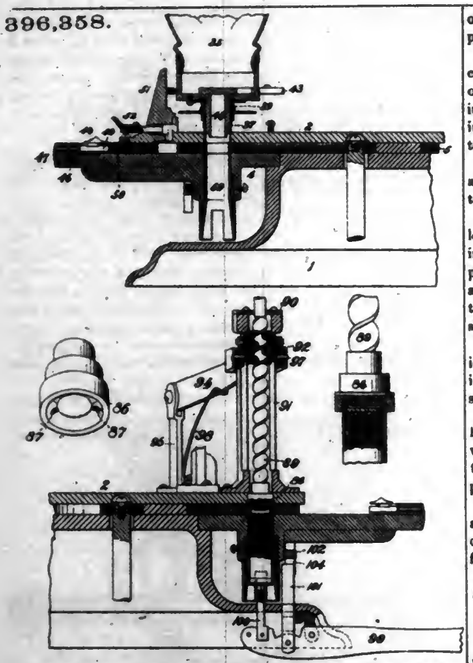
396,857. TRANSOM-LIFTER. JOHN FREEMAN, Philadelphia, Pa., assignor to Thomas Devlin & Co., same place. Filed Sept. 20, 1888. Serial No. 285,842. (No model.)

Claim.—1. A transom-lifter consisting of an oscillating shaft, a toggle-lever having the lip 8 at the pivotal connection of its parts, and the recessed portion 2, said lever adapted to be pivotally connected to said shaft and a transom, the arm D, rigidly connected to said shaft and having a segment on one end, the pulleys 5 and 7, and the cords 4 and 6, said parts combined substantially as described.



2. The combination of a rocking shaft with a two-arm lever se-

cured to said shaft, so as to extend radially therefrom peripherally-grooved, a segment at the outer end of one of its arms, the pulley 7 above said segment, the cord 6, secured to the segment and passing over said pulley 7, the pulley 5 below the rocking shaft, and the cord 4, secured to the other arm of the lever and passing through the said pulley 5, said parts being combined so as to operate or rock said shaft in opposite directions, substantially as described.



396,858. CARTRIDGE-LOADING MACHINE. EDWARD A. FRANKLIN, Brenham, Tex., assignor to Bailey Farrell & Co., Pittsburg, Pa. Filed Dec. 12, 1887. Serial No. 257,638. (No model.)

Claim.—1. The combination, in a machine for loading cartridges, of a stationary bed-plate mounted on a stand and an oscillating plate, 5, beneath it, with a revolubie plate arranged beneath the oscillating plate and carrying a pair of shell-holders at opposite sides, powder, shot, and wad chargers, together with a plunger for charging the cartridges, mounted on the bed-plate, and a feeding device comprising a shell-hopper, chute, and guide having a plunger, all arranged in conjunction with and operated from the movable plates for charging the empty shells into the holders, substantially as and for the purposes described.

2. A wad-hopper consisting of an open frame formed of vertical wires, one of which is removable for the purpose of charging the hopper through its sides, substantially as and for the purposes described.

396,858.

3. A wad-hopper having a threaded lower end, whereby it may be adjustably attached to a threaded socket, and a lock-nut whereby its adjusted position may be fixed, substantially as and for the purposes described.

4. In a cartridge-loading machine, a bed-plate, combined with a hopper for supplying ammunition and having a charging-chamber at its base composed of an externally-threaded tube fast on said bed-plate, a tube extending from the hopper into the first-named tube, and a screw-collar swiveled to the hopper and engaging the externally-threaded tube and rotatable to raise and lower the hopper, and thereby vary the capacity of the charger, substantially as and for the purposes described.

5. In a cartridge-loading machine, a bed-plate, combined with a hopper for supplying ammunition and having a charging-chamber at its base composed of an externally-threaded tube fast on said bed-plate, a tube extending from the hopper into the first-named tube, and a screw-collar swiveled to the hopper and engaging the externally-threaded tube and rotatable to raise and lower the hopper, and thereby vary the capacity of the charger, and a bracket rising from the bed-plate and provided with a set-screw tapped into the hopper and adapted to bind the hopper to the bracket, substantially as and for the purposes described.

6. The combination of a stationary bed-plate, a charging-plunger, wad-hoppers arranged on opposite sides of the plunger, wad-slides operated by spring-dogs for feeding the wads into the path of the plunger, an oscillating striker having a spring-pawl for engaging and retracting the slides, so as to permit the feed of the wads, and a tripping device for tripping the pawl to permit the release of the spring-dog, substantially as and for the purposes described.

7. The combination of a revoluble plate carrying the shell-holders with a spring-actuated incline arranged below the plunger for raising the shell in the holder into proper position with relation to the range of the plunger, substantially as and for the purposes described.

8. In a cartridge-loading machine, the stationary bed-plate, in combination with the revoluble plate and the shell-holders depending therefrom, a partly-revoluble plate interposed between the bed-plate and the revoluble plate, cartridge charging or loading devices fixed to the bed-plate, slides for such devices arranged in the bed-plate and adapted to be moved to open and close the loading devices, and arms projecting from the revoluble plate and carrying pawls to operate such slides, and also to connect and release the two plates, substantially as and for the purposes described.

9. The combination of the oscillating or partially-revolving plate with a tubular guide attached to the bed-plate and provided with a hinged side, which, when opened, acts to receive the empty shells, a plunger operating inside of the guide, an incline operated by a radial arm from said plate for actuating said plunger, and a bent rod for opening and closing the hinged side, substantially as and for the purposes described.

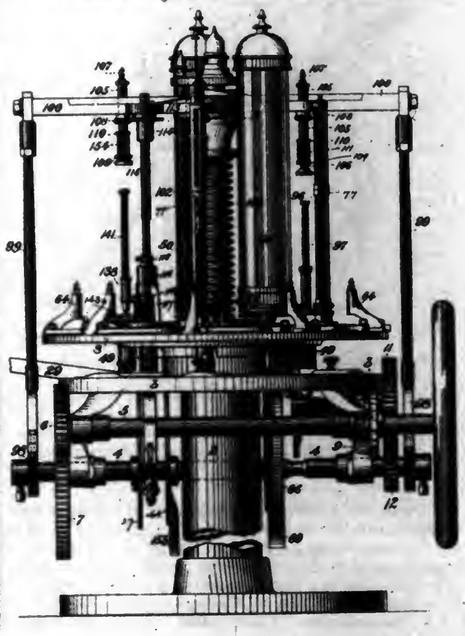
10. The combination of the tubular guide for receiving the empty cartridge, a spring-plunger arranged in said guide and operated by an oscillating incline to depress the plunger, a spring-stop for maintaining the plunger in a depressed position, and a wedge on said oscillating incline for tripping the stop and releasing the plunger, substantially as and for the purposes described.

11. The combination of the shell-holder with a tubular guide and a spring-plunger for feeding the empty shell into the holder, substantially as and for the purposes described.

12. The combination of the shell-hopper having a chute at its lower end, one part of which is movable, with a pivoted stop for closing the end of the hopper when the hinge of the chute is closed, a stop placed back of the end of the hopper the distance of one shell, and a pin arranged in the path of the hinged part of the chute, so as to trip the end stop when the hinged part is open and close the second stop, substantially as and for the purposes described.

13. The combination of the revoluble shell-holder with a crimping device arranged on the bed-plate and a recessed pitman for raising the cartridge up to and centering it beneath the crimper, substantially as and for the purposes described.

14. The combination of a cartridge-loading device and a feed-hopper for feeding the shells, said hopper having a track or way elevated above the bottom of the hopper to free the rims or flanges of the shells from contact with the hopper's bottom and thus insure their proper descent, substantially as and for the purposes described.



15. The combination of a bed-plate, a detachable shell-holder, and a revoluble plate in the bed-plate, and provided with circular feed-openings of different gages, so as to enable the holder to be changed for different-gage shells, substantially as and for the purposes described.

396,859. CARTRIDGE-LOADING MACHINE. EDWARD A. FRANKLIN, Brenham, Tex., assignor to Bailey Farrell & Co., Pittsburg, Pa. Filed Dec. 12, 1887. Serial No. 257,640. (No model.)

Claim.—1. In a cartridge-loader, the combination of a stationary bed-plate, a revoluble plate situated above the stationary plate and carrying one or more shell-holders, a shell-hopper, a shell-feeder situate below the plane of the shell-holders, and adjustable plates secured to the stationary bed-plate in the line of the movement of the shell-holders for accommodating different-lengthed shells, substantially as and for the purposes specified.

2. A wad-holder composed of two or more cylinders fitting one within the other and provided with slots sufficiently wide to admit of the passage of wads into the wad-holder laterally, the said cylinders being rotarily adjustable on a longitudinal axis to bring said slots into and out of register, substantially as and for the purpose described.

3. In a cartridge-loading machine, the combination of a stationary

396,859.

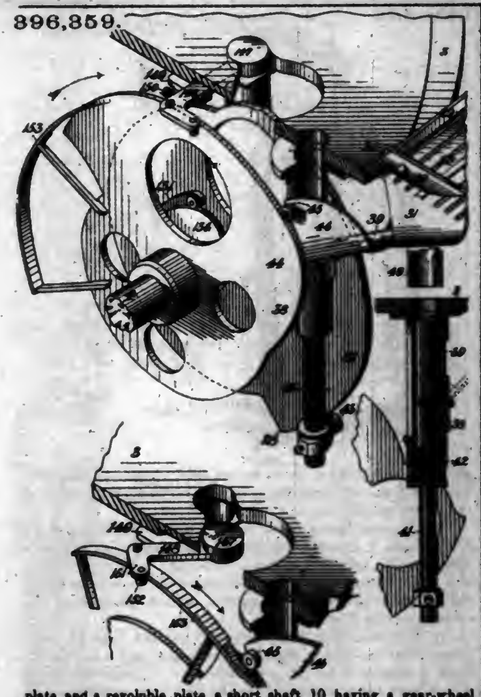


plate and a revoluble plate, a short shaft, 10, having a gear-wheel, 11, operated by the main shaft 4, a collar, 13, fast on the short shaft, two oppositely-radiating arms, 14 15, fast to said collar, and a flange, 16, depending from the revoluble plate and having ratchets 17 for the purpose of imparting an intermittent rotary motion to the revoluble plate, substantially as and for the purposes specified.

4. In a cartridge-loading machine, the combination of a stationary plate, a revoluble plate provided with depending ratchets 17, a driven shaft, 10, having arms 14 and 15 fixed thereto, the cams 20 and 21, also connected with and moved by said shaft, and a lock-rod, 22, operated by said cams to engage and disengage the revoluble plate, substantially as and for the purpose described.

5. In a cartridge-loading machine, an inclined shell-hopper, 29, provided on its lower surface with a series of ridges or grooves, 30, so as to raise the body of the shell above the bottom of the hopper sufficiently to prevent the rim on the head of the cartridge-shell from coming in contact therewith, substantially as and for the purposes described.

6. In a cartridge-loading machine, the combination of an inclined shell-hopper, a retaining shield or guard, 32, constructed of two or more superposed segmental sections of sheet metal adjustably connected by a slot and set-screw, and pivoted in the mouth of the shell-hopper, a shell-feeder having a pivoted leaf, the rotary cam acting upon said leaf, and a projection from the pivoted guard extended into the path of movement of the pivoted leaf, substantially as and for the purposes specified.

7. In a cartridge-loading machine, the combination of a shell-hopper, a retaining shield or guard, 32, vibrating arms 34, secured to said guard and pivoted to the hopper so as to locate the guard in the discharge end of the hopper, the shell-feeder having the pivoted leaf 39, and the bent rod 36, connecting the said pivoted leaf and guard, substantially as and for the purpose described.

8. In a cartridge-loading machine, the shell-feeder constructed of a cylindrical tube having a hinged leaf, 39, and an arm, 46, provided with the roller 45, combined with a rotary cam, 44, substantially as and for the purpose described.

9. In a cartridge-loading machine, the combination of a shell-hopper, a shell-feeder having a hinged leaf arranged to fall at the discharge end of the hopper, and a spring and a cam co-operating with the said leaf to direct the shell from the hopper into the feeder, and a plunger arranged in the feeder and connected with a retracting cam and a projecting spring, substantially as and for the purpose described.

10. In a cartridge-loading machine, the combination of a stationary bed-plate, an intermittently-revoluble plate, a series of shell-holders secured to the last-named plate, a shell-hopper and a vibrating shield or guard arranged in the discharge end of the hopper, a shell-feeder situated below the stationary bed-plate, and into which the shells are delivered from the hopper by the vibrating shield or guard, a spring-plunger for delivering the shells from the shell-feeder into the shell-holder, and a rotary cam for actuating the plunger, substantially as and for the purpose described.

11. In a cartridge-loading machine, the combination of a powder or shot canister mounted upon a stationary plate, a charger situated below the canister, a sliding plate for making and breaking connection between the canister and the charger, said plate having a cam on its outer edge, and a post or posts mounted on the revolving plate so as to operate the slides, substantially as and for the purposes described.

12. In a cartridge-loading machine, the combination of a stationary plate, 51, and a shot or powder canister having a charger connected to said plate, a cut-off in the upper end of such charger, and a slide, 60, arranged in the lower end of each charger and provided with a slot and thumb-screw, 61, to connect it movably to the plate 51, so as to cut off the lower mouth of the charger and close the same until the shell is brought into position for its charge of powder or shot, substantially as and for the purposes specified.

13. In a cartridge-loading machine, the combination of the stationary plate 51, having openings 56, shot or powder canister having a charger arranged beneath it, a spring-slide, 62, arranged in the bottom of the canister to admit a charge into the charger and then cut off the supply, and a revoluble plate, 8, having a series of shell-holders attached thereto, said holders being open at the top of the revoluble plate, substantially as and for the purposes described.

14. In a cartridge-loading machine, the combination of a stationary bed-plate, a type-holder, 72, arranged to rotate upon said plate, an inking-pad, 68, also arranged upon said plate to swing up against and ink the type in the type-holder, a rotary cam and connections between it and the type-holder and inking-pad, and a revoluble plate having a series of shell-holders provided with slots into which the type-holder is projected, substantially as and for the purpose described.

15. In a cartridge-loading machine, the combination of a stationary plate, a revoluble plate having a series of shell-holders and arranged above the stationary plate, a second non-rotating plate arranged above the revoluble plate, a wad-hopper and a wad-plunger on said non-rotating plate, a wad-slide arranged beneath the wad-hopper, and inclined arms 155, mounted upon the revoluble plate and acting upon the wad-slide, substantially as and for the purpose described.

16. In a cartridge-loading machine, the wad-slide 82, composed of two strips of metal removably united, combined with a slideway and an adjustable hopper, substantially as and for the purpose described.

17. In a cartridge-loading machine, the combination of a stationary plate, a revoluble plate having a series of shell-holders arranged above the stationary plate, a second non-rotating plate arranged above the revoluble plate, a wad-hopper and a wad-plunger on said non-rotating plate, a wad-slide arranged beneath the wad-hopper, and inclined arms 155, adjustably mounted upon the revoluble plate and acting upon the wad-slide, substantially as and for the purpose described.

18. In a cartridge-loading machine, the combination of a spring stamping-plunger, a vertically-reciprocating cross-head, a hammer attached with an intervening spring to said cross-head and arranged thereon in the plane of the plunger to act upon and depress it upon the descent of the cross-head, and an inking-roller to supply ink to the stamping device, substantially as and for the purpose described.

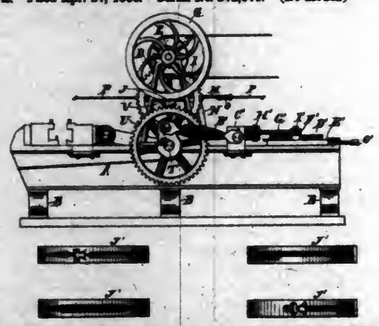
19. In a cartridge-loading machine, the stationary bed-plate 3, having an opening through which the shell is discharged after being stamped, the pivoted disk 147, arranged in said opening to support the disk while being stamped, and the cam 153 and spring 150, for operating the said disk, in combination with the stamping device secured above the bed-plate and comprising a plunger and the reciprocating cross-head having a hammer to descend upon the plunger to operate the stamping device, substantially as and for the purpose described.

20. In a cartridge-loading machine, the combination of a stationary plate having an aperture for the passage of the wad, an inserted plate, 87, which plate is provided with two or more openings of different sizes to accommodate different sizes of wads, and a locking-bolt, 86, substantially as and for the purpose specified.

21. In a cartridge-loading machine, the combination of a wad-hopper, a wad-slide, and the arm 160, arranged vertically in the wad-hopper base and provided with a spring normally elevating it, and a set-screw for depressing it at pleasure, and the arm 161, connected to and moving with the other arm to close and open the wad-hopper through the movements of said arm 160, substantially as and for the purpose described.

22. In a cartridge-loading machine, the combination of a rotating crimping-head, a plunger, 122, arranged beneath said head and carrying the shell to be crimped, a cam, 134, on the rotary shaft 4, the plunger-operating arm 129, pivoted to a stationary member of the machine and having the arm 131 engaging the cam, and an ad-

justable foot on said lever interposed between it and the plunger, substantially as and for the purpose described.



396,360. LETTER-BOX. MADORA J. HEWLETT, Paducah, Ky. Filed July 25, 1888. Serial No. 281,014. (No model.)

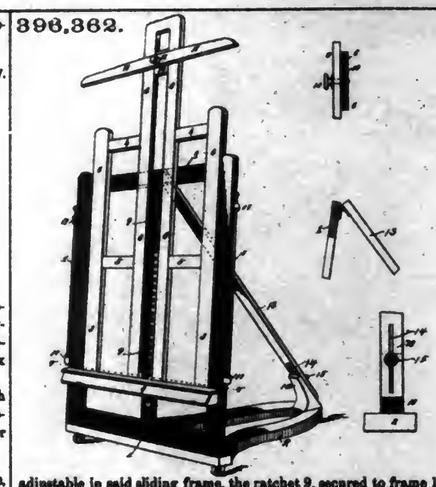
Claim.—1. The combination, in a letter-box, of the frame H, secured thereto and provided with an opening, and a partially-revolving disk, I, placed in the frame, with the lid C, provided with a projection, of a rod engaging the disk, and a bottom or door to the box which operates the rod and the disk, substantially as described.

2. The combination, in a letter-box, of the lid C, provided with a projection upon its inner side, with the disk I, which is held in position by the projection, the operating-rod, and the bottom or door for operating the disk through the rod, substantially as set forth.

396,361. ROLLING-DIE MACHINE. WILLIAM H. JOHNSON, Racine, Wis. Filed Apr. 27, 1888. Serial No. 272,076. (No model.)

Claim.—1. In a die-machine, two segmental oscillating die-blocks having opposing convex surfaces respectively pivoted to a stationary support, in combination with each other and with operating mechanism adapted to communicate an oscillating movement to both of said dies simultaneously, substantially as and for the purpose specified.

2. The combination, in a die-machine, of two rolling die-blocks, D' D', each provided with interchangeable adjustable face-blocks J' J', die-retaining pivots F' F', connecting-links G' G', head-block C, pitmen B' B', cranks A' A', shaft T, and a chain of gears communicating therefrom with the driving mechanism, substantially as and for the purpose specified.



3. The combination of the driving-shaft J, the therein-revolving spur-wheels I I, provided with notched hubs K K, and the grooved collars L L, provided with teeth or lugs *d d*, levers M M, centrally pivoted on standard N and provided with bifurcated ends riding in the grooves in collars L L, the toggle-arms O O, and reciprocating rod P, supported and riding in the top of standard N and provided with handles, substantially as and for the purpose specified.

4. In the die-operating mechanism herein described, the combination of the shaft T, geared with the operating mechanism of the machine, cranks A' A', pitmen B' B', reciprocating cross-head C', connecting-links G' G', communicating between the cross-head C' and the oscillating die-blocks D' D', and the convex removable dies or face-blocks J' J', affixed to the opposing ends of the die-blocks D' D', substantially as and for the purpose specified.

5. The combination of the shaft T, geared with the operating mechanism of the machine, cranks A' A', pitmen B' B', cross-head C', pivots H' H', connecting-links G' G', die-blocks D' D', interchangeable die-blocks J' J', having opposing convex surfaces connected with said blocks D', and adjustable journal-bearings L L, secured in said die-blocks D' and adapted to operate on the die-supporting pivots F' F', all substantially as and for the purpose specified.

396,362. EASEL. CHARLES MAHER, St. Louis, Mo. Filed Apr. 17, 1888. Serial No. 270,908. (No model.)

Claim.—1. The combination, to form an easel, of the frame 1, hinged to the base 2, the sliding frame 3, mounted directly upon the frame 1, a cross-piece, to which the canvas is adapted to be secured,

adjustable in said sliding frame, the ratchet 9, secured to frame 1, and the catch 8 therefor, attached to said sliding frame, substantially as and for the purpose described.

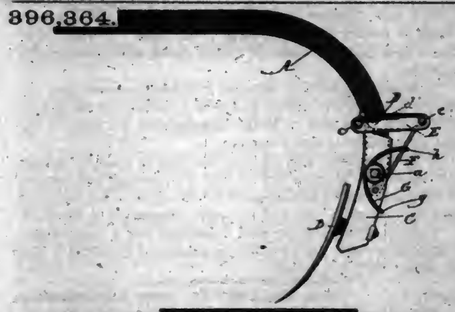
2. The combination of the frame 1, hinged to the base 2, the sliding frame 3, mounted directly upon said frame 1, an adjustable cross-piece, 11, to which the canvas is adapted to be secured, movable in said sliding frame, a leg, 13, hinged to the frame 1 and adjustably secured to the base 2 by means of slot and thumb-screw, substantially as described.

3. The combination of the hinged frame, as 1, a second frame sliding within the same, to which the canvas is secured, a ratchet, 9, a catch, 8, secured to the sliding frame, a block, 10, adjustable in said sliding frame and provided with cross-piece 11 and thumb-screw 12, a leg, as 13, hinged to said frame 1, and adjustable by means of slot and thumb-screw, substantially as described.

396,363. SASH-FASTENER. WILLIAM T. MORGAN, Muncie, Ind. Filed Aug. 4, 1888. Serial No. 282,019. (No model.)

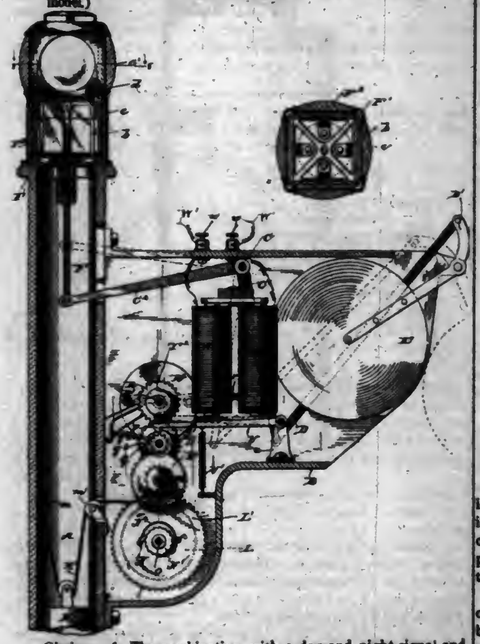
Claim.—1. The combination, with a stationary rod secured to the window-frame and provided with a series of perforations and a groove, of a sliding spring-rod secured to the upper sash and provided with a pin adapted to slide in said groove and enter said perforations, all constructed, arranged, and operating substantially as shown and described.

2. The combination, with a stationary rod secured to the window-frame and provided with a series of perforations and a groove, of a sliding rod having its upper end bifurcated to form arms and secured to the upper sash, and a pin arranged between the said arms and said stationary rod, passed between said arms on the sliding rod, substantially as described.



3. The combination, with a stationary rod and a sliding rod secured to the upper sash and adapted to engage said stationary rod, said sliding rod provided with a series of perforations and a groove, of a hook secured to the lower sash and adapted to slide in said groove and enter said perforations, substantially as described.

396,364. CULTIVATOR. JOHN F. PACKER, Chicago, Ill., assignor to The David Bradley Manufacturing Company, same place. Filed Oct. 27, 1888. Serial No. 289,230. (No model.)



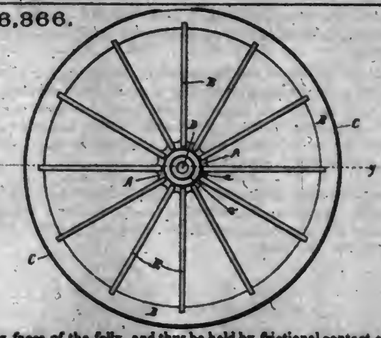
Claim.—1. In a cultivator-beam, the combination, with a spring-sustained pivoted shovel-support, C, of the locking bar or rod F, whereby the spring-vibrations are prevented from being communicated to the shovel, substantially as described.

2. A standard or beam and a shovel and shovel-support pivoted to the beam, in combination with links D and E, hooked rod F, and spring G, constructed substantially in the form shown, substantially as and for the purpose specified.

396,364.

396,365. RAILWAY-SIGNAL. WILLIAM C. PAUL and OSCAR D. KLEINSTUBER, Milwaukee, Wis., assignors of one-third to Thomas K. Ewing, same place. Filed July 21, 1887. Serial No. 244,903. (No model.)

Claim.—1. The combination, with a day and night signal and suitable gearing, of two cam-wheels facing in opposite directions and arranged one above the other, an electro-magnet, and an armature-pawl, one end of which is pivoted to the casing and the other having a head adapted to engage alternately with the notches of the respective cam-wheels, a wrist-wheel carried by the shaft of one of the cam-wheels, a link wristed to said wrist-wheel, and a bell-crank lever connected by said link with the wrist-wheel and toggled to the day and night signals, substantially as described.



2. The combination, with the electro-magnet and its pivoted armature having a double catch-head on its free end, of two oppositely-faced cam-wheels, and clock-work gearing for driving them, a wrist-wheel carried by the shaft of one of the cam-wheels, and levers linked to said wrist-wheel and to the signals, substantially as described.

396,366. WHEEL. THOMAS J. RICE, Beulah, Colo. Filed June 26, 1888. Serial No. 278,269. (No model.)

Claim.—As a new article of manufacture, a wheel whose spokes E are inwardly inclined at their bases *b'* reversely to the adjacent surface of the hub A, so that a wedge-like union of the hub and spokes is established and covered by driving the hub in or out of contact without dislocating the spokes, and whose outer bases, *b b*, are inclined outwardly from a transverse median line to correspond with the ad-

396,366.

joining faces of the felly, and thus be held by frictional contact solely, for the purpose set forth, and in the manner specified and illustrated.

396,367. SECONDARY BATTERY. ISAIAH L. ROBERTS, Brooklyn, assignor to the Roberts-Brevoort Electric Company, (Limited,) New York, N. Y. Filed May 1, 1888. Serial No. 272,519. (No model.)

Claim.—The combination, in an electric battery, of a suitable conductor carrying upon it the oxide of a metal with its coated side or sides in contact with a mass of paste, substantially as described, which holds the oxide in place upon the conductor and permits electrolysis.

396,368. SECONDARY BATTERY. ISAIAH L. ROBERTS, Brooklyn, assignor to the Roberts-Brevoort Electric Company, (Limited,) New York, N. Y. Filed May 1, 1888. Serial No. 272,520. (No model.)

Claim.—1. In an electric battery, a conducting-support covered in whole or in part with a salt of a metal, the said salt being formed into a paste and intimately spread upon the supporting-conductor, in combination with a pasty mass through which electrolysis can take place, which pasty mass is adapted to hold the salt in contact with the conducting-support, substantially as described.

2. In an electric battery, a conducting-support covered in whole or in part with a salt of a metal in a finely-divided condition, in combination with a pasty mass through which electrolysis can take place, which pasty mass is adapted to hold the salt in contact with the conducting-support, substantially as described.

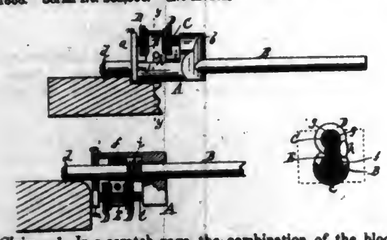
3. In an electric battery, a conducting-support covered in whole or in part with the salt of a metal surrounded by an envelope of gelatinized fiber, in combination with a pasty mass through which electrolysis can take place, which pasty mass is adapted to hold the salt in contact with the conducting-support, substantially as described.

4. The combination of a conducting-support formed of metal having upon its surface a salt of the same metal, in combination with a pasty mass adapted to hold the salt in position and to permit of electrolysis, substantially as described.

396,369. SECONDARY BATTERY. ISAIAH L. ROBERTS, Brooklyn, assignor to the Roberts-Brevoort Electric Company, (Limited,) New York, N. Y. Filed Oct. 11, 1888. Serial No. 287,575. (No model.)

Claim.—1. The process of making an electric battery, which consists in covering a conducting-support with a metallic salt itself made into a paste, and then holding the same in position upon the

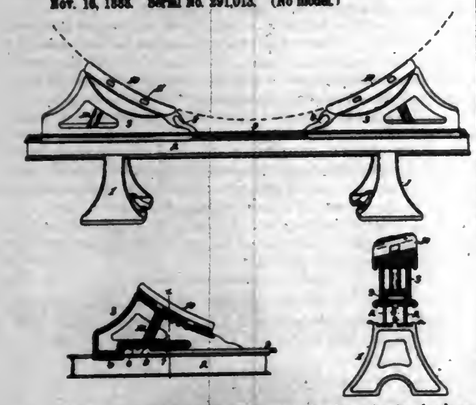
support in the completed battery by the use of a paste capable of electrolysis, or of permitting chemical action to pass, substantially as described.



2. The process of making an electric battery, which consists in covering a conducting-support with a metallic salt, enveloping the same in an envelope or bag of suitable material, preferably gelatinized fiber, then surrounding the conducting-support, salt, and bag with a paste capable of electrolysis, or of permitting chemical action to pass, substantially as described.

396,370. APPARATUS FOR SIZING BARRELS. THOMAS ROBERTS, Philadelphia, Pa., assignor of one-half to John J. Crouse, same place, and John Ansty, Lansdale, Pa. Filed Aug. 25, 1888. Serial No. 283,755. (No model.)

Claim.—A pair of skids for sizing barrels, said skids having side rails with recesses out of line with each other, substantially as described.



396,371. SCRATCH-GAGE. WILLIAM G. ROSS, Decatur, Ill., assignor of one-half to William A. Houck, Rochester, N. Y. Filed Aug. 9, 1888. Serial No. 282,380. (No model.)

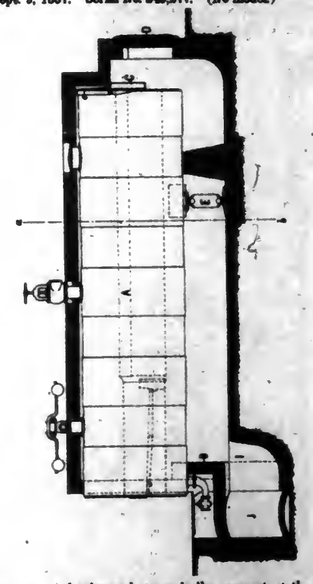
Claim.—1. In a scratch-gage, the combination of the block A, the rod B, extending through the same and provided with the scratch-point *d*, the screw C, the adjusting-nuts D D, slotted clamp E, and the thumb-screw *h*, arranged to operate in the manner and for the purpose specified.

2. In a scratch-gage, the combination of the block A, the rod B, provided with scratch-point *d*, the screw C, the adjusting-nuts D D, the slotted clamp E, the thumb-screw *h*, and the spring *i*, arranged to operate in the manner and for the purpose specified.

396,372. BARREL-STAND. CHARLES C. SCHREINER, Cincinnati, Ohio, assignor to the L. Schrufer & Sons Company, same place. Filed Nov. 16, 1888. Serial No. 291,013. (No model.)

Claim.—1. The combination of supporting-bases having horizontal ways, the shoes movable along the length of the ways to adjust the shoes to and from each other, locking devices for securing the shoes in their adjusted position, and saddles on the shoes for sustaining a cask, substantially as described.

2. The combination of supporting-bases having ways, two shoes arranged on the ways, and one movable to and from the other along the length of the ways, locking devices for holding the shoes stationary, and a rocking saddle on each shoe, substantially as described.



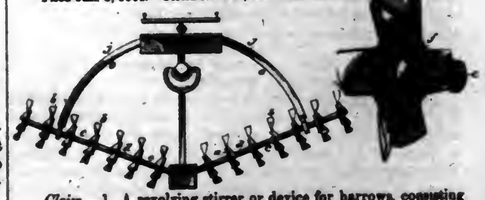
3. A cask-support consisting of the stands 1, provided with grooves to receive the flanged ways 2, the shoes 3, provided with concave seats, and the saddles 10, having convex bases, substantially as specified.

4. In combination with the ways 2, rigidly supported upon the base, the shoes 3, provided with lock-teeth 7, and the lock-bar 9, resting upon the ways, with its hooks engaging with the teeth of the shoes, substantially as herein specified.

5. In combination with the ways 2, having an aperture between them, the shoes 3, provided with a tenon, 4, projecting down between the ways and adapted to slide upon and be locked to the ways, and means for locking the shoes to the ways, substantially as described.

6. In a cask-support, the shoe 3, provided with a concave seat, in combination with the self-adjusting saddles 10, supported in said seat, substantially as specified.

396,373. STEAM-BOILER SETTING. GEORGE H. SELLERS, Ridley Park, Pa., assignor to the Edge Moor Iron Company, Edge Moor, Del. Filed Sept. 9, 1887. Serial No. 249,277. (No model.)



Claim.—1. A horizontal steam-boiler, except at the firing end, inclosed within a chamber, so that products of combustion shall have access to the entire exterior of the boiler within the chamber, in combination with a rocker-support and a fixed safety-support, substantially as and for the purposes set forth.

2. In combination with a steam-boiler and a suitable support, the saddle G, composed of two pieces united by the loop-strap *d d*, substantially as described.

3. A steam-boiler and the saddle G, in combination with the rocker-frame E, which supplements the loop-strap *d d*, substantially as described.

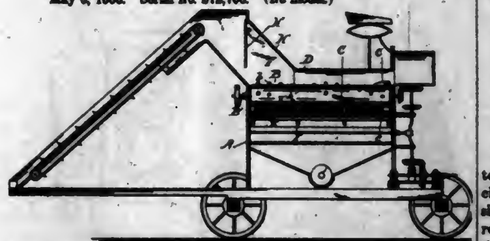
4. In combination with a steam-boiler, the rocker-support E, composed of the rocker-frame E, its base-plate F, and the saddle G, arranged and combined substantially as and for the purposes set forth.

396,374. HARROW. EDWIN F. SHERMAN, Springfield, Mass.; Caroline M. Sherman executrix of said Edwin F. Sherman, deceased. Filed Jan. 5, 1888. Serial No. 259,901. (No model.)

Claim.—1. A revolving stirrer or device for harrows, consisting of a central plate, *a*, in combination with radial blades *b*, projecting therefrom, the leading edges of which blades are radial and the following edges bent or offset from the plane of rotation, said offset being on a straight line, substantially as shown.

2. A revolving-blade device for harrows, consisting of a central plate, *a*, having exterior ribs, as *f*, and having blades *b* attached to said plate between said ribs and projecting radially therefrom, substantially as shown.

3. In a revolving harrow, the combination of a shaft, blade-holding plates *a*, sleeves *d*, and removable blades *b*, whose inner ends project below and are held in place by the sleeve ends, substantially as and for the purposes stated.



4. In a harrow or cultivator, a revolving harrow or tooth plate with tooth-supporting ribs upon each side, in combination with removable blades whose inner ends fit between said ribs, substantially as shown.

5. A blade for revolving harrows, having the rear portion of its earth-working part offset or bent at an angle on a straight line extending from the outer edge from a point a short distance back from the leading edge and extending upward and rearward, substantially as shown.

6. The revolving stirrer or device described, consisting of a hub or central portion, *a*, and plate-metal arms secured alternately to the opposite sides of said central portion and extending radially therefrom, the following corners of which arms are bent alternately in opposite directions, substantially as described.

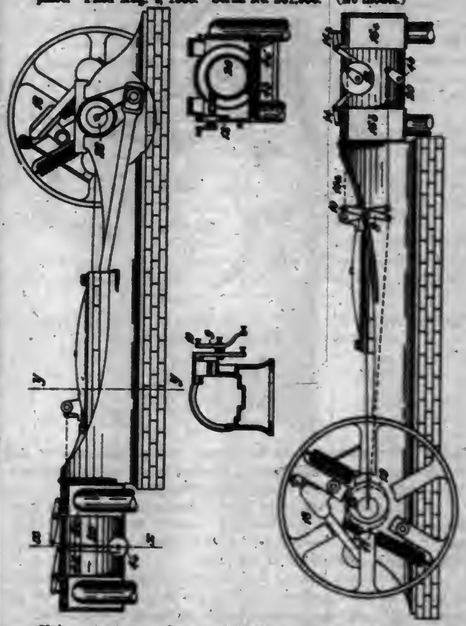
7. In a revolving harrow, the combination of a shaft, *c*, a series of single plates, *a*, sleeves *d*, disposed between said plates, and removable blades whose inner ends rest between the ends of the sleeves and plates, substantially as shown.

396,375. CORN-SHELLER. DAVID SHELLING, Adams, La Salle County, assignor to the King & Hamilton Company, Ottawa, Ill. Filed May 3, 1888. Serial No. 272,703. (No model.)

Claim.—1. In a corn-sheller, a shelling-cylinder provided with teeth arranged spirally on the cylinder and short spiral wings arranged at intervals in the spiral rows of teeth, in combination with a tubular casing surrounding said cylinder, substantially as and for the purposes specified.

2. In a corn-sheller, the casing D, composed of bars E and circular supports F, in combination with the shelling-cylinder B, provided with teeth *b*, arranged in spiral rows, and short spiral wings C, mounted on said cylinder adjacent to the circular supports F of the casing, substantially as and for the purposes specified.

396,376. OVERFLOW-CHECK NOZZLE. EPHRAIM W. SPEAR, Boston, Mass., assignor of two-thirds to George W. Lawler and James L. Smith, same place. Filed Aug. 18, 1888. Serial No. 283,097. (No model.)



Claim.—1. An automatic overflow-check nozzle consisting of the combination of a liquid-discharge nose, a separate air-admitting tube, and an acoustic indicator, constructed and arranged substantially as and for the purposes described.

2. An automatic overflow-check nozzle consisting of a discharge-nose, N, a separate air-admitting tube, B, terminating at its outer end near the end of the said nose and at its inner end near the inner side of the can, and an acoustic indicator, C, attached to the inner end of the tube B, substantially as and for the purposes described.

3. An automatic overflow-check nozzle provided with an acoustic indicator, substantially as described.

396,377. VALVE-GEAR FOR ENGINES. JOSEPH W. THOMPSON, Salem, Ohio, assignor of one-half to the Buckeye Engine Company, same place. Filed Aug. 4, 1888. Serial No. 281,953. (No model.)

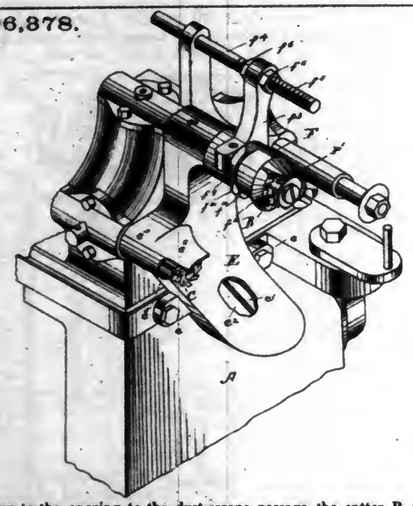
Claim.—1. A cam plate or disk for valve-gears, which is fitted to oscillate upon a central bearing and provided with one or more circumferentially-adjustable sections, each having a cam-groove consisting of substantially concentric portions of longer and shorter radius, respectively, connected by an intermediate eccentric portion, substantially as set forth.

2. The combination of a cam plate or disk having a central hub fitted to oscillate upon a fixed bearing and a peripheral rim or flange, one or more cam-sections fitting between and abutting against said hub and rim, each having a groove consisting of substantially concentric portions of longer and shorter radius, respectively, connected by an intermediate eccentric portion, and bolts passing through slotted holes in the cam sections or disk and securing the sections adjustably to the disk, substantially as set forth.

3. The combination of a valve governing one or more cylinder-ports, an oscillating cam having a cam-groove, substantially as described, a valve-lever coupled to the valve-stem and engaging the cam-groove, and an eccentric actuating a rod coupled to a pin connected with the oscillating cam, substantially as set forth.

4. The combination of an eccentric fixed upon a driving-shaft, an eccentric mounted adjustably upon said shaft, a compound rocker system connected to the rods of the fixed and adjustable eccentrics, a cam fitted to oscillate upon a fixed bearing and provided with one or more cam-grooves, substantially as described, a rod coupling a pin connected to said cam with a pin on the compound rocker system, and an induction valve or valves, each actuated by a lever engaging one of said cam-grooves, substantially as set forth.

396,378. BOOT OR SHOE TRIMMING MACHINE. CHARLES H. TRASK, Lynn, Mass. Filed Mar. 19, 1888. Serial No. 267,597. (No model.)



Claim.—1. The combination, in a sole or heel edge trimming machine, of a rotary cutter with a hood containing a passage connecting with a passage extending to an exhaust-chamber and horizontally adjustable by means substantially as specified, as and for the purposes described.

2. The combination of the box or casing having a section of the escape-passage, the section e^3, having an opening, e^5, the hood F, the rod f^9, the supporting-arm f^3, the nuts f^4, and the cutter B, substantially as described.

3. The combination of the hood F, having the section *f*, provided with the hole f^7, to fit the shaft f^9, the cutter B, and devices for moving the hood horizontally upon the shaft, substantially as described.

4. The combination of the hood F, adjustable horizontally in re-

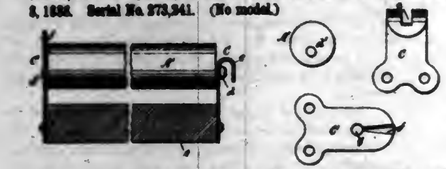
396,878.

lation to the opening to the dust-escape passage, the cutter B, and a sole-edge rest, f^7, formed upon or attached to said hood and horizontally movable therewith, substantially as described.

5. The combination of the hood F, horizontally adjustable in relation to the cutter B and having a recess, f^9, the spring-heel edge-rest f^7, supported by said hood, and the adjusting-nuts f^{10}, held in said recess f^9, substantially as described.

6. The combination of the shank-edge cutter C, with the box or casing having a section, c^4, provided with an opening, c^6, and an extension, c^5, projecting over the cutter, substantially as described.

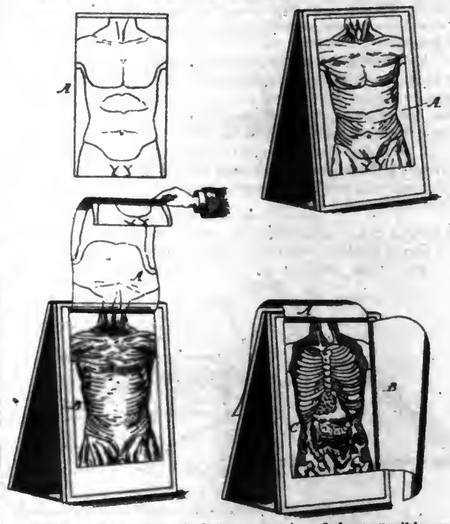
7. The combination of the shank-edge cutter C, the sole-edge cutter B, the box E, having the passage communicating with the exhaust and provided with the section c^4, having the opening c^6 in proximity to the shank-edge cutter C, and the section c^5, having the adjustable or movable sleeve provided with an opening in proximity to the sole-edge cutter B, substantially as described.



8. The combination of the cutter B and the hood F, having the opening g', and the end F', drawn in or reduced in size to provide the narrow opening g between it and the cutter, and forming a narrow passage of uniform width about the cutter, substantially as described.

396,879. HEMMER FOR SEWING-MACHINES. ALONZO WAYNE, Lancaster, Wis., assignor of one-half to Lemuel J. Arthur, same place. Filed July 25, 1888. Serial No. 281,095. (No model.)

Claim.—The combination, with a hemmer-plate, of a longitudinally-divided hem-turning scroll having its parts hinged together to permit opening for the insertion of the work, and a spring fixed to the hemmer-plate, with its free end resting upon the scroll and provided with a bend to receive the scroll when partially open and to resist further opening or closing motion thereof, whereby the parts are held firmly in convenient position for the insertion of the work.



396,880. TROUSERS-STRETCHER. THOMAS WHITE and JOHN MILNE, New York, N. Y.; said Milne assignor to said White. Filed May 8, 1888. Serial No. 273,241. (No model.)

Claim.—1. In a trousers-stretcher, the combination, with a suitable brace, of clamping-bars, one fixed and the other movable, eccentric pivots on the ends of the movable bar, and bearings for said pivots on the fixed bar, one such bearing being slotted and hook-shaped and the pivot therein being headed to permit the movable bar to be swung away from the fixed bar without disconnecting said pivot from the bearing, and the other bearing constructed to permit removal of the pivot therefrom, substantially as and for the purpose described.

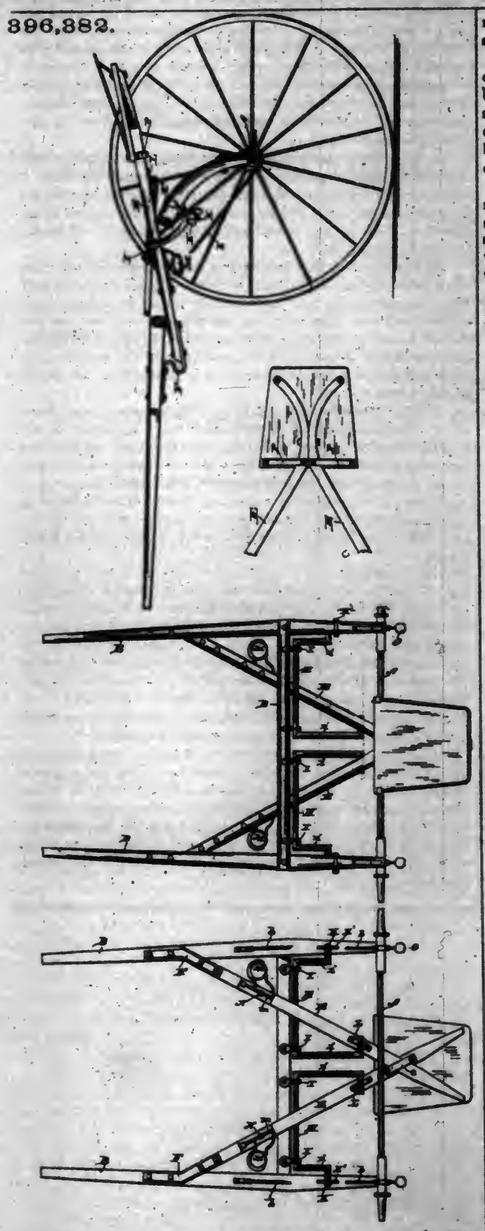
2. In a trousers-stretcher, the combination, with a suitable brace of clamping-bars, one fixed and the other movable, eccentric pivots on the ends of the movable bar, and bearings for said pivots on the fixed bar, one such bearing being slotted and hook-shaped and the pivot therein being headed, for the purpose specified, and the other bearing having a groove extending from the pivot-hole to the extremity thereof to act as a guide for the proper pivot, substantially as and for the purpose described.

396,881. ANATOMICAL CHART. LEVI W. YAGGY, Chicago, Ill., assignor to the Western Publishing House, same place. Filed Oct. 1, 1888. Serial No. 286,847. (No model.)

Claim.—In an anatomical chart, a series of sheets flexibly connected together, each having thereon a representation of some part or organ of the body, in combination with a transparent or semi-transparent sheet having thereon a front view of the exterior of the trunk and flexibly connected with the main part of the chart, whereby such transparent sheet can be brought over any one or more of the remaining sheets of the chart which may be at any one time exposed to view and the position of such exposed sheet or sheets relative to the front exterior of the body can be seen through such transparent sheet, substantially as specified.

396,882. TWO-WHEELED VEHICLE. DAVID A. GARVER and CLARENCE H. STRAIGHT, Bryan, Ohio; L. W. Wilder administrator of said Clarence H. Straight, deceased. Filed Sept. 8, 1888. Serial No. 284,573. (No model.)

Claim.—1. In a two-wheeled vehicle, the combination, with the axle and shafts connected thereto, of seat-bars connected to the shafts at the forward ends and brought together at the rear ends at a point near the center of the front edge of the seat, and springs for supporting said bars, substantially as described.



2. In a two-wheeled vehicle, the combination, with the axle and shafts connected thereto, of seat-bars connected to the shafts at the forward ends and extended back and crossed at substantially the center of the front edge of the seat, the crossed ends forming the support for the seat, and springs for supporting said bars, substantially as described.

3. In a two-wheeled vehicle, the combination, with the axle and shafts connected thereto, the seat-bars connected to the shafts at the forward ends and brought close together at the rear ends, forming the support for the seat, and the cross-bar connecting the shafts, of the torsion-springs mounted on and parallel with the cross-bar, the ends being extended at right angles and engaging the shafts and seat-bars, respectively, substantially as described.

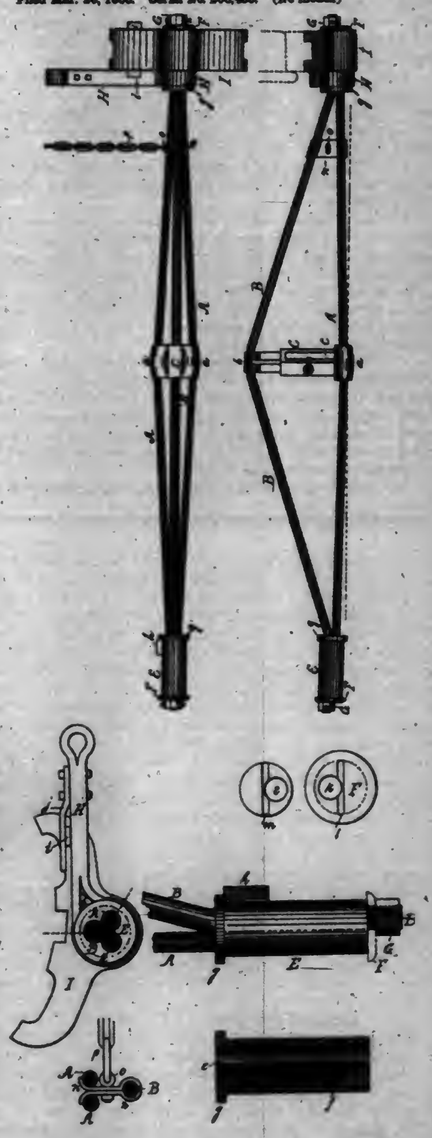
4. In a two-wheeled vehicle, the combination, with the axle, shafts connected thereto, cross-bar uniting the shafts, and the seat-bars, of torsion-springs lying parallel with and in proximity to the cross-bar, one end of each of said springs being adjustably connected to the shaft and the opposite end engaging the seat-bars to support the same, substantially as described.

5. In a two-wheeled vehicle, the combination with the axle, the shafts connected thereto, the cross-piece uniting the shafts, and the

396,882.

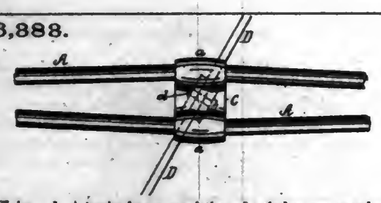
seat-bars, of the torsion-springs mounted on the cross-piece, the outer ends of said springs being bent backward and connected to the shafts and the inner ends bent backward at points between the seat-bars and engaging said bars to support the same, whereby the space at either side of the seat-bars is unobstructed, substantially as described.

6. In a two-wheeled vehicle, the combination, with the axle, the shafts connected thereto, and the cross-piece uniting the shafts, of the seat-bars connected to the shafts by substantially S-shaped springs and extended backward beneath the cross-piece, and torsion-springs mounted on and parallel to the cross-piece with the backwardly-extending ends for supporting said bars, substantially as described.



7. In a two-wheeled vehicle, the combination, with the axle, the shafts connected thereto, the cross-bar, and the seat-bars connected to the shafts at the forward ends by the substantially S-shaped springs and extending backward beneath the cross-bar of the seat supported on the rear ends of the seat-bars and the stirrups or foot-rests mounted on said seat-bars at the forward ends, substantially as described.

8. In a two-wheeled vehicle, the combination, with the axle, shafts connected thereto, seat-bars united to the shafts at the forward ends by substantially S-shaped springs, and the cross-piece uniting the shafts, of torsion-springs mounted on the cross-piece and bent at the ends to engage the shafts and seat-bars, respectively, the seat on said bars at the rear, and the foot-rests or stirrups thereon at the forward ends, substantially as described.



9. In a two-wheeled vehicle, the combination, with the axle, the shafts connected thereto, the cross-piece uniting the shafts, and the seat-bars connected to the shafts at the forward ends, of the torsion-springs engaging the seat-bars to elevate the same and connected to the under side of the shafts by the bolt, set-nut, and clip, whereby the tension of said springs may be adjusted, as set forth.

10. In a two-wheeled vehicle, the combination, with the shafts B B, of cross-piece D, springs H, having rearward extensions i', clips I, the seat-bars E, and wear-plates L, substantially as described.

396,883. BRAKE-BEAM. HARVEY L. PRESTON, Hudson, Wis. Filed Mar. 26, 1888. Serial No. 268,483. (No model.)

896,888.

Claim.—1. A brake-beam consisting of a tie-bar composed of two rods separated at their middle point, a double-inclined truss-rod, a sleeve uniting the said three rods at their extremities, the said sleeve forming bearings adapted to receive a hanger and brake-head, and means, substantially as described, for adjustably cambering said tie-rods to incline said sleeve-bearings to a greater or less angle from the longitudinal line of the beam.

2. A brake-beam consisting of a tie-bar composed of two rods separated at their middle point, a double-inclined truss-rod, a removable sleeve having a triple socket adapted to receive and unite the extremities of the said three rods, the said sleeve forming bearings adapted to receive a brake-hanger and brake-head, and a branching king post or strut, the said branches having bearings for said tie-rods and the opposite end of the body of the strut having a bearing for said truss-rod, substantially as and for the purpose herein specified.

3. In a brake-beam of the character described, consisting of two tie-rods and a truss-rod supported at their middle point by a forked strut, a triple sleeve removably mounted upon and retaining together the extremities of said rods, an outwardly-extending annular flange formed on the inner end of said sleeve, a V-shaped lug upon said sleeve abutting against said flange, and a brake-hanger adapted to surround said sleeve and having a recess to receive said lug, substantially as specified.

4. A brake-beam consisting of a tie-bar composed of two rods separated at their middle point, a double-inclined truss-rod, the extremities of the said tie-rods and truss-rod being brought together and united at their extremities by means of a removable sleeve forming bearings for the brake-hanger and brake-head, and the said tie-rods being cambered from their middle point, substantially as described, whereby the said sleeve-bearings are held at a slight angle to the longitudinal line of the beam.

5. A brake-beam consisting of three rods trussed together at their middle point by means of a forked strut forming the fulcrum-bar, the said rods being brought together at their extremities, a movable sleeve mounted upon and retaining said extremities together, and means for retaining said sleeve normally in position upon the extremities of the rods to form a seat for the brake-head, substantially as and for the purpose herein specified.

6. In a brake-beam of the character described, consisting of two main rods mounted in bearings formed at one end of the fulcrum-bar and a truss-rod mounted in a bearing at the opposite end of said fulcrum-bar and bent at its extremities to lie substantially parallel with the main rods, a triple sleeve having a socket of a form to receive the extremities of the three rods, the said truss-rod extending entirely through said sleeve and provided with a screw-thread and nut, whereby the sleeve may be retained in place, substantially as and for the purpose herein specified.

7. In a brake-beam of the character described, consisting of the two main rods and a truss-rod supported at their middle point by a forked strut, a triple sleeve mounted upon and retaining together the extremities of said rods, and an outwardly-extending annular flange formed on the inner end of said sleeve, substantially as and for the purpose herein specified.

8. In a brake-beam, in combination with the main rods and truss-rod, a sleeve having a triple socket of a form to fit the combined bulk of the several rods, the truss-rod extending entirely through the sleeve and provided at its outer projecting end with a screw-thread and nut, and the main rods abutting against an upright shoulder formed near the outer end of the sleeve by the termination of the portion of the triple socket in which said rods are held, substantially as and for the purpose herein specified.

9. In a brake-beam, in combination with the main rods and truss-rod, a triple sleeve mounted upon the outer united extremities of said rods and adapted to form a seat for the brake-head, the truss-rod extending entirely through said sleeve and provided at its outer projecting extremity with a screw-thread and nut, and a flange-cap of larger diameter than the said sleeve and adapted to be held in place upon the outer extremity of the truss-rod between said nut and the outer end of the sleeve, substantially as and for the purpose herein specified.

10. In a brake-beam, in combination with the main rods and truss-rod, a triple sleeve mounted upon the outer extremities of said rods and adapted to form a seat for the brake-head, the truss-rod extending entirely through said sleeve and provided at its outer extremity with a screw-thread and nut, a flange-cap of larger diameter than the said sleeve and adapted to be held in place upon the end of the truss-rod between said nut and the outer end face of the sleeve, the said sleeve having a groove formed across its outer end face, and a correspondingly-shaped feather formed across the inner face of the flange-cap, substantially as and for the purpose herein specified.

11. In a brake-beam of the character described, consisting of the main rods and the truss-rod united at their extremities and supported at their middle by means of bearings in a forked strut, the clamp-plates *n n*, adapted to grasp the several rods at the opposite extremities of the plates, and an eyebolt, *o*, passing through said plates and adapted to be connected with the supporting frame-work by means of a chain or other suitable support, substantially as and for the purpose herein specified.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

STACHELBERG *et al. v.* PONCE.

Decided December 17, 1888.

TRADE-MARK.

It appearing that the mode in which the complainants packed their cigars, the kind of boxes used by them, the number of cigars in each bunch, the particular color of ribbon or tape around each bunch, and the size and shape of the cigars were all old in the trade, and that the name "La Normanda" had been used for cigars resembling the "La Normandi" cigars in size and shape, &c., in different parts of the country several years prior to the adoption of the words "La Normandi" by the complainants or their assignor, the adoption of these words as a Trade-Mark and their registration could not take away the right previously acquired by the public in the use of the words "La Normanda" as indicating a particular kind of cigars.

APPEAL from the Circuit Court of the United States for the District of Maine.

STATEMENT OF THE CASE.

This is a Trade-Mark case. The principal relief asked by the appellants, who were the plaintiffs below, is a decree enjoining the appellee, who was the defendant below, his agents and servants, from using as a trade-name in their business of manufacturing and selling cigars, the words "Normandie," or "E. P. Normanda," or "La Normanda," or "Normanda;" such use of those words being, it is alleged, a violation of the right of the plaintiffs to the exclusive use of the words "La Normandi" and "Normandi" in their business of manufacturing and selling cigars of a certain kind.

It is alleged, among other things, that one Asher Bijur, of New York, was engaged from 1858 to 1865 in manufacturing and packing cigars of various grades and shapes, some of which, of superior quality, were called "La Normandi," and were put up in boxes containing 250 each, labeled and branded with those words; that, being of fine stock, skillfully made, and of a shape that pleased the eye, his cigars of that kind became widely known, gaining great favor with the public, particularly in the New England States; that the first use by any one engaged in the manufacture, packing, or sale of cigars of the words "La Normandi" or "Normandi" was by him, those words constituting his Trade-Mark for cigars of the above description; that on or about February, 1865, he assigned, sold, transferred, and conveyed to the plaintiff, Michael Stachelberg, his heirs, and assigns, all his right, title, and interest in and to the exclusive use of the words "La Normandi" and "Normandi;" that on or about January 1, 1873, the plaintiffs formed a partnership under the firm-name of M. Stachelberg & Co., said Trade-Mark becoming their joint property; that since said assignment they have been engaged in manufacturing cigars under the names "La Normandi" and "Normandi," bestowing great care upon their packing, putting them up in bunches, (each bunch being tied with a peculiar colored and striped ribbon,) and offering them for sale in boxes containing 250 cigars each, branded with the words "La Normandi;" and that they have incurred great expense in bringing such cigars so named to public attention, whereby large profits have accrued from their sale.

The bill also states that on the 19th of February, 1876, the plaintiffs deposited in the Patent Office at Washington the name "Normandi" as a Trade-Mark, and March 7, 1876, received from that Office a certificate showing such record; that after said assignment, and up to the date of and since such deposit, they have used the word "Normandi," with the prefix "La," and that by virtue of such assignment, and of their uninterrupted use of the words "La Normandi," they acquired and have the sole and exclusive right to use them as a Trade-mark.

It is further alleged that since January 1, 1881, the defendant Ponce has been manufacturing, and causing to be manufactured, and offering for sale, cigars substantially similar in shape, size, and outward appearance to their La Normandi cigars, and has put them in boxes of the same pattern, general shape and size, and tied with ribbons colored and striped and resembling the ribbons used by them, his boxes being branded some with "Normanda," some "E. P. Normanda," and others "Normandie," whereby the defendant has fraudulently imposed and, unless restrained from so doing, will continue to impose upon the public his cigars as the real "La Normandi" cigars, manufactured, put up, and sold first by Bijur and afterward by the plaintiffs, and whereby, also, great and irreparable injury will be done to the plaintiffs in their business.

The defendant admits in his answer that he has sold cigars under the brand or label of "La Normanda;" but those words, he alleges, have always been accompanied on the boxes or packages containing them by the words "E. P.," or "E. Ponce," or "Ernesto Ponce," and sometimes by the words "Portland, Maine," thus indicating the manufacturer and the place at which his cigars were made. Denying that his Trade-Mark infringes the alleged trade-name of the plaintiffs, or that he intends to use any trade-name of theirs, he insists that Bijur did not, and could not, have an exclusive right to the words "La Normandi" as a Trade-Mark; that the words "Normandi" and "Normanda" are of foreign origin and of different significations, the former being a geographical and the latter a personal name; that the word "Normanda" has long been publicly used as a name or designation for cigars, was stamped upon boxes and packages containing them long prior to any of the alleged rights of the complainants; and that such terms were in public use as a designating-mark for a manufacture of cigars at Havana as early as 1861, and were so used in that year as a brand for cigars put up and sold by him, as well as by others. He contends that there is nothing in the shape or size of his cigars, or in the manner in which he bundles or ties them up, which can be exclusively appropriated by the plaintiffs. In respect to the use of the words "La Normandie," he denies that he has ever manufactured, or ordered to be manufactured, any cigars branded with those words, although in the course of his business he has bought and sold other and common brands of cigars marked in that way.

It was in proof that the alleged Trade-Mark, "La

Normandi," was used by the assignor of the plaintiffs as part of a label that consisted of those words printed at the top thereof; a picture, immediately below those words, of the interior of a cigar-factory while occupied by the employés of the manufacturer; and a fac-simile of Bijur's signature, together with the initials "A. B." The label used by the plaintiff consists of the words "La Normandi" at its top, beneath those words a picture of the interior of a cigar-factory as above stated, and at the bottom of the picture the following words and a fac-simile signature of M. Stachelberg, to wit:

Genuine La Normandi Segars are branded with my initials and the labels inside are signed in my own handwriting. M. Stachelberg. Entered according to act of Congr. A. D. 1866 by M. Stachelberg in the Clerk's Office of the Dis. Court of the Southern District of N. Y.

By the decree below the bill was dismissed upon the ground that when a right to the use of a Trade-Mark is transferred, either by the act of the original owner or by operation of law—

the fact of transfer should be stated in connection with its use; otherwise a deception would be practiced upon the public. (*Stachelberg v. Ponce*, 23 Fed. Rep., 490.)

Mr. Rowland Cox for the appellant.

Mr. William Henry Clifford for the appellee.

Mr. Justice HARLAN delivered the opinion of the Court.

After stating the facts as above, he continued: We are of opinion that the plaintiffs are not entitled to an injunction restraining the defendant from using the words "La Normanda" or "Normanda" as part of a brand or label for cigars manufactured or sold by him. If it was satisfactorily shown that those words were not used in the trade to designate a particular kind of cigars, until after the words "La Normandi" or "Normandi" had become a part of the established Trade-Mark of Bijur, it might be necessary to consider whether the former words taken in connection with the entire label or brand used by the defendant, his mode of packing his cigars, and their size and appearance, were calculated to deceive the public by inducing the belief that they were the same cigars as La Normandi cigars, manufactured and sold by Bijur and by the plaintiffs. But no such case is made by the proof. On the contrary it appears, by a preponderance of evidence: First, that the mode in which Bijur, and after him Stachelberg & Co., packed their La Normandi cigars, the kind of boxes used by them, the number of cigars in each bunch, the particular color of the ribbon or tape around each bunch of 25, the putting of 250 cigars in each box, and the size and shape of the cigars, were all old in the trade, preceding, in point of time, the adoption by Bijur of the words "La Normandi" as part of his trade-name; second, that for several years prior to the adoption by Bijur of his Trade-Mark, and from about that date until the bringing of this suit, cigars resembling the La Normandi cigars, in size and shape, in the color of the ribbon or tape by which the bunches of 25 were tied, and in the manner in which they were put up and packed, were and have been made and sold, in quite large numbers, in different parts of this country, under the name of "La Normanda." An effort is made to discredit the evidence establishing these facts by showing by witnesses, engaged for many years in the business of manufacturing and selling cigars, that they never knew or heard of any being sold under the name of "La Normanda." But the evidence to that effect is entirely negative in its character, and is not sufficient to overcome the direct positive testimony of witnesses, some of whom, as early as 1853, actually manufactured and sold La Normanda cigars of the kind above described, while others remember that domestic cigars, under that designation, were in the market before Bijur commenced the manufacture of the La Normandi cigars. In this view of the evidence the plaintiffs are not entitled to the relief asked. The adoption by Bijur of the words "La Normandi" as part of his Trade-Mark could not take away the right previously acquired by the public in the use of the words "La Normanda" as indicating a particular kind of cigars.

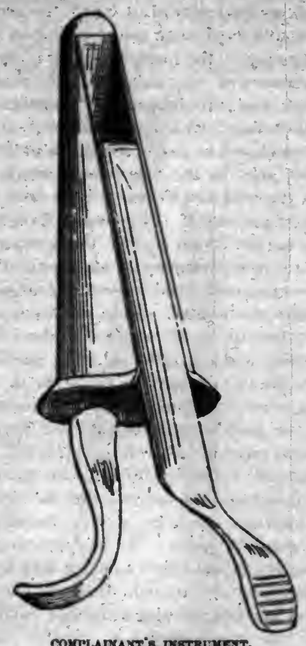
This conclusion is sufficient to dispose of the case, and renders it unnecessary to consider other grounds upon which, it is insisted, the decree below should be sustained.

The decree is affirmed.

U. S. Circuit Court—Eastern Judicial District of Missouri, Eastern Division.

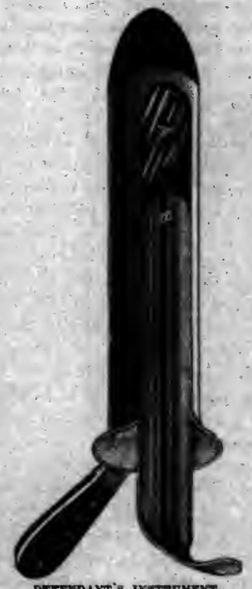
BRINKERHOFF *v.* ALOE.

Decided December 24, 1888.



1. BRINKERHOFF PATENT—FIRST CLAIM IS ANTICIPATED.
   The first claim of the patent granted to A. W. Brinkerhoff March 2, 1880, on rectal speculums, is for a slide extending the entire length of the tube. *Held* anticipated by the older art.
2. MATERIAL NOT ESSENTIAL.
   Where an element of a claim does not depend for its novelty in the material of which it is made it will be anticipated by a like element in a like instrument of different material.
3. SAME.
   The slide employed in the Brinkerhoff instrument and covered, broadly, by the first claim of the patent is made of metal. The patent makes no mention of any novelty existing in the material of which the slide is composed. *Held* that the claim is anticipated by a glass slide in a similar instrument.
4. PATENTABILITY—WHAT DOES NOT AMOUNT TO INVENTION.
   A speculum consisting of a tube with a slide and a closed end was old. *Held* that adding an incline to the closed end to prevent the impaction of pile-tumors did not involve invention.
5. SAME—THIRD CLAIM VOID FOR WANT OF INVENTION.
   The third claim of the Brinkerhoff patent covers a speculum composed of a tube with a closed end and a slide and having an incline at the closed end. *Held* void for want of invention.
6. AGGREGATION.
   A claim consisting of a number of elements which do not coact to produce a new and useful result is a mere aggregation and not a patentable combination.
7. SAME—BETTER RESULTS NOT PROOF OF INVENTION.
   Where several old elements are so combined as to produce a better instrument than was formerly in use, but each of the old elements does only what it formerly did in the instrument from which it was borrowed and in the old way, *Held* that the combination is not a patentable one.
8. SAME—SECOND CLAIM IS AN AGGREGATION AND VOID.
   The second claim of the Brinkerhoff patent covers a slotted tube having an incline and a slide. *Held* that the incline acted precisely as it did when placed in the forward end of a slotted tube not provided with a slide, and that therefore the claim covered an aggregation only and was void.

Messrs. Lee, Brown & Lee for the complainant.



Mr. George H. Knight and *Mr. A. Binswanger* for the defendant.

THAYER, *D. J.*:

This is a bill to restrain the infringement of Letters Patent No. 224,991, granted to Alexander W. Brinkerhoff, under date of March 2, 1880, for an improvement in rectal specula.

COMPLAINANT'S INSTRUMENT.

DEFENDANT'S INSTRUMENT.

The patentee in his specification thus describes his invention:

My speculum is made of metal and plated in the usual manner to secure a bright interior and smooth surface. In shape it is conical, and has one side slotted through its entire length of chamber. Into such slot H is closely fitted a movable slide, B, having upon its rear end a handle, D, for actuating it. On the side of tube A, opposite the slide, is another handle, D, by which to hold the tube when in use.

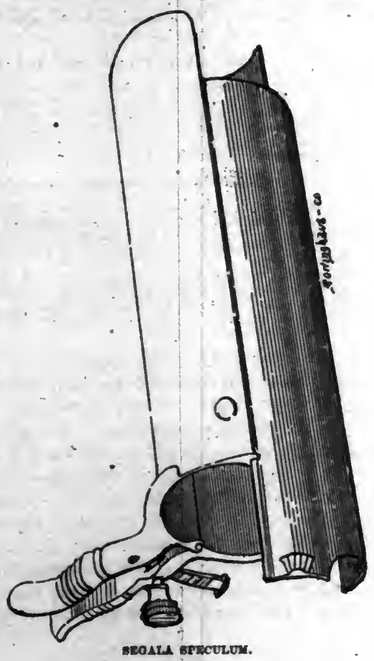
Around the large end of tube A is a flange or lip. * * * and in the forward end of the chamber is an incline, K, made necessary in specula having closed ends to prevent * * * the impaction of pile-tumors, enlarged glands, or surplus membrane in the end of the chamber, and thereby enable the operator to withdraw the instrument with safety and ease.

Of the nature of his invention the patentee says:

* * * My invention consists in the use of a slide extending through the length of one side of the tube and an incline inside of the forward or small end of the chamber, extending from the bottom of the chamber upward and forward to the under side of the slide when in place, to prevent injury to the membrane while withdrawing the instrument, &c.

The claims made in the specification are as follows:

1. A slide in the side of a speculum, extending through its whole length, and used substantially as herein described.
2. The incline in the front end of the chamber, in combination with the tube, slot, and slide, substantially as and for the purposes herein set forth.
3. In cylindrical tubular specula having a slotted side and closed end to prevent the entrance of faeces, the incline in the front end of the chamber, extending upward from the bottom and forward to under side of slide, substantially as described, and for the purposes herein set forth.



First. It is clear that the first claim of this patent covering "a slide in the side of a speculum, extending through its whole length," cannot be sustained. Indeed, it is not seriously contended by complainant's counsel that the device covered by that claim is novel. I shall not go into the details of the evidence, therefore, on this branch of the case, but will content myself with the general statement that the testimony of Dr. Warren B. Outen, Dr. Chas. Bernays, and Dr. Charles E. Michel, as well as the testimony of Wm. Grady and Herman Speckler, satisfies me that rectal speculums closed at one end, having a slot in the side

REED'S INSTRUMENT.

extending the full length of the chamber and fitted with a slide, had been used by the medical fraternity in this country before the date of the alleged invention. While it is true that defendant has not produced any of the speculums that were so in use, and

has only produced a model of one made in his own shop since this suit was filed, known as the "Reed speculum," yet I consider this fact not sufficient in

SEGALA SPECULUM.

CATHETER.

itself to overcome the positive statements of intelligent and entirely disinterested witnesses, who had occasion to know the fact whereof they speak, that speculums with slotted sides fitted with slides were in use and to some extent were on sale in this country prior to the date of the alleged invention in July, 1878. The Reed instrument, and possibly all the instruments of which the witnesses above named have spoken, had glass slides instead of metal; but that fact is not important, as the material of which the slide is composed is not claimed as an essential feature of the device. But even if the foregoing view is erroneous, I am furthermore of the opinion that the first claim of the patent was anticipated by "Segala's tri-valve vaginal speculum," which was produced on the hearing and was shown to have been in use in this country since 1860; also, by the "catheter," which was produced on the trial and shown to have been on sale in this country since 1874. (Defendant's Exhibits 17ª and 5ª.) The use for which both of the instruments last referred to were designed is analogous to that in which complainant employs his instrument. Both instruments are tubular. Each has a slot in the side extending the full length of the chamber, fitted with a metal slide, which is intended to be wholly or partially withdrawn (the same as the slide in the rectal speculum) when the operator has occasion to examine or treat the particular organs for the treatment of which these instruments were constructed. In view of the slides shown in Segala's vaginal speculum and in the catheter and the use made of the same it must be held that there is nothing novel in the slide claimed in complainant's patent. He has in this particular matter merely appropriated a device long known and used in surgical instruments fitted for the examination of certain interior membranes or cavities of the body for the improvement of another instrument adapted to the treatment of other interior membranes. Hilton's rectal speculum, an instrument said to have been in use in England as early as 1870, also clearly anticipates the first claim of complainant's patent, and probably the second and third claims. If Hilton's speculum, as contended, was described in a printed publication in England as early as 1876, that fact also invalidates the first claim of the patent under consideration, and most likely the second and third claims. The original printed publication relied upon, said to have been published in London as early as 1876, was not produced at the hearing before the master, but in lieu thereof a volume, entitled "Rest and Pain," published in New York in 1879, which purports to be a reprint of the earlier English publication, was produced. Some testimony was offered to the effect that application had been made to the English publishers and to other book-sellers in London and in this country for a copy of the original publication, and that they reported the work to be out of print. All of the testimony, however, tending to show that a book entitled "Rest and Pain" was published in London in 1876 and that the work reprinted in this country in 1879 is an accurate copy thereof is of the nature of hearsay; and, as objection was duly taken to the testimony when it was produced before the master, and was insisted upon at the trial, the objection must be sustained, no matter how persuasive the inference may be that there was a foreign publication which described Hilton's speculum. The latter instrument is accordingly ignored as an anticipation of complainant's invention.

Second. The third claim of the patent is a claim for the "incline" in cylindrical tubular specula having a slotted side and closed end. The particular device attempted to be covered by this claim was anticipated, in my opinion, by a rectal speculum produced by Dr. Mudd, (Defendant's Exhibit 18ª,) and shown to the satisfaction of the court to have been purchased at an instrument-store and to have been in use in this country before the date of complainant's invention.

DR. MUDD'S INSTRUMENT.

The instrument in question is tubular; it is conical in form, has a slotted side, a closed end, and, what is of more importance, an incline at the closed end extending from the bottom of the chamber upward and forward to the end of the slot. It is true that the angle made by the incline with the axis of the tube in the latter instrument approaches more nearly to a right angle than the incline in complainant's speculum. Nevertheless there is a pronounced "incline," and, moreover, Dr. Mudd testifies that one purpose of the "incline" is to protect the mucous membrane from injury when the speculum is withdrawn. It should be further observed that complainant's specification does not make the angle at which the incline is set in his speculum an essential feature of the device. As described in his specification, the utility of the incline consists in preventing "the impaction of pile-tumors," &c., and in enabling the operator to withdraw the instrument without injury to the membranes. This is precisely the function of the incline in the speculum produced by Dr. Mudd, and apparently it was set at an angle which effectually accomplished that purpose. At all events no complaint appears to have been made against that speculum on the ground that the incline failed to accomplish the purpose had in view. The Squire speculum (Defendant's Exhibit 9ª) also shows an incline in the forward or closed end in all respects like that in complainant's instrument; but the testimony in the case leaves it somewhat doubtful whether the "incline" in Squire's speculum was placed therein shortly before or shortly after complainant claims to have invented it. For that reason the patent is not affected by the evidence offered by defendant in relation to the Squire instrument.

Third. In view of what has been said it appears that plaintiff's right to relief depends on the second claim, for the "incline * * * in combination with the tube, slot, and slide." This claim is attacked on two grounds: first, that the combination as a whole was anticipated by Dr. Hodgen when he caused an incline in the form of a mirror to be set permanently in the forward end of the old "Reed speculum," about the year 1876; and, second, that the combination is devoid of invention and patentable novelty. I shall concede that the evidence as to what Dr. Hodgen caused to be done with the Reed speculum 12 or 13 years since is, under the circumstances, not of that certain and convincing character which ought to be required to overturn the claims of a duly-issued patent. The second objection to the claim, however, is more formidable. The Reed speculum, before alluded to, shows "the tube, slot, and slide" combined in a manner that does not differ essentially from the form in which the same elements are combined in complainant's combination. To these three elements the patentee added a fourth—the "incline in the front end of the chamber." But the "incline," as before stated, was itself an old device which had been used in speculums such as were produced by Dr. Mudd. Furthermore, it was used in the old instruments for the same purpose that complainant professes to have invented it—that is to say, to avoid injuring protruding membranes when the speculum was withdrawn. Even if complainant had been the first to use the incline in tubular speculums having closed ends, the device was a very obvious one, scarcely rising to the dignity of an invention considering the function it performed, as is well illustrated by the account which the patentee gives of the manner in which the idea was conceived. He states that he first constructed his speculum, as shown in the specification, with a tube, slot, and slide, but without an incline. When he made the first trial of the instrument, he discovered the risk of injuring such membranes as happened to protrude through the slot, as others had discovered, who used the Mudd instrument. Thereupon he employed a jeweler to solder a small piece of metal in the forward end of the chamber, so as to form an incline, and subsequently amended his specification by adding the third claim, which is substantially a claim for the incline as an independent device. But regardless of the obvious nature of the improvement made by adding the incline, the court is of the opinion that the combination so formed was not patentable, because no new result or effect was produced by the united action of the old elements. To sustain a patent on a combination of old devices it is well settled that a new result must be obtained which is due to the joint and co-operating action of all the old elements. Either this must be accomplished or a new machine of distinct character and function must be constructed. (*Pickering* v. *McCullough*, 104 U. S., 310; *Hailes* v. *Van Wormer*, 20 Wall.,

353; *Tack Co.* v. *Manfg. Co.*, 9 Bissell, 258; *Wringing Mach. Co.* v. *Young*, 14 Blatch., 46.) If several old devices are so put together as to produce even a better machine or instrument than was formerly in use, but each of the old devices does what it had formerly done in the instrument or machine from which it was borrowed, and in the old way, without uniting with other old devices to perform any joint function, it seems that the combination is not patentable. (*Hailes* v. *Van Wormer, supra; Beckendorf* v. *Faber*, 92 U. S., 347.)

In the present case the incline when placed in combination with the "tube, slot, and slide" acted precisely as it did when placed in the forward end of a slotted tube not provided with a slide. Its action was in no sense modified by the new relation in which it was placed, nor did it in unison with the other elements of the combination produce a distinctively new result.

In accordance with these views the bill is dismissed.

U. S. Circuit Court—District of Maryland.

STUART *v.* THORMAN *et al.*

Decided November 5, 1888.

STUART—COMPOSITE PAVEMENTS.

Letters Patent No. 269,480, granted December 19, 1882, to Peter Stuart, for an improvement in composite pavements, again sustained and *Held* not anticipated by Patent No. 90,825, June 1, 1869, to Dotch and Duempelman.

APPLICATION for preliminary injunction to restrain infringement of patent.

STATEMENT OF THE CASE.

Bill was filed to enjoin the infringement of Patent No. 269,480, granted to Peter Stuart, of Glasgow, Scotland, December 19, 1882, for composite pavements. The claim of the patent is as follows:

A composite pavement formed with circular, square, or analogous depressions of equal or nearly equal diameter in each direction, and with even or level margin on the pavement surface, to adapt them to operate in the manner described.

The specification describes the mode of operation as follows:

My improvement is especially, though not exclusively, intended for application to sidewalks; and it consists in the formation in the surface of pavements of depressions of such a character that in stepping thereon the pressure of the feet will expel the air, causing a partial vacuum, which, supplementing the mechanical effect of the roughened surface, will operate to afford an additional hold to the feet and prevent slipping. This beneficial effect is greater when the pavement is wet, at which time pavements as ordinarily constructed with smooth or grooved surfaces are more than usually slippery.

Messrs. Price & Steuart for the complainant.

Mr. William Pinkney Whyte for the defendants.

MORRIS, *J.*:

The complainant exhibits his patent, together with the record of the case of the *Vulcanite Paving Company* v. *The American Artificial Stone Pavement Company* in the Circuit Court of the United States for the Eastern District of Pennsylvania, in which, by the judgment of Judges McKennan and Butler, his patent was adjudicated and sustained. The same defenses were made in that case as in this, and were considered and passed upon by the court. All the anticipating patents now set up in defendants' answer were set up then, except No. 90,825, dated June 1, 1869, granted to Dotch and Duempelman. I am satisfied that this is not an anticipation of the invention claimed by complainant.

The specification of the Dotch and Duempelman patent states:

The smooth surface of all concrete pavements is very objectionable on account of the liability of horses slipping thereon. To obviate this difficulty we pass over the pavement before it becomes perfectly cool a corrugated roller or a roller having a series of flanges or projections around its circumference, which indents the surface, leaving it in the condition of the Nicholson or any other well-paved road.

This was simply a method of producing lines of depression or indentations in a composition road-bed such as would catch the shod feet of horses and prevent them from slipping. It would not accomplish what the complainant sets out to accomplish, and complainant's invention would be almost entirely useless in preventing horses from slipping, which was the object which Dotch and Duempelman had in view. Complainant's invention is especially intended for sidewalks, and consists in the formation in the surface of a smooth pavement of depressions of such a character that in stepping on them the pressure of the foot on a number of them at once will expel the air, and by causing a vacuum afford by suction an additional hold to the sole of the foot to prevent slipping. This result, it is claimed, is more effectively attained when the pavement is wet and ordinarily would be more slippery, because then the suction is more complete. It is perfectly plain that continuous corrugated lines or large depressions, such as would assist the foothold of shod horses, would have no such effect.

The case in the eastern district of Pennsylvania having been, as appears from the record and the briefs of the very able counsel who took part in its presentation, thoroughly contested, the complainant is entitled now to the benefit of that adjudication in his favor. The affidavits filed in support of this motion for a preliminary injunction and the specimens of the pavement put down by the defendant exhibited in court leave no doubt in my mind as to the infringement.

The complainant, therefore, under all the rules of practice governing such applications, is entitled to the granting of a preliminary injunction as prayed.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Indexes to Foreign Patents.

The following indexes to foreign patents have been translated, compiled, and published under the authority of the Commissioner of Patents, and may be obtained as a Patent Office publication at the prices given below:

INDEX TO FRENCH PATENTS, 1791 to 1876, inclusive, (subject-matter, one volume, 935 pages, bound in cloth $10 00

INDEX TO ITALIAN PATENTS, 1848 to May 1, 1882, (subject-matter,) one volume, 120 pages—

Bound half-turkey	2 50
Bound in cloth	1 25
Paper covers	1 00

Indexes to Patents on Electricity.

Appendix No. 2 to the index to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1883, has been issued, and is now for sale. These indexes, arranged alphabetically, numerically, and by classes, are completed to June 30, 1883, and comprise the following volumes:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

DESIGNS.

18,874.—CORNER-IRON FOR TRUNK-TOPS.—*Philip Carpeles*, Milwaukee, Wis. Application filed December 21, 1888. Serial No. 294,330. Term of patent 7 years.

18,875.—TRUNK.—*Philip Carpeles*, Milwaukee, Wis. Application filed December 21, 1888. Serial No. 294,331. Term of patent 7 years.

18,876 to 18,878, inclusive.—PHOTOGRAPH-EXHIBITOR-CASE BODY.—*George M. Porteous* and *Frederick S. Miller*, Chicago, Ill. Applications filed December 28, 1888. Serial Nos. 294,874 to 294,876, inclusive. Term of patents 7 years.

18,879.—THERAPEUTIC BOTTLE.—*Emeline Clark Post*, Yorktown, Va. Application filed December 4, 1888. Serial No. 292,668. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,197.—CUTICLE OINTMENTS.—*The Bolling Drug Company*, Little Rock, Ark. Application filed September 19, 1888. Used since January 1, 1888.

"The words 'CRYSTAL CREAM' with the representation of a sparkling or cut jewel between them."

16,198.—PRESERVED MEATS.—*The Cunningham & De Fourier Company, (Limited,)* London, England. Application filed October 12, 1888. Used since January 1, 1879.

"The words 'STRASBOURG MEATS' and a pictorial group of buildings representing a bird's-eye view of the town of Strasbourg."

16,199.—BOOTS, SHOES, AND SLIPPERS.—*Fannie Dalsimer*, Philadelphia, Pa. Application filed December 10, 1888. Used since October 1, 1887.

"The word 'REFORM.'"

16,200.—SHOES.—*The Elderkin Taylor Company*, Rochester, N. Y. Application filed December 24, 1888. Used since April, 1887.

"The word 'RUBA.'"

16,201.—OLEAGINOUS FOOD SUBSTANCES.—*N. K. Fairbank & Company*, Chicago, Ill. Application filed August 24, 1888. Used since August 1, 1888.

"The representation of the head, head and neck, or head, neck, and other portions of a steer or other bovine visible through a body of growing cotton."

16,202.—CUTLERY.—*Graef & Schmidt*, New York, N. Y. Application filed November 28, 1888. Used since October 1, 1888.

"The representation of a spider."

16,203.—BAKING-POWDER.—*George C. Hanford*, Syracuse, N. Y. Application filed December 17, 1888. Used since March 1, 1877.

"The words 'NONE SUCH.'"

16,204.—WRITING-PAPER AND ENVELOPES.—*Bradley A. Hard*, New York, N. Y. Application filed December 18, 1888. Used since October 1, 1888.

"The word 'AMERICA.'"

16,205.—LEATHER FOR THE UPPERS OF SHOES.—*Charles S. Hull*, Boston, Mass. Application filed December 18, 1888. Used since November, 1888.

"The words 'LA CONFIANCE.'"

16,206.—JAPAN TEA.—*Henry J. Hunt*, Yokohama, Japan, London, England, and Chicago, Ill. Application filed December 8, 1888. Used since September, 1888.

"The word 'HIRADO.'"

16,207.—COUGH MEDICINE FOR INTERNAL USE.—*Benjamin T. Jacobs*, Stapleton, N. Y. Application filed December 1, 1888. Used since November 25, 1888.

"The letters 'A. B. C.'"

16,208.—COLOGNE.—*Benjamin Kent*, Paterson, N. J. Application filed December 8, 1888. Used since September 1, 1888.

"The words 'SILK CITY.'"

16,209.—NERVE TONIC AND STIMULANT.—*Benjamin Kent*, Paterson, N. J. Application filed December 8, 1888. Used since June 1, 1888.

"The word 'COCA-COLA.'"

16,210.—MIXTURE OR COMPOUND FOR MAKING GINGER-ALE.—*M. Michaelis & Son*, New York, N. Y. Application filed September 18, 1888. Used since December 13, 1883.

"The word 'CREAM.'"

16,211.—MEDIUM-GRADE RUBBER BELTING.—*New York Belting and Packing Company*, New York, N. Y. Application filed December 4, 1888. Used since November 20, 1888.

"The word 'THRASHER.'"

16,212.—SIRUP AND SUGAR.—*Lyman F. Palmer*, Topeka, Kans. Application filed December 4, 1888. Used since November, 1888.

"The word 'MAPLEETTE.'"

16,213.—MAIZE OR INDIAN CORN.—*Charles E. Prunty*, St. Louis, Mo. Application filed December 10, 1888. Used since June, 1888.

"The words 'PRINCE CHARLES.'"

16,214.—WRITING-PAPER.—*The Riverside Paper Company*, Holyoke, Mass. Application filed December 8, 1888. Used since January 1, 1888.

"The representation of a Pompeian lamp."

16,215.—BAKING-POWDER.—*Konn B. Sayres*, Cincinnati, Ohio. Application filed November 12, 1888. Used since November 1, 1888.

"The bust portrait of a North American Indian."

16,216.—JAPAN TEA.—*Smith, Baker & Co. of Japan*, New York, N. Y. Application filed September 28, 1888. Used since May 1, 1888.

"The words 'THE ARATA TEA,' two large diamonds arranged one above the other with their greatest diameter in a horizontal line and touching at their points, and two small ones arranged in the angles of the lines forming the two large diamonds."

16,217.—COTTON OR PARTLY COTTON AND WOOL AND PARTLY WOOL WOVEN FABRIC.—*Smith, Hogg & Gardner*, New York, N. Y. Application filed November 30, 1888. Used since August 2, 1887.

"The word 'OUTING.'"

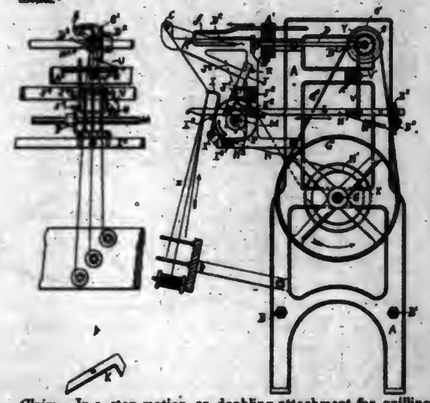
16,218.—FLOUR, WHEATEN GRITS, FARINA, OATMEAL, CORNMEAL, AND HOMINY.—*The St. Paul Roller Mill Company*, St. Paul, Minn. Application filed December 23, 1887. Used since December 6, 1887.

"The representation of a branch of orange-blossoms diagonally across an irregular square border in one corner in connection with the words 'ORANGE BLOSSOM.'"

16,219.—LIQUID REMEDY FOR ABRASIONS AND OTHER EXTERNAL INJURIES AND DISEASES OF THE SKIN.—*Egbert B. Waldo*, Syracuse, N. Y. Application filed November 5, 1888. Used since January 1, 1870.

"The words 'ELASTIC CUTICLE.'"

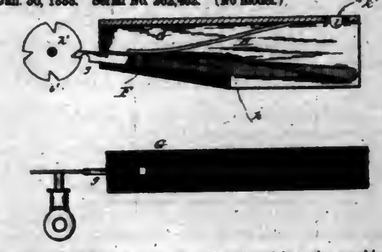
LABELS.



5,806.—Title: "ROGERS & DIAMOND'S CELEBRATED COUGH CURE."—*Rogers & Diamond*, Chicago, Ill. Application filed December 24, 1888.

5,807.—Title: "THE GREAT INDIAN SALVE AND PLASTER."—*Oscar S. Stearns*, New York, N. Y. Application filed December 17, 1888.

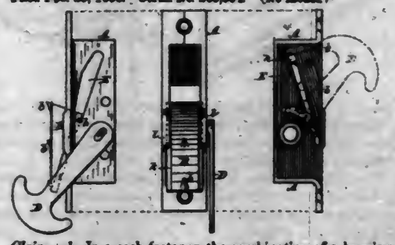
PATENTS



GRANTED JAN. 22, 1889.

396,884. STOP-MOTION FOR QUILLING-MACHINES. DWIGHT ASHLEY, Paterson, N. J. Filed Feb. 1, 1888. Serial No. 262,502. (No model.)

Claim.—In a stop-motion or doubling attachment for quilling-machines, a rock-lever which carries one end of the quill-spindle shaft provided with a tension-spring, a tilting lever provided with a pin and a slot, as illustrated and described, a reach-rod carrying a taper piece used as a wedge, and having a spring for drawing the same backward when unlatched, and stop-pins to limit its backward and forward motion, a latch-lever which acts by gravity, a revolving toothed wheel which engages with a pin in the tilting lever to force it backward, and the drop-wires shown and described, and for the purposes described and set forth.



396,885. SYSTEM AND APPARATUS FOR EXTINGUISHING FIRES. CHARLES ARROGAST and JOHN W. KUEHLER, Pittsburg, Pa. Filed Jan. 30, 1888. Serial No. 262,462. (No model.)

Claim.—1. In a fire alarm and extinguisher, the combination, with the water-supply pipes of an extinguishing system and a series of spring-actuated cocks controlling the same, of a notched wheel or disk connected to said cocks or valves, a pivoted spring-lever adapted to engage with said wheels, and a fusible plug normally restraining said levers and preventing the movement of said cocks, substantially as described.

2. In a fire-extinguishing system comprising a water-supply pipe leading to the interior of a building and having one or more branch distributing-pipes, a spring-actuated or automatic cock or valve connected to said supply-pipe, a notched disk secured to the stem of said valve, a casing containing a pivoted lever engaging with said disk, a spring which presses upon said lever, and a fusible plug upon which said lever normally bears, all the parts being so arranged that when said plug is fused the lever will be pressed downward and out of engagement with the valve-stem, substantially as described.

396,886. SASH-FASTENER. FRANK A. BACON, Greenville, Pa. Filed Feb. 25, 1888. Serial No. 265,234. (No model.)

Claim.—1. In a sash-fastener, the combination of a housing with a sector mounted therein, a wedge guided in slots in said housing, and a gravitating lever for operating the same, substantially as specified.

2. The combination of a bisected housing having slots therein with the wedge seated in said slots and provided with teeth on its rear side, a sector, also provided with teeth to engage the teeth of the wedge, and a gravitating lever for operating the same, substantially as and for the purpose set forth.

3. In a sash-fastener, the combination of the housing with the sector C, having a double set of teeth, the wedge B, having a double set of teeth on the back thereof, said teeth being adapted to engage the teeth of the sector, and a gravitating lever, substantially as set forth.

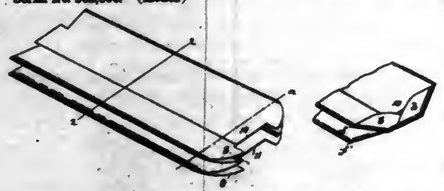
4. The housing A, provided with slots E and guides *l*, in combination with the wedge B, having lugs *k*, flanges *k*, to engage with said slots and guides, and provided with teeth *b*, a double sector meshing with the teeth of said wedge, and a gravitating lever, D, connected therewith, substantially as and for the purpose set forth.

396,887. COMPOSITION FOR PRINTERS' INKING-ROLLERS. JOHN D. BAYLIS, Philadelphia, Pa. Filed Apr. 6, 1888. Serial No. 269,854. (No specimens.)

Claim.—1. The herein-described composition of matter for the making of printers' inking-rollers, the same consisting of a mixture of glue, glycerine, sugar, Venice turpentine, rosin-oil, and saltpeter, and in the proportions substantially as described.

2. The herein-described composition of matter for the making of printers' inking-rollers, the same consisting of a mixture of glue, glycerine, sugar, Venice turpentine, oil of tar, rosin-oil, and saltpeter, and in the proportions substantially as described.

396,888. BAG. LORENZO D. BENNER, Peoria, Ill. Filed May 30, 1887. Serial No. 238,576. (Model.)



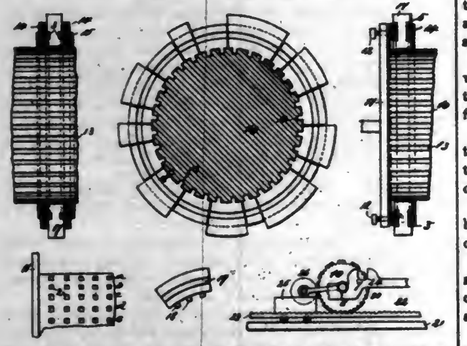
Claim.—1. The herein-described bellows-sided bag, the bottom whereof is provided with the portions 10 12, folded back upon the underlying portion of the bag, and the portions 14 16, folded over and cemented to the portions 10 12, substantially as described.

2. The herein-described bellows sided-bag, the bottom whereof when distended is formed by the two folded-back portions 10 12, the underlying inturned portions, and the folded-over and overlapping portions 14 16, substantially as described.

3. The herein-described bellows-sided bag, the bottom whereof when distended is formed by the oppositely folded-back portions 10 12 and the oppositely folded-over portions 14 16, the said portions 10 12, contiguous with the portions 14 16, being folded over upon themselves on diagonal lines *f f'*, substantially as described.

4. The herein-described bellows-sided bag, the bottom whereof is formed by folding back the end portions, 10 12, leaving projecting side pieces, which are folded back on diagonal lines *f f'* onto the body of the bag, so as to close the mouth of the bag.

396,389. BAG. LORENZO D. BENNER, Peoria, Ill. Filed Feb. 3, 1888. Serial No. 262,890. (Model.)



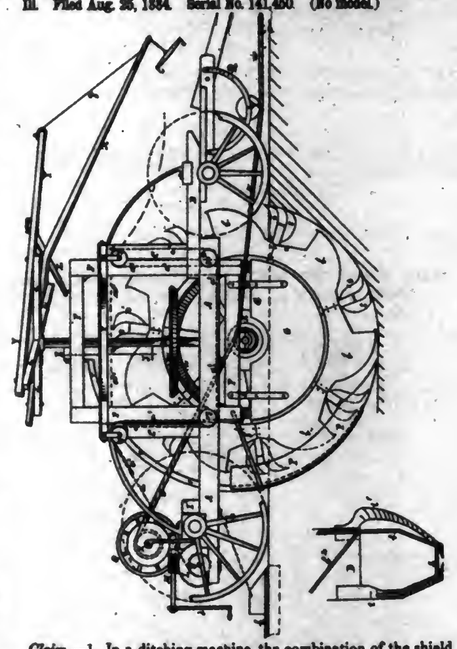
Claim.—1. The herein-described bag provided with the side incisions, 9, forming free end flaps, and the ends of the sides of the blank folded back on oblique lines onto the opposite sides of the body of the bag to close the end of the bag.

2. The herein-described bag provided with the side incisions, 9, forming free end flaps, 10 11, and freed projections 12 13, which are folded back on oblique lines onto the opposite sides of the body of the bag to close the end of the bag.

3. The herein-described bag-blank the end of which is cut on curved lines to form free end flaps, 10 11, and freed projections 12 13, the two projections being of sufficient length to close the end of the blank.

396,390. PRINTING-CYLINDER. WILLIAM BERRI, Brooklyn, N. Y. Filed Dec. 13, 1887. Serial No. 257,775. (No model.)

Claim.—1. A segmental printing block or die formed with recessed side faces and with projections extending from its inner circumferential face, as and for the purpose stated.



2. A printing block or die formed with recessed side faces and transverse ribs on its inner face, substantially as described.

3. The combination, with a cylinder provided with a series of recesses on its peripheral face, of printing-blocks having recessed side faces and projections on their inner faces, and binding-rings provided with laterally-extending projections, substantially as described.

4. The combination, with a cylinder provided with a series of longitudinal grooves, of segmental printing blocks or dies provided with recesses on their side faces and with transverse ribs on their inner faces, clamping rings provided with laterally-projecting flanges and binding-screws, substantially as herein shown and described.

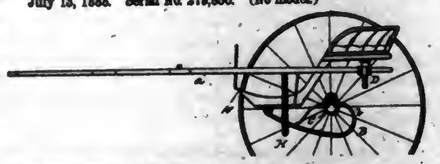
5. The combination, with a cylinder formed with a recessed peripheral face, of printing blocks or dies having recessed side faces and provided with projections which extend from their inner circumferential faces, said projections being arranged to enter the recesses formed in the peripheral face of the cylinder, clamping-rings arranged about the cylinder and formed with laterally-extending projections arranged to enter the recesses of the printing blocks or dies, and a means for locking the parts together, as and for the purpose stated.

396,391. DITCHING-MACHINE. ULRIC BLOCKENDORFER, Chicago, Ill. Filed Aug. 25, 1884. Serial No. 141,450. (No model.)

Claim.—1. In a ditching-machine, the combination of the shield or guard G, the straps *s*, and the movable frame with the gear-wheel *n* and the excavating-wheel, substantially as described.

2. In a ditching-machine, the combination, with the vertically-adjustable frame and the excavating-wheel, of the curved chute P, trough-shaped in cross-section and secured to the adjustable frame and supported by the curved supports *r* and stays *f'*, substantially as shown and described.

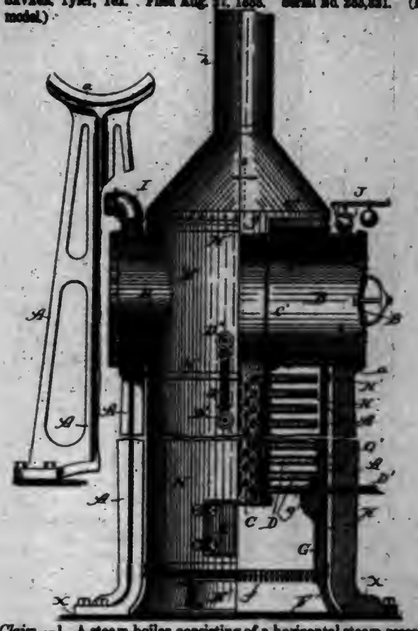
3. In a ditching-machine, the combination of an excavating-wheel, a spool-shaped drum, H, mounted on the shaft which carries the excavating-wheel, and an adjustable roller, V, substantially as set forth.



4. In a ditching-machine, the combination of the movable frame, the excavating-wheel mounted therein, the axle 1, adapted to support two riding-wheels, and the removable axle 1', adapted to receive one of the riding-wheels, substantially as described.

5. In a ditching-machine, an excavating-wheel provided with buckets *b*, in combination with projecting mold-board-shaped picks or teeth *t'*, substantially as and for the purpose set forth.

6. In a ditching-machine, the combination of an excavating-wheel, a spool-shaped drum, H, mounted on the shaft which carries the excavating-wheel, and a roller, K, to receive the tow-line, substantially as set forth.



7. In a ditching-machine, a vertical driving-shaft, N, in combination with cross-bars *h*, secured to said shaft N, a curved or inclined sweep secured to the said cross-bars *h* at one end thereof, a projecting bar, Y, secured at the other end of said cross-bars *h*, and a rod or chain, *g*, substantially as and for the purpose specified.

396,392. ROAD-CART. LEWIS F. GASTON, Philadelphia, Pa. Filed July 13, 1888. Serial No. 279,830. (No model.)

Claim.—The combination, in a road-cart, of the body N, the rear end or seat portion of which is supported by means of a transverse spring, D, rigidly secured to the thills *a a*, which pass to the rear of the axle C, and the hook-shaped springs B, the rear curved ends clipped to the axle C, and the forward ends of which are suitably connected to the under side of the front of the foot portion of the body N, substantially as specified.

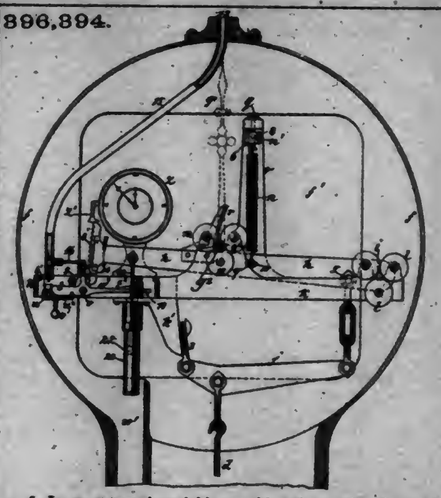
396,393. RADIAL-TUBE BOILER. JOHN CLARKE and ROBERT W. SAVAGE, Tyler, Tex. Filed Aug. 17, 1888. Serial No. 283,231. (No model.)

Claim.—1. A steam-boiler consisting of a horizontal steam-reservoir, a vertical cylinder provided with radial tubes suspended therefrom and forming a steam-generating chamber, all supported by standards placed underneath said horizontal steam-reservoir and outside of the casing surrounding said steam-generating chamber, and the fire-box placed under said steam-generating chamber, all substantially as described, and for the purposes set forth.

2. A steam-boiler consisting of a horizontal steam-reservoir, a vertical steam-generating chamber with radial tubes thereon suspended from said horizontal steam-reservoir, a fire-box placed underneath said vertical steam-generating chamber, a casing composed of fire-brick and other suitable material surrounding said fire-box, vertical steam-generating chamber, and a portion of said horizontal steam-reservoir at a suitable distance therefrom, and standards placed outside of said casing and underneath the ends of said horizontal steam-reservoir, thereby supporting said horizontal steam-reservoir and said vertical steam-generating chamber with the radial tubes placed thereon, all substantially as described, and for the purposes set forth.

3. The combination, in a steam-boiler, of ash-pan F, fire-box brick G G', placed thereon, arch G'', covering H, surrounding said fire-brick G G' and arch G'', bands H' H', securing covering H in position, horizontal steam-reservoir B, supported by standards A A, placed outside of said covering H, and vertical steam-generating chamber C, provided with radial tubes D, suspended from said horizontal reservoir B, all substantially as described, and for the purposes set forth.

396,394. COIN-CONTROLLED WEIGHING-MACHINE. WILLIAM S. DAVENPORT, St. Johnsbury, Vt. Filed Mar. 4, 1887. Serial No. 229,672. (No model.)

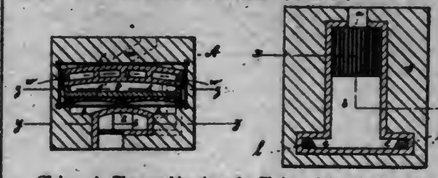


Claim.—1. The combination of the counterbalanced beam *h*, having the rack *r*, with the rotary index-shaft g^3, having the pinion *r'*, and the groups of rollers 12, supporting the index-shaft, substantially as shown and described.

2. The combination, with the pivoted beam *h*, of the counterbalance-spring *n*, attached at one end near the center of said beam, the non-rotating block *n'*, carrying the other end of said spring, frame *k* and support *o*, and adjusting-screw *q*, substantially as shown and described.

3. The combination of the frame *k* and support *o* and the pivoted beam-lever *h* with the counterbalance-spring *n*, connected to said lever near the center thereof, longitudinally-adjustable spring-stud 9, non-rotating vertically-adjustable block *n'*, and adjusting-screw *q*, substantially as shown and described.

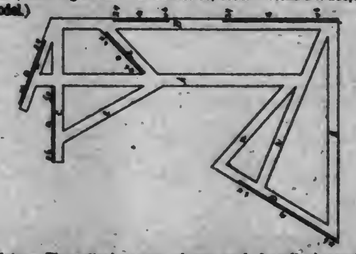
4. In an automatic weighing-machine, a coin-receiving-trip device consisting of a counterbalanced lever, *i*, having coin bucket or socket *i'*, in combination with the escapement device *u* u^2, and counterbalanced trip-lever *v*, engaging the escapement device, substantially as shown and described.



396,394.

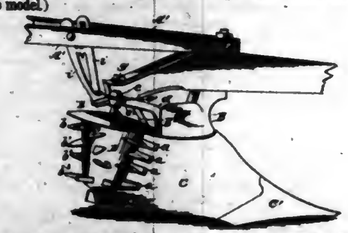
5. In an automatic weighing-machine, the combination of the scale-beam *h*, a detent-rack, *d'*, attached to the scale-beam of the machine, with the detent-pawl *s*, engaging the same, the counterbalanced coin-lever *i*, operatively engaging said detent-pawl, the coin-recess *i'* on said lever, the coin-duct 15, terminating over said recess, the escapement *u* u^2, and the trip-lever *v*, arranged and operating substantially as shown and described.

6. In an automatic weighing-machine, the combination of the coin-duct 15 and slide, a coin-lever, *i*, having a coin-bucket, *i'*, arranged under the end of said duct, the detent-pawl *s*, and a projection on the coin-lever engaging said pawl, with a cut-off valve, 16, arranged to close said slide and connected with said coin-lever, whereby the valve is closed in the duct when the coin-lever is swayed by the weight of the coin, substantially as shown and described.



396,395. BAKER'S OVEN. FRITZ DÜRRKOP, New York, N. Y. Filed Oct. 8, 1888. Serial No. 287,508. (No model.)

Claim.—1. The combination of a T-shaped fire-chamber, *b*, having the fire-place *a* in the rear end of the oven, with the baking-chamber *g* and interposed air-chamber *c*, and with the upright flues *l*, communicating with the branches *c* of chamber *b*, substantially as specified.



2. The combination of a fire-chamber, *b*, having the fire-place in the rear of the oven, with a superposed air-chamber, *c*, which is wider than such fire-chamber, and which is solidly supported on both sides of the same, and with a baking-chamber, *g*, above the air-chamber *c*, substantially as specified.

396,396. TAILOR'S AND DRESS-MAKER'S SQUARE. PARKER FAIRT, Wilmington, Ill. Filed Oct. 18, 1888. Serial No. 288,415. (No model.)

Claim.—The tailor's square shown and described, consisting of the combination of the right-angled blades B and S, the angle-blades *a*, *c*, *e*, *i*, *n*, and *r*, and brace *o*, all having graduated scales, as shown, and brace A, arranged parallel with blade B, for supporting said angle-blades, substantially as and for the purpose set forth.

396,397. REVOLVING MOLD-BOARD FOR PLOWS. CHARLES GAYLORD, East Wilson, N. Y. Filed June 15, 1888. Serial No. 277,196. (No model.)

Claim.—1. The combination, with a plow-standard and a mold-board, of a conical drum or cylinder having teeth that radiate from its side, substantially as set forth.

2. The combination, with a mold-board supported on a plow-beam, of a conical cylinder supported to rotate near the rear edge of the mold-board, and attached radial teeth, substantially as set forth.

3. The combination, with a mold-board, a standard, and a plow-beam, of a conical cylinder having rows of teeth radiating from its side surface adapted to register with notches cut in the adjacent edge of the mold-board, substantially as set forth.

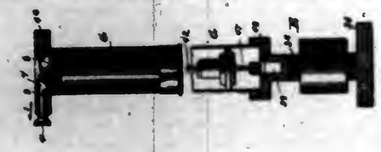
4. The combination, with a mold-board and a revolubly-supported conical cylinder having rows of radial teeth, of a disk mounted on the top of the conical cylinder and adapted to rotate with it, substantially as set forth.

5. The combination, with a mold-board, a standard, and a plow-beam, of a conical cylinder, boxes to support the cylinder, journals axially affixed to the cylinder to engage these boxes, and rows of radial teeth secured to the cylinder so as to project through notches made in the mold-board and be rotated by the impinge of a furrow-slice cut by the plow, substantially as set forth.

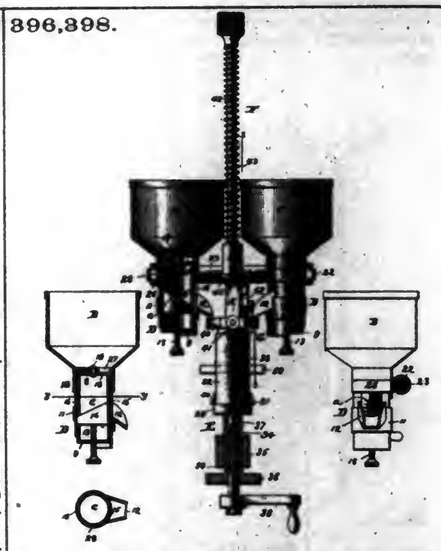
6. The combination, with a plow-beam, a standard, a mold-board, and a plowshare, the mold-board plate being notched at intervals, of a cylinder, teeth arranged in rows which project radially from the side surface of the cylinder, journals affixed axially in the ends of the cylinder, boxes adapted to revolubly support the cylinder, and a convex cylinder-disk secured concentric with the cylinder on its upper end, substantially as set forth.

7. The combination, with a plow-standard, of a mold-board, a revoluble tapering cylinder, teeth affixed radially in the cylinder, and scrapers adapted to bear on the surface of the cylinder between the rows of teeth, substantially as set forth.

8. The combination, with a plow-beam, a standard, a mold-board, plowshare, and landside, of a revoluble conically-tapered cylinder, rows of teeth radially projecting from the cylinder, notches made in the mold-board to receive the teeth and allow them to move freely therein, and a series of scraper-blades made to project from the standard and be in position to scrape the soil from the cylinder between the rows of teeth, substantially as set forth.



396,398. CARTRIDGE-LOADING MACHINE. EMILE F. GENEVAY, Corinth, Miss. Filed May 3, 1888. Serial No. 272,885. (No model.)



Claim.—1. In a cartridge-loading device, the combination of a supporting-frame, a pair of hoppers for the powder and shot, a removable bar, 22, and sleeves connected with said hoppers and adapted to be supported by said bar upon opposite sides of the frame, substantially as described.

2. In a cartridge-loading device, the combination of a supporting-frame, a pair of hoppers for the powder and shot, a removable bar, 22, having a web, 25, and sleeves connected with said hoppers adapted to surround the bar upon opposite sides of the frame, and having slotted ends to receive a portion of the web, substantially as described.

3. The combination, with a hopper, of a rotatable chambered valve connected thereto, having two openings, one at its end for permitting a quantity of material to enter the valve, and the other at its side for discharging such material therefrom, substantially as described.

4. The combination, with a hopper, of a valve-casing, a rotatable chambered valve mounted therein and having closed ends, one of said ends provided with an opening registering with the hopper-opening,

and a second opening in the side of the valve registering with a discharge-opening in the casing, substantially as described.

5. The combination, with a hopper, of a valve-casing connected thereto, a chambered valve mounted in said casing and having closed ends, one of which is provided with an opening registering with the hopper-opening, and the other end providing an adjustable bottom for varying the size of the chamber, substantially as described.

6. The combination, with a hopper, of a valve-casing connected thereto, a rotatable chambered valve pivotally mounted in said casing, a movable bottom in said valve, and an adjusting-rod for moving the bottom, substantially as described.

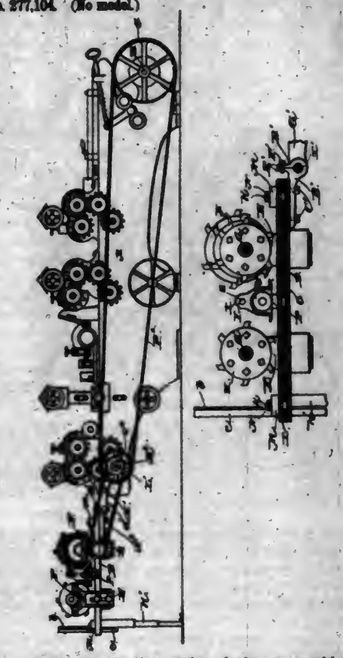
7. The combination, with a hopper, of a valve-casing connected thereto, a chambered valve mounted in said casing, and a movable end for varying the size of the chamber, of an adjustable spout carried by the casing, substantially as described.

8. The combination, with a hopper, of a cylindrical casing connected thereto having an opening, 27, communicating with the hopper and a side discharge-opening, a cylindrical chambered valve mounted in said casing, having an opening in its end adapted to register with the opening 27 in the casing, and a side discharge-opening adapted to register with the similar opening in the casing when the valve is moved to close the other openings, substantially as described.

9. In a cartridge-loading device, the combination of a vertically-adjustable cartridge-supporting spindle, 34, a cup-shaped rest mounted on said spindle and having a crank for rotating it, a bracket, 40, for sustaining the upper end of the cartridge, and a reciprocating plunger, F, substantially as described.

10. In a cartridge-loading device, the combination of a vertically-adjustable cartridge-supporting spindle, 34, a cup-shaped rest mounted on said spindle and having a crank for rotating it, a divided sustaining-sleeve, 32, and a bracket, 40, for sustaining the upper end of the cartridge, substantially as described.

11. In a cartridge-loading device, the combination of a vertically-adjustable cartridge-supporting spindle, 34, having a central opening, a cup-shaped rest, 29, having a stem, 37, extending through the opening in the spindle, and a crank for rotating the rest, a bracket, 40, and a beading-tool, 41, substantially as described.



12. In a cartridge-loading device, the combination of a cartridge-supporting spindle, 34, a rotatable rest, 29, mounted on said spindle, a bracket, 40, for sustaining the end of the cartridge-shell, and beading-tool 41, movably mounted in said bracket and having a beading-groove, 9, substantially as described.

13. In a cartridge-loading device, the combination of a rotatable rest for the cartridge, a fixed bracket, 40, for sustaining the upper end of the cartridge, and a beading-tool seated in said bracket and adapted to be moved into operative position, substantially as described.

14. In a cartridge-loading device, the combination of a cartridge-supporting spindle, a rotatable rest carried thereby, a fixed bracket, 40, for sustaining the upper end of the cartridge and having a central opening for the passage of the load into the cartridge, and a beading-tool seated in said bracket and adapted to be moved into operative position over the cartridge, substantially as described.

15. In a cartridge-loading device, the combination of a rotatable rest for the cartridge, a fixed bracket, 40, for sustaining the upper end of the cartridge, and a beading-tool seated in said bracket and having a groove, 9, and a projection, 7, that is adapted to be moved to place said groove and projection in operative position, substantially as described.

396,399. MACHINE FOR GROOVING LUMBER. JULIAN T. GRZYBOWSKI, Grand Rapids, Mich., assignor of one-half to Richard H. Butterworth and James Lowe, same place. Filed June 14, 1888. Serial No. 277,104. (No model.)

Claim.—1. The combination, with a planing or matching machine, of a grooving-machine hinged or pivoted at its feed end directly to the rear end of the planer or matcher and adapted to be raised to a horizontal position or folded down out of the way, substantially as described.

2. The combination, with the planing-machine having the counter-shaft L', adapted to be driven by the driving-shaft B, of the grooving-machine pivoted at its feed end directly to the rear or discharge end of the planer or matcher, and having the oppositely-inclined shafts carrying the cutters, and provided with pulleys connected to pulleys on the counter-shaft by suitable belts, substantially as described.

3. In a grooving-machine adapted to be connected to a planer or matcher, the combination of the table or bed having the bearings D', the brackets or plates G', adapted to be secured to and disconnected from the planer or matcher, and the pintle shaft or rod extending through openings in the plates G' and in the bearings D', whereby the grooving-machine may be hinged to one end of the planer or matcher, substantially as described.

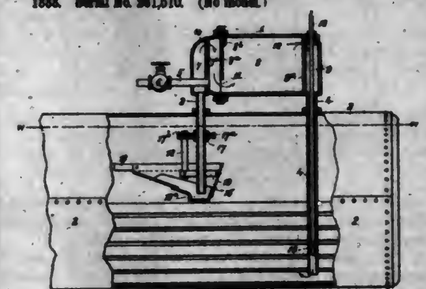
4. The combination, in a grooving-machine adapted to be attached to a planer or matcher, of the table or bed D, having the separate brackets B', provided with the split bearings D' and the clamping-bolts therefor, the separate plates or brackets G', adapted to be attached to one end of the planer-frame, and the pintle rod or shaft fitted in openings in said brackets or plates and in the split bearings D', substantially as described.

5. In combination with a planing or matching machine, the grooving-machine hinged or pivoted to the discharge end of said planing-machine, said hinge or pivotal attachment of the two machines being capable of lateral adjustment, as set forth.

6. In combination with the planer having the pintle rod or shaft I' secured rigidly thereto, the grooving-machine having affixed to its table or bed the brackets B', provided with bearings D', to fit the shaft I' and pivot the grooving-machine thereto, said bearings D' being laterally adjustable on the pintle-shaft I', as set forth.

7. In a grooving-machine, the combination of the cutters, the rollers M, arranged at the feed and discharge end of the machine on opposite sides of the cutters, said rollers being arranged in pairs set at a distance apart to receive the board between them, and the rollers U, arranged between the cutters and set at a distance apart, the rollers U bearing on top of the board and the rollers M bearing against the sides thereof, as set forth.

8. In a grooving-machine, the table or bed having the standards P laterally adjustable transversely across the table, each standard being independently adjustable, the rollers U, journaled in said standards and adapted to bear on the top of the board to be worked upon, as set forth.



9. In a grooving-machine, the table or bed having the standards P laterally adjustable transversely across the table, each standard being independently adjustable, the rollers U, journaled in said standards and adapted to bear on the top of the board to be worked upon, and the guards or shields X, attached to the standards on the outer side of the rollers and having the feet A', to bear against the upper side of the board.

10. The combination, in a grooving-machine, of the standards P, secured to the table or bed and having the vertical slots, the rollers U, the spindles therefor secured and vertically adjustable in the slots, and the guards or shields X, fitted over the said rollers and having the clamping-bolts securing them to the standard, said clamping-bolts being also adjustable in the slots, substantially as described.

11. In a grooving-machine, the table having the openings *a* at one end, combined with the transverse shield *b*, arranged across the table, having depending legs *c* at the ends designed to fit in the openings *a*, as set forth.

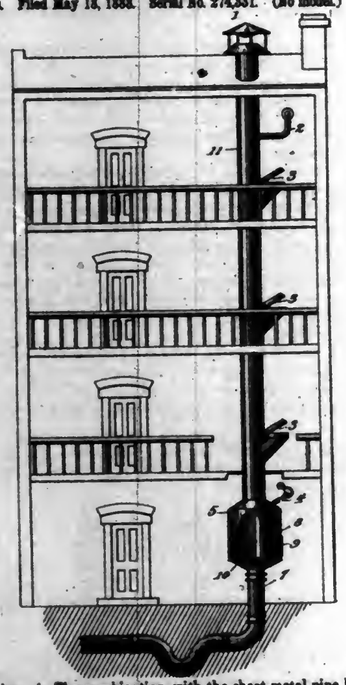
12. In combination with the planing or matching machine, the grooving-machine hinged or pivoted at its feed end directly to the discharge end of the planer or matcher, the outer or discharge end of the grooving-machine being provided with a leg or standard, K, as set forth.

396,400. BOILER-CLEANER. GEORGE GUILD, Knoxville, Tenn., assignor of one-half to Charles H. Brown, same place. Filed Jan. 21, 1888. Serial No. 261,510. (No model.)

Claim.—1. The combination, with the boiler, of a settling-drum, pipes connected to the bottom of said drum remote from each other and to said boiler, partitions dividing said drum from top to bottom between said pipes and having perforations at their tops, a deflector extending downward into said drum to within a short distance from its bottom, and a blow-off pipe extending through the end of said drum, and also through one of said partitions at a level below the end of said deflector, whereby sediment throughout the extent of the bottom of said drum between said partitions may pass out via the blow-off without obstruction, as set forth.

2. The combination, with a settling-drum, a boiler, and pipes connecting the drum with the boiler, of a device for collecting the scum from the surface of the water, consisting of the skimmer 15, a bracket secured adjustably to one of said pipes, and a hanger suspending said skimmer from said bracket, as herein set forth.

3. The combination, with a settling-drum, a boiler, and pipes connecting the drum with the boiler, of the skimmer 15, for collecting the scum, a basin, 15^a, at one end of said skimmer, a bracket secured to one of said pipes, and a hanger secured to said bracket and to said skimmer, supporting said basin directly under the end of said pipe, substantially as set forth.



4. The combination, with a boiler and a pipe extending into the boiler for drawing off water, of means for collecting the scum, consisting of a skimmer, 15, having in one end a basin, 15^a, arranged under the end of said pipe, floats secured to the other end, and a hanger hinged to the end opposite said floats and mounted adjustably on the said outlet-pipe, as set forth.

5. In a boiler, the combination of an outlet-pipe, 3, a bracket, 17, on the pipe, a hanger, 18, a frame, 19, on a skimmer, 15, hinged to said hanger, and floats 16 on the other end of the skimmer, as set forth.

6. The combination, with a boiler, of a drum supported thereon

by two pipes leading from the boiler, the said drum having a settling-chamber, a blow-off pipe communicating with the lower part of the settling-chamber, two end chambers with which the supporting-pipes communicate, and which communicate with the settling-chamber at the top of the drum, and a partition, D, in the settling-chamber for directing the water downward, as herein shown and described.

396,401. SWILL-RECEPTACLE. JUDSON W. HALL, Worcester, Mass. Filed May 18, 1888. Serial No. 274,331. (No model.)

Claim.—1. The combination, with the sheet-metal pipe having a ventilator at its top, of the receptacle at its lower end provided with apertures S, substantially as and for the purpose set forth.

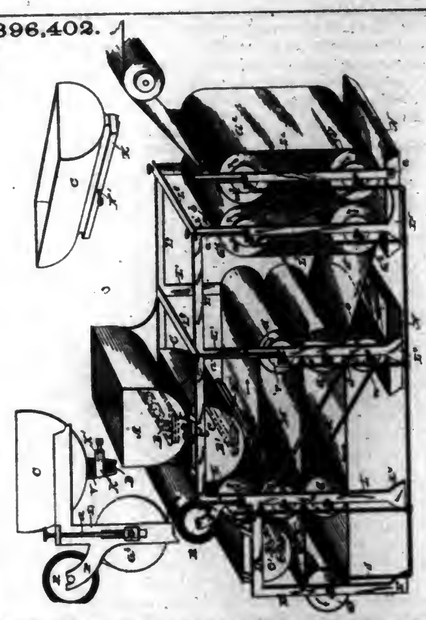
2. The combination of the ventilated sheet-metal pipe and its receptacle with the water-supply pipe 2, in connection with the house water-pipe, substantially as described.

3. The combination, with the sheet-metal pipe, the receptacle, and its connection to the sewer, of the hot-water pipe 4, substantially as set forth.

4. A swill-receptacle comprising, in combination, the ventilated sheet-metal pipe having covered inlets at each story, the water-supply pipe connected with said ventilated pipe and the house water-pipe, the receptacle at the bottom of the ventilated pipe connected with the sewer, and the hot-water pipe connected with said bottom receptacle and the house-boiler, substantially as set forth.

396,402. MACHINE FOR WAXING PAPER. SAMUEL HOSKINSON, Steubenville, Ohio, and GEORGE B. RAYMOND, Chicago, Ill. Filed July 2, 1887. Serial No. 243,283. (No model.)

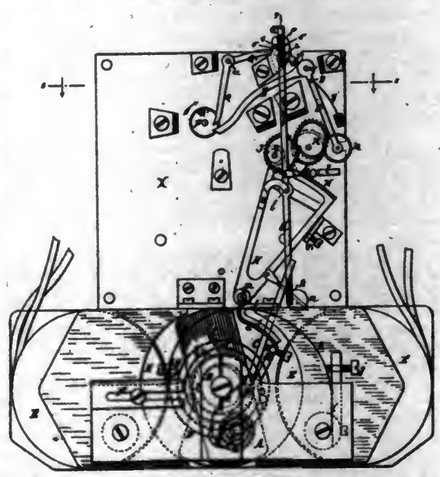
Claim.—1. The combination, with fixed standards and rollers journaled therein, of pivoted standards, rollers journaled in said pivoted standards, and metallic belts carried by these rollers, substantially as set forth.



2. The combination, with fixed standards, pivoted standards, and hollow metallic rollers journaled in these standards, of flexible metallic belts and adjusting-screws for varying the contact of these metallic belts, substantially as set forth.

3. The combination, with fixed standards, pivoted standards, and hollow metallic rollers journaled in said fixed and pivoted standards, of flexible metallic belts carried on said rollers, heating-pipes passing through the rollers, and adjusting-screws for varying the relative positions of the rollers, and the metallic belts, substantially as set forth.

4. The combination, with a set of standards, rollers journaled therein, and web and metallic belts carried on said rollers, of wax-troughs, the latter each having a mouth in its bottom, a fibrous filling in the mouth, and an adjusting-screw for opening and closing the mouth, substantially as set forth.



5. The combination, with a set of standards, rollers journaled

396,402.

therein, and drip-pans located in position to catch the superfluous coating material, of fibrous and metallic belts carried on the rollers, belts for communicating motion to the rollers, feed-troughs located over the fibrous belts, and screws for varying the contact of the rollers and belts, substantially as set forth.

396,403. ELECTRIC METER. MARIE J. B. JACQUEMIER, Paris, France. Filed Aug. 20, 1888. Serial No. 283,172. (No model.) Patented in France Apr. 12, 1887, No. 183,830; in England Oct. 18, 1887, No. 14,236; in Germany Oct. 22, 1887, No. 45,422; in Belgium Oct. 24, 1887, No. 79,297, and in Italy Nov. 26, 1887, XVI, 22,688, XLIV, 490.

Claim.—1. The combination of an electro-motive device, a moving part or detector, and a totalizer, with a motor clock-work adapted to impart motion to said detector and totalizer, a detent normally restraining said clock-work, a timing clock-work, and a cam driven thereby and adapted at certain intervals of time to displace said detent and free the motor clock-work.

2. In an electric meter, an electro-motive device, the moving member of which is displaced more or less according to the varying energy of the current to be measured, a retracting-spring acting against said moving member in opposition to the current, a movable stop, against which said retracting-spring is re-enforced, and a more sensitive supplemental spring tending to displace said stop, acting on

said moving member through the main retracting-spring and adapted to retract it against feeble currents.

3. The combination, with an electro-motive device, a detector, and a totalizer, of a clock-work adapted to impart motion to said detector and totalizer, a detent adapted to arrest said clock-work upon the contact of the detector with the moving member of said electro-motive device, and a timing clock-work adapted to release said parts at certain intervals of time.

4. The combination, with an electro-motive device, a detector, and a totalizer, of a clock-work adapted to impart motion to said detector and totalizer, a timing clock-work adapted to release said clock-work at certain intervals of time, and thereby permit the advance of the detector and totalizer, a detent for arresting said driving clock-work upon the stoppage of said detector by the moving member of the electro-motive device, and a disengaging device for throwing said driving clock-work out of engagement with said detector during the return of the latter to its normal position.

5. The combination, with an electro-motive device, of a detector-lever adapted to be arrested thereby, a toothed sector to which said lever is pivoted, said lever adapted to make contact at one end with the moving member of said electro-motive device, a detent connected to the other end of said lever, and a clock-work adapted to impart motion to said sector and to be arrested by said detent.

6. The combination, with an electro-motive device, of a detector-lever adapted to be arrested thereby, a toothed sector to which said lever is pivoted, said lever adapted to make contact at one end with the moving member of said electro-motive device, a detent connected to the other end of said lever, a clock-work adapted to impart motion to said sector and to be arrested by said detent, a retractile device acting to restore said sector after its displacement, and a disengaging device for disconnecting said clock-work from said sector.

7. The combination, with an electro-motive device, a detector, and a totalizer, of a clock-work adapted to impart motion to said detector and totalizer, and intermeshing toothed wheels arranged between said detector and totalizer, said wheels having such shape that the angular displacement of the totalizer from the starting position until the detector is stopped by the moving member of said electro-motive device is proportional at each instant to the energy of the current acting on the said electro-motive device.

8. The combination, with an electro-motive device and a detector-lever, of a clock-work adapted to impart motion to the fulcrum of said lever, and a detent adapted to be displaced by the movement of said lever upon its encounter with the moving member of the electro-motive device, and on such displacement to arrest said clock-work.

9. The combination, with an electro-motive device, of a detector-lever adapted in its movement to be stopped by the moving member of said electro-motive device, a clock-work for imparting motion to said lever, a detent normally engaging the flier of said clock-work in order to restrain the same, a timing clock-work adapted to release said detent at intervals, and a detent adapted to be displaced by said detector-lever upon its stoppage by the moving member of said electro-motive device, and by such displacement to arrest the clock-work.

10. The combination, with an electro-motive device, of a detector-lever, a carrier to which said lever is pivoted, a clock-work adapted to impart motion to said detector through said carrier, a disengaging device for disconnecting said clock-work from said carrier, a detent for restraining said clock-work, and a timing clock-work adapted at intervals to first release said detent, and thereby permit said clock-work to effect the movement of said detector, and subsequently to operate said disengaging device to permit the restoration of said detector and its carrier to their normal positions.

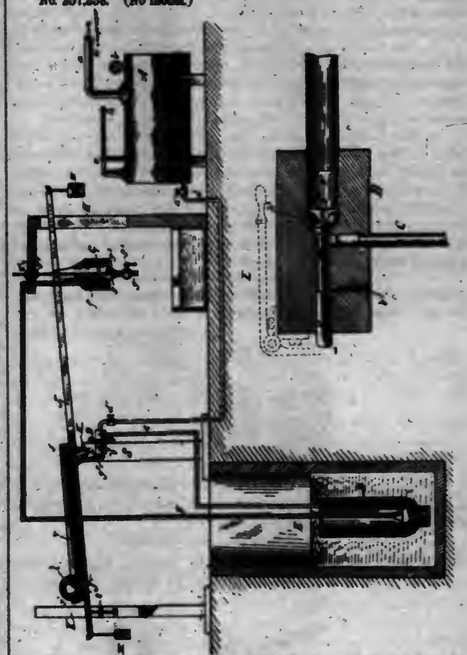
11. The combination, with an electro-motive device, a detector, and a clock-work for imparting motion to said detector, of a detent for restraining said clock-work, a lever, Q, for operating said detent, a disengaging device for disconnecting said clock-work from said detector, a lever, S, for operating said disengaging device, a timing clock-work, and a rotary cam, P, driven by said timing clock-work and adapted to displace successively said levers Q and S.

12. The combination of an electro-motive device, a detector, and a clock-work for moving said detector at intervals toward the moving member of said electro-motive device, an arm connected to and moved by said moving member and arranged to contact with and stop said detector, and a yielding connection between said arm and moving member for reducing the shock of the arm against the detector in case of the sudden movement of said moving member due to a sudden change in the current.

13. The combination of an electro-motive device, a detector adapted to move at intervals until stopped by such electro-motive device, a clock-work for imparting motion to said detector, and means for winding said clock-work, consisting of an electro-magnet and a circuit-closer in circuit therewith, adapted to close the circuit thereto upon the relaxation of the spring to be wound below a certain tension, and mechanical connections between the armature of said magnet and said spring for winding the latter upon the excitation of the magnet.

14. The combination, with an electro-motive device, a detector adapted to move at intervals from its initial position until stopped by said electro-motive device, a clock-work for imparting motion to said detector, and a timing clock-work for setting said clock-work in motion at intervals, of means for rewinding said clock-work, consisting of an electro-magnet and a circuit-closer in circuit therewith, adapted to close the circuit thereto upon the relaxation of the spring to be wound below a certain tension, and mechanical connections between the armature of said magnet and said spring for winding the latter upon the excitation of the magnet.

15. In an electric meter, the combination, with a clock-work, of an automatic rewinding device therefor consisting of an electro-magnet, a rock-lever provided with a retractile weight, a ratchet-and-pawl connection between said rock-lever and the spring to be rewound, a circuit-closer adapted to close the circuit through said magnet upon the fall of said rock-lever under the impetus of its retractile weight to its lowest position, and a connection between the armature and said rock-lever, whereby the attraction of the armature by the magnet serves to rock said lever and lift its retractile weight, whereby the spring is kept wound to a tension proportional to the retractile tension of said weight.



396,404. CHAIN-LINK. HARRY R. KELLEY, Niagara Falls, N. Y. Filed July 7, 1888. Serial No. 279,261. (No model.)

Claim.—1. A flat chain-link, A, stamped or cut out of sheet metal, one end having a hole at *a* for the reception of the next link at that end, the other end having the link-opening *c'*, and slot *d* continuing therefrom and adapted to receive the next link and to be closed edgewise against the edge of the link itself, making a cold-shut, substantially as specified.

2. As a new article of manufacture, the flat chain-link A, made from sheet metal and having an open end or ends, *c' d*, and the side or end *c*, adapted to be shut against the edge of the link A, substantially as set forth.

396,405. AUTOMATIC COMPRESSED-AIR WATER-ELEVATOR. JOHN K. LESLY, Tom's Brook, assignor of two-thirds to Noah W. Solomberger and German Smith, Winchester, Va. Filed Dec. 8, 1887. Serial No. 257,238. (No model.)

Claim.—1. The combination, with the storage-vessel, the submerged drum provided with a valve opening upward, a valve-box

provided with a connected plunger and valve, and an air-vent, of pipes connecting the vessel A, the drum D, and valve-box B, a vibrating beam, J, provided with a toe, *f*, adapted to act on plunger *b'*, a bucket hung from one arm of said beam and provided with an outlet-pipe, a stationary valve for this outlet-pipe, and a pipe leading from the drum D and arranged to discharge water into said bucket, all substantially as described.

2. The combination, with a pivoted working-beam, J, and a bucket, G, pivoted to this beam and provided with an outlet and a valve-seat in its bottom, of a stationary adjustable valve adapted to close upon the valve-seat in the bottom of the said bucket, a support for the valve, a support for the beam J, a supply-pipe, F, emptying into said bucket G, and means for elevating the water, substantially as described.

3. The combination, with a pivoted weighted beam, J, provided with a toe, g^3, a bucket, G, pivoted to the said beam, and a rolling counterbalancing-weight upon said beam, of a stationary valve, *g*, adapted to close upon a valve-seat in the bucket G, a valve-box, B, a reciprocating valve in said box, this valve being opened by the toe g^3 on the beam J, air-pipes *d e*, a submerged drum, D, provided with an inwardly-opening valve, and a water-supply pipe, F, leading from the drum D to the said pivoted bucket G, all arranged as and for the purpose herein stated.

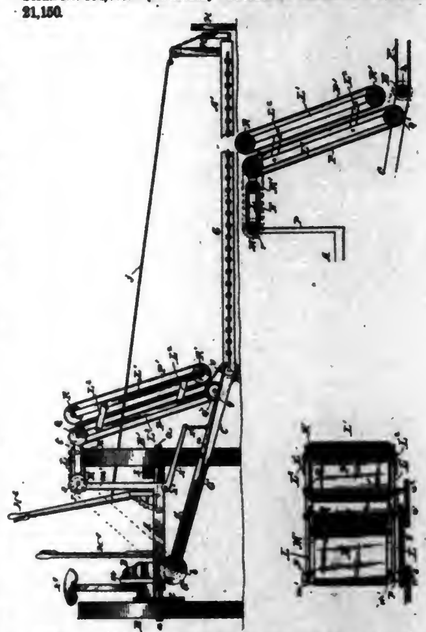
396,406. SAW-SET. ANTHONY J. LEWIS and FREDERICK A. SAUER, Wilkes-Barré, Pa. Filed Oct. 12, 1888. Serial No. 287,900. (No model.)

Claim.—1. In a saw-set, the combination, with the stock or body having an anvil on its upper side, of the gage or guide consisting of a plate, F, arranged transversely to the stock or body and provided at its rear edge with the vertical ribs or flanges G G, and the prongs H, passing around the anvil and projecting in rear of the same, and the set-screw inserted between said prongs into the body and having its head bearing on the prongs to clamp them to the body, as set forth.

2. The combination of the body having a lip, L, at its rear end, the hammer mounted on the body, the lever fulcrumed thereon and engaging the hammer, the pin mounted in the lip L and having a trip-plate at its upper end engaging the hammer, and a spring coiled around said pin between the trip-plate and the lip L, as set forth.

3. The combination of the body provided at its rear end with a lip, L, having a perforation, M, the hammer mounted on the body and having its rear end provided with the offset N, the pin O, having its lower end inserted into the perforation M and its upper end provided with a trip-plate, P, having its front edge turned up, forming a rib engaging the offset N, the spring coiled around the pin O, between the trip-plate and the lip L, and the lever fulcrumed on the body and engaging the hammer, as set forth.

396,407. ELECTRIC-WIRE CONDUIT. JOHN LYNCH, Washington, D. C. Filed Nov. 5, 1888. Serial No. 290,082. (No model.)



Claim.—A rectangular terra-cotta-wire conduit-pipe having rectangular partitions, all of uniform thickness and made in one integral piece, substantially as shown and described.

396,408. TAIL-PIECE FOR VIOLINS. ROBERT A. MACBRADY, New York, N. Y. Filed Mar. 26, 1886. Serial No. 196,800. (No model.)

Claim.—The combination, with the tail-piece of a violin or other similar instrument, of the studs with split heads adapted to hold strings or wires.

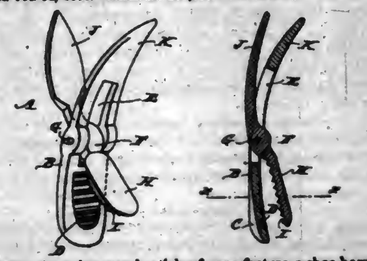
396,409. HARVESTER. SAMUEL D. MADDEN, Mimosburg, Ohio, assignor to Mary Madden, Sarnia, Ontario, Canada. Filed June 13, 1884. Serial No. 134,776. (No model.) Patented in Canada Feb. 25, 1885, No. 21,150.

Claim.—1. The combination of the main wheel-frame, a pivoted platform-frame extending laterally beyond the main wheel-frame, an intermediate pivoted connecting-frame, and an elevator consisting of two frames, each supporting a grain-conveying belt, and one frame being upwardly and outwardly inclined and hinged to the intermediate frame near the inner end of the grain-platform and jointed at its upper end to the other frame, which is arranged substantially horizontally and is jointed to standards upon the main wheel-frame, substantially as described.

2. The combination of the main wheel-frame supported by two wheels, a pivoted platform-frame extending laterally beyond the main wheel-frame, an intermediate frame pivoted to the wheel-frame and extending laterally in front and rear of one of the supporting-wheels, and an elevator consisting of two parts or frames jointed together and one hinged to standards upon the main wheel-frame and the other to the said intermediate frame, substantially as described.

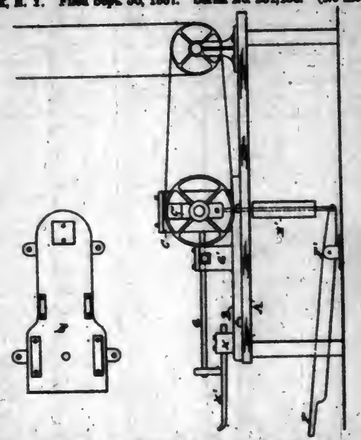
3. The combination, with a main wheel-frame supported upon driving-wheels, a platform-frame, and an intermediate frame pivoted at its opposite ends to said main and platform-frames, of an elevator composed of two frames jointed together and one hinged to the main wheel-frame and the other to the intermediate frame, rollers journaled in said frames and provided at their forward ends with driving-wheels, a driving-belt between the said wheels, and elevator-belts mounted upon said rollers, substantially as described.

4. The combination, with the main wheel-frame supported by two wheels and the grain-platform frame, of the grain-elevator, which delivers the cut grain from the grain-platform over the inner wheel, consisting of a substantially-horizontal frame, L, hinged to supports on the main wheel-frame, an inclined elevating-frame, L^2, pivoted at its upper end to the frame L and supported at its lower end adjacent to the grain-platform, and the upper belt-frame, L', hinged by links to the frame L^2, substantially as described.



5. The combination of the main wheel-frame, its supporting-wheels, the platform-frame in lateral alignment with said main wheel-frame, an intermediate frame connecting said main wheel and platform frames and extending laterally in front and rear of one of the supporting-wheels, the jointed elevator composed of frames L L^2, the frame L^2 being connected at its lower end to said intermediate frame, the frame L being hinged to supports on the main wheel-frame, and the upper belt-frame, L', connected to the frame L^2 of the jointed elevator by links whereby to move independent of said jointed elevator, and whereby, also, both frames forming the elevator are moved toward the main wheel-frame when the platform-frame is raised, substantially as described.

396,410. STENCIL. WILLIAM F. MCKAY, Toronto, Ontario, Canada; Sara McKay administratrix of said William F. McKay, deceased. Filed Jan. 5, 1888. Serial No. 257,737. (Model.)



Claim.—The frame A, carrying stencil, having journaled roll C at one end, supported on springs F F at the other and provided with pins G G, in combination with a plate, B, arranged under the stencil, and a table, E, carrying gages D D, as shown and described.

396,411. SHOE-HORN. SAMUEL D. MCKENZY, Philadelphia, Pa. Filed Oct. 31, 1888. Serial No. 289,656. (No model.)

Claim.—As an improved article of manufacture, a shoe-horn consisting of the horn B, having the concave lower end, C, and the handle K, and provided with the slot E and the ridges D, and the arm F, passing through and pivoted in the slot of the horn and provided with ridges I on the inner side of its lower end, as set forth.

396,412. SHARLING-MACHINE. WILLIAM MCPHERSON, New York, N. Y. Filed Sept. 30, 1887. Serial No. 251,153. (No model.)

Claim.—1. In a sharling-machine, the combination of the sharling-iron, the hammer, the trip-wheel operatively connected therewith, and the sliding boxes in which the trip-wheel is journaled, substantially as set forth.

2. In a sharling-machine, the combination of the hammer, the trip-wheel operatively connected therewith, the sliding boxes in which the trip-wheel is journaled, and the adjustable sharling-iron, substantially as set forth.

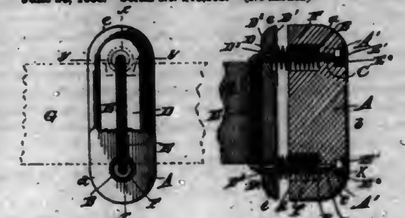
3. In a sharling-machine, the combination of a hammer, a trip-wheel operatively connected therewith, the sliding boxes in which the trip-wheel is journaled, and the weighted foot-lever to govern the force of the blow of the hammer, substantially as set forth.

4. In a sharling-machine, the combination of the hammer, the trip-wheel operatively connected with the hammer, the sliding boxes in which the trip-wheel is journaled, and the foot-regulator connected with the boxes, substantially as set forth.

5. A sharling-machine consisting of a sharling-iron, a hammer suitably fulcrumed and its inner end provided with a lip or catch constructed to engage the trundles of the trundle or trip wheel, and a bumper surrounded by a spring to prevent the rebound of the hammer, substantially as shown and described.

396,418. SKATE. THOMAS H. MCGROWN, Biggsville, Ill. Filed May 7, 1888. Serial No. 273,098. (No model.)

Claim.—1. In a skate, the combination, with a sole-plate, of a rear runner rigidly secured thereto, having an inwardly-curved front edge and guide-lugs projecting beyond said edge, and a front runner pivoted to said plate and having an outward curve on its rear edge conforming to the curvature of said forward edge of the rear runner, substantially as described.



2. In a skate, the combination, with a sole-plate, of a runner rigidly secured thereto, having an inclined lower front edge, as I', and an upper curved front edge, as I, a runner pivoted to said plate in front of said other runner, and having a curved upper rear edge, as H, and an inclined lower rear edge, as H', which are adapted to fit against the said edge of the rear runner, substantially as described.

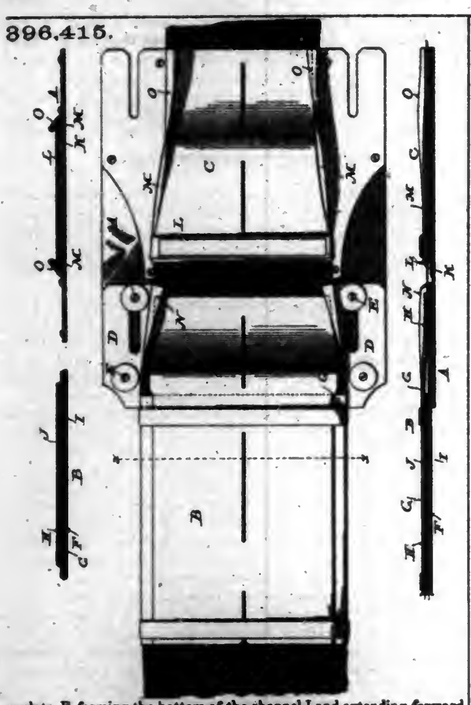
3. In a skate, the combination, with the plate and a rigidly-secured runner, of a pivoted runner having a curved spring, as K, secured thereto and to the plates between the forward ends thereof, substantially as described.

4. In a skate, the combination, with the plate, of a rigid runner secured thereto, having lugs permanently secured thereon projecting obliquely from its forward sides, a runner pivoted to said plate and working between said lugs, and a spring, as K, between the forward ends of said plate and pivoted runner, said spring being rigidly secured to the plate and runner, substantially as described.

5. In a skate, the combination, with the plate, of a rigidly-secured runner C, having lugs G on its forward end and a curved and inclined edge, as I and I', a forward pivoted runner in alignment with said other runner, brackets, as F, secured to said plate, in which said runner is pivoted, and a spring, as K, secured between the pivoted runner and the forward end of the plate, substantially as described.

396,414. TRUSS. JOSEPH B. MELONEY, Hosmer, Wis. Filed June 23, 1888. Serial No. 278,360. (No model.)

Claim.—In a truss, the combination of a base-block and a head-block, each provided with two openings, the respective openings in one block being in alignment with the corresponding openings in the companion block, the inner part of each opening being recessed or enlarged, two spiral springs interposed between the blocks and seated in the respective aligning openings, as specified, a yoke-shaped rod having its side arms in the respective springs and openings aforesaid, the ends of said arms being secured to the base-block, the cross-piece of the yoke lying outside of the head-block, whereby the body-band may be secured between said cross-piece and head-block, substantially as specified.

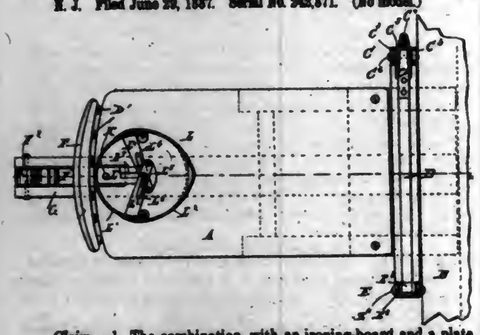


396,415. DEVICE FOR FOLDING THE EDGES OF FABRICS. JOHN R. MCKENZIE, Glens Falls, N. Y., assignor of one-half to Joseph Fowler, same place. Filed Oct. 6, 1888. Serial No. 287,377. (No model.)

Claim.—1. In a device for folding the edges of one fabric upon the edges of another, the combination, with a folder, B, comprising the separated channels I J, of different widths, one above the other, and the converging folding-lips N, of the folder C, provided with converging lips O, to receive the double fabric and fold it upon itself.

2. In a device for folding the edges of one fabric upon the edges of another, the combination of the plates F, G, and H, separated from one another to form channels I and J, of different widths, the plate G terminating short of the plates F and H, and the plate H being bent down in line with the plate G, and converging folding-lips N, formed upon the lower plate, F, and extending from the lower channel, I, upward toward each other and above and overhanging the plate H.

3. In a device for folding cloth, in combination with the folder B, having two channels, I and J, of different widths, separated by a partition, G, a plate, H, forming the top of the channel J and extending forward and downward in advance of and in line with the partition G,



896,415.

a plate, F, forming the bottom of the channel I and extending forward in advance of the partition G, and U-shaped folding-lips N, formed upon the plate F and converging toward each other above the upper plate, H.

4. In a device for folding the edges of one fabric upon the edges of another, the combination, with the body provided with two fabric-receiving channels, one above the other, and the lower channel of greater width than the upper, of converging folding-lips on each side of the body, arranged in line with the wider channel, to receive the fabric passing through the latter and to turn it over upon the edges of the fabric passing through the narrow channel.

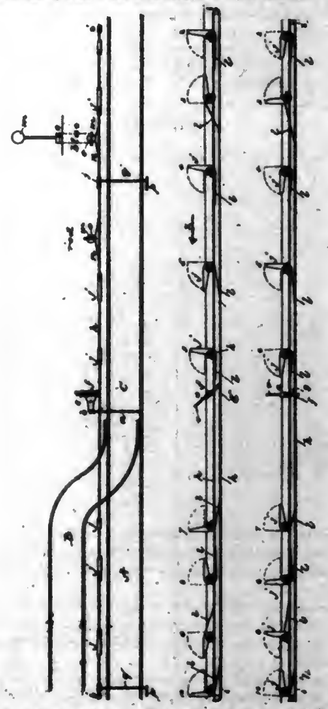
896,416. SHIRT-IRONING TABLE. JAMES H. MOUNT, Jamesburg, N. J. Filed June 29, 1887. Serial No. 242,871. (No model.)

Claim.—1. The combination, with an ironing-board and a plate, C, attached thereto and formed with hinge-lugs C^2, a shoulder, C^3, and a curved or inclined bearing, C^4, of a clamping-bar, D, hinge-plates C^2, attached to the end of the same, a pivot, C^2, passed through the lugs C^2 and plates C^2, a spring, C^7, coiled on the pivot C^2, and having its ends resting against the shoulder C^3 and the bar D, respectively, and a check-spring, C^8, attached to the bar D, and adapted to co-operate with the bearing C^4, substantially as shown and described.

2. The combination, with an ironing-board and a block, H, fixed below the same and formed with a longitudinal groove, G^2, in its under side, of a bar, G, mounted to slide lengthwise in said groove and formed with longitudinal slots in its front and rear ends, a clamping-screw, G^2, passed through the rear one of said slots into the block H, a clamping-bar, F, adapted to bear against the ironing-board and having a shank pivoted in the front one of said slots, and a cam-lever pivoted in the latter slot and adapted to work against said shank, substantially as shown and described.

3. In a yoke-clamping device for shirt-ironing boards, the combination of a pivotal cam-lever, F^2, having its bearing-surface F^3 cut on a circle of which the pivot of the lever is the center, and a swinging clamping-bar, F, having the bearing-surface F^4 of its shank F' cut on a like circle, substantially as and for the purpose specified.

4. The combination, with an ironing-board, of a neckband-ring formed of two movably-connected sections of thin elastic material, one section being connected to the board, and both sections having inwardly-compressible end portions, substantially as described.



5. A neckband-ring formed of elastic hoop-sections L' and L^2, an interiorly-projecting bar, L^3, on one section, and interiorly-projecting arms L^4 on the other section pivotally connected to the bar L^3, substantially as described.

896,417. DYE. SYLVESTER M. NEVILLE, Cleveland, Ohio. Filed Dec. 2, 1887. Serial No. 256,811. (No specimens.)

Claim.—1. A coloring composition insoluble in water and alcohol and soluble in benzine, turpentine, and similar solvents, consisting, essentially, of fatty matter—such as common soap—sulphate of zinc, and such pigment as before compounding is soluble in water or liquid, substantially as set forth.

2. A coloring composition insoluble in water and alcohol and soluble in benzine, turpentine, and similar solvents, consisting, essentially, of common soap diluted or dissolved in water, coloring-matter, as aniline colors such as will dissolve in liquid soap, and sulphate of zinc, substantially as set forth.

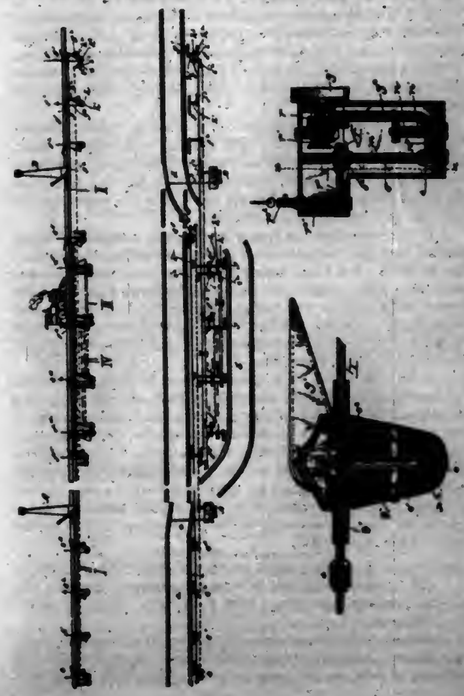
896,418. AUTOMATIC RAILWAY-SWITCH. A. INGRAM PARSONS, St. Louis, Mo.; H. F. Parsons (administrator of said A. Ingram Parsons, deceased) assignor, by mesne assignments, to the Parsons Block, Switch and Frog Company, New York, N. Y. Filed Mar. 11, 1886. Renewed Oct. 4, 1888. Serial No. 287,209. (No model.)

Claim.—1. A railway-switch comprising a switch-bar, a worm-geared operating-lever, a worm-shaft meshing therewith, all arranged at the side of the track, an endless bar, chain, cable, or the like, and vertical levers connected thereto to move it in opposite directions, and means, substantially as described, for actuating said vertical levers to rotate said worm-shaft, and thereby actuate the worm-geared lever and simultaneously lock it, and consequently the switch, in desired position, substantially as set forth.

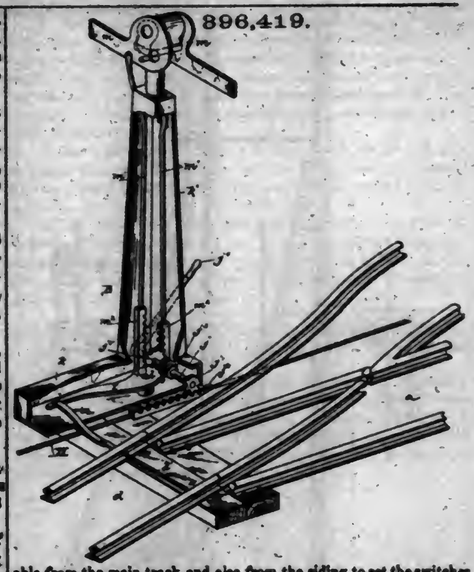
2. A railway-switch-operating mechanism comprising an endless rod, chain, cable, rope, or the like, mounted upon pulleys, a series of vertical levers to move said rod in either of two directions, and a switch-lever having a worm-gear, and a worm-shaft connected to said rod, and all arranged at the side of the track, combined with signals connected to said endless rod and operated by the operating of the switch, substantially as set forth.

3. The combination of the endless rod or its described equivalent and a series of vertical levers flexibly connected in order to the upper and lower members of said rod, with a switch mechanism comprising a switch-bar, a worm-geared segmental lever connected thereto, and a worm-shaft connected to and rotated by the movement of the said rod, the whole arranged parallel to the rails, substantially as described.

4. A switch-operating mechanism comprising a switch-bar and rails, as usual, and two series of alternately rising and falling or reversing levers connected with the switch-bar, and each by its operation in one way causing the other to operate in the reverse direction, thereby always to present for use one or the other series of levers, substantially as described.



5. A switch-bar and a locking mechanism connected therewith, which is also its operating medium, combined with series of rising and falling levers connected with said operating medium and arranged to work in series, so as to insure the presentation of one or the other series in operative position for reversing the last movement of the switch, substantially as described.



896,419. RAILWAY SWITCH AND SIGNAL. HENRY F. PARSONS, New York, N. Y., assignor, by mesne assignments, to the Parsons Block, Switch and Frog Company, same place. Filed Apr. 23, 1888. Serial No. 271,603. (No model.)

Claim.—1. A main track, a siding, and switches at each end of the siding, combined with switch-operating mechanism, comprising two systems, each having two series of permutable reversing-levers and connecting mediums for coupling in pairs the series of each system, substantially as described.

2. In a railway switch and signal mechanism, the rails and bar of the switch, combined with a suitable number of the reversing so-called "levers" of this specification, each lever comprising the exposed arm adapted to be operated by or from a passing train or locomotive, a toothed arm connected to said exposed arm, a rotary shaft operated from said toothed arm, a rotary signal, rods connecting the several levers together and to the switch, and gearing interposed in each lever between its rotary shaft, rods, and signal, substantially as described.

3. The main track, an interposed siding, switches at each end of said siding, and switch-stands for said switches, combined with the levers c, c', c^2, c^3, c^4, c^5, and c^6 and the levers f, f', f^2, f^3, f^4, f^5, and f^6, connected in two systems of two series each, which systems are operable from the main track and also from the siding to set the switches and signals, substantially as described.

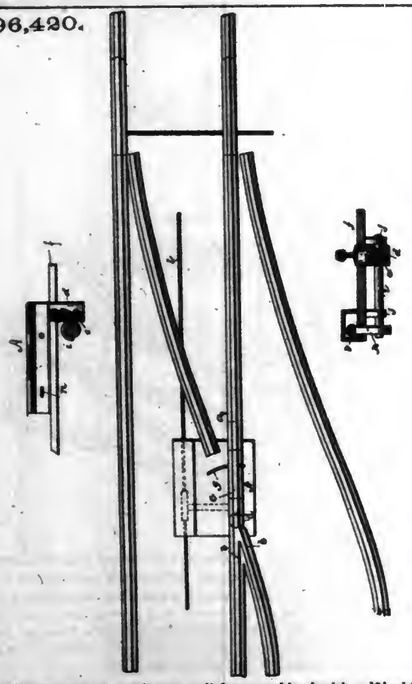
4. A combined switch-stand and signal-tower comprising a suitable casing, a shaft and means to rock it, a gear-wheel on said shaft, semaphores or targets, and toothed rack-bars meshing with said wheel and connected with the said targets, in combination with the switch and switch-bar, substantially as described.

5. A combined switch-stand and signal-tower comprising a suitable casing, a rotary or rocking worm-shaft, a horizontal lever geared to said worm-shaft and coupled to the switch-bar, a pinion, semaphores or targets, and toothed rack-bars geared to said pinion and engaging the said targets, substantially as described.

6. The so-called "lever" of this specification, comprising an exposed arm adapted to be operated by or from a passing train or locomotive, a toothed arm connected to said exposed arm, a rotary shaft operated from said toothed arm, and gearing which is interposed between the parts operated by said lever and said rotary shaft, substantially as described.

7. In a railway-switch, the combination of a pair of oppositely-movable rods with a series of "levers," herein so called, each consisting of an exposed arm to be operated by a passing locomotive or train, a toothed arm connected to said exposed arm, a rotary shaft geared with said toothed arm, and a rotary shaft which in turn is geared to the rods, substantially as described.

8. The so-called "levers" of this specification, combined with the water-tight casing and a separable cap therefor containing in packed bearings the rods for connecting the levers in series, substantially as described.



9. A combined switch and signals therefor, composed of a main track, an interposed siding, switches at each end of said siding, and switch-stands, and signals for said switches, combined with the levers c, c', c^2, c^3, c^4, c^5, and c^6 and the levers f, f', f^2, f^3, f^4, f^5, and f^6, each provided with a co-operating signal and connected in two systems of two series each, which systems are operable from the main track and also from the siding to set the switches and signals, substantially as described.

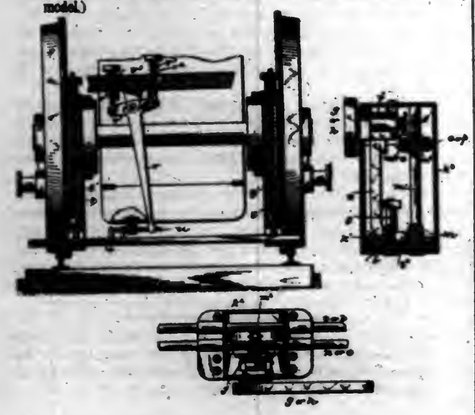
10. The combination, with automatic switch-operating mechanism, comprising a suitable number of the so-called "levers" of this specification and the combined switch-stand and signal-tower, substantially such as described, of the frog s and connections between them, substantially as described.

11. The so-called "lever" of this specification, comprising an exposed arm adapted to be operated by or from a passing train or locomotive, a toothed arm connected to said exposed arm, and a rotary shaft operated from said toothed arm, combined with a signal and rods for connecting a series of such levers and gearing interposed between the said rotary shaft and the rods and signal, substantially as described.

896,420. CONTINUOUS RAIL-FROG FOR RAILWAYS. HENRY F. PARSONS, New York, N. Y., assignor, by mesne assignments, to the Parsons Block, Switch and Frog Company, same place. Filed Apr. 23, 1888. Serial No. 271,609. (No model.)

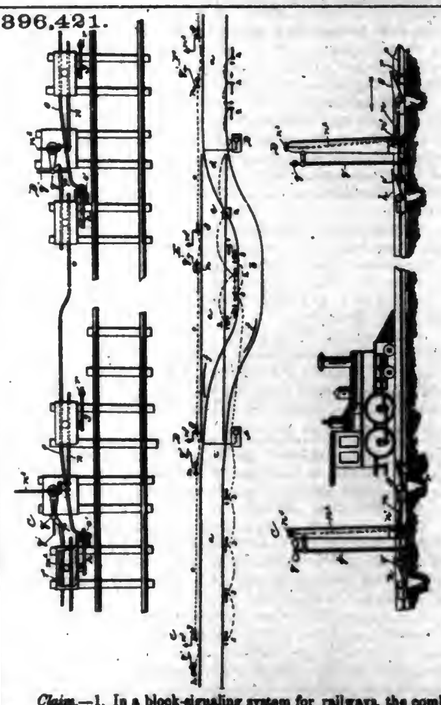
396,420.

Claim.—1. A continuous rail-frog, combined with self-locking worm-gearing for operating it, substantially as described.



2. A railway-frog provided a toothed gear, combined with a shaft and a toothed gear thereon meshing with the gear of the frog, and by its rotation serving to move or shift the frog and lock it in given position, substantially as described.

3. The combination, with a pivoted frog and a segmental worm-gear thereon, of a worm-shaft geared with the worm-gear and adapted to be rotated to shift the frog from one position to another and back again and incidentally to lock the frog in its positions of use, substantially as described.



4. The combination, with a continuous rail-frog, of automatic operating mechanism and self-locking worm-gearing connecting the two, substantially as set forth.

5. A railway-frog provided with a toothed gear, and a shaft and a toothed gear thereon meshing with the gear of the frog, and by its rotation serving to move or shift the frog and lock it in given position, combined with automatic operating mechanism connected with said shaft, substantially as described.

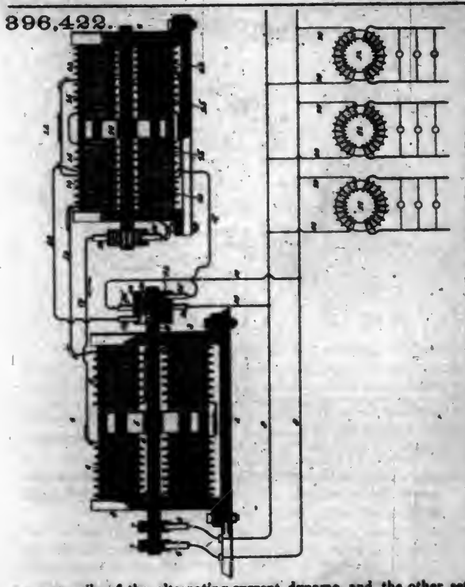
396,421. AUTOMATIC BLOCK-SIGNALING SYSTEM AND APPARATUS FOR RAILWAYS. HENRY F. PARSONS, New York, N. Y., assignor, by mesne assignments, to the Parsons Block, Switch and Frog Company, same place. Filed Apr. 23, 1888. Serial No. 271,510. (No model.)

396,421.

Claim.—1. In a block-signaling system for railways, the combination of a series of signal-stations arranged along the track at suitable intervals, each comprising an entrance-signal connected with a lever to be operated by or from the locomotive, and a second signal connected with an independent lever adapted to be similarly operated, the second lever being provided with a blocking mechanism for the entrance-lever, and also with connections with the entrance-lever of the station in advance, substantially as described.

2. In a block-signaling system for railways, the combination of a number of signal-stations arranged alongside the track, each comprising two levers independently geared to individual signal-targets at its own station and respectively independently geared to the target-operating levers of the stations next adjoining on both sides, substantially as described.

3. In a block-signaling system for railways, a number of signal-stations arranged alongside the track, and each comprising two levers, g and h, connected to independent signals, the levers g and h of adjacent stations being connected for co-operation, and a blocking mechanism for the station in the rear being also included in this connection and operable by it, substantially as described.



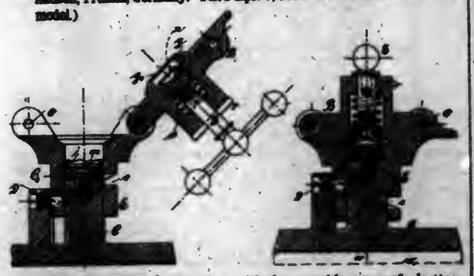
4. In a block-signaling system for railways, a number of signal-stations arranged alongside the track and comprising the combination of levers g and h and signals n^2 and q' at each station, toothed rack-bars n and p, respectively geared to the levers g and h and signals n^2 and q' of their own station, a pivoted block, o', beneath each lever h, and a toothed rack-bar, o, geared to the lever g and coupled to block o' of one station and geared to lever h of the station in advance, substantially as described.

5. In an automatic block-signaling system for railways, a number of signal-stations arranged alongside the road, and each comprising signals and entrance and exit levers therefor and blocking devices for the entrance-levers, with connections between the levers and signals of adjacent stations on both sides, combined with a bar on the locomotive movable laterally to engage the levers and depress them to operate the signals and block an entrance-lever in the rear, and also yielding vertically by contact with an immovable obstacle—such as one of the blocked levers—to arrest the attention of the engineer, substantially as described.

396,422. REGULATION OF ALTERNATE-CURRENT GENERATORS. GUSTAV FRANKENBURG, Cleveland, Ohio, assignor to the Brush Electric Company, same place. Filed Nov. 5, 1887. Serial No. 254,415. (No model.)

Claim.—1. The combination, with an alternating-current dynamo, of a separate exciting-dynamo having its field-magnets provided with two sets of coils, one set being included in the circuit of the field-

396,422.



magnet coils of the alternating-current dynamo, and the other set being included in a shunt across the brush-terminals of the alternating-current dynamo.

2. The combination, with an alternating-current dynamo, of a separate exciting dynamo having its field-magnets provided with two sets of coils, one set being included in the circuit of the field-magnet coils of the alternating-current dynamo, and the other set being included in a shunt across the working-circuit, and a commutator included in the shunt for straightening the current to the set of field-coils therein, substantially as set forth.

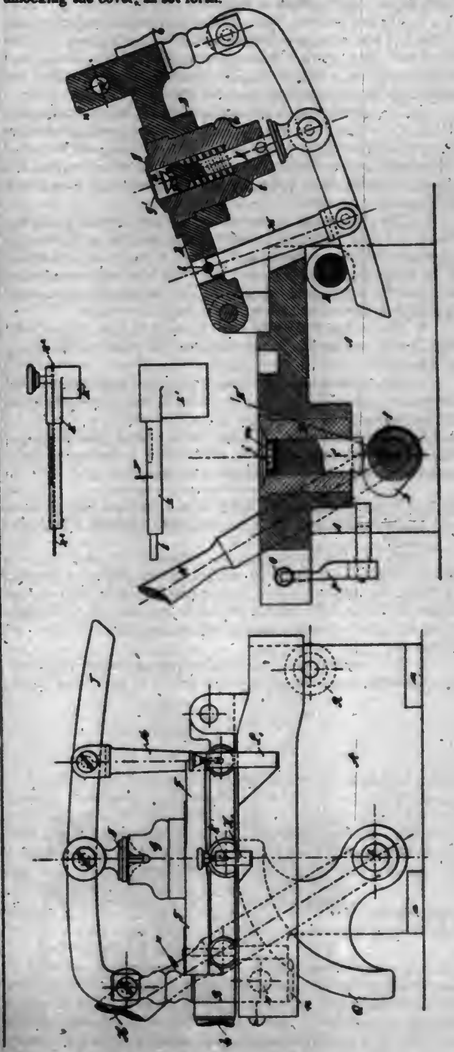
3. In a system of electrical distribution, the combination of a separately-excited alternating-current generator having its field-coils charged by a self-exciting dynamo, with auxiliary differential coils upon the field-magnets of the exciter in a shunt across the brush-terminals of the alternating-current generator, and a commutator for straightening the currents in the shunt, substantially as described.

4. The combination, with an alternating-current dynamo, inductoriums in multiple-arc branches of the main line from the alternating-current dynamo, and translating devices included in the secondary circuits of the inductoriums, of a separate exciting-dynamo having two sets of field-magnet coils, one set being included in circuit with the field-magnet coils of the alternating-current dynamo, and the other set included in a shunt from the main line, substantially as set forth.

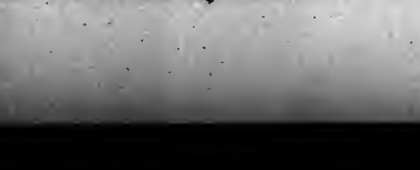
396,423. BUTTON-MACHINE. CARL A. PFENNING, Barmen Ritterhausen, Prussia, Germany. Filed Apr. 5, 1888. Serial No. 269,670. (No model.)

Claim.—1. The combination, with the movable cover of a button-making machine, of a button-forming stamp carried by the cover, a retaining device, as described, for temporarily holding the stamp in its elevated position, an operating-spring whereby the stamp is thrust downward when released, and an operating-handle, all substantially as and for the purpose set forth.

2. The combination, in a button-forming machine, of a movable cover containing a button-forming stamp driven by a spring and a pin attached to the stem and resting in ways, whereby the upward movement of the stamp is caused by the sliding of the pin in the ways, substantially as described.

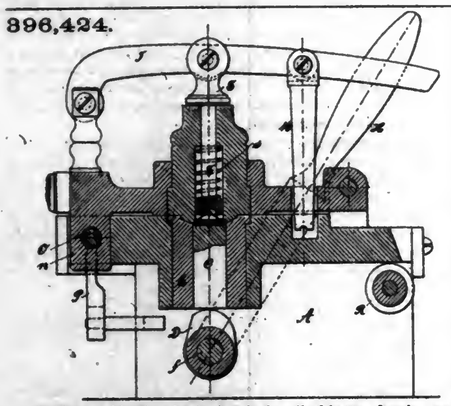


3. The combination, in a button-forming machine, of a base, a screw centrally mounted thereon, a surrounding sleeve engaging with said screw and carrying the button-forming core upon its upper end, a second sleeve surrounding said first sleeve and adapted to move vertically thereon, a cover containing button-forming mechanism mounted upon said sleeve, and a handle for operating said button-forming mechanism, substantially as described.



4. The combination of the core C, the sleeve E, the cover B, pivoted upon the sleeve E and locked thereon in operation, the button-forming plunger S, driven by a spring, s, and raised by a pin, r, traveling in the slot r', substantially as described.

5. The combination of the base w', carrying screw w, the part C, screwing upon the screw w, the pin D, suitably supported upon the part C, the sleeve E, having slot e, and the cover B, pivoted on the sleeve E and carrying the button-forming mechanism operated by the handle S, substantially as described.



396,424. BUTTON-MACHINE. CARL A. PFENNING, Barmen Ritterhausen, Prussia, Germany. Filed Apr. 5, 1888. Serial No. 269,672. (No model.)

Claim.—1. The combination, in the herein-described button-forming mechanism, of a base carrying a core for forcing the button upward, a cover containing button-forming mechanism pivoted thereon, a lock for locking the cover upon the base, and a lever provided with connections, substantially as described, for raising the core and unlocking the cover, as set forth.

396,424.

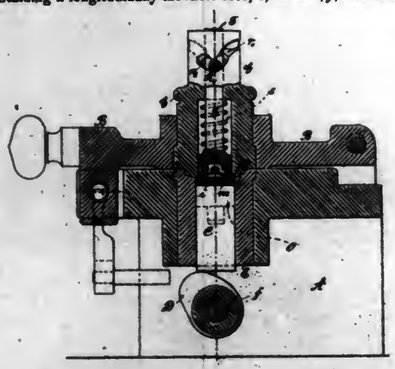
2. The combination, in the herein-described button-forming machine, of a cover containing button-forming parts and a bolt for locking the button-shank within the cover until it is dropped upon the parts beneath, substantially as described.

3. The combination, in the herein-described button-forming machine, of a pivoted cover containing button-forming mechanism driven downward by a spring, a lever operating said spring and connected to the cover, and a roller fixed to the base for operating the lever and raising the spring, substantially as described.

4. The combination, in the herein-described button-forming machine, of a pivoted cover containing button-forming mechanism driven downward by a spring, a lever operating said spring and connected to the cover, and a roller fixed to the base for operating the lever and raising the spring, and a spring-lock for locking the spring when raised, substantially as described.

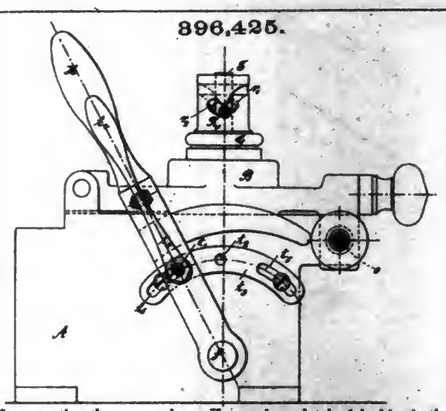
5. The combination, in the herein-described button-forming machine, of a base containing a longitudinally-movable button-forming core operated by an eccentric upon a shaft, a lever for operating said shaft, a bolt for locking the cover upon the base, and a connection, substantially as described, between the lever and the bolt for operating the lock between the cover and the base, as set forth.

6. The combination of the base A, cover B, lever H, and bolts K, L, and O, operated by the movement of the lever H, substantially as described.



7. The combination of the base A, the cover B, pivoted thereon, the lever J, operating stamp S, and a roller, R, for operating the lever, substantially as described.

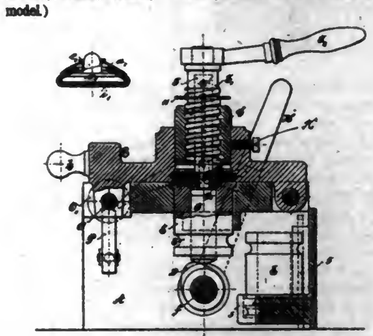
8. The combination of the base A, the cover B, pivoted thereon, the lever J, operating stamp S, a roller, R, for operating the lever, and an arm, M, and bolt *l*, substantially as described.

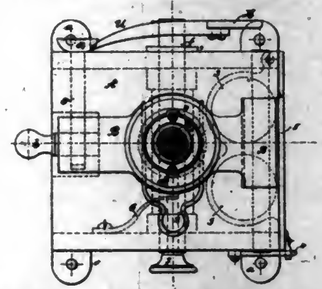


396,425. BUTTON-MACHINE. CARL A. PFENNING, Barmen Ritterhausen, Prussia, Germany. Filed Apr. 5, 1888. Serial No. 269,673. (No model.)

Claim.—1. The combination, in a button-forming machine, of a base, a longitudinally-movable core supported thereon, a cam arranged in the path of the core, an operating-handle for the cam, and a latch for temporarily securing the handle intermediate of the limits of its swinging movement, substantially as and for the purpose described.

2. The combination, in a button-forming mechanism, of the base A, containing a longitudinally-movable core, C, an axis, *f*, and cam D,

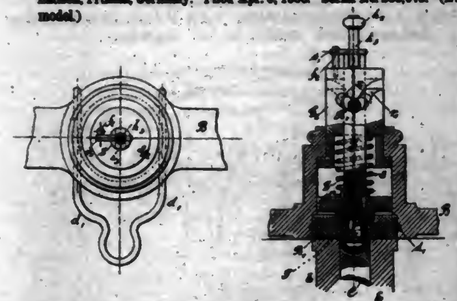




396,425.

for operating the same, a lever, H, carrying a latch, *f'*, locking in the segment *f*, which itself is capable of longitudinal adjustment by means of the slots *f'*, substantially as described.

396,426. BUTTON-MACHINE. CARL A. PFENNING, Barmen Ritterhausen, Prussia, Germany. Filed Apr. 5, 1888. Serial No. 269,674. (No model.)



Claim.—1. In the machine herein described, the combination of a base supporting a button-forming cylinder and a central core and an adjusting device therefor, a cap above the cylinder provided with a corresponding die removably locked therein by a pronged wire, as described, and a stamp carried by the cap and adapted to be driven through said cap and die by a screw, substantially as set forth.

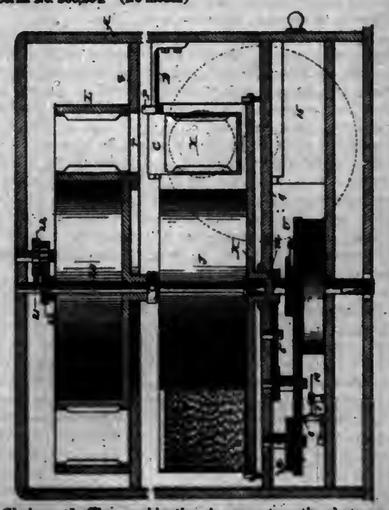
2. In the machine herein described, the combination of a base supporting a button-forming cylinder and a central core, a cap removably connected to the base and provided with a die having lateral recesses coinciding with recesses in the cap and detachably locked in place by a pronged wire fitted to said recesses, and a stamp carried by the cap and adapted to be driven through said cap and die by a screw, substantially as described.

3. The combination, in a button-forming machine, of a frame, A, a button-forming cylinder, E, a central core, C, and a bolt, 7, entering a recess in the part E and projecting without the casing, substantially as described.

4. The combination, in a button-forming machine, of a frame containing the button-forming part G', locked therein by a pronged wire, and the ejector-wire 9, for ejecting the same, substantially as described.

396,427. BUTTON-MACHINE. CARL A. PFENNING, Barmen Ritterhausen, Prussia, Germany. Filed Apr. 6, 1888. Serial No. 269,675. (No model.)

Claim.—1. In a button-forming machine, a cylinder within which the button is formed, a core for raising the button therein, a stamp having its axis coincident with the core, and a hook for sustaining the button passing through said stamp, substantially as described.



2. In a button-forming machine, a movable guide and a stamp, S, supported and centralized thereby and detachably connected thereto, in combination with the spring *s*, actuating said guide, and the handle R', traveling in the slot *r'*, for elevating the guide and stamp, substantially as described.

3. The combination, in a button-forming machine, of the cap B the button-forming part B', provided with bevel *g*, and the stamp S', depressed by spring *s* and raised by handle R', traveling in the slot *r'*, substantially as described.

4. The combination, in a button-forming machine, of a stamp, S', and a central longitudinally-movable button-holding wire, *k'*, substantially as described.

5. The combination, in a button-forming machine, of the stamp S, provided at its upper end with a slot, a central button-supporting wire traversing the stamp, and an arm at or near the upper end of said supporting-wire, whereby the latter may be sustained from the top of the stamp or be permitted to drop into the slot therein, substantially as and for the purpose described.

396,428. AUTOMATIC PHOTOGRAPHIC APPARATUS. WILLIAM B. POPE and EDWARD L. POOLE, Baltimore, Md. Filed Jan. 9, 1888. Serial No. 260,204. (No model.)

Claim.—1. The combination, in an automatic photographing apparatus, of a camera for prepared plates, baths to receive said plates in succession, a shutter, and an actuating motor and detent, and detent-operating device, whereby on the release of the detent the shutter, carrier, and plates are automatically moved to first expose the plates and then pass them successively through the baths, substantially as described.

2. The combination, with a camera, of a plate-carrier within the same constructed to support a series of separately-detachable plates, a plate-holder to receive the plates from the carrier, a shutter, a detent, a motor, whereby said carrier is automatically moved to feed the plates into the field of the lens after each exposure, and the baths, substantially as described.

3. The combination, with a camera, of a movable plate-carrier, baths, shutter, automatic carrier, and shutter operating and stop devices, and stop-actuating mechanism, substantially as set forth.

4. The combination, with a camera, of a movable plate-carrier and baths and shutter within the same, and carrier and shutter actuating and stop devices, a coin-holder, and connections between the same and the stop, whereby the latter is released in the presence of a coin, substantially as described.

5. In an automatic photographic apparatus, a plate-carrier, baths, shutter, electric stop arranged within a camera, and generator electrically connected with said stop, and a coin-holder having points connected with the generater and arranged to contact with a coin in said holder to complete a circuit, substantially as described.

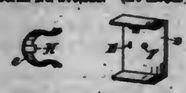
6. The combination, with a camera, of a plate-carrier and a series of baths, a motor connected to move the parts to carry the plate to and from the baths, and a stop and stop-actuating device, substantially as described.

7. The combination, in a camera, of a plate-carrier, shutter, motor, electric stop, and coin-holder electrically in line with the generator and stop, and with contacts arranged to complete an electric circuit to withdraw the stop when a coin is in the holder, substantially as described.

8. The combination, with a camera box and plate-holder, of a shutter, an electric shutter-actuating mechanism, and a coin-holder electrically in line with said actuating mechanism and a battery, and with contacts arranged to contact with opposite sides of a coin in the holder to complete the circuit, substantially as set forth.

9. The combination, with a camera, shutter, and stop device, of a coin-holder provided with a movable retaining device connected with the shutter-stop device to be operated thereby to release the coin when the shutter is released, substantially as set forth.

10. The combination, with a camera, of a plate-holder, a series of baths, a motor connected to move the parts to introduce the holder in succession into said baths, a stop for holding said motor out of action, a coin-holder, and connections between the latter and the said stop, whereby the motor is released as the coin passes through the holder, substantially as set forth.



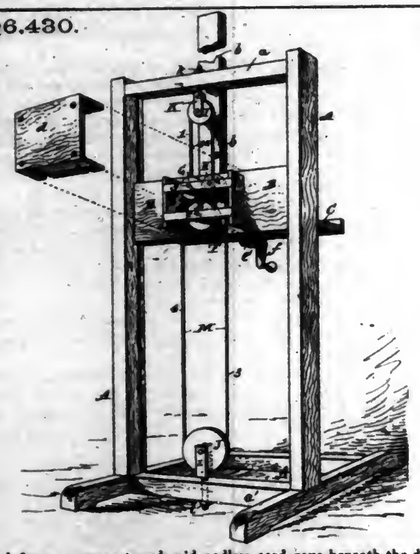
11. The combination, with the camera, plate-carrier, baths, spring-motor, and motor-stop device, of a shutter and actuating device, a shutter-catch connected with said stop device, and a coin-holder provided with a retaining device connected with said catch, substantially as set forth.

12. The combination, with the camera and pivoted plate-holder therein, of a movable rack carrying a series of plates for supplying said holder with said plates in succession, and the movable baths, substantially as set forth.

13. The combination, in a camera, of a movable plate-holder and a series of baths, and actuating means for carrying said holder from one bath to another in succession, and plate-discharging mechanism for discharging each plate after it passes through the last bath, substantially as set forth.

14. The combination, with a camera, of a shutter and a movable plate-holder, a movable rack for supplying the plate to the holder, a series of baths for receiving the plate in succession, all arranged within the camera-box, motor devices for actuating the moving parts, stops for retaining said parts normally at rest, and a coin-holder and connections between the same and said stop, substantially as and for the purpose set forth.

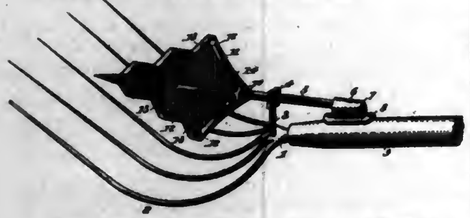
396,429. DOOR-CHECK. CHARLES A. PRATT, Toledo, Ohio. Filed June 7, 1888. Serial No. 276,322. (No model.)



Claim.—In a door-catch, the combination of a C-shaped spring having a riveting-lug, H, at one side of its middle or bent portion, a backing or plate provided with a recess for receiving said lug and with means for attaching the plate to the door or frame, and a disk formed with an elongated slot for permitting the adjustment of the disk and with means for its attachment opposite to the spring, substantially as described.

396,480. DIFFERENTIAL PULLEY-AND-CORD HOISTING-GRADING. CARL H. W. RENNER, New York, N. Y. Filed June 23, 1888. Serial No. 277,503. (No model.)

Claim.—1. The combination, in differential hoisting or drawing gearing, of two pulleys of different diameters held by one shaft to the part or structure to be moved, an endless cord, idler pulleys or guides allowing the cord to be passed under both the differential pulleys, upper and lower pulleys or guides for the cord held to a relatively-



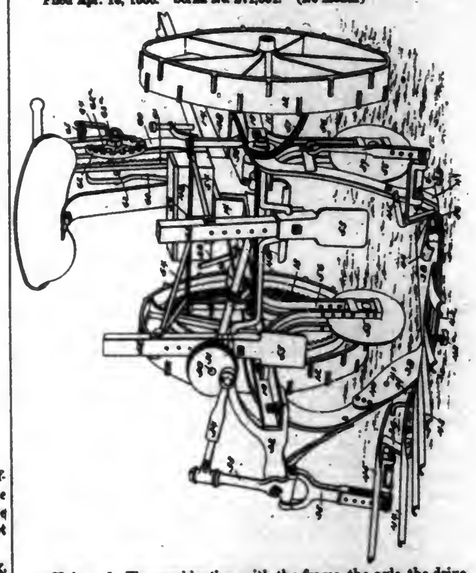
396,430.

fixed frame or support, and said endless cord rove beneath the differential pulleys and over the idler pulleys or guides on the movable part or structure, and also rove around or over the pulleys or guide on the relatively-fixed frame or structure, substantially as herein set forth.

2. The combination, in differential hoisting or drawing gearing, of two differential pulleys, E F, on a shaft, *e*, journaled to a movable part or structure, guide-pulleys G H on said structure, guide-pulleys I J on a relatively stationary frame or support, and an endless cord, M, passed beneath the pulleys E F and over the pulleys G H and around or over the pulleys I J, substantially as herein set forth.

396,431. BAND-CUTTING FORK. ARTHUR ROGMAN, Holder, Ill. Filed Apr. 23, 1888. Serial No. 271,542. (No model.)

Claim.—1. An attachment for grain-forks, consisting of the tapering blade 11, having shouldered cutting-edges 12 on opposite sides, and provided with the bar 5, the screw-threaded post 3, having the enlarged and apertured part 4, and the socket-piece 7, substantially as described.



2. The combination, with the fork 2, the handle 9, provided with the socket-piece 7, and the post 3, secured to the head of the fork and having apertured enlargement 4, of the bar 5, secured in the socket-piece and enlargement of the post, and the cutting-blade 11, provided with the shoulders 12, having bearded cutting-edges 13, substantially as herein shown and described.

396,432. PROCESS OF MAKING PAINT FROM OIL FOOTS. GEORGE W. SCOLLAY, New York, N. Y. Filed Mar. 31, 1888. Serial No. 268,007. (Specimens.)

Claim.—1. The process, substantially as herein described, of making paint of the residuum resulting from the refinement of vegetable oils, which consists of mixing vegetable oil with alkali in solution, for the purpose of precipitating the residuum and refining the oil, then separating the refined oil from the residuum, and then mixing said residuum with a metallic chloride or its equivalent, for the purpose of converting it into paint.

2. The process, substantially as herein described, of making paint of the residuum resulting from the refinement of vegetable oils, which consists of mixing vegetable oil with alkali in solution, for the purpose of precipitating the residuum and refining the oil, then separating the refined oil from the residuum, then excluding the air from said residuum until it assumes a lighter or yellow color, and then mixing said residuum with a metallic chloride or its equivalent, for the purpose of converting it into paint.

396,433. POTATO-DIGGER. JAMES W. SCOTT, Uhrichsville, Ohio. Filed Apr. 16, 1888. Serial No. 271,091. (No model.)

Claim.—1. The combination, with the frame, the axle, the drive-wheel, a transverse shaft rotated from the drive-wheels, a longitudinal shaft driven from said transverse shaft, and a shovel adjustably secured to the frame, of a reciprocating shaker-bar hinged at one side to the frame, a lever-connection between the shaker-bar and the longitudinal shaft, substantially as shown, fingers attached to said shaker-bar and graduated from the center, an auxiliary bar attached longitudinally to the shaker-bar at its ends, and a set-screw passing through the auxiliary bar in engagement with the shaker-bar, substantially as shown and described, whereby the shaker-bar may be more or less straightened, concaved, or convexed, as set forth.

2. The combination, with the frame, the axle, the drive-wheel, a transverse shaft rotated from the drive-wheel, a longitudinal shaft driven from said transverse shaft, and a shovel adjustably secured to the frame, of a reciprocating shaker-bar hinged at one side to the frame, a lever-connection between the shaker-bar and longitudinal shaft, said connection consisting of an upper arm, 33, pivoted upon the bracket 32, of the frame, and an adjustable connecting-rod, 34, pivoted to arm 33 and connected at its opposite end to the crank-disk 31 upon the longitudinal shaft 30, and an arm, 35, pivoted upon lateral projections upon the lower end of the arm 33, said arm 35 capable of forward and rearward movement and adjustably connected at its lower end to the shaker-bar, said shaker-bar provided with fingers connected to the shovel, all arranged substantially as and for the purpose described.

3. In a potato-digger, essentially as described, the combination, with the main frame, the vertical standards 48, mounted thereon, the transverse cross-bar 49, connected to said standards, the drive-wheels, the axle, and sprocket-wheels upon the axle adjacent to the drive-wheel, of a crank-shaft journaled in the frame, a sprocket-wheel carried by the shaft, an endless belt connecting the sprocket-wheels of the crank-shaft and axle, alternately vertical reciprocating posts pivoted upon the crank-shaft, and shovels adjustably secured to the lower extremities of the posts, their upper ends pivoted to the cross-bars 49 by means of the horizontal connecting-arms 54, substantially as and for the purpose described.

4. In a potato-digger, substantially as described, the combination, with the frame, the axle, the drive-wheels, the plow secured to the rear end of the frame, and the tongue pivoted upon the axle and extending forward over the front of the main frame, of the means for raising and lowering the frame, said means consisting of a rearwardly-inclined bar, 61, extending upwardly from the tongue 14, provided with a longitudinal slot, one wall of which is toothed, a perpendicular standard, 60, mounted upon the forward end of the frame 10, a notched disk, 62, formed upon the upper outside edge thereof, a spindle, 63, passing transversely through said disk 62, and bar 60, provided at its inner end with a pinion engaging the toothed wall of the standard 61, and a crank-arm, 63*, mounted upon the outer end of said spindle, said arm adapted to be normally held in engagement with the notched disk by means of the plate 64 and spring 65, all arranged substantially as and for the purpose described.

5. In a potato-digger, the combination, with a reciprocating shaker-bar and fingers secured to the same, of an auxiliary bar attached at its ends longitudinally beneath the main shaker-bar, and a set-screw passing through the auxiliary bar to an engagement with the main bar, substantially as shown and described, whereby the main bar may be straightened, concaved, or convexed, as desired.

6. In a potato-digger, substantially as herein described, the combination, with a shovel, a reciprocating shaker-bar, fingers secured to the same and graduated to ascend from the center, the outermost of which fingers are secured to the shovel, of an auxiliary bar attached at its ends longitudinally beneath the main shaker-bar, and a set-screw passing through the auxiliary bar to an engagement with the main shaker-bar, substantially as and for the purposes specified.

7. In a potato-digger, essentially as herein described, the combination, with a reciprocating shaker-bar, and fingers attached to said bar graduated to ascend from the center outward, of an auxiliary bar attached at its ends longitudinally beneath the main shaker-bar, and a set-screw passing through the auxiliary bar to an engagement with the main bar, substantially as shown and described, whereby the potatoes are prevented from spilling over the sides of the shaker, as set forth.

396,434. PLOW. THOMAS W. SHUNK, Bucyrus, Ohio. Filed Oct. 1, 1888. Serial No. 286,876. (No model.)

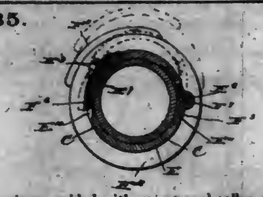
Claim.—1. In a plow, the combination, with the frog or sheth, of a point proper having a vertical wall, *a*, a horizontal lateral flange, *b*, and an inclined lateral flange, *c*, forming a tapering recess in which said frog is fitted, and a bolt or other device to secure the frog and point together.

2. In a plow, the combination, with the frog or sheth, a vertical adjustable standard secured to it, and braces also secured to it, of a beam pivotally connected with the said standard and with said braces.

3. In a plow, the combination, with the frog or sheth, a standard having a slot and a series of holes, bolts carried by the frog or sheth and fitted to said slot and either of said holes, and braces secured, one of them by one of said bolts and the other by another bolt, to the frog or sheth, of a beam pivoted to the standard and to said braces by horizontal bolts.

4. In a plow, the combination, with the frog or sheth having two bolts and integral lugs near one side of one bolt and the opposite side of the other bolt, of a standard adjustably secured by said bolts and fitted between the said lugs.

5. In a plow, the combination, with the frog and the point fitted thereto and constructed in the wall thereof away from the landside, with a groove, *f*, and constituting a shoulder by the remaining upper portion of said wall, of a share-wing secured to the frog and fitted against said shoulder so constituted and into the said groove.



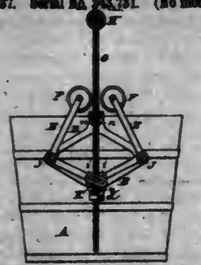
6. In a plow, the combination, with the frog or sheth, of a point proper having a vertical wall, *a*, a horizontal lateral flange, *b*, and an inclined lateral flange, *c*, whereby a tapering recess is formed for the point of the frog, a bolt fitted through the walls of the frog and point, and an elongated bolt-hole to admit of adjusting the point.

396,435. HOSE-COUPLING. JAMES D. SLOAN, Rushville, Ind. Filed June 1, 1888. Serial No. 275,702. (No model.)

Claim.—1. In a hose-coupling, the combination, with the coupling-body E, provided with a lug, E', and a projection, E^2, a hinged portion, F, provided with a forwardly-extending spring-catch adapted to engage the lug E' when closed and the projection E^2 when opened, said hinged portion and the body portion provided with internal

396,435.

grooves, of a pipe provided with an external collar adapted to enter the internal grooves in the coupling, substantially as and for the purpose specified.



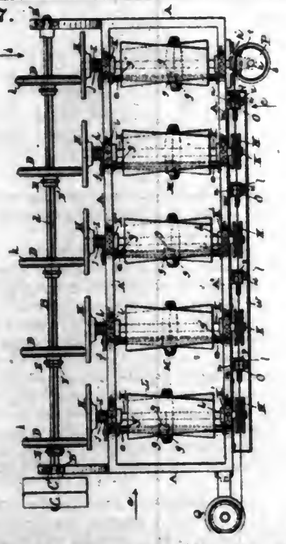
2. A hose-coupling consisting of a body provided with a lug, E', said lug being provided with a smaller lug, E^2, a hinge engaged to said body, said hinge portion being provided with a spring-catch, F^2, the inner sides of the body aforesaid being grooved, in combination with a pipe provided with a collar adapted to engage with the groove in the body aforesaid, substantially as and for the purpose specified.

3. A hose-coupling consisting of a body provided with a recess, E^{2a}, on its outer side, a lug, E', provided with a smaller lug, E^2, a spring-actuated hinge portion engaged to said body, said hinge portion being provided with a spring-catch, F^2, the inner sides of the body aforesaid being grooved, the hinge portion being beveled, as specified, in combination with a pipe provided with a collar adapted to engage with the groove and bevel parts aforesaid, substantially as and for the purpose specified.

4. A hose-coupling consisting of a body portion, E, provided with an opening for the reception of a hinge portion, and a hinge for closing said opening, said body being provided with external corrugations, and also provided with collars E' E^3 E^4, the respective inner sides of the body and hinge portion being grooved and beveled, as specified, one side of the hinge portion being provided with a grooved extension, F^3, in combination with the pipe C, provided with collars C' C^3 and external corrugations, substantially as and for the purpose specified.

5. A hose-coupling consisting of a body portion, E, provided with an opening for the reception of a hinge portion, and a hinge portion for closing said opening, said body being provided with external corrugations and threads, also provided with shoulder and flange, the inner side of the body being grooved, one side of the hinge portion being provided with a grooved extension, F^3, in combination with the pipe C, having collars C' C^3, and also provided with external corrugations and threads, and the internally-threaded collars D D', substantially as and for the purpose specified.

396,436. MOP-WRINGER. F. ROLLIN SMITH, Bennington, Vt. Filed July 8, 1887. Serial No. 243,791. (No model.)



Claim.—1. The combination, with a pail, of two pairs of bell-crank levers pivoted on the pail—one pair on each side thereof—a pair of rollers journaled in the outer co-ordinate arms of said levers and parallel to each other, and a vertically-sliding bail-handle adapted to slide in guideways attached to the sides of the pail and fitted with suitable provisions for connecting with the inner co-ordinate arms of said levers, substantially as shown, whereby the vertical movements of said bail will cause said rollers to approach and recede from each other, substantially in the manner described, and for the purposes set forth.

2. The combination, with a pail, of the casting B, provided with legs *c d*, the bell-crank levers E, pivoted thereon and having slots in their inner arms, and rolls F, journaled in their outer arms, and the bail G, passing through lugs *c d* and provided with pins K, which engage the slots in the inner ends of the bell-crank levers, whereby the upward movement of the bail separates the rolls and the downward brings the rolls into operative position, substantially as described, and for the purposes set forth.

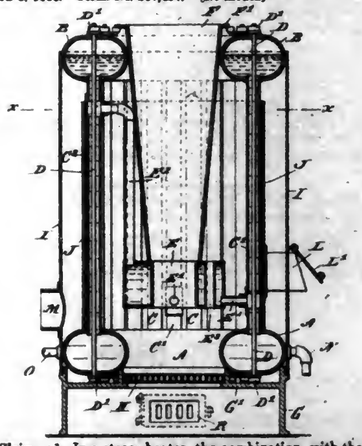
396,437. WIRE-DRAWING MACHINE. HERBERT SMITH, Worcester, Mass. Filed Nov. 7, 1888. Serial No. 290,126. (No model.)

Claim.—1. In a wire-drawing machine, the combination of a

896,437.

series of adjustable rotary friction driving-disks and a series of rotary friction-driven disks driven at varying speeds from the first-named disks, with a series of friction-cones on the same shafts as the friction-driven disks, a series of friction-cones driven at varying speeds from the first-named cones through the medium of a series of adjustable belts arranged one between each pair of cones of the series, a series of drawing-through pulleys, and the wire-drawing block, said pulleys being on the same shafts as the driven cones and the block on an independent shaft driven in turn from the shaft of one of said driven cones, all having suitable supports, as well as constructed and arranged for operation substantially as and for the purpose set forth.

2. In a wire-drawing machine, the combination of a series of adjustable rotary disks and a series of rotary disks driven at varying speeds from the first-named disks, with a series of friction-cones on the same shafts as the driven disks, a series of friction-cones driven at varying speeds from the first-named cones through the medium of a series of adjustable belts arranged one between each pair of cones of the series, a series of drawing-through pulleys, and the wire-drawing block, said pulleys being on the same shafts as the driven cones and the block on an independent shaft driven in turn from the shaft of one of said driven cones, a series of adjustable die-holders, and the dies, all having suitable supports, as well as constructed and arranged for operation substantially as and for the purpose set forth.



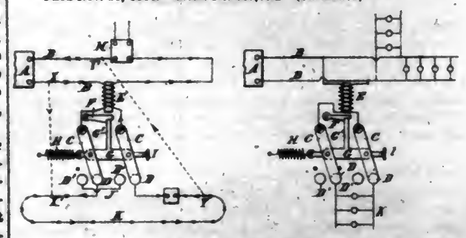
3. In a wire-drawing machine, the combination of the adjustable rotary friction driving-disks D, mounted on and keyed to driving-shaft B so as to slide but not turn thereon, and having means for moving each independently on said driving-shaft, with the rotary friction-driven disks H, mounted on shafts arranged at right angles to shaft B and having means for forcing said disks H against disks D, friction-cones J L, the cones J on the same shafts with disks H and cones L on shafts parallel to said first-named shafts, adjustable friction-belts M, interposed between the peripheries of each pair of cones J L and having means for moving the same laterally between the ends of the cones, the drawing-through pulleys N, and block P, said pulleys mounted on the same shafts as the friction-driven cones L, and the block on an independent shaft driven from one of the shafts of said driven cones, the stationary adjustable die-holders O, arranged between the drawing-through pulleys, in line therewith, the dies *l*, held in position in said die-holders, suitable means for supplying the lubricating-fluid to said dies and for discharging or carrying off the waste, a suitable reel for holding the wire as it is drawn forward into the machine, and suitable means for supporting the various parts, substantially as and for the purpose set forth.

4. In a wire-drawing machine, the combination of the adjustable rotary friction driving-disks D, mounted on and keyed to driving-shaft B so as to slide but not turn thereon, and having means for moving each independently on said driving-shaft, with the rotary friction-driven disks H, mounted on shafts arranged at right angles to shaft B and having means for forcing said disks H against disks D, friction-cones J L, the cones J on the same shafts with disks H and cones L on shafts parallel to the first-named shafts, adjustable friction-belts M, interposed between the peripheries of each pair of cones J L and having means for moving the same laterally between the ends of the cones, and the drawing-through pulleys mounted on the same shafts as the driven cones L, substantially as and for the purpose set forth.

5. In a wire-drawing machine, a die-holder comprising, in combination, the vertical plate *m*, having a vertical holding-slot in its front side and secured to a stationary support, the angle-plate *n*, adjustably fastened in the slot in said plate *m* and having the horizontal arm *n'*, provided with the vertical slot n^3, and the die-receptacle *p*, adjustably fastened to said arm *n'*, substantially as set forth.

6. In a wire-drawing machine, the combination of the die *l* with a die-holder, O, consisting of a stationary holding-plate, *m*, an angle-plate, *n*, adjustably fastened to said plate *m*, and a receptacle, *p*, in turn adjustably fastened to plate *n*, substantially as set forth.

896,438. STEAM-HEATER. HENRY SPERL, Susquehanna, Pa. Filed Oct. 8, 1888. Serial No. 287,497. (No model.)



Claim.—1. In a steam-heater, the combination, with the tubular base and crown rings, of pipes connecting and communicating with said rings, a reservoir, E, mounted above the said base-ring, said reservoir being provided with a central opening and a series of flues, a series of pipes, E', connecting the reservoir and pipes aforesaid, and a furnace, substantially as described.

2. In a steam-heater, the combination, with the tubular base and crown rings, of pipes connecting said rings and communicating therewith, a reservoir mounted above said base-ring, said reservoir being provided with a central opening and a series of flues, a series of pipes, E' E^2, connecting the reservoir and pipes aforesaid, and a furnace, substantially as described.

3. In a steam-heater, the combination, with the tubular base and crown rings, of pipes connecting and communicating with said rings, a reservoir provided with a central opening and a series of flues, a series of pipes, E' E^2, connecting and communicating with the reservoir and pipes aforesaid, an outer and inner jacket, a magazine, and a furnace, substantially as described.

4. In a steam-heater, the combination, with the tubular base and crown rings, of pipes connecting and communicating with said rings, a reservoir provided with a central opening and a series of flues, a series of pipes, E' E^2, connecting and communicating with the reservoir and pipes aforesaid, an inner and outer jacket, a series of dampers, a magazine, and a furnace, substantially as described.

896,439. ELECTRICAL SWITCH. ELMER A. SPERRY, Chicago, Ill., assignor, by mesne assignments, to Herbert E. Goodman, Boston, Mass. Filed Nov. 23, 1886. Serial No. 219,654. (No model.)

Claim.—1. In combination with a double switch adapted to be operated by a spring or equivalent, a catch organized to oppose said spring, and an electro-magnetic core wound with two coils of equal magnetizing effect, which are placed one in the circuit with each switch-arm, said magnet placed so as to control and operate the catch, substantially as and for the purpose specified.

2. An electrical switch provided with two simultaneously-moving arms, a retracting device previously energized, an armature operating a catch to retain said arms in opposition to said retracting device, and differential electro-magnet in circuit with each of the two arms of said switch adapted to control the said catch, as and for purpose specified.

3. In combination with the main circuit, a duplex switch forming a connection between said main circuit and a loop or branch circuit, a differential magnetic system, the opposing helices of which are in electrical connection one with each arm of the switch, and an actuating mechanism, said magnet placed so as to control and operate the actuating mechanism and the latter to operate the switch, substantially as and for the purpose specified.

4. In a duplex switch, the combination, with simultaneously-moving switch-arms, of a retracting device, a catch to hold the same, and a magnet operating said catch having two helices, one in circuit with each switch-arm, substantially as and for the purpose specified.

5. Two loop or branch circuits terminating each in two electrical contacts, in combination with a duplex switch the arms of which are adapted to operate in connection with said contacts, and which are in connection with the main circuit through two electro-magnetic helices which oppose each other, and connecting mechanism consisting of the catch and spring or its equivalent for operating said switch, said magnet placed so as to control and operate the catch, substantially as and for the purpose specified.

6. The duplex switch, substantially such as described, in combination with two differentially-acting electric helices, the circuits through which being those passing the arms of the switch, said magnets being located between said switch-arms and the points of production of the electrical currents upon the circuit, substantially as specified and shown.

7. The combination of a main line with a service-loop thereon, a duplex switch whose arms complete the connections with the main line, a differential magnet through which the loop-current passes in opposite directions, a retracting-spring connected with such switch, and a catch to hold such switch, said catch controlled by the magnet, so as when released to release the switch and permit the loop to be cut out of the main line.

896,440. AERATED TONIC BEVERAGE. WALTER B. STARKEY, Stockton, Cal. Filed Aug. 21, 1888. Serial No. 283,375. (No specimens.)

Claim.—The herein-described aerated tonic beverage, composed of granulated sugar, water, oil of sassafras, oil of cajeput, attar of rose, alcohol, phosphate of iron, tartaric acid, Honduras sarsaparilla, burnt sugar, and carbonated water, in the proportions specified.

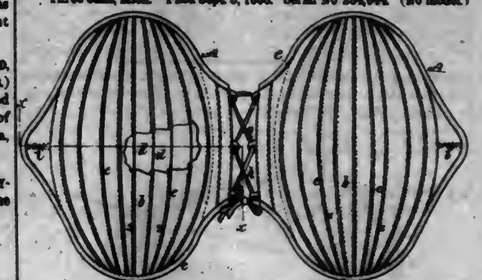
896,441. CULTIVATOR AND PULVERIZER. HORACE H. TAYLOR, Santa Rosa, Cal., assignor to himself and Charles R. Wheelock, same place. Filed Aug. 9, 1888. Serial No. 282,285. (No model.)

Claim.—In a cultivator and pulverizer, the combination, with the main frame, of the cross-bars C C, the transversely-arranged rotatable shafts, the cams fixed to the said shafts, the two sets of cutter-bars F, arranged one set in advance of the other and journaled near one end to the lower portion of the said cross-bars, and the springs D, secured at one end to the cross-bars and their opposite ends bearing upon the upper sides of the bars, the said bars having their upper ends extended beyond the fulcrum-point to be engaged by the cams, substantially as specified.

896,442. SHUTTER-BOWER. JOHN J. TAYLOR, Philadelphia, Pa., assignor to himself and William H. Abbott, same place. Filed Mar. 29, 1888. Serial No. 268,750. (No model.)

Claim.—A combined shutter hinge and holder comprising the short leaf B, the long leaf E, jointed to the leaf B, bent at right angles to its inner end and formed with integral vertically-apertured lugs along its arm G, the holding-arm M, having a downwardly-extending outer end, L, and an attaching-plate to which the inner end of said arm is pivotally connected, substantially as set forth.

896,443. BOX FOR ICE-CREAM. JAMES VAN DYK, Brooklyn, N. Y. Filed Nov. 5, 1888. Serial No. 290,265. (No model.)



Claim.—1. The herein-described box and movable bottom therefor, the box being formed open at top and bottom and provided with an inwardly-extending flange at its bottom extending upward into the interior of the box, forming a channel around the body at the inside thereof, and forming, also, a seat for the movable bottom, the said bottom being provided with a downwardly-extending flange on its under side, the flange of the body and that of the movable bottom being relatively so formed as to fit tightly one within the other, substantially as described.

2. The combination, with the box-body open at top and bottom and the movable bottom therein, of a fixed stop or retainer for the bottom, secured to the inner surface of the body a distance from the bottom to allow a limited outward movement of the bottom, substantially as described.

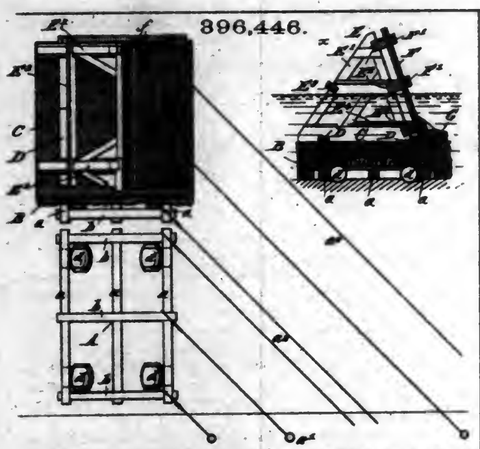
3. The combination of the movable bottom formed with a downwardly-extending flange on its under side, and the body formed open at top and bottom and provided with a raised flange around the under side at the bottom and with a retainer for the movable bottom, the flange on the body and that on the movable bottom being relatively so formed as to fit one within the other, substantially as described.

896,444. BOSOM-PAD. EDWARD K. WARREN and JOSEPH H. ARES, Three Oaks, Mich. Filed Sept. 5, 1888. Serial No. 284,644. (No model.)

Claim.—1. A dress and garment pad or form having its covering or facing composed of a single thickness of cloth, with elastic ribs arranged at suitable distances apart, secured by stitching thereto, and having its ends at the opposite ends of the ribs gathered or drawn together, substantially as specified.

2. The within-described dress and garment pad or form, consisting of a covering or facing of cloth of single thickness, and having stitched pocket-like plaits in it, elastic ribs of incorrodible material within said plaits, the whole being gathered or drawn together at the ends of the ribs, and a marginal binder applied to said gathered portions, essentially as set forth.

896,445. BUTTON. TALBOT WATSON, Baltimore, Md. Filed May 12, 1888. Serial No. 274,396. (No model.)

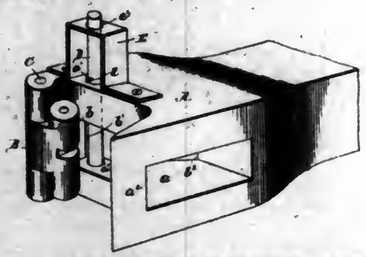


Claim.—In a button, the combination of the top 2, provided with slots on the under side thereof, a shank, 5, a bottom, 6, said bottom being in the form of a T, and a locking device consisting of a disk with springs on the top thereof, and wings on the under side thereof, said locking device being free to rotate on the said shank, for the purpose set forth.

896,446. DIKE. HENRY C. WEBER, St. Charles, Mo. Filed Nov. 6, 1888. Serial No. 290,101. (No model.)

Claim.—1. A dike comprising a float-frame, layers of poles, brush, willows, or rails thereon, trestle E, and inclined front layer, F, of poles, brush, willows, rails, or other similar material, substantially as described.

396,446.



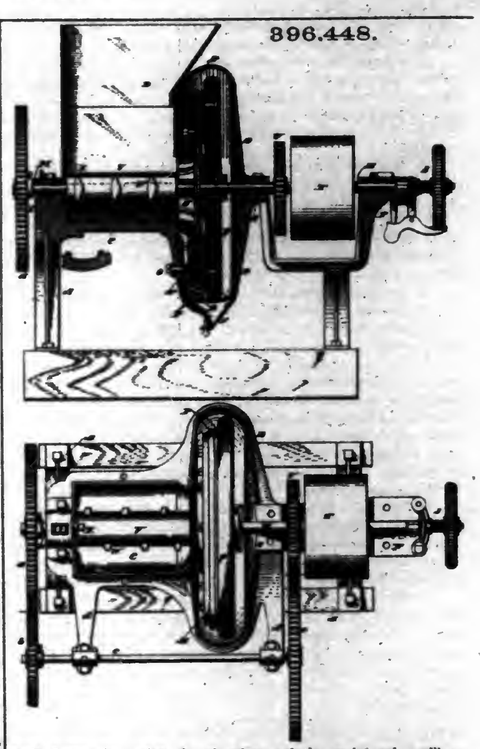
2. The float-frame A and opposite layers, B C, of poles, brush, willows, or rails, in combination with a trestle, E, and inclined layer F, of poles, brush, willows, or rails, substantially as described.

3. The trestle E, built upon layers of poles, brushes, rails, or willows, and a float-frame, and formed with shelves E^4, substantially as and for the purposes set forth.

4. The float-frame A, layers B C thereon of poles, rails, brush, or willows or other material, and the trestle composed of A-shaped end frames and the front bars, E^3 E^3, in combination with the layer of poles, brush, willows, or rails F, bound to the bars E^3, substantially as described.

5. The float-frame and layers of poles, brush, rails, or willows thereon and the trestle-frame and inclined poles, willows, rails, or brush F, in combination with the bundle of poles, brush, willows, or rails G, secured at the bottom of the poles F, substantially as described.

396,447. CAR-COUPLING. DAVID Y. WILSON, Gum Tree, assignor of one-half to Adam P. Reid, Parkersburg, Pa. Filed June 4, 1888. Serial No. 276,001. (No model.)



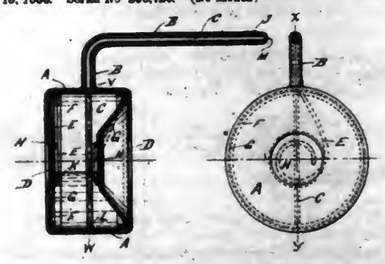
Claim.—In a locking mechanism for car-couplings, the combination, with a coupler-head provided with a transverse opening and a locking-tongue in the transverse opening, and limited in its forward movement by the front wall thereof, and having its rear portion flattened to afford a gravity-support, and provided upon its upper face with a concavity forming a pin-seat and on its front edge with a pin-notch, of a coupling-pin adapted to be supported by the rear portion of the locking-tongue and rest in the said concavity, forming a pin-seat to hold the locking-tongue in the proper position preparatory for coupling, and fall in front of said tongue in the pin-notch when the support is withdrawn, substantially as described.

396,448. CRUSHING AND GRINDING MILL. JAMES F. WITCHELL, Springfield, Ohio, assignor to the Foos Manufacturing Company, same place. Filed July 27, 1887. Serial No. 245,395. (No model.)

Claim.—1. In a crushing and grinding mill, the combination, with the main shaft and grinding mechanism carried thereby, of an auxiliary shaft mounted opposite the center of the grinding mechanism independently of the main shaft, a feeding-crusher mounted on the auxiliary shaft, a chamber in which the feeding-crusher operates, and motion-conducting mechanism interposed between the main shaft and the feeding-crusher, and consisting of a shaft geared to the main and auxiliary shafts through interchangeable gearing, whereby the relative speed of the main and auxiliary shafts may be varied and motion conducted from one of them to the other.

2. In a crushing and grinding mill, the combination, with the

396,448.

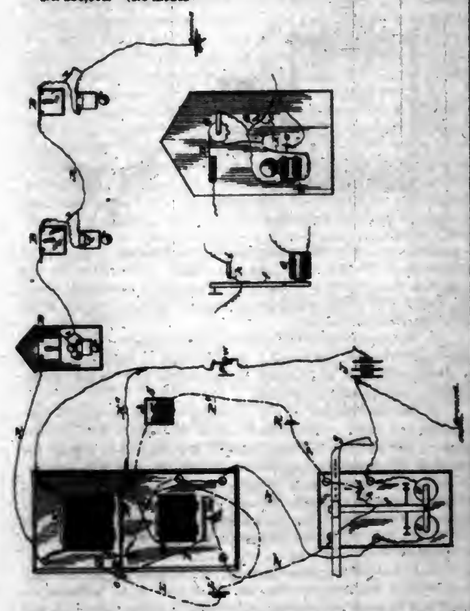


main frame, the casing, the chamber, and the main and auxiliary shafts mounted upon the frame substantially in line with each other, of a stationary grinding-head within the casing, a rotary grinding-head carried by main shaft, and a feeding-crusher within said chamber and carried by the auxiliary shaft, a pinion on the main shaft, a gear-wheel on the auxiliary shaft, and motion-conducting mechanism transmitting motion at different speeds from one shaft to the other, consisting of a shaft mounted upon said frame, a gear-wheel carried thereby and meshing with the said pinion, and a pinion carried thereby and meshing with the first-named gear-wheel.

3. In a crushing and grinding mill, the combination, with the main shaft and grinding mechanism, of an auxiliary shaft mounted substantially in line with the main shaft, a feeding-crusher mounted thereon and arranged to feed the material longitudinally to the grinding mechanism, a chamber in which the crusher operates, and a shaft geared to the main and auxiliary shafts and rotating the latter at a different speed from the former.

4. In a crushing and grinding mill, the combination, with the main frame and casing, of an auxiliary shaft mounted at one end in the frame and at the other within the eye of a grinding-head, and a grinding-head secured to the casing and having an eye therein, and spiders extending across the eye and having the upper and lower faces thereof at an angle to a horizontal plane.

396,449. ATOMIZER. JOHN B. WOOTTEN, Reading, Pa. Filed Nov. 13, 1888. Serial No. 290,736. (No model.)



Claim.—1. In an atomizer, the combination, with a compressible liquid-receptacle, of an air-tube, B, secured to and communicating with the upper portion of said receptacle, and a liquid-tube, C, extending to the lower portion of the same, all arranged and operated substantially as set forth.

2. In an atomizer, the combination of a liquid-receptacle consisting of a rigid case with opening and flexible lining, substantially as described, and air and liquid tubes communicating with said receptacle, all adapted to operate substantially as set forth.

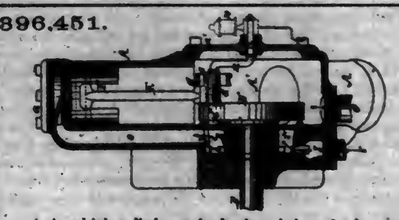
3. In an atomizer, the combination, with a rigid case with opening and flexible lining, substantially as described, of a spring or springs arranged to press upon said lining, substantially as and for the purpose set forth.

4. In an atomizer, the combination, with a compressible receptacle, of an interior spring or springs arranged to restore said receptacle to its normal shape after being compressed, for the purpose set forth.

396,450. MUNICIPAL TELEGRAPH SYSTEM. THEODORE J. ZOELLER, Louisville, Ky., assignor, by mesne assignments, to the United States Signal Clock Company, same place. Filed Jan. 5, 1888. Serial No. 259,893. (No model.)

Claim.—1. The combination, with an electric circuit and slowly and rapidly operating circuit-breakers or transmitters therein, of a primary and a secondary relay located at a given station, a register and an indicator, and local circuits, those containing the register and secondary relay being controlled by the main or primary relay alone and that containing the indicator being controlled conjointly by the main and secondary relays and the register, as and for the purpose set forth.

2. A central-station apparatus for combined fire and police telegraphs, consisting of a main or primary and a secondary relay and two receiving-instruments—such as a register or recorder and an indicator—combined by means of the following circuits: a local circuit containing the register and closed by the contact of the main relay-armature with its back-stop, a local circuit including the secondary relay and closed by the contact of the main relay-armature with a front stop, *d*, and a local circuit including the indicator and closed by the simultaneous contact of the main relay-armature with front stop, *c*, the secondary relay-armature with its back-stop, and a spring on the register-armature with a stop, *i*, as and for the purpose set forth.



396,451. MULTIPLE-CYLINDER ENGINE. CHARLES C. ABBE, Brooklyn, N. Y. Filed Jan. 24, 1888. Serial No. 261,774. (No model.)

Claim.—1. A multiple-cylinder engine having the cylinders and shaft-bearing formed in one piece and the crank, valve, and cylinder-chambers open to each other.

2. A multiple-cylinder engine having a driving-shaft provided with a crank and a valve around the shaft and between the crank and the power-transmitting end of the shaft.

3. A multiple-cylinder engine having a shaft with a single crank, and a valve around the shaft and between the crank and the bearing of the shaft.

396,451.

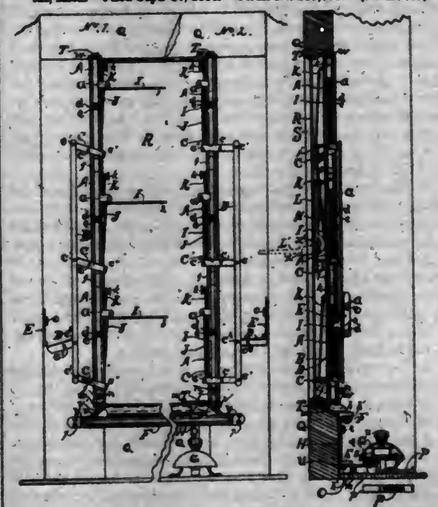
4. A multiple-cylinder engine having a balanced valve surrounding the driving-shaft and provided with an annular distributing-chamber communicating with the cylinders.

5. A multiple-cylinder engine having a shaft provided with a single crank, and a valve seated in a casing around the shaft and between the crank and the power-transmitting end of the shaft.

6. A multiple-cylinder engine having a hollow valve seated in a valve-chamber around the driving-shaft and behind a single crank and held to its seat by the crank.

7. A multiple-cylinder engine having a valve behind the crank and supported upon a hub which forms the bearing for the crank-shaft.

8. A multiple-cylinder engine having a crank-shaft, and a valve in the form of a hollow ring around the shaft and behind a single crank, the outer periphery of the valve being tapered and adapted to a corresponding seat in the casing.



9. The combination of a crank, pistons, and piston-rods having feet adapted to a crank-pin with a tapering threaded split ring and a corresponding threaded confining-ring.

10. The combination of a crank, pistons, and piston-rods having feet adapted to a crank-pin, and one of said feet having a pin adapted to a split ring provided with a recess for said pin, and a confining-ring for the split ring.

11. A multiple-cylinder engine having a valve with an inlet-port, *i*, around its periphery opening into an annular chamber within the valve, a port, *p*, in the periphery opening from the annular chamber, and an exhaust-port, *p'*, also in the periphery in same plane with port *p*, and a diaphragm separating the steam from the exhaust-space.

12. A multiple-cylinder engine having an annular chamber with cylinder-casings radiating from same and adapted to support within the casings the cylinder-tubes proper, which are held in position at the outer ends by close frictional contact and at the inner ends by projecting lugs, whereby exhaust-steam from the crank-chamber is permitted to circulate around the cylinders.

396,452. BURGLAR-ALARM. WILLIAM J. ACKERMAN, Grand Rapids, Mich. Filed Sept. 17, 1888. Serial No. 285,632. (No model.)

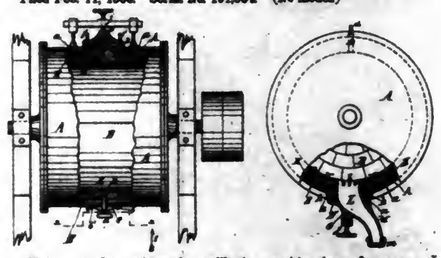
Claim.—1. A burglar-alarm having an alarm-bell and stop-lever, in combination with a tripping device, H, attached to the sash in such a manner that it may be raised and lowered with or without raising the sash, and provided with a projection, *h*, which rests upon the cross-bar, a projection, *h'*, that rests upon the stop-lever, and a slot, *r*, to allow of its being raised and lowered without raising and lowering the sash by turning the cross-bar, a cross-bar, F, arranged to turn

freely in and supported by plates 1 and provided with a flattened surface, *k'*, so arranged that the turning of the bar will raise or lower the slide H, and with inclines *v*, which act with corresponding inclines on the end of the rod T to turn the cross-bar when the rods turn, supporting-rod T, having the lower end cut diagonally to correspond with the inclines *v* on the cross-bar, pressure-bars I, attached to the supporting-rods and arranged to throw out over the surface of the glass or to fold down by the side of the supporting-rod, springs J, attached to the support and arranged to throw the pressure-bars out over the glass, spring K, arranged to draw the pressure-bars toward the glass, and pins *k* in the support, for the reception of the spring K, substantially as and for the purpose set forth.

2. The combination, in a burglar-alarm, of an alarm-bell and a stop-lever with a tripping device or slide, H, attached to the sash by a pin, *t*, passing through the slot *r*, and provided with projections *k* and *k''*, a cross-bar, F, supported by and arranged to turn freely in plates attached to the window-sash, and provided with a flattened surface for the support and manipulation of the slide H, and with projecting inclines *v*, for turning the cross-bar by the action of the diagonal end of the supporting-rod T, supporting-rod T, having the lower end formed to act upon the inclines *v*, so as to turn the cross-bar when the rod turns, and provided with jackets or tubes A, within which it is arranged to turn freely, with collars for the support of the tubes, pins *c*, which are acted upon by the tubes to turn the rod, and a knob, *n*, with which to turn the rod to place by hand, and is attached to the sash-stile by means of plates *w*, in which it turns freely, tubes or supports A, which are arranged to work freely upon the rod T, and are provided with slots *d*, for the free action of the pins *c*, and with a pin, *k*, for the reception of the end of the spring K, pressure-bars I, attached to the tubes or supports A in such a manner that they may be folded down by the side of the supports or thrown out over the glass, springs J, attached at one end to the tubes and arranged to act upon the pressure-bars in throwing them out over the glass, springs K, attached at one end to the sash and at the other end to the pin *k*, for the purpose of drawing the pressure-bars against the glass, catches C, pivoted to the sash and arranged to hold the pressure-bars down to the side of the supports, connection B, lever D, and bracket E, arranged to act upon the catches C, all substantially as described, and for the purpose set forth.

3. The combination, in a burglar-alarm, of an alarm-bell and stop-lever with a slide, H, having projections *k*, *k'*, and *k''*, and a slot, *r*, and attached to the sash by means of a pin, *t*, a cross-bar, F, provided with a flattened surface for the support of the slide, and inclines to facilitate turning the cross-bar, and attached to the bottom rail of the sash by means of plates, in which it turns freely, supporting-rods T, attached to the sash-stile by means of plates, in which it is arranged to turn freely, supports A, arranged to work freely upon the supporting-rods, springs K, arranged to turn the supporting-rods by attaching one end to the sash-stile and the other end to a pin on the support, catches C, pivoted to the sash-stile and arranged to extend over the support and hold the pressure-bars to place, connection B, lever D, and bracket E, arranged to set upon the catches, and a lever, L, pivoted to the sash-stile with one end resting upon the glass, and a spring, M, one end of which is attached to the sash-stile, and the other end passes over the lever and against the end of the catches in such a manner that when the lever is thrown down the spring will force the catches around and allow the arms to throw out over the surface of the glass, substantially as and for the purpose set forth.

4. The combination, in a burglar-alarm, of an alarm-bell provided with the necessary stop-motion, with supporting-rods T, arranged to turn freely in plates *w*, attached to the sash-stile and provided with a pin, *k*, pressure-bars I, attached to the supporting-rods in such a manner that they may be folded down by the side of the rod, or may be extended out over the glass, a spring, K, which attaches at one end to the sash-stile and at the other end to the pin *k* on the supporting-rod, to hold the pressure-bars solidly against the glass, and a catch for holding the pressure-bars in place at the side of the supporting-rod, substantially as and for the purpose set forth.



5. The combination, in a burglar-alarm, of an alarm-bell provided with the necessary stop-motion, with supporting-rods for the support of the tubes A, said supporting-rods being provided with collars *f*, one below each tube, and a pin, *c*, to work in each slot *d* in the tubes, and supported in bearings or plates secured to the sash, supports A, which are arranged to turn freely upon the supporting-rod, and are provided with slots that work over the pins *c* in the rod, and with pins *k* to receive one end of the springs K, pressure-bars I, so attached to the supporting-tubes that they may be folded down by the side of the support, or may be thrown out over the glass, springs J, arranged to throw the pressure-bars out over the glass, catches C, arranged to secure the pressure-bars down to the body of the supports, connections B, lever D, pivoted to the sash-stile, and bracket E, pivoted to the window-jamb for the purpose of operating the catch, substantially as and for the purpose set forth.

6. A burglar-alarm having an alarm-bell with the necessary stop mechanism, and having supporting-rod T, supporting-tubes A, pressure-bars I, catches C, with connections B, D, and E, spring J, for throwing the pressure-bars to position, spring K, for holding the pressure-bars solidly against the glass, and a pin, *k*, for the reception of the spring K, in combination with a lever, L, pivoted at one end to the ogee of the sash-stile, the other end being left free to rest upon the glass, and a spring, M, attached at one end to the sash-stile, the other end passing over the lever and resting against the end of a catch, C, substantially as and for the purpose set forth.

7. A burglar-alarm consisting of an alarm having the necessary stop-motion, in combination with pressure-bars pivoted to a standard at the side of the sash-stile, arranged to extend out over and be held firmly against the surface of the glass, substantially as and for the purpose set forth.

396,453. TRITURATING-MILL. JOHAN R. ALSING, New York, N. Y.

Filed Feb. 11, 1886. Serial No. 191,584. (No model.)

Claim.—1. In a triturating-mill, the combination of a cover, J, composed of the cap *d'*, and the inner block, *d*, secured to the said cap, with the cylinder provided with lining having an integral block, K, formed with a hole or opening suitable to tightly fit the said block *d*, substantially as specified.

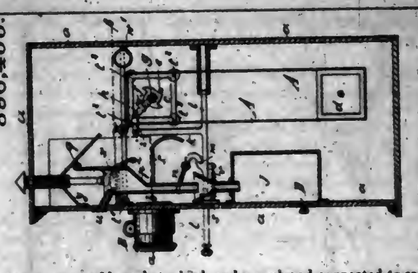
2. The combination, with a triturating-cylinder having a charge-opening, of the spout or funnel L, provided with an inner grate, *l*, and a discharge-pipe, M, and adapted to replace the cover in the charge-opening, substantially as specified.

3. The combination, with a triturating-cylinder having a charge-opening and ring *k*, of the spout or funnel L, provided with an inner grate, *l*, and an outer discharge-pipe, M, and adapted to replace the cover in the charge-opening, the same being provided with a flange, N, and a packing-ring, *n*, in the said flange, and with the screw-seat O and a set-screw engaging the said seat and threaded through an arm or bar attached to the said cylinder to form a tight packing with the ring *k*, surrounding the discharge-opening, substantially as hereinbefore set forth.

4. In a triturating-mill, the combination, with the cylinder having lining B, discharge-opening, and an air-hole, E, to facilitate the discharge through said opening, of the plug D, fitting tightly the said air-hole, said plug being made of material adapted to wear off by the grinding action evenly with the inner lining, B.

5. In a triturating-mill, the combination, with the cylinder having lining B, discharge-opening, and an air-hole, E, to facilitate the discharge through said opening, of the plug D, fitting tightly the said air-hole, and the spring-latch *e* and catch *b'*, to tighten the said plug, substantially as specified.

396,454. PROCESS OF FORMING MOLDS FOR CASTING. BERA J. AMES, Austin, Minn. Filed Oct. 26, 1888. Serial No. 289,176. (No specimens.)



Brief.—Prefers, after applying the plaster-of-paris to the face of the mold, to dust over it a thin charcoal facing, and then return the pattern to the mold, thereby pressing the facing firmly against the sand of the mold.

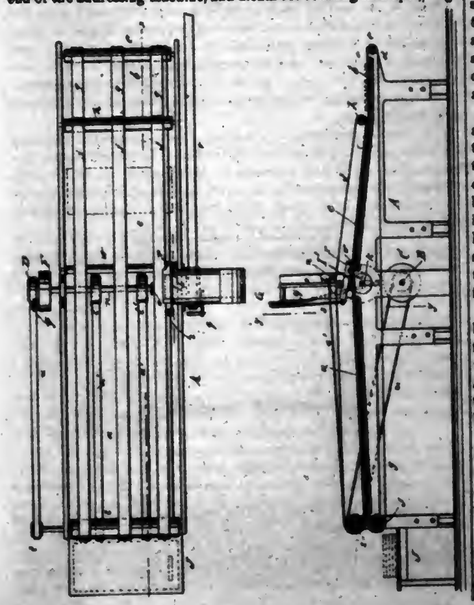
Claim.—The process of forming a mold for casting which consists in molding the pattern in a body of green sand, drawing out the pattern, and applying to the surface of the mold thus formed a coating or lining of dry plaster-of-paris, which absorbs the moisture from the sand and becomes set, substantially as described.

396,455. AUTOMATIC PICTURE-EXHIBITOR. CONRAD RAGE, St. Gallo, Switzerland. Filed June 6, 1888. Serial No. 276,271. (No model.) Patented in Germany Mar. 6, 1888, No. 10,732; in France Mar. 6, 1888, No. 176,166; in England Mar. 6, 1888, No. 2,375; in Austria-Hungary Mar. 6, 1888, No. 3,473, and in Belgium Mar. 15, 1888, No. 80,896.

Claim.—1. In an automatic picture-exhibitor, a chain of pictures supported on two drums having flat sides or faces of equal dimensions and revolving on suitable shafts, in combination with a ratchet-wheel rigidly mounted on one of said drum-shafts having the same number of teeth as each of said drums has sides or faces, a lever bearing a pawl to operate said ratchet-wheel, and a push-rod connected to said lever, substantially as described.

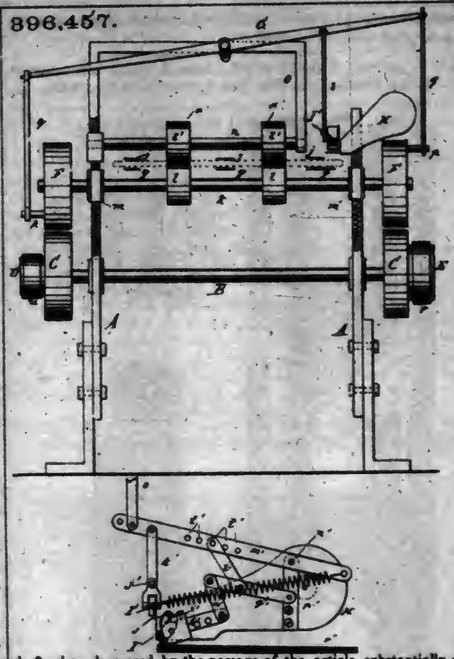
396,455.

2. In an automatic picture-exhibitor, a chain of pictures supported on two drums revolving on suitable shafts, in combination with a ratchet-wheel rigidly mounted on one of said shafts, a lever bearing a pawl to operate said ratchet-wheel, a push-rod connected to said lever, a spring to restore said push-rod to its normal position when removed therefrom, and a pivoted lever, one end of which is in locking-contact with said push-rod and the other end of which extends into a pivoted coin-chute, substantially as and for the purpose specified.



3. In an automatic picture-exhibitor, a pivoted coin-chute having a rigid arm attached thereto, in combination with a chain of pictures supported on revolving drums operated by a push-rod and pawl and ratchet-wheel, a pivoted lever one end of which is in locking-contact with said push-rod and the other end of which extends into said pivoted coin-chute, and a projecting roller attached to the edge of said chain of pictures, so that as the chain revolves the roller will come in contact with the arm of the chute and push said chute slightly from said chain of pictures, in the manner and for the purpose set forth.

396,456. BISCUIT. PERCY H. BAILY, London, County of Middlesex, England, assignor of one-half to B. F. Smith, Chicago, Ill. Filed Mar. 31, 1888. Serial No. 269,130. (No specimens.)



Claim.—A food or health biscuit composed of a flour, butter, sugar, and milk combined with an artificial powder consisting of tribasic phosphate of calcium, carbonate of calcium, fluoride of calcium, phosphate of magnesium, phosphate of soda, and chloride of sodium, substantially in the proportions set forth.

396,457. ADDRESSING-MACHINE. HENRY BAKER, Jr., La Grange, Ga. Filed Sept. 4, 1886. Serial No. 212,715. (No model.)

Claim.—1. The combination, with an addressing-machine having a rotary vertically-movable operating-shaft receiving its vertical movement from the article to be addressed, of a carrier extending past said shaft at right angles thereto and adjacent to the delivery end of the addressing-machine, and means for rotating said operating-

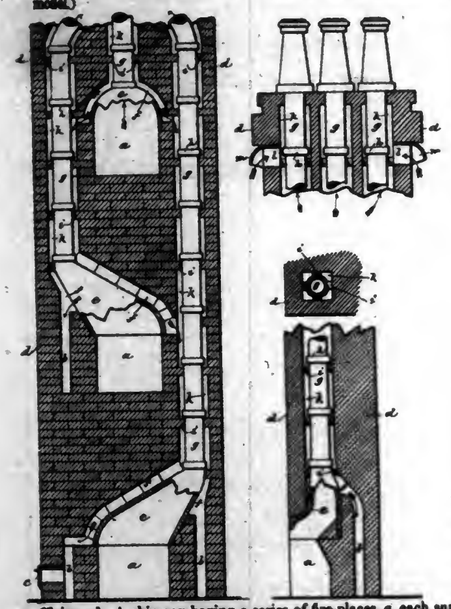
396,457.

shaft when depressed by the passage of the article, substantially as set forth.

2. The combination, with an addressing-machine having a rotary vertically-movable operating-shaft depressed by the passage of the article and a second shaft parallel with the said shaft and mounted in fixed bearings, of a carrier passing between said shafts and adjacent to the delivery end of the addressing-machine, and a power-shaft with which said vertically-movable shaft is engaged when depressed by the article, substantially as set forth.

3. The combination, in a machine for addressing newspapers, with the table having a transverse opening and the endless carrier passing along the upper face of the table, of a rotary and vertically-movable shaft extending across the under side of the table and having rollers extending up through said transverse opening, a power-shaft below the roller-shaft and adapted to rotate it upon the depression of the said roller-shaft by the passage of the paper over it, a transverse shaft journaled in fixed bearings above the vertically-movable shaft and having rollers contacting with the rollers thereon, an addressing device, and mechanism for operating the said adressing device when the vertically-movable shaft is depressed by the paper and rotated by the said power-shaft, substantially as set forth.

4. The combination with the frame, the endless carrier, and the addressing-machine at one side of the frame, of a yielding shaft adapted to be depressed by the passage of the article to be addressed and extending transversely to the carrier and having crank-pulleys at its ends provided with oppositely-arranged crank-pins, a lever pivoted between its ends above the shaft and parallel therewith, rods connecting the ends of the lever with said crank-pins, a rod connecting the lever between its ends with the addressing-machine, and a power-shaft below said pulleys for operating them upon the depression of the yielding shaft by the article to be addressed, substantially as set forth.



5. In an addressing-machine, the combination, with the endless bands *j a' g* and devices for supporting and moving the bands, of the fixed shaft *n*, provided with wheels *l' l'*, the movable shaft *k*, provided with wheels *l l*, the friction-wheels F, secured on the ends of the shaft *k* and carrying crank-pins *p*, the driving-shaft B, provided with friction-wheels C, the lever G, the addressing device H, and the connecting-rods *q s*, substantially as shown and described.

6. In an addressing-machine, the combination, with the feed-rollers *d' e'*, ratchet *g'*, arm *K'*, having a pawl, *i'*, engaging said ratchet, the lever *q'*, the link *u'*, the link *r'*, and lever *m'*, of the fixed blade I and the pivoted blade I', connected to lever *m'*, substantially as set forth.

7. The combination, with the feed-rollers, the ratchet *g'*, arm *K'*, and pawl *i'*, of the lever *m'*, pivoted near its rear end and connected between its ends with the arm *K'* of the fixed blade I, pivoted blade I', connected to the forward end of lever *m'*, and the spring *p'*, con-

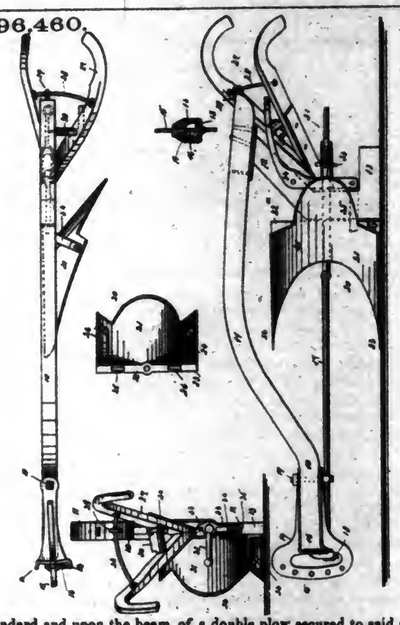
necting the rear end of lever *m* with the outer end of the pivoted shear-blade, substantially as set forth.

396,458. CHIMNEY-FLUE. JAMES R. BARNEY and SAMUEL R. BRYAR, Pittsburg, Pa. Filed July 9, 1888. Serial No. 279,460. (No model.)

Claim.—1. A chimney having a series of fire-places, *a*, each surrounded by an air-space, *b*, which communicates with the exterior surrounding atmosphere by openings *c*, a separate vertical flue for each fire-place, which flues are arranged in different vertical planes and communicate with the air-space *b*, a hood, *e*, placed over each fire-place and having a contracted exit which terminates in the lower end of the vertical flue, and the flue-liners *g*, housed within said flues and communicating with the hoods *e*, the flue-liners being of less diameter than the flues, to leave an intermediate air-space, *k*, substantially as and for the purpose described.

2. A chimney having a series of fire-places, *a*, each surrounded by an air-space, *b*, which communicates with the surrounding atmosphere, a series of vertical flues, one of which is provided for each fire-place and communicating with the air-space *b* thereof, the connecting-flues *f*, intermediate of the vertical flues, a hood, *e*, placed over each fire-place and having a contracted exit terminating in the lower end of the vertical flue, and a flue-liner, *g*, provided in each vertical flue, to leave an intermediate air-space, *k*, and connected with the contracted exit of the hood *e*, the upper end of the vertical flues communicating with the surrounding atmosphere by openings *l*, which are protected by depending curved hoods *m*, substantially as and for the purpose described.

396,459. FLOWER-STAND. PETER BERTRAND, South Lyon, Mich. Filed June 5, 1888. Serial No. 276,112. (No model.)

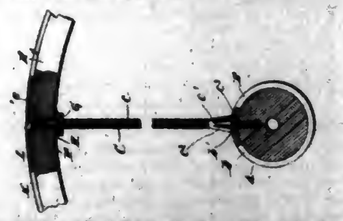


Claim.—The flower-stand described, composed of the inclined staves of unequal length, the longer staves bent outwardly at their lower ends, forming legs for the stand, the bottom D, arranged above the lower end of the shorter staves, leaving a chamber, G', below the bottom D, and the vessel H, concealed within said chamber and supported by the lower ends of the shorter staves, substantially as shown and described.

396,460. SWIVEL-PLOW. FERDINAND J. BLANKE, Whitewater, Wis. Filed Aug. 25, 1888. Serial No. 283,717. (No model.)

Claim.—1. The combination, with a plow-beam, a standard projected therefrom, and a longitudinal rotary shaft journaled in said

396,460.



standard and upon the beam, of a double plow secured to said shaft, consisting of continuous mold-boards and attached aligning shares, and provided with recesses in the rear end of the landsides, a lever pivoted to the standard, a bolt sliding in the standard pivoted to the lever, and a crank-arm secured to the rear end of the shaft, substantially as shown and described.

2. The combination, with a plow-beam, a standard projected therefrom, and a longitudinal shaft journaled in said standard and upon said beam, of a double plow secured to said shaft, provided with a recess in the rear of each landside, a lever fulcrumed to the standard, a bolt sliding in said standard pivoted to said lever, plow-handles pivoted upon the shaft, and a crank-arm secured to the rear end of the shaft, having lugs capable of alternately engaging the handles, substantially as shown and described.

3. The combination, with a plow-beam, a standard projected therefrom, and a longitudinal shaft journaled in said standard and upon the beam, of a double plow secured to said shaft, provided with a recess in the rear of each landside, a lever fulcrumed upon the standard, a bolt sliding in said standard pivoted to said lever, plow-handles having a sliding attachment to the beam and pivoted upon the shaft, a latch-bar secured to said handles, and a crank-arm secured to the rear end of the shaft, provided with oppositely-disposed lugs alternately engaging the handles, substantially as shown and described.

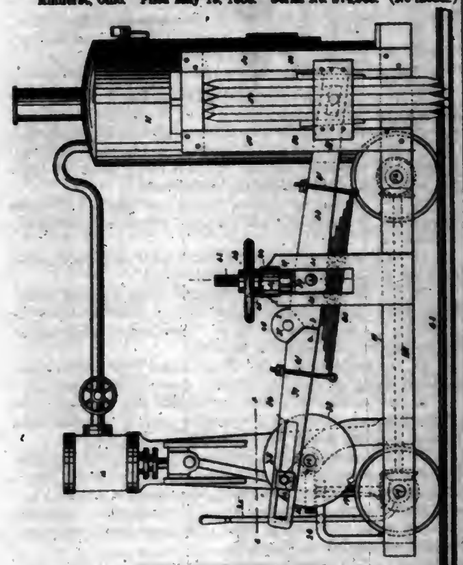
4. The combination, with a plow-beam, a standard projected therefrom, and a clevis pivoted to the beam, having side ears, of a longitudinal rotary shaft journaled in said standard and clevis, a cam secured to the forward end of the shaft, capable of alternately engaging the side ears of the clevis, and a double plow rigidly attached to the said shaft, substantially as shown and described.

396,461. VEHICLE-WHEEL. JEROME BOLICK, Conover, N. C. Filed Oct. 27, 1888. Serial No. 289,266. (No model.)

Claim.—1. In a wheel, the combination of the hub, the spokes having the hollow portions *c* and the solid portions *c'* at their inner ends, the said solid portions being screw-threaded to screw in apertures in the hub, the rigid tapered collars c^2, hexagonal in transverse section on the solid portions of the spokes, tapered toward their outer

ends, and provided at their inner ends with shoulders bearing on the hub, and the felly secured to the outer ends of the spokes, substantially as specified.

2. In a wheel, the combination of the sockets F, fitting in radial perforations in the felly, the exteriorly-threaded spokes C, extending into the said sockets, the nuts G, screwing on the threaded portions of the spokes, and the washers H, fitting around the spokes and interposed between the nuts and the felly, substantially as specified.



3. In a wheel, the combination of the sockets F, fitting in perforations in the felly, the exteriorly-threaded spokes C, extending into the said sockets, the nuts G, screwing on the threaded portion of the spokes and bearing against the inner side of the felly, and the screws L, passing through the tire and engaging the outer ends of the spokes, substantially as specified.

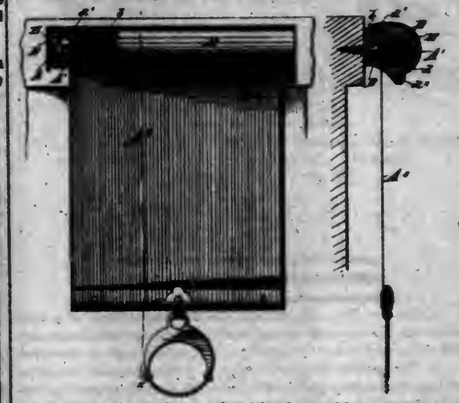
4. In a wheel, the combination, with the hub, of the sleeve fitting over the inner end of the hub and comprising the sand-band, the central band provided with perforations registering with perforations in the hub, and the intermediate connecting portion between the sand-band and central band, and the spokes fitting in the registering perforations, substantially as set forth.

5. In a wheel, the combination of the sockets F, fitting in perforations of the felly, the exteriorly-threaded spokes extending into the sockets, and the nuts G, screwing on the spokes and bearing against the felly, as set forth.

6. In a wheel, the combination of the sockets F, fitting in perforations of the felly, the screws L, engaging the tire and entering the felly, the exteriorly-threaded spokes extending into the sockets, and the nuts G on the threaded portion of the spokes.

396,462. CHANNELING-MACHINE. WILLIAM H. BRYANT, North Amherst, Ohio. Filed May 19, 1888. Serial No. 274,385. (No model.)

Claim.—1. In a channeling-machine, the combination, with a pivoted drill-carrying lever formed of sections which are aligned and pivoted together at their abutting ends, of a leaf-spring arranged parallel thereto and spanning the joint between the sections, and connected thereto at its respective ends, substantially as and for the purpose specified.



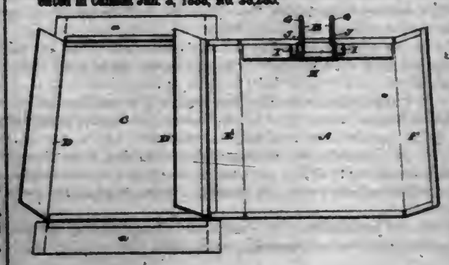
2. In a channeling-machine, the combination, with the drill-carrying lever, made of two aligned abutting sections pivoted together a fulcrum on which the longer section of said lever is pivoted, a leaf-spring arranged beneath the fulcrum and extending an equal distance each way therefrom and beneath the joint of the lever-sections in line with the same, and shackles which connect the ends of the spring with the respective lever-sections, as shown and described.

3. In a channeling-machine, the combination, with a lever made up of sections 37 and 53, formed, respectively, with bearing faces or shoulders 4 and 3, and connected by a pivot or pintle, 2, of an adjustable fulcrum upon which the lever is mounted, a crank-shaft, crank or wrist pins carried thereby, blocks arranged in longitudinal slots formed in the lever-sections 37, the crank-pins engaging said blocks, a drill-carrying box mounted in vertical guides and provided with a stud or pin which rides in a slot formed in the lever-section 53, and a spring, 60, arranged beneath the lever and connected to the lever-sections by shackles 61, substantially as described.

4. In a channeling-machine, the combination, with a crank-shaft provided with a wrist-pin, of a block with which said wrist-pin engages, a lever-section, 37, formed with a longitudinal slot, 36, in which the block rides, a lever-section, 53, pivotally connected to the section 37, the sections 37 and 53 being formed with abutting bearing-faces 4 and 3, a fulcrum-pin, 38, upon which the lever is mounted, a means, substantially as described, for adjusting said fulcrum-pin, a spring arranged beneath the lever and connected to the lever-sections by shackles 61, a drill-carrying block, ways in which said block is mounted, a stud or pin extending from the block and riding in a longitudinal slot formed in the lever-section 53, substantially as described.

5. In a channeling machine, the combination, with a drill-carrying lever and a means for rocking the same, of a fulcrum-pin upon which the lever is mounted, a block, 39, arranged to support the fulcrum-pin, a threaded shank extending upward from said block, a plate supported above the lever and provided with ratchet-teeth, the threaded shank passing through said plate, a nut engaging the threaded shank above the plate, a pawl carried by said nut and arranged to engage the ratchet, and a jam-nut carried by the shaft below the ratchet-plate, substantially as described.

396,463. EXHIBITOR FOR WINDOW-SHADES, MAPS, &c. EDWIN A. BULLARD, Vassar, Mich. Filed July 10, 1888. Serial No. 279,512. (No model.)



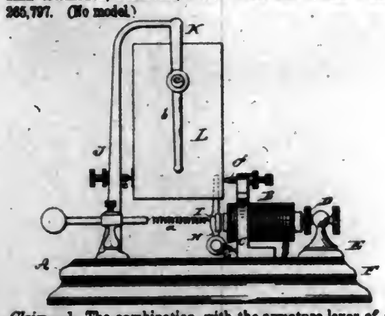
Claim.—1. As an improved article of manufacture, a protector for window-shades, consisting of a semi-cylindrical body having closed ends and provided along its upper longitudinal edge with a downwardly-projecting flange, and a cylindrical bead along its lower longitudinal edge, as set forth.

2. The combination, with a slat having a longitudinal groove in the upper edge, said slat adapted to carry a curtain and fixture, of a protector consisting of a semi-cylindrical body provided with a longitudinal flange extending at right angles downward from the upper edge and engaging the groove of said slat, substantially as shown and described.

3. The combination, with a slat having a longitudinal groove in the upper edge, said slat adapted to carry a curtain and fixtures, of a protector consisting of a semi-cylindrical body having closed ends and provided with a longitudinal flange extending downward at right angles to the upper edge, and a cylindrical bead integral with the lower edge, all combined to operate substantially as shown and described.

396,464. BINDING-CASE. CALVIN A. CAMPBELL, Montreal, Quebec, Canada. Filed June 1, 1887. Serial No. 239,967. (Model.) Patented in Canada Jan. 3, 1888, No. 26,265.

Claim.—1. A knockdown binding-case composed of the bottom A, top C, flap E, hinged to the top and bottom, and the side D, hinged to the top adjacent to the flap E, substantially as described.



2. A knockdown binding-case composed of the bottom A, top C, flap E, hinged to the top and bottom, the sides D D, hinged to the top upon opposite edges thereof, and the flap F, hinged to the side of the bottom opposite the flap E, substantially as and for the purpose specified.

3. The arched transferring-wires G, made of a single piece of wire pointed at the ends, as shown, combined with the hinged receiving-wires J, beveled at the ends, with the bevel extending in the direction of a line drawn through the two receiving-wires and arranged to lock the points of the transferring-wires, substantially as described.

4. The arched transferring-wires G, made of a single piece of wire pointed, as shown, in combination with the receiving-wires J, beveled substantially at right angles to a line drawn through the wires G J, and connected together by the body-piece L, hinged to the bed-plate H and acted upon by the spring K, substantially as specified.

5. The combination of the fixed plate and arched transferring-wires secured thereto with the body-piece L, carrying the receiving-wires, pivoted to the fixed plate and overlapping the same, substantially as described.

396,465. SOUNDER ATTACHMENT. GEORGE H. CAREY and WILLIAM MCARTHUR, Dellarville, Mich. Filed Mar. 1, 1888. Serial No. 265,797. (No model.)

Claim.—1. The combination, with the armature-lever of a relay or sounder, of a resonant box adjustably suspended above the sounder, with the armature-lever projecting into it, substantially as described.

2. The combination, with a relay, of a bent standard secured to the base of the relay and provided with downwardly-projecting forks on its bent end, a resonant box suspended between the forks of the standard by the set-screws *e*, and the adjusting-screws *e f*, substantially as herein shown and described.

396,466. TILE-MACHINE. CHARLES CARR, Boston, Mass. Filed July 14, 1887. Serial No. 244,362. (No model.)

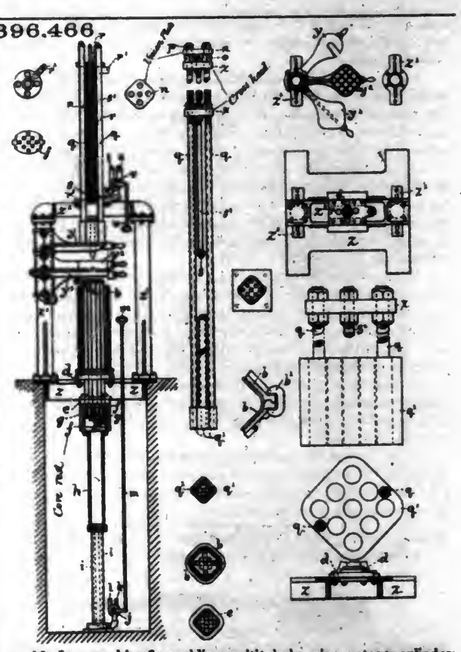
Claim.—1. In a machine for molding multitubular pipe-sections, the combination of the side rod hammers, cross-head, piston-rod, piston, steam-cylinder, and mold, substantially as described.

2. In a machine for molding multitubular pipe-sections, a series of independently-free vertically-sliding cores seated upon a vertically-sliding core rest or table, substantially as described.

3. In a machine for molding multitubular pipe, the series of relatively-smaller retracting-rods attached to independently-movable cores, in combination with a detached reciprocating core-rest, substantially as described.

4. In a machine for molding multitubular pipe-sections, the steam-cylinder constructed with the side-hammer-rod guides, in combination with the hammer or hammers, piston-rod, side-hammer rods, cross-head, and mold, substantially as described.

5. In a machine for molding multitubular pipe, in combination with a steam-cylinder, piston, rod, cross-head, and side rod hammers, the union *n*, substantially as described.



6. The combination of the steam-cylinder, the core-rest, and the detached core-retractors, and independent cores, substantially as described.

7. In a machine for molding multitubular pipe-sections, the convertible hammer consisting of heads *q'*, rods *q*, and head *x*, piston-rod *s'*, piston *s*, and union *n*, substantially as described.

8. In a machine for molding multitubular pipe, a set of separately-free vertically-sliding cores, and upper and lower guide-sockets, in combination with a vertically-movable core-rest, substantially as described.

9. The combination of the stationary piston, traveling cylinder, core-rest, and cores, substantially as described.

396,466.

10. In a machine for molding multitubular pipe, a steam-cylinder and core-rest, in combination with a series of graduated retracting-rods and separately-movable cores in guides, substantially as described.

11. In a machine for molding multitubular pipe-sections, in combination with separately-movable vertically-sliding cores, the upper and lower core-guides, substantially as described.

12. In a machine for molding multitubular pipe, the journaled hammer-rest, in combination with the tamping-hammers, substantially as described.

13. In a machine for molding multitubular pipe, the journaled table and feed-hopper, substantially as described.

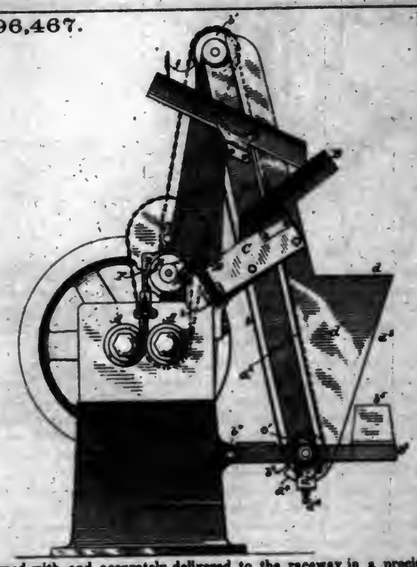
14. In a machine for molding multitubular pipe, the series of tubular hammer-rods and hammer head or heads, in combination with the cross-head *x*, a mold having a cluster of cores, and a hammer-actuating mechanism, substantially as described.

15. The combination of the falling-hammer lifter and the simultaneously-falling but detached hammer, substantially as described.

16. In a machine for molding multitubular pipe, the combination of the union *n*, a cross-head, *x*, a mold, a series of hammers, and a hammer-actuating mechanism, substantially as described.

17. The combination of a dead weight, inelastic hammer, dropping simultaneously with but unattached to a falling-hammer lifter, a mold, and hammer-lifting mechanism, substantially as described.

18. The hammer unattached to and in combination with a simultaneously-falling cross-head or lifter, a piston-rod, piston, and steam-cylinder, substantially as described.



396,467. MACHINE FOR FEEDING HORSESHOE-NAILS. JOHN A. COLEMAN, Providence, R. I. Filed Jan. 26, 1887. Renewed Oct. 26, 1887. Again renewed July 2, 1888. Serial No. 278,856. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of a raceway for supporting pendent blanks in line and in precise axial adjustment, a receptacle for said blanks wherein said axial adjustment is maintained or controlled, and diving-fingers which are interposed between said raceway and receptacle and detach blanks singly from said raceway, turn them end for end, and cause them to dive into said receptacle.

2. The combination, substantially as hereinbefore described, of a raceway for supporting pendent blanks in line and in a precise axial adjustment, a feed-tube which controls or maintains said axial adjustment, and diving-fingers which are interposed between said raceway and feed-tube and detach blanks singly from said raceway, reverse them endwise, and cause them to dive into said feed-tube.

3. The combination, substantially as hereinbefore described, of a raceway slotted to support pendent nail-blanks in a precise axial adjustment and an inclined V-shaped adjusting-chute merging at its foot with the slot in said raceway, whereby blanks with rectangular heads on being dropped into said chute are axially adjusted and their shanks

396,467.

aligned with and accurately delivered to the raceway in a precise axial adjustment.

4. The combined adjusting chute and raceway, substantially as hereinbefore described, consisting of a raceway slotted to support flat-sided and substantially rectangular-headed nail-blanks in a pendent position and with a precise axial adjustment, and an inclined V-shaped chute merging with said raceway and having at their junction a longitudinal central groove which is in line with the slot of the raceway and with the center of the chute and has a width less than the width of the head of a blank and slightly greater than its thickness, whereby a blank while sliding down said chute is partially adjusted axially therein, then fully adjusted by being turned on its edge in said groove and then delivered to and held by said raceway in a pendent position and in a precise axial adjustment.

5. In horse-nail-feeding mechanism, the combination, substantially as hereinbefore described, of a combined adjusting chute and raceway essentially embodying an inclined V-shaped supporting-surface and a slot or space for receiving blanks and supporting them in a pendent position, a receptacle for nail-blanks in mass, and carriers for detaching single blanks from said mass and delivering them to said chute, whereby a row or line of blanks is deposited on and supported by said raceway, each in a pendent position and in a precise axial adjustment.

6. In horse-nail-feeding mechanism, the combination, substantially as hereinbefore described, of the combined adjusting chute and raceway, a receptacle for blanks, carriers for detaching and conveying blanks from the mass to said chute, and diving-fingers at the foot of the raceway which pick blanks from said raceway, turn them end for end, and cause them to dive into a receptacle which maintains or controls the axial adjustment of the blanks.

7. In horse-nail-feeding mechanism, the combination, with the raceway, of a revolving disk provided with fingers which pick blanks from said raceway, reverse them end for end, and cause them to dive into a suitable receptacle, substantially as described.

8. In horse-nail-feeding mechanism, the combination of the diving-fingers, a blank-supporting raceway, and a spider-wheel provided with yielding arms, which sweep along a portion of the path occupied by the blanks while supported on said raceway, substantially as described, and thereby to place the foremost blank within the path of the diving-fingers to enable the latter to pick the blanks in regular order from the raceway.

9. In horse-nail-feeding mechanism, the combination, substantially as hereinbefore described, of a blank-supporting raceway provided at its foot with thin sleader projections for supporting a headed blank by contact with the sides thereof adjacent to its neck, and diving-fingers separated by a space slightly greater than that occupied by said projections, whereby said fingers may readily move freely by the projections and nevertheless engage with the head of a blank for picking it from the raceway.

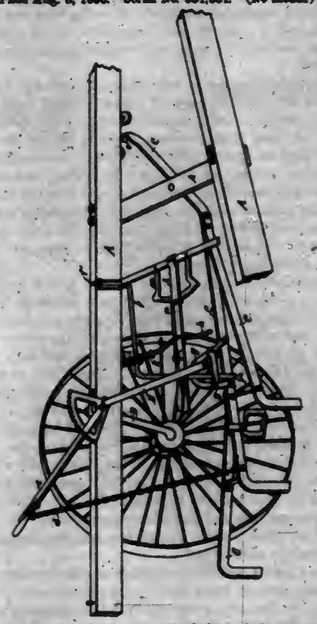
10. In horse-nail-feeding mechanism, the combination, with the raceway, of diving-fingers and the revolving disk carrying said fingers and provided at its periphery with a recess for the reception of the shank of a blank carried by said fingers.

11. In horse-nail-feeding mechanism, the combination, substantially as hereinbefore described, of a pan or receptacle for receiving blanks in mass, a feed-tube for delivering said blanks to the metal-working mechanism and interposed between said pan and tube, a series of blank-carriers on an endless belt, a combined adjusting-chute and raceway, and diving-fingers which detach blanks singly from said chute and cause them to dive into said feed-tube.

12. In a horse-nail-feeding mechanism, the combination, substantially as hereinbefore described, of a pan for receiving blanks in mass, an endless belt traveling within the pan and along its back and provided with carriers for engaging with the heads of the blanks, and thereby detaching blanks from the mass and discharging them singly from the pan.

13. The combination, substantially as hereinbefore described, of the blank-pan, the endless belt, and the belt-tightening frame.

14. The combination, substantially as hereinbefore described, of the blank-pan, the endless belt traveling within said pan, and an adjustable support for said pan, whereby the bottom of the latter is adjusted vertically with relation to the lower portion of the belt.



15. The endless belt provided with a series of carrying-studs in pairs and adapted to engage with the heads of blanks, substantially as described.

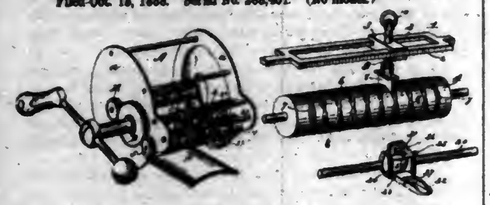
16. The endless belt provided with the series of carrying-studs arranged in diagonal lines on the face of the belt, substantially as described.

17. The raceway provided with surfaces for supporting headed nail-blanks in a pendent position and with interior coincident ribs for restricting the shank-space without undue frictional contact with the shanks of the blanks.

18. The combination, with the feed-tube and the diving-fingers, of the clearer within said tube and in the center of the path in which said fingers are moved, substantially as described.

396,468. WHEEL-CULTIVATOR. EDWARD R. COWLIN, Wauseon, Ohio. Filed Aug. 3, 1888. Serial No. 281,881. (No model.)

Claim.—1. In a cultivator, a swiveled crank brace-rod rotating horizontally, in combination with the plow-beam or drag-bar provided with a guide sliding upon said brace-rod, substantially as shown and described, for the purpose specified.



2. In a cultivator, a swiveled crank brace-rod rotating horizontally, in combination with the plow-beam or drag-bar provided with a guide sliding upon said brace-rod, and spring *k*, substantially as shown and described, for the purpose specified.

3. In a cultivator, the frame of the machine, the plow-beams, swiveled brace-rods *f*, and guides *g*, in combination with cross-rod *h* and lever *n*, substantially as shown and described, for the purposes specified.

4. In a cultivator, the frame of the machine, the plow-beams, swiveled brace-rods *f*, and guide *g*, in combination with cross-rod *h*,

lever *l*, rack *m*, and stop *n* and springs *k*, substantially as shown and described, for the purposes specified.

396,469. FISHING-REEL. JOSEPH P. COTTIGAN, St. Paul, Minn. Filed Oct. 18, 1888. Serial No. 288,461. (No model.)

Claim.—1. The combination, with the spool and winding mechanism of a reel, a guide-bar attached to the frame and having parallel grooves or ways therein, and a slide mounted to reciprocate in said grooved ways, of a cylinder provided with reversed grooves mounted in proximity to said guide-bar, and a pin adjustably mounted in said slide and provided with a blade entering the groove in the cylinder to reciprocate the slide, substantially as described.

2. In combination with the spool-frame and winding mechanism of a reel, a cylinder provided with reversed grooves and connected to the driving mechanism, a guide-bar mounted in proximity to said cylinder, a slide mounted to reciprocate upon said guide-bar, an eye or guide for the line connected to said slide, and an adjustable pin supported in said slide and carrying a blade for engaging the grooves in the cylinder, substantially as described.

3. In combination with the spool of a reel such as described, a tension device composed, essentially, of two guides through which the line is passed, and an intermediate hinged cross-piece, substantially as and for the purpose set forth.

4. In combination with the winding drum or spool of a reel, a tension device consisting, essentially, of two guides supported upon the frame, and a yoke pivotally supported to swing between the guides and carrying a cross-bar with supporting-springs, substantially as described.

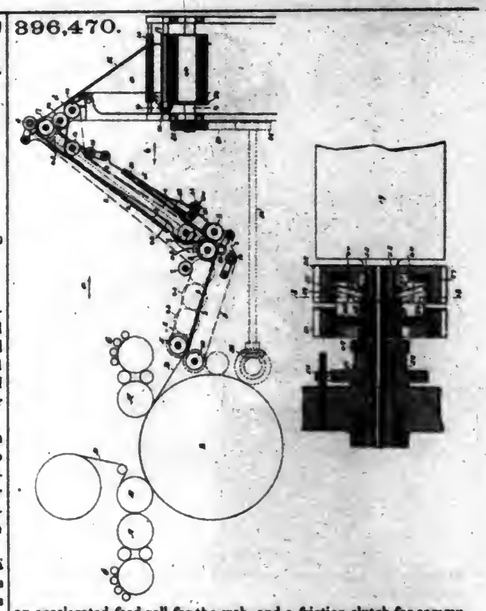
5. The combination, in a fishing-reel and with the winding drum or spool, of two angularly-disposed guides mounted upon the frame, and a yoke pivoted to swing between said guides and carrying a cross-piece with yielding tension devices operating to hold the line when passed through the guide and over the cross-piece clamped between the cross-piece and wall of the guide, substantially as described.

6. The combination, in a fishing-reel and with the winding-spool thereof, of a guide through which the line is carried to the spool, and a cross-bar or support for the line mounted upon a swinging support and adapted to be moved toward the guide to clamp the line against the latter, substantially as described.

7. The combination, in a fishing-reel and with the winding-spool thereof, of a guide through which the line is conducted to the spool, and a friction-bar mounted on movable supports in front of said guide and held pressed toward the wall of the guide by elastic tension devices, said bar being adapted and arranged to be drawn toward the guide by the friction of the line upon it, substantially as described.

8. In a fishing-reel and in combination with the winding-spool thereof, two guides angularly disposed, and a pivoted yoke carrying a cross-bar mounted upon springs, said cross-bar being interposed between the guides in position to be acted upon by the line and swung up toward the rear guide to clamp the line, substantially as described.

9. The combination, to form a tension attachment for a fishing-reel, of the bar provided with a line-guide and a frictional tension-bar mounted upon said bar and movable toward and from the front of the guide with an elastic support for holding said bar pressed upon the line, substantially as described.



10. In a fishing-reel and in combination with the spool, the winding mechanism and an eye or guide reciprocated longitudinally of the reel to lay the line, and a tension device, substantially such as described, consisting of a guide for the line and a movable bar supported to reciprocate in front of said guide and provided with elastic pressure devices, substantially as described.

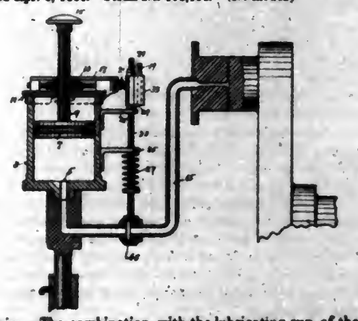
11. In combination with the spool and winding mechanism of a fishing-reel, substantially as described, the slide carrying the line-guide and blade, the grooved cylinder, and the pinion connected to said cylinder by a pawl-and-ratchet connection and receiving motion from the driving mechanism, whereby the spool may be rotated backwardly without moving the cylinder, substantially as described.

396,470. WEB-FEEDING MECHANISM. LUTHER C. CROWELL, Brooklyn, N. Y. Filed Dec. 9, 1887. Serial No. 257,459. (No model.)

Claim.—1. The combination, with a web-printing mechanism and a web-severing mechanism, of a longitudinal folding mechanism,

396,470.

an accelerated feed-roll for the web, and a friction-clutch for communicating the motion to said roll, substantially as described.



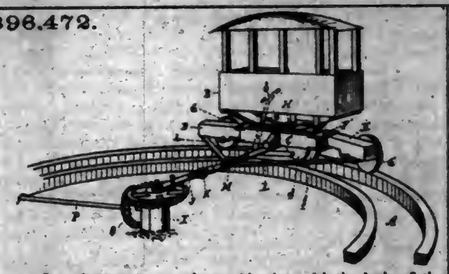
2. The combination, with a web-printing mechanism and a web-severing mechanism, of a web-turning mechanism, an accelerated feed-roll for the web, and a friction-clutch for communicating the motion to said roll, substantially as described.

3. The combination, with a web-printing mechanism and a web-severing mechanism, of an accelerated feed-roll for the web and a friction-clutch for communicating the motion to said roll, substantially as described.

4. The combination, with a web-printing mechanism and a web-severing mechanism, of a pair of accelerated feed-rolls for the web and an adjustable friction-clutch for communicating motion to said rolls, substantially as described.

5. The combination, with a web-printing mechanism and a pair of web-feeding rolls, as 14 or 19, of the fast gear 21 and the loose gear 22, the flange 37, spring 29, and adjusting-screw for regulating the pressure of the spring upon the flange, substantially as described.

396,471. LUBRICATOR. WILLIS M. DERBY, Minneapolis, Minn. Filed Apr. 8, 1886. Serial No. 196,190. (No model.)

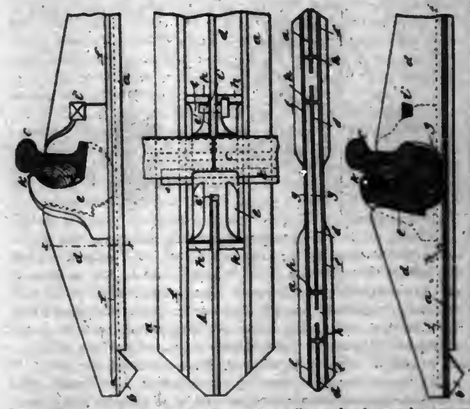


Claim.—The combination, with the lubricating-cup, of the piston arranged therein, the pipe connected to the crank-pin and jointed to the exit-pipe of the lubricator, the operating-rod, and connecting mechanism between said operating-rod and said piston, whereby the crank-pin may be lubricated, as described.

396,472. CIRCULAR COASTER. JAMES DUNCAN, Coshocton, Ohio. Filed Mar. 20, 1888. Serial No. 267,806. (No model.)

Claim.—1. In a circular coaster, the combination, with the body, of two or more supporting-wheels in circular alignment, outriggers adjustable on said body and each carrying one of the wheels, and of a tongue secured in radial relation thereto and provided with means for attaching it to a fixed point, substantially as described.

396,472.



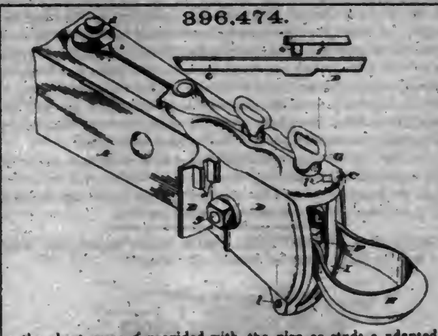
2. In a circular coaster, the combination, with the body of the vehicle, of the supporting-truck, in three sections pivotally connected together, and each provided with the supporting-wheels adapted to be adjusted to different circular alignment with each other, substantially as described.

3. In a circular coaster, the combination, with the body of the vehicle, of the supporting-truck, in three sections pivotally connected together, and each provided with the supporting-wheels in circular alignment with each other, of the radial tongue secured to the central part of the body, and of two hounds adjustably securing the end trucks with the tongue, substantially as described.

4. In a circular coaster, the combination, with the single-rail track, of the body B, the supporting-truck consisting of the central part, C, provided with the supporting-wheel H, and the outriggers D and E, pivotally and laterally connected thereto and provided with the supporting-wheels G, in circular alignment with each other, the propelling devices applied to the central wheel, substantially as described, the radial tongue provided with the extension-joint, and the hounds L, adjustably connected to the tongue, all the parts being arranged and constructed to operate substantially as described.

396,473. COMBINED RAIL-CHAIR AND SLEEPER. CLEMENT P. BEPINASSE, Montauban, France. Filed Nov. 6, 1888. Serial No. 290,086. (No model.)

Claim.—1. A metallic sleeper for railways having on its upper surface a central longitudinal rib, longitudinal side ribs parallel therewith, and pairs of transverse ribs intersecting said central and side ribs, said central rib being recessed and notched near its extremities, substantially as shown and described.



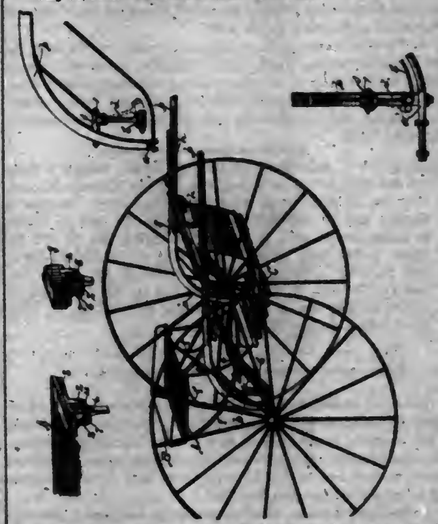
2. The combination, with a metallic railway-sleeper having on its upper surface a central longitudinal rib, longitudinal side ribs parallel therewith, and pairs of transverse ribs intersecting said central and side ribs, said central rib being recessed and notched near its extremities, of a compressible packing-block having a serrated upper surface inclosed by said side and transverse ribs, a rail-chair having a serrated bottom surface bearing on said packing-block and said central rib and between said side and transverse ribs, and means for locking the rail in said chair, substantially as shown and described.

396,474. PLOW-CLEVIS. CHARLES A. REESE, Canton, Ohio. Filed Oct. 10, 1888. Serial No. 287,750. (No model.)

Claim.—1. The combination of the beam A, having attached thereto the crown-head B, the frame formed in two sections, C and D, said sections being hinged together, the draft-link E, pivotally attached to the frame and carrying the screw-threaded nut F, and the screw G, substantially as and for the purpose specified.

2. The combination of the sections C and D, the long arms *b* and

396,474.



c, the short arms *f*, provided with the pins or studs *e*, adapted to enter the apertures in the arms *b* and *c*, and a draft-link, substantially as and for the purpose specified.

3. The pin or key H, provided with the tange *k*, in combination with the crown-head B, provided with the teeth *a*, and with the frame C D, substantially as and for the purpose specified.

4. The combination of the frame formed in two sections, said sections being hinged together, the draft-link E, pivotally attached to said frame and carrying the screw-threaded nut F, the screw G, and bolt *g*, substantially as and for the purpose set forth.

5. The combination of the frame formed in two sections, the fender I, provided with the pins or extensions *l* and *P*, the draft-link E, and bolt *g*, and the beam A, substantially as and for the purpose specified.

396,475. ROAD-CART. GEORGE GIMSON, Fairmount, N. Y. Filed July 30, 1888. Serial No. 281,426. (No model.)

Claim.—1. The combination of a shackle having journal-bearings arranged one above the other and at substantially right angles to each other, and a pivot-bolt, *l*, for securing the shackle to the cart, with a pendent stirrup, *d*, pivoted at one extremity to the said shackle at its other journal-bearing and secured to the end of the supporting-spring S, substantially as and for the purpose set forth.

2. The combination of the seat-supports hinged at their forward extremity to the frame of the cart, a transverse spring secured to the seat-supports, a shackle pivoted to the shafts, a stirrup pivoted at one extremity to the shackle, and the extremities of the spring pivoted to the opposite extremity of the pivoted stirrup, substantially as and for the purpose set forth.

3. The combination of the seat A, braces *f*, supporting the seat, pivoted at their forward extremity, and secured to a transverse cross-spring between their two extremities, with shafts secured to the axle, shackles pivoted to the shafts and rocking transversely of the cart, stirrups *d*, pivoted to the rocking shackle and rocking lengthwise of the cart, with a pivotal connection between the extremities of the transverse spring and the stirrups, substantially as and for the purpose set forth.

4. The combination, with a shackle having journal-bearings arranged one above the other and at substantially right angles to each other, and a pivot-bolt, *l*, for securing the shackle to the cart, a pendent stirrup, *d*, pivoted at one extremity to the said shackle at its other journal-bearing and secured to the end of the supporting-spring S, with a detachable foot-rest connected to the cart, and braces A, secured on the frame in suitable proximity to the foot when in position for speeding, substantially as and for the purpose set forth.

5. The combination of the seat A and cross-bar *g*, each provided with lugs 2, the rails 4 of the foot-rest provided with eyes fitting between the lugs 2, the bolts 6, for securing the rails to the lugs, and the pins 7, substantially as and for the purpose set forth.

396,476. FIFTH-WHEEL. JOHN M. GIRAUD, Warwick, Md. Filed Aug. 24, 1888. Serial No. 283,672. (No model.)

Claim.—1. The improved fifth-wheel herein described, comprising the wheel A, provided with a circumferential rim-flange, *a'*, and having circular portions *a a*, projected above and below such flange, the circle having an opening to receive one of such portions *a* and a rabbet to receive the flange *a'*, and the ring arranged to cover such flange *a'*, and having an opening to receive one of the portions *a*, substantially as set forth.

2. In a fifth-wheel, the combination of a wheel, A, having a circumferential rim-flange, *a'*, and provided with circular portions *a a*, projected above and below such flange, and the framing or holder receiving such wheel, substantially as set forth.

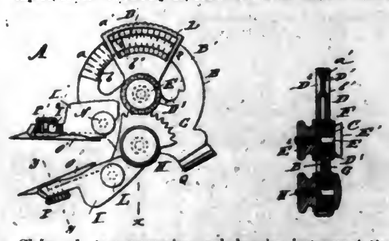
3. The circle having opening *b* and rabbet *b'*, combined with the wheel having similar circular portions, *a a*, and flange *a'* between the same, such flange being fitted to the rabbet *b'*, and the ring C, secured to the circle, substantially as set forth.

4. The combination, substantially as described, of the axle, the circle B, having opening *b* and rabbet *b'*, the bolster, the wheel A, having portions *a a* and flange *a'*, the clips securing said wheel to the bolster, the ring C, and the clips having their arms extended upon opposite side of the axle through the circle and ring and secured, all substantially as set forth.

396,477. MANUFACTURE OF LOCK-NUTS. GEORGE A. GOODWIN and WILLIAM P. HOW, Westminster, County of Middlesex, England. Filed Oct. 19, 1888. Serial No. 288,566. (No model.) Patented in England Mar. 10, 1887, No. 3,654; in Italy Dec. 14, 1887, No. 22,750; in France Dec. 16, 1887, No. 187,619; in Belgium Dec. 16, 1887, No. 79,942; in New South Wales Jan. 4, 1888, No. 451; in Victoria Feb. 3, 1888, No. 5,008; in South Australia Feb. 6, 1888, No. 956; in New Zealand Feb. 20, 1888, No. 2,867; in Spain Feb. 24, 1888, No. 13,495; in Austria-Hungary Apr. 8, 1888; in Portugal Apr. 20, 1888, No. 1,239, and in Queensland May 26, 1888, No. 404.

Claim.—1. In the art of making lock-nuts, the improvement which consists in forming a superficially-ribbed bar or piece of metal, cutting the bar, punching in the blank so formed a hole having the raised or ribbed projections contiguous thereto, and compressing the projections inwardly to form locking-lugs for engagement with the bolt, substantially as and for the purposes described.

2. The method herein described of making lock-nuts, which consists in forming a double-ribbed metal bar or blank, cutting the blank, punching a hole transversely through the ribbed face between the ribs and contiguous thereto, tapping the nut, and compressing the projecting ribbed portions to contract the intervening space, and to form clamping or locking lugs for the bolt, substantially as set forth.



396,478. MACHINE FOR TRIMMING, PLANING, AND SAWING STEREOTYPE-PLATES. LUCIUS GOSS, Upper Montclair, N. J., and SAMUEL W. TREW, Brooklyn, N. Y. Filed Apr. 11, 1888. Serial No. 270,249. (No model.)

Claim.—1. The machine herein shown and described, consisting of a suitable frame and a reciprocating bed-plate, C, in combination with edge-trimming knives, plane, diagonally-set saw, and the holding-bars, all arranged substantially as and for the purposes set forth.

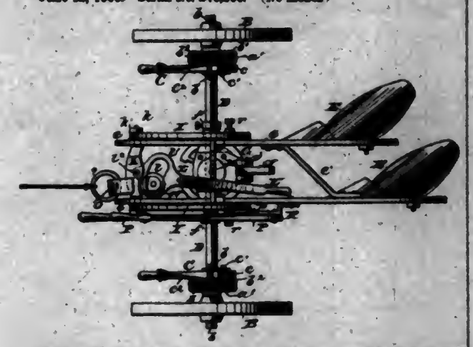
2. The combination, with the reciprocating bed-plate, of the holding-bars formed at their under surfaces with beveled ribs or projections *c*, substantially as and for the purposes set forth.

3. The combination, with the reciprocating bed-plate C, of the circular trimming-knives F, the axes of which stand slightly above the bed-plate, whereby the movement of the stereotype-plate in contact with the knives will cause them to revolve, substantially as described.

396,479. CALIPERS AND DIVIDERS. THOMAS GREEN, East Davenport, Iowa. Filed July 13, 1888. Serial No. 279,837. (No model.)

Claim.—1. In a measuring and drawing instrument, the combination, with a plate having a segmental graduated part and a fixed arm held on the said plate, of an indicator held to turn on the said plate over the said graduated part, a gear-wheel formed on the said indicator, a segmental gear-wheel in mesh with the said gear-wheel on the indicator and turning on the said plate, and an arm held on the said segmental gear-wheel and adapted to support divider-arms or inside or outside caliper-arms, substantially as shown and described.

2. In a measuring and drawing instrument, the combination, with a plate having a segmental graduated part, of an indicator held to turn on the said plate over the said graduated part, a gear-wheel formed on the said indicator, a segmental gear-wheel in mesh with the said gear-wheel and turning on the said plate, an arm held on the said segmental gear-wheel, and divider-arms held on the said fixed plate and segmental arm, substantially as shown and described.



3. In a measuring and drawing instrument, the combination, with a plate having a segmental graduated part, of an indicator held to turn on the said plate over the said graduated part, a gear-wheel formed on the said indicator, a segmental gear-wheel held in mesh with the said gear-wheel on the indicator and turning on the said plate, an arm held on the said segmental gear-wheel, and inside caliper-arms held on the said plate and the said segmental arm, substantially as shown and described.

4. In a measuring and drawing instrument, the combination, with a plate having a segmental graduated part, of an indicator held to turn on the said plate over the said graduated part, a gear-wheel formed on the said indicator, a segmental gear-wheel held in mesh with the said gear-wheel on the indicator and turning on the said plate, an arm held on the said segmental gear-wheel, and outside caliper-arms held on the said plate and on the segmental arm, substantially as shown and described.

5. In a measuring and drawing instrument, the combination, with a plate provided with a lug and a beveled part, of an arm secured to the said plate by a bolt and provided with a recess in which fits said lug, and also provided with an under-cut fitting onto the said bevel, substantially as shown and described.

6. In a measuring and drawing instrument, the combination, with a plate provided with a notch and a beveled part, of an arm secured to the said plate by a bolt and provided with a lug fitting into the said notch, and also provided with an under-cut fitting onto the said bevel, a segmental arm held to turn on the said plate, and an arm fastened to the said segmental arm by a bolt and provided with a notch fitting onto a lug on the said segmental arm, and also provided with an under-cut fitting on the bevel end of the said segmental arm, substantially as shown and described.

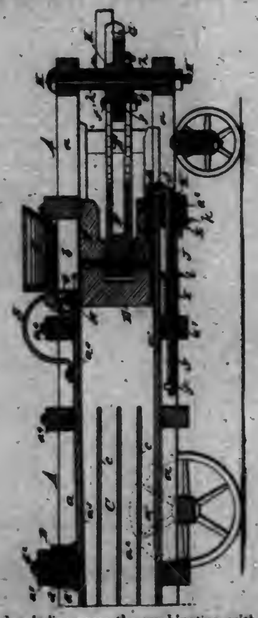
396,480. SULKY-PLOW. GEORGE W. HAINES, Stockton, Cal. Filed June 12, 1888. Serial No. 276,800. (No model.)

Claim.—1. In a sulky-plow, the combination, with the frame and a transverse shaft held thereto and vertically adjustable thereon, of a rocking support on said shaft, guide-plates held to said support, a plow or plows having beams extending next the guide-plates, a bar or plate connecting said guide-plates and also connecting the forward ends of the plow-beams, and a draft attachment connected to said bar or plate, substantially as shown and described, whereby the plows may be adjusted to working depth independently of the sulky-wheels, or so that their depth of working may be controlled by or from the wheels, as herein set forth.

2. In a sulky-plow, the combination, with the frame and a transverse shaft held thereto and vertically adjustable thereon, of a rocking support on said shaft, guide-plates held to said support, a plow or plows having beams extending next the guide-plates, and a bar or plate connecting said guide-plates and also connecting the forward ends of the plow-beams, and said beams having a series of holes to receive the bar or plates, substantially as described, for the purposes set forth.

3. In a sulky-plow, the combination, with the frame, a transverse shaft thereon, a fifth-wheel plate-coupling supported on said shaft, opposite parallel guide-plates held to said coupling and receiving the plow-beams between them, a bar connecting the forward ends of the beams and guide-plates, and a draft device connected to the plow-beams, substantially as herein set forth.

4. In a sulky-plow, the combination, with the frame A, of a shaft, D, vertically adjustable on the frame, a fifth-wheel coupling, G H, hung on said shaft, a latch, J, for said coupling, guide-plates I I, held to the coupling-plate H, a plow or plows having a beam or beams ranging along the plates I I, a cross bar or plate, K, loosely connecting the plow-beams and guide-plates, and a draft device held to the bar K, substantially as described, for the purposes set forth.



5. In a sulky-plow, the combination, with a frame, a transverse shaft thereon, a rocking support on said shaft, guide-plates held to said support, and a plow or plows having beams ranging along said plate or plates and connected thereto at the forward end, of a rack, R, on the guide-plate, a lever, P, slotted at *p'* and fulcrumed on a pin, *r*, passed through the slot *p'* into the guide-plate, and a latch on the lever adapted to the rack R, substantially as herein set forth.

6. In a sulky-plow, the combination, with the frame, a support thereon, and a plow or plows held to said support, of a draft-bar fitted to the plow beam or beams, a lever having a transverse slot or cross-head at its forward end and pivoted thereat to the draft-bar, a draft-clevis fitted to slide transversely on the lever-head, and a detent for the lever, substantially as shown and described, whereby by shifting the lever the clevis will automatically adjust itself to secure any required side draft of the plows, as herein set forth.

7. In a sulky-plow, the combination, with the frame, a transverse shaft thereon, a rocking support on said shaft, a plow or plows held to said support and provided with a series of upper and lower draft-holes at their forward ends, a rocking bar, as K, adapted to said draft-holes, a lever, L, having a slot, *l*, and pivoted to the bar K, a rack on the plows with which the lever is adapted to lock, and a draft-clevis fitted to slide transversely in the lever-slot *l*, substantially as herein set forth.

8. In a sulky-plow, the combination, with the frame, a transverse shaft, D, thereon, a rocking support on said shaft, plates I I, held to said support, a plow or plows having beams held between the plates I I, and provided with a rack, M, a rocking bar or plate, K, held to the plow-beams and to the plates I, a lever, L, having a head-slot, *l*, and pivoted to the bar K, and a laterally-movable draft-clevis, as N O, fitted to the lever L at its slot *l* and adapted to engage the rack M, substantially as described, for the purposes set forth.

396,481. BALING-PRESS. DAVID L. HANHAY, Grapeville, N. Y. Filed July 5, 1888. Serial No. 279,076. (No model.)

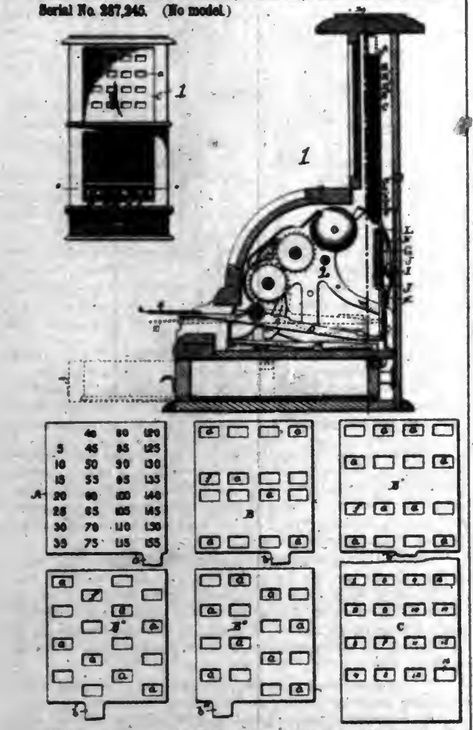
Claim.—1. In a baling-press, the combination, with the press-case and a plunger therein having a lug or shoulder, *c*, of a rod, J, made flat-sided and provided with a lug, *j*, a bushing journaled on the press-frame and in which the flat-sided rod is fitted for endwise movement, and a spring normally forcing the rod backward substantially as described, for the purposes set forth.

2. In a baling-press, the combination, with the press-case and a plunger therein having a lug or shoulder, *c*, of a flat-sided rod, J, provided with a lug, *j*, a bushing journaled on the press-frame and in which the flat-sided rod is fitted for endwise movement, a spring normally forcing the rod backward, and an operating-rod connected to the bushing for turning it and the rod J, substantially as herein set forth.

3. The combination, with the baling-box, of a triangular folder extending across the box and journaled for rotation at the rear of its feed-opening, and a yielding device normally holding the folder with one angle downward and one face presented to the drawn-back plunger, substantially as described, whereby the folder will be given a partial rotation for folding material by one face of it at each effective stroke of the plunger, and will present its next face to the plunger when the latter retracts, as and for the purposes set forth.

4. The combination, with the baling-box, of a triangular folder extending across the box and journaled for rotation at the rear of its feed-opening in vertically-yielding bearings, and a yielding device normally holding the folder with one angle downward and one face presented to the drawn-back plunger, substantially as described, whereby the folder will be given a partial rotation for folding material by one face of it at each effective stroke of the plunger and will yield bodily to avoid excessive friction on the plunger, and will present its next face to the plunger when the latter is retracted, as and for the purposes set forth.

5. The combination, with the press-frame, of a triangular folder, N, journaled across the baling-box at its feed-opening, and a spring S, held to the frame and bearing on the folder, substantially as herein set forth.



6. In a baling-press, the combination, with the press-frame, of vertically-movable flanged plates O, pins or bolts P, holding them to the frame, springs R on the bolts, a triangular folder, N, journaled to the plates and crossing the rear end of the feed-opening, and a spring normally holding the folder with one side vertical and facing the drawe-back plunger, substantially as herein set forth.

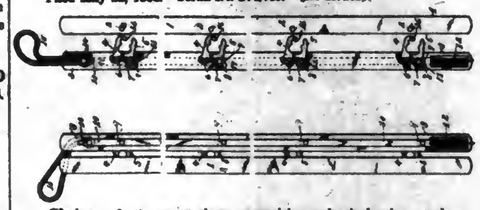
396,482. FIRE-BAR. HUGO HARTUNG, Berlin, Germany. Filed Mar. 16, 1888. Serial No. 267,415. (No model.) Patented in England Dec. 23, 1887, No. 17,006, and in Belgium Dec. 31, 1887, No. 79,134.

Claim.—In a fire-bar having the polygonal-shaped divisions A, which taper into the body of the fire-bar at *a*, in combination with the peculiarly-formed air-passages B between each division and the alternated slanting surfaces *c*, for the purpose as described.

396,483. INDICATING DEVICE FOR CASH REGISTERS AND INDICATORS. JOHN C. HARLETT, Muscatine, Iowa. Filed Oct. 4, 1888. Serial No. 287,245. (No model.)

Claim.—1. In a cash-register, the combination of a plate having a series of numbers thereon, another plate having a series of sight-openings, one of these plates being movable relatively to the other, a series of movable perforated exposing-plates, and keys or levers for moving the said plates, substantially as described.

2. In a cash-register, the combination of a plate having thereon a series of numbers, another plate having a series of sight-openings, one of these plates being stationary relatively to the other, the number of rows of numbers being twice the number of the rows of sight-openings, the movable perforated exposing-plates, and the levers for moving the plates, substantially as described.

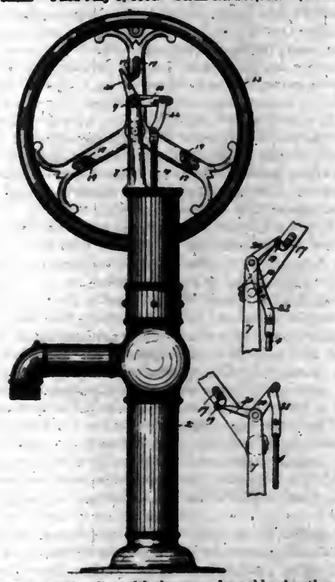


3. In a cash-register, the combination of a movable plate, A, having thereon a series of figures, a stationary plate, C, in front of the plate A, having a series of sight-openings, the movable perforated exposing-plates arranged between the plates A and C, and the levers for moving said plates, substantially as described.

4. In a cash-register, the combination of the plate A, having thereon a series of numbers, the movable perforated exposing-plates lying one in front of another in front of the plate A, the operating levers or keys, and the arms connecting the levers or keys and the plates arranged in the same plane, substantially as described.

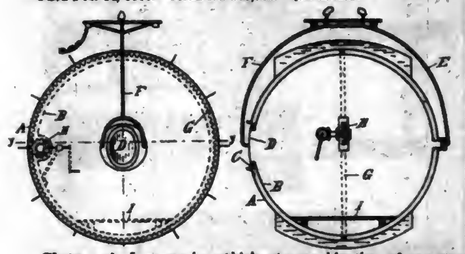
5. In a cash-register, the combination of a plate bearing a series of numbers, movable perforated exposing-plates, operating-levers for the movable plates, connecting-arms between the movable plates and levers arranged in the same plane, locking projections, as the nuts J, carried by the arms, and a rocking bar arranged to be contacted by the said projections when the levers are moved, substantially as described.

6. In a cash-register, the combination of the plate A, bearing a series of numbers, the movable perforated exposing-plates B, B′, B″, and B‴, the stationary plate C, having a series of sight-openings, a series of levers or finger-keys, connecting-arms between the levers and plates, the nuts J on the arms, and the rocking bar I in rear of the arms in position to be struck and operated by the said nuts as the levers are operated, substantially as described.



396,484. CORSET-CLASP. MAX W. HENIUS, Bridgeport, Conn. Filed May 22, 1888. Serial No. 274,713. (No model.)

Claim.—1. A corset-clasp comprising a busk having studs, a second busk having fixed eye portions 4, curved to form hooks 16, pointing slightly inward toward said second busk, and thereby adapted to hold the studs and take all of the strain when the corset is tightly laced, movable eye portions also carried by said second busk and adapted to prevent the escape of the studs when the corset is loosely laced, and a slide connecting and adapted to operate said movable eye portions, substantially as set forth.



2. A corset-clasp comprising a busk having studs, a second busk having fixed eye portions 4, pivoted movable eye portions 5, having vertical slots and also carried by said second busk, and a slide, 10, carrying studs engaging said vertical slots of eye portions 5, substantially as set forth.

396,485. PUMP-OPERATING MECHANISM. OLE HENJUM, Minneapolis, Minn. Filed July 9, 1888. Serial No. 279,263. (No model.)

Claim.—The combination, with the pump-barrel having the standards 7, of the fly-wheel 13, pivoted to one of said standards 7 and having the projections 17, the shaft 9, adapted to turn in proper bearings in the standard 7 and having the arm 20, adapted to be engaged by the projections 17 in the revolution of the fly-wheel, the arm 10, adjustably secured to the shaft 9, so as to regulate the length of "throw" of the pump-plunger, the plunger 4, having suitable flexible or link connection with the arm 10, and the spring 23, fitted upon said plunger, adapted to force it downward when the arm 19 is released from engagement with the fly-wheel, substantially as described.

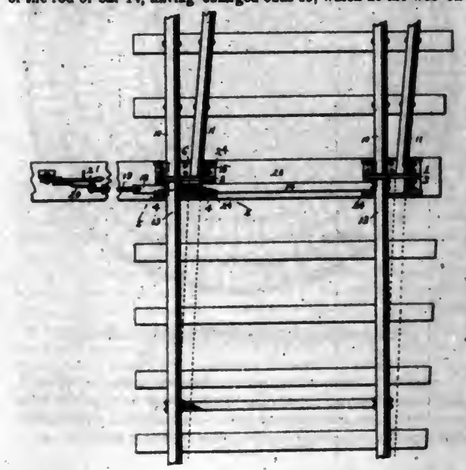
396,486. MARINE VEHICLE. WILLIAM HENRY, Alpena, Mich. Filed Feb. 14, 1888. Serial No. 263,902. (No model.)

Claim.—1. In a marine vehicle, the combination of an outer globe and an inner water-tight globe concentrically supported within the outer globe and the two made relatively rotatable to each other, substantially as described.

2. In a marine vehicle, the combination of an outer globe and an inner globe concentrically within the outer globe on trunnions, and the two made relatively rotatable to each other, and paddles secured to the outer globe, substantially as described.

3. In a marine vehicle, the combination of an outer globe, an inner globe concentrically secured within the outer globe by means of trunnions, a hollow trunnion projecting through the outer globe, and air-circulating devices connecting with said trunnions and projecting to the top of the vehicle, substantially as described.

4. In a marine vehicle, the combination of an outer globe, an inner globe concentrically secured within the outer globe by means of trunnions, a hollow trunnion projecting through the outer globe, and air-circulating devices connected with the hollow trunnion, made of hollow tubing and forming a skeleton frame for a seat above the device, substantially as described.



5. In a marine vehicle, the combination of concentric inner and outer globes rotatably secured in relation to each other and provided with the means for propelling the outer globe from the inner globe, and a platform within the inner globe, substantially as described.

6. In a marine vehicle, the combination of an outer globe, the inner globe concentrically supported on trunnions, the equatorial gear upon the inside of the outer globe, the drive-pinion carried by the inner globe, and a crank-shaft and connecting-gear for conveying power thereto, substantially as described.

7. In a marine vehicle, the combination of an outer globe, the inner globe concentrically supported on trunnions, the equatorial gear upon the inside of the outer globe, the drive-pinion carried by the inner globe, a crank-shaft and connecting-gear for conveying power thereto, and a platform in said inner globe, substantially as described.

396,487. COMBINED HEAD-CHAIR AND CONNECTING-ROD. WILLIAM J. HOOPER, Rincon, N. Mex. Filed Feb. 15, 1888. Serial No. 264,149. (No model.)

Claim.—1. In a switch, the combination, with the throw-rails 13, of the rod or bar 14, having enlarged ends 15, which fit the web on the inner sides of the rails, outer plates, 17 18, fitting the webs of the rails and bolted through the rails to said ends 15, and the switch-bar 18, connected with said outer plate, 17, whereby the rails will be firmly connected above the plane of the top edges of the chair-sockets, substantially as set forth.

2. The combination, with throw-rails 13, of rod or bar 14, having enlarged ends 15, fitted to said rails, one of which is bolted to the outer throw-rail, 13, and a plate, 16, fitted thereto and the other to the inner throw-rail, 13, and the enlarged end 17, having a rod or bar, 18, connected with a switch-operating mechanism, substantially as described.

396,488. DOOR-CHECK. FRANKIE A. HOOVER, Kinsco, Kans. Filed Sept. 6, 1888. Serial No. 284,907. (No model.)

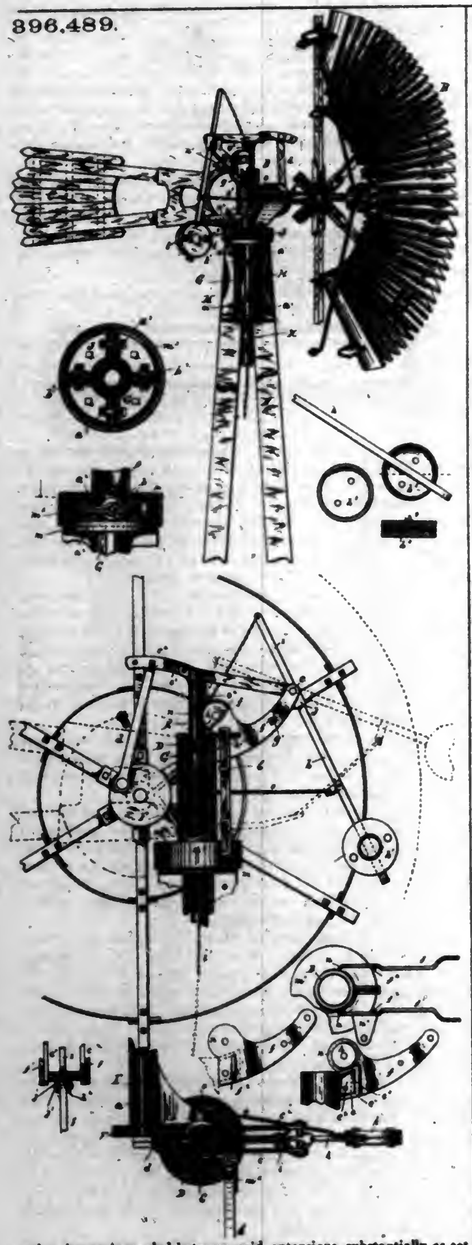
Claim.—1. In a door-check, the combination, with the bracket secured to the door and provided with a guide loop or box having a rib or projection, *c*, of the swinging check-arm pivoted at one end to the casement and operating at its free end in the loop or box, the said arm being provided with a notched rib or rack which is adapted, when the arm is elevated, to engage the rib or projection *c*, and the latch arranged under the free end of the said arm and adapted to raise the same, substantially as and for the purpose specified.

2. In a door-check, the combination, with a guide loop or box arranged at the upper edge of a door and provided with the rib or projection *c*, of the catch arranged on the casement at the free edge of the door, and the swinging check-arm pivoted to the casement, operating in the guide loop or box, and adapted to engage the said catch when the door is closed, the said swinging arm being provided with a notched rib or rack to engage the rib *c*, substantially as and for the purpose specified.

3. In a door-check, the combination, with a guide loop or box arranged on a door, of the swinging arm pivoted to the casement and operating in the said loop or box, and the adjustable stop M, arranged on the said arm, substantially as specified.

4. In a door-check, the combination, with a guide loop or box arranged on a door, of the swinging arm pivoted to the casement and operating in the guide loop or box, and the catch H, secured to the casement at the free edge of the door and provided with an anti-friction roller, A, provided with a rubber or elastic periphery, the free end of the swinging arm being adapted to engage the said catch, substantially as and for the purpose specified.

5. In a door-check, the combination, with a guide loop or box, E, provided with a depending rib or projection, *c*, of the swinging check-arm G, operating at its free end in the said loop or box, the latch arranged under the free end of the swinging arm and adapted, when operated, to raise the same and engage it with the rib or projection *c*, and the revoluble door-knob connected by suitable rods or wires with the said latch, whereby, when the knob is turned, the latch is operated, substantially as specified.



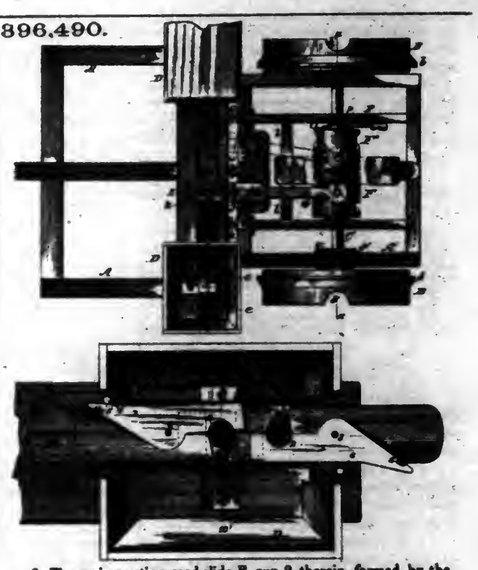
6. In a door-check, the combination, with the guide loop or box provided with the rib or projection *c*, and the swinging check-arm operating at its free end in the loop or box, and adapted, when elevated, to engage the rib or projection, of the latch mounted on the door and adapted to engage the swinging arm, the rods or wires connecting this latch to the revoluble door-knob, the swinging link connected at its free end to the said wires or rods, and the locking-arm adapted to engage the swinging link to hold the swinging arm in its elevated position, substantially as specified.

7. In a door-check, the combination, with the guide loop or box E, provided with the rib or projection *c*, the swinging check-arm operating at its free end in the loop or box, and the latch mounted on the door and adapted to operate the swinging arm, of the sleeve C, arranged on the shank of the revoluble door-knob, the swinging link connected at its free end to the latch and the sleeve by the rods or wires *k* and *k′*, and the locking-arm L, adapted to engage the swinging link, to hold the swinging arm in its elevated position, substantially as specified.

396,489. WINDMILL. DAVID J. HOWENSTEIN, Canal Fulton, Ohio. Filed Oct. 19, 1887. Serial No. 252,788. (No model.)

Claim.—1. In a windmill, the combination of hollow rotary spindle D, provided with lug *e*, having rib *e′*, and arms *f f′*, provided, respectively, with ears f^3, engaging with rib *e′*, said arms each provided with extensions *n*, projecting over the opening in the hollow spindle,

396,489.



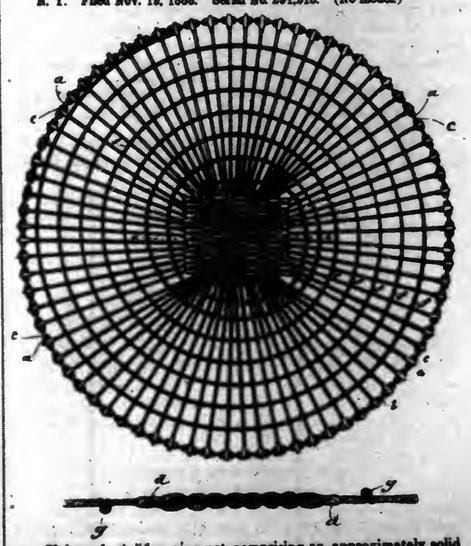
and a sheave journaled between said extensions, substantially as set forth.

2. In a windmill, the combination of hollow rotary spindle D, provided at its upper portion with lug *e*, having rib *e'*, and arms *f f'*, provided, respectively, with ears *c'*, engaging, respectively, with rib *d'*, said arms each provided with the extension *n*, projecting over the opening in the hollow spindle, one of said arms provided with lug *n'*, and a sheave pivoted between said extensions, and vane G, pivoted at its upper portion to said lug *n'*, substantially as set forth.

396,490. CORN-PLANTER. SAMUEL HUFFMAN, Matamora, Kans. Filed Dec. 2, 1886. Serial No. 184,492. (No model.)

Claim.—1. In a corn-planter, the seed-slide E, carrying a pivoted part, 1, that forms one half of the cup 2, in combination with the removable block 4 in the opposite half for graduating the size of the seed-hole, substantially as shown and described.

396,490.



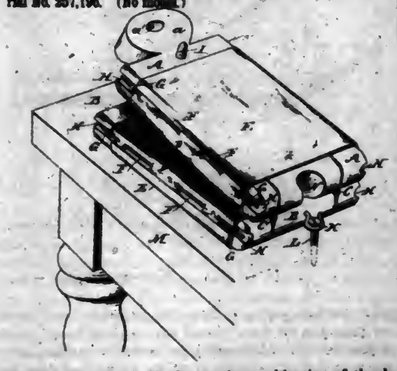
2. The reciprocating seed-slide E, cup 2 therein, formed by the pivoted part 1, and the removable block 4, in combination with the sectional lever G, pivoted upon the frame A', all substantially as described and shown.

3. The hinged pivoted lever G, with the double cam F and F' for hill-dropping or drilling, in combination with the seed-slide E, having the cup 2 therein, formed by the pivoted part 1, and the removable block 4, as shown and described.

4. In a corn-planter, the seed-slide E, having a hinged pivoted lever, G, cams F and F', axle C, pointer *o*, revolving with the axle, and index-plate N, secured to frame A', in combination with the bearing-wheels B B, one of which is provided with scale S and notches *b'*, substantially as shown and described.

5. In a corn-planter, the seed-slide E, hinged pivoted lever G, cams F and F', ratchet-wheels O, pawl P, axle C, index-plate N, and pointer *o*, in combination with the bearing-wheels provided with the marking-notches *b'* and raised flange *b*, all as shown and described.

396,491. LIFE-SAVING NET. MALCOM HUSTER, Long Island City, N. Y. Filed Nov. 19, 1888. Serial No. 291,313. (No model.)

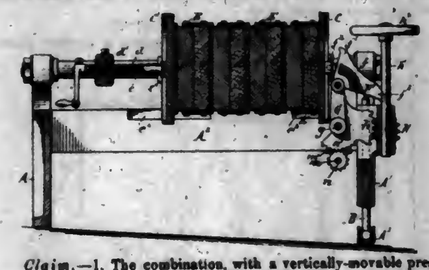


Claim.—1. A life-saving net comprising an approximately solid rope center piece and ropes radiating therefrom to form the body proper of the net, said radiating ropes being combined at their outer ends with a grasping rope or chain, substantially as specified.

2. A life-saving net comprising an approximately solid rope center piece formed from the radiating ropes and spliced pieces, substantially as specified.

3. A life-saving net the body of which is made of rope and consists of pieces radiating approximately from a common center and a spirally-wound rope secured thereto at regular intervals, substantially as specified.

396,492. KNIFE-CLEANER. ROBERT W. JAMIESON, Prince Albert, Saskatchewan, Northwest Territory, Canada. Filed Dec. 7, 1887. Serial No. 257,196. (No model.)



Claim.—1. In a knife-cleaner, the combination of the double-faced reversible blocks A and B, hinged together, one of them being provided with a hook, K, at the hinged end, and the other block provided, near the hinge, with a notch or recess, N, to allow passage of the hook when the blocks are reversed, substantially as described.

2. In a knife-cleaner, the combination, with a block provided with eyes or staples G, of a cleaning or polishing fabric or facing passed over the face of the block and at the edges thereof, and pins F, interlaced through the facing and entering the eyes or staples, substantially as herein set forth.

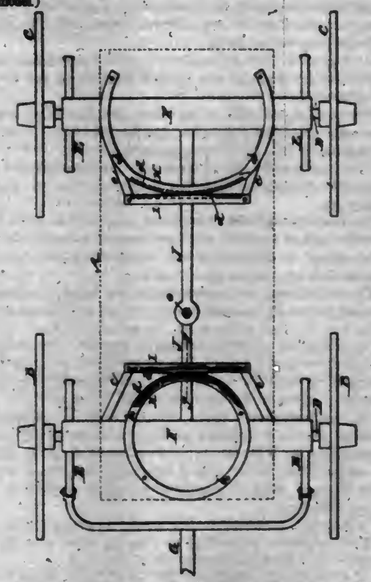
3. In a knife-cleaner, the combination, with a cleaning or polishing block having edge grooves H and eyes or staples G therein, of a cleaning or polishing fabric or facing passed over the face of the block and entered into the slots H, and pins F, interlaced through the edges of the facing in the slots and entering the eyes or staples G, substantially as herein set forth.

396,493. CHEESE-PRESS. WILHELM JEPPESEN, Nytjobing, Falster, Denmark, assignor to Johan D. Frederiksen, Little Falls, N. Y. Filed Sept. 25, 1888. Serial No. 286,304. (No model.) Patented in Denmark Nov. 18, 1887, No. 225.

Claim.—1. The combination, with a vertically-movable press-frame, of a movable head-block, a pressure-screw by which the head-block is moved, a stationary support, a lifting device resting on said support and carrying the movable end of the press-frame, and a movable foot-block bearing against said lifting device, whereby the cheese is pressed and the press-frame is raised by tightening the screw, and further pressure is exerted upon the cheese by the descent of the frame as the cheese shrinks, substantially as set forth.

2. The combination, with a vertically-movable press-frame, of a movable head-block, a pressure-screw by which the head-block is moved, a stationary support, a lifting-lever resting on said support and carrying the movable end of the press-frame, a movable foot-block bearing against the lifting-lever, a hanger pivoted on the press-frame and connected with the lifting-lever, and an adjusting device, whereby the hanger can be turned forwardly or backwardly, thereby adjusting the leverage of the lifting-lever, substantially as set forth.

3. The combination, with the horizontal press-frame having one of its ends made vertically movable, of a pressure-screw arranged lengthwise in said frame, a movable head-block upon which said screw operates, a stationary support provided with guides on which the movable end of the press-frame can be raised and lowered, a lifting device resting on said support and carrying the movable end of the press-frame, and a movable foot-block bearing against said lifting device, substantially as set forth.



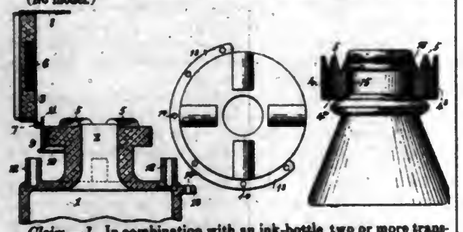
4. The combination, with the press-frame, the movable foot-block C, the head-block C', and a pressure-screw, *d*, of the foot-piece A^2, provided with upright rods B, passing through openings in the press-frame, and the lifting-lever F, attached to the press-frame and resting upon the rods B, substantially as set forth.

5. The combination, with the press-frame and the movable head and foot blocks, of a support arranged at one end of the press, a lifting-lever resting on said support, a hanger provided with a toothed segment, and a worm journaled in the press-frame and engaging with said segment, substantially as set forth.

6. The combination, with the press-frame, the movable head and foot blocks, and the stationary supports B, of the lifting-lever F, the adjustable hanger G, having a gear-segment, n', the shaft *m*, provided with a pinion, *n*, meshing with said gear-segment, and the pointer or indicator *k*, mounted on the shaft *m*, substantially as set forth.

7. The combination, with the press-frame, the movable head and foot blocks C C', and the stationary supports B, of the lifting-lever F, the adjustable hanger G, provided with gear-segments n' *h*, the worm H, engaging with the segment *h*, the shaft *m*, provided with a pinion meshing with the segment n', and the indicator *k*, mounted upon said shaft and traversing a scale, *k'*, substantially as set forth.

396,494. RUNNING-GEAR FOR VEHICLES. ALFRED W. JOHNSON, New Brunswick, N. J. Filed Sept. 7, 1888. Serial No. 284,774. (No model.)



Claim.—1. In wagons and other vehicles having swiveling axles, the swiveling axle or axles arranged loosely beneath the body of the vehicle and adapted to admit of said body moving laterally over such axle or axles, in combination with rope or chain carriers attached the one to the body over the swiveling axle and the other connected with the adjacent axle, and crossing flexible connections uniting said carriers, substantially as specified.

2. In wagons and other vehicles having swiveling axles D D, the combination of the body A, arranged loosely over said axles, the rope or chain carriers H H, secured to the under side of said body over the axles, the flexibly-connected cross-beams F F, loose from the body and arranged over the axles, springs connecting said cross-beams with the axles, rope or chain carriers I I, connected with said cross-beams, and the crossing-rope or flexible connections *d*, uniting the carriers H and I, essentially as herein set forth.

3. The combination of the swiveling axles D D, the body A, arranged loosely over said axles, the rope or chain carriers H H, secured to the under side of said body over the axles, the cross-beams F F, loose from the body and arranged over the axles, springs connecting said cross-beams with the axles, rope or chain carriers I I, connected with said cross-beams, the crossing rope or flexible connections *d d*,

uniting the carriers H and 1, and separate laterally-flexible connections between said cross-beams and said axles, respectively, substantially as described.

396,495. INK-BOTTLE AND ATTACHMENT THEREFOR. NELSON JOHNSON, Knoxville, Pa. Filed Mar. 6, 1888. Serial No. 266,373. (No model.)

Claim.—1. In combination with an ink-bottle, two or more transverse ribs or projections formed radially across the head or shoulders of the bottle for supporting a pen, substantially as herein described.

2. The combination, with an ink-bottle having two or more transverse projections or ribs formed on its head, of a hinged cap having corresponding grooves or depressions, whereby the same is adapted to close tightly upon said head, as shown, the said ribs and depressions serving for the support of the pen-holder when the bottle is open, as herein set forth.

3. An ink-bottle having a number of upwardly-extending pins or projections on its shoulder, substantially as and for the purpose set forth.

4. An ink-bottle having on its shoulder a number of upwardly-extending perforated pins or projections arranged circumferentially, as and for the purposes set forth.

5. An ink-bottle having a number of pins or projections on its shoulder extending upwardly and inclined inwardly, as and for the purpose set forth.

6. The combination, with an ink-bottle, of a horizontal annular flange or collar surrounding the same, said flange having perforations for the insertion of pins, for the purpose set forth.

7. The combination, with an ink-bottle, of a collar thereon having a number of upwardly-extending projections, for the purpose herein set forth.

8. The combination, with an ink-bottle, of a collar having a horizontal portion and an upturned portion or flange, said upturned portion being serrated or notched and said horizontal portion being secured to the neck or shoulder of the bottle.

9. The combination, with an ink-bottle, of a collar, 4, consisting of horizontal portion 4^a, upturned portion 4^b, and projections 15, for supporting it on the neck of the bottle, as set forth.

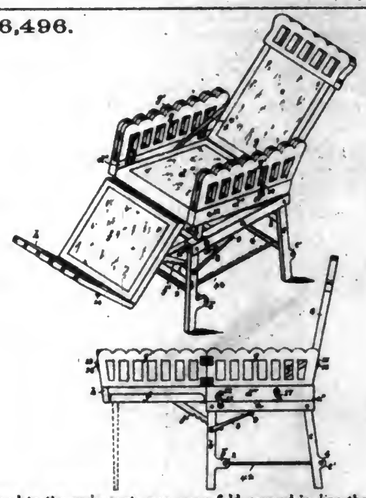
10. In combination with an ink-bottle, a collar, 4, consisting of the horizontal portion 4^a, upturned serrated portion 4^b, and projections 15, for supporting the collar on the bottle, said projections being secured around the neck of the bottle by a wire, 16, as set forth.

11. In combination with an ink-bottle, a collar, 4, consisting of the horizontal portion 4^a, serrated portion 4^b, and spring projections 15, for supporting the collar on the bottle, substantially as set forth.

12. An ink-bottle having formed integrally therewith a circumferentially-arranged series of substantially vertical projections, substantially as described.

13. A dipping attachment for ink-bottles, consisting of the tube 18, fitting to said bottle and having overlapping edges, whereby the same is rendered collapsible, substantially as described.

14. In combination with an ink-bottle, a tube, 18, fitting in said bottle and having a spring, 18^b, coiled on it and confined between the flange 18^a and mouth of the bottle, as herein set forth.



15. In a dipping attachment for ink-bottles, the combination of the conical thimble 18 and the springs 19, secured thereto, substantially as and for the purpose set forth.

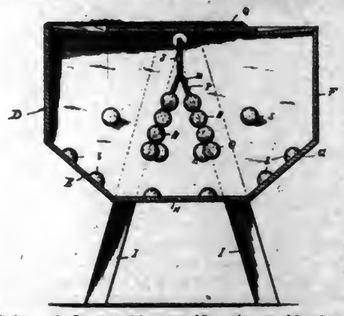
396,496. FOLDING CONVERTIBLE CHAIR. DANIEL B. KEMPTER, Boston, Mass. Filed Jan. 23, 1888. Serial No. 261,643. (No model.)

Claim.—1. In a chair, in combination, the seat *d*, the back *e*, hinged thereon, means, substantially as described, for adjusting and locking said back in position, the rest *f*, hinged to the seat, means, substantially as described, for adjusting and supporting said rest in position, the foot-rest *h*, hinged to said rest, the arms made in two parts, *g* and *g'*, the main parts *g* hinged to the seat and the parts *g'* hinged to the main parts *g* and adapted to fold around in line therewith, means, substantially as described, for locking the arms *g* and *g'* to the back *e* and foot-rest *h*, respectively, the legs *b b' c*, hinged and connected, substantially as described, so as to fold down flush with the frame or body of the chair, and means for locking said legs in an upright position, all substantially as and for the purpose set forth.

2. In a chair, the arms made in two parts, *g* and *g'*, the parts *g* hinged to the seat so as to fold down parallel therewith and the parts

396,496.

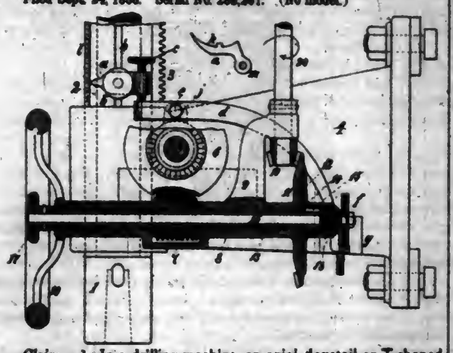
g' hinged to the main parts *g* so as to fold around in line therewith, a leg-rest hinged to the front edge of the seat, and means, substantially as described, for locking said arms securely in position, all combined and operating substantially as and for the purpose described.



3. In a chair, the combination, with the main frame *a*, having a rearward projection, a'', of the rest *f*, hinged to the front edge of the seat and having the hinged foot-rest *h*, the leaves of the hinge being applied directly to the flat surface of said rest, and the projection a'' being so located as to engage with the end of the foot-rest *h* and fold it up against the rest *f* when the parts are turned beneath the seat, substantially as described.

396,497. TRUSS FOR TORSION-BALANCES AND THE LIKE. WILLIAM KENT, Pontois, assignor to the Springer Torsion Balance Company, Jersey City, N. J. Filed June 4, 1888. Serial No. 275,969. (No model.) Patented in England Apr. 13, 1886, No. 5,134.

Claim.—The combination, with a torsion-wire, of a truss composed of a single piece of metal extended or expanded against said wire, substantially as set forth.

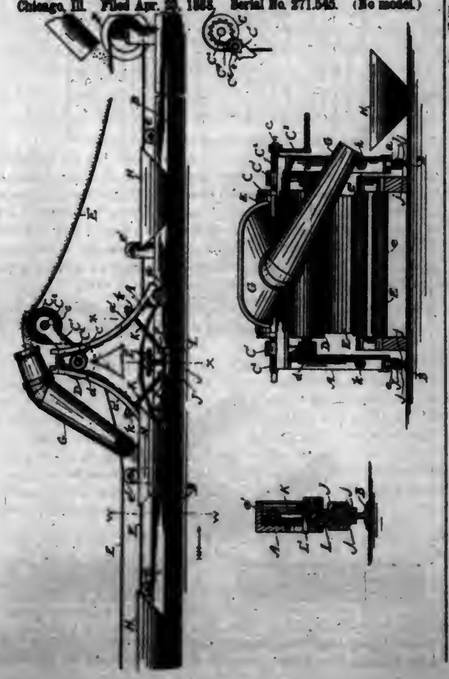


396,498. WASHING-MACHINE. CHARLES D. LA PORT, Carson, Iowa. Filed Mar. 29, 1888. Serial No. 268,670. (No model.)

Claim.—1. In a washing-machine, the combination, with the body, of an agitator having arms extending out therefrom, balls rigidly secured on the ends of said arms, and a series of balls on the arms above the rigid balls adapted to revolve and move vertically thereon, substantially as described.

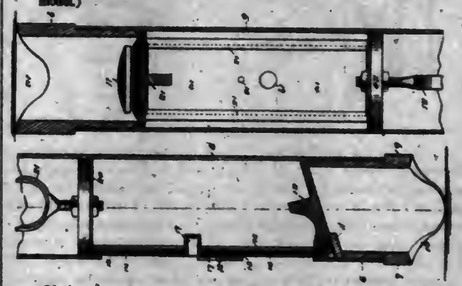
2. In a washing-machine, the combination, with the suds-box having hemispherical projections on its inner faces, of an agitator having diverging arms extending downwardly therefrom, balls rigidly secured on the outer ends of the arms, a series of rotatable and vertically-movable balls above the said other balls, and springs on the arms for forcing the movable balls down, substantially as described.

396,499. AUTOMATIC FEED-STOPPING DEVICE FOR DRILLING-MACHINES. WILLIAM LODGE and CHARLES DAVIS, Cincinnati, Ohio. Filed Sept. 24, 1888. Serial No. 286,261. (No model.)



Claim.—1. In a drilling-machine, an axial dovetail or T-shaped groove, *h*, worked into the outside of sleeve 2, an axial graduation in inches and their fractions cut on the outside of said sleeve, and a pointer, *a*, fitting to the circular form of sleeve 2, sliding with its tongue in groove *h*, having a radial extension, *m*, to receive an adjusting-screw, *c*, in combination with pointer *a*, a screw, *i*, sliding with its head in groove *h*, and a knob, *b*, serving as nut for said screw, adapted to tighten said pointer to sleeve 2, all substantially as described, and for the purpose specified.

2. In a drilling-machine, a lever, *d*, fulcrumed on the sliding head 4 and so shaped as to come on its front end in contact with an adjusting-screw, *c*, attached by virtue of pointer *a* to sleeve 2, and form on its rear end a pawl, *n*, to engage with a ratchet-wheel, *f*, secured to rod 16 in the feed mechanism, and a bracket, *g*, secured to the sliding head 4 and serving as support for the rear end of lever *d*, all substantially as set forth, and for the purpose specified.

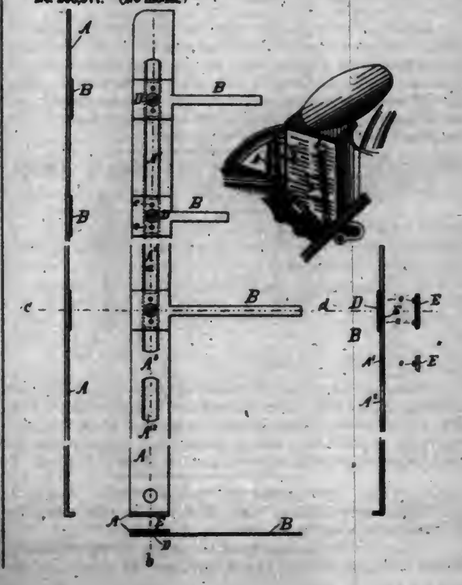


3. In the feed mechanism of a drilling-machine, the combination of a hollow worm-shaft, 8, with rod 16 revolving within its bore, said rod having on its front end a fixed actuating-knob, 17, on its rear end a fixed collar or nut to keep it in place a thread to engage with half-clutch 12, and a fixed ratchet-wheel, *f*, to engage with a lever, *d*, fulcrumed on the sliding head of a drilling-machine, all substantially as described.

396,500. BELT CONVEYER AND TRIPPER. JAMES MACDONALD, Chicago, Ill. Filed Apr. 23, 1888. Serial No. 271,545. (No model.)

Claim.—The combination, with a movable belt conveyer and tripper, of a clamping-shoe arranged between the wheels of the tripper and normally adjusted to loosely clamp the flange of the track-rail, a set-screw for rigidly securing the same to the rail, and obliquely-adjusted rods extending in opposite directions and attached, respectively, to the opposite ends of said clamping-shoe and to the frame of the tripper, whereby said tripper may be rigidly secured to the track or permitted to move thereon while said shoe is in normal engagement with said track, substantially as shown and described.

396,501. SAND OR MUD PUMP. RANSOM G. MEAD and BOOM MAGEE, Warren, Pa. Filed Sept. 3, 1887. Serial No. 248,716. (No model.)



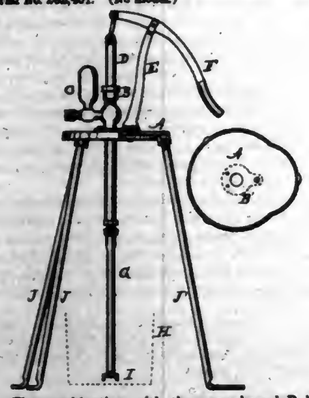
Claim.—1. In a sand-pump, the pump cylinder having the discharge-opening 13, an interior wall-slide, 14, for closing said opening, and a valve having its hinge secured to the pump-wall at the lower edge of said opening and inclining upward therefrom, whereby the said valve when closed is caused to act as an inclined chute to facilitate the discharge of the sand and mud from the cylinder through said opening when the latter is uncovered, as shown and described.

2. The combination, in a sand-pump, of the pump-cylinder having the discharge-opening 13 and wall-slot 18, a valve, and a piston with a slide fitted in interior guides, and means for operating said slide from the outside, consisting of a socket, 19, projecting inward from said slide, having an uncovered relation to the cylinder-slot 18, while the latter is maintained in closed relation to the pump-chamber by said slide, substantially as described.

3. The pump-cylinder having the wall discharge-opening 13 and slot 18, and having the interior guides, 15 15, in combination with the slide 14, having the interior projecting socket, 19, and the exterior projecting pin, 16, the latter operating to maintain the uncovered relation of said socket to said cylinder-slot 18, and the slide serving to perpetually close said slot, the valve 12, and the piston 20, substantially as described.

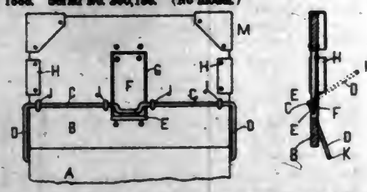
396,502. GRIPPER FOR PLATEN PRINTING-PRESSES. RICHARD MURRAY, Jr., Saratoga Springs, N. Y. Filed Mar. 24, 1888. Serial No. 268,377. (No model.)

Claim.—1. In a platen-press, a gripper provided with a slot, A', and a metallic plate, E, placed into the slot A', with the finger B, attached to the said plate, substantially as described, and for the purpose set forth.



2. In a platen-press, a gripper provided with a slot, A', a plate, E, provided with studs *e e*, placed into the slot A', and the fingers B B, attached to the studs *e e* on the plate E and adjusted by the screw D, all substantially as described, and for the purpose set forth.

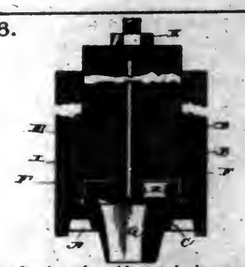
396,503. CHECK-VALVE AND TRAP. CHARLES K. MOORE, Elizabeth, N. J. Filed July 30, 1888. Serial No. 281,365. (No model.)



Claim.—The combination of the parts hereinabove recited, viz: the casing or body A, having inclined neck or inlet and rapidly-descending valve-chamber bottom, the recessed or chambered cover B, the valve disk or gate C, having central projection with concavity or socket formed therein, and the hinge-arm or valve-stem D, having T-shaped upper extremity and spherical lug-provided lower termination, these said parts being constructed, relatively arranged, and operated substantially as shown and described, and for the purposes specified.

396,504. PUMP. ABRAM H. NIXON, Dayton, Ohio. Filed Aug. 10, 1888. Serial No. 282,401. (No model.)

Claim.—The combination, with the pump-barrel B, having a flange, of the plate A, provided with legs upon which said flange rests and through which the said barrel extends, the standard E, secured upon the top of said flange by a threaded extension which passes through said flange and plate and is provided with a nut beneath, and the plunger D and handle F therefor, said handle being pivoted to the top of said standard, substantially as described.

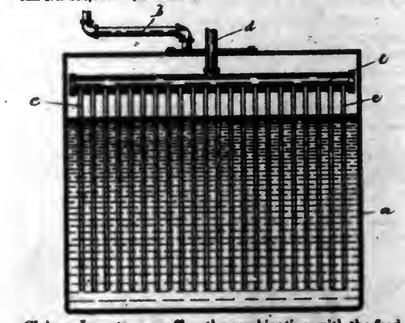


396,505. BOOK-CLIP. JOHN W. NOLAN, Chicago, Ill. Filed Jan. 9, 1888. Serial No. 260,196. (No model.)

Claim.—In a book-clip, the combination of a body, B, with the fastening devices M H, a wire clip composed of the portions K, D D, C C, and E, the same being journaled on the back of the body, and the spring F, which bears against the portion E and thus keeps the other side of the wire-clip depressed upon the leaves of the book.

396,506. APPARATUS FOR MOLDING PIPES. WILLIAM A. PALMER, South Pittsburg, Tenn. Filed Aug. 28, 1888. Serial No. 283,726. (No model.)

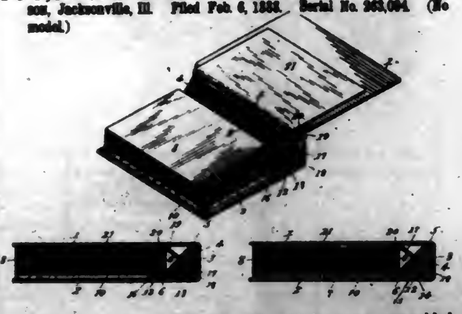
Claim.—1. The combination of the pattern having the annular rabbet at its lower end, the plug or cone below the pattern, and the



contracting ring fitted on the rabbet at the lower end of the pattern, provided with the projecting bead or flange, and adapted to engage the cone or plug when the pattern is pulled upward out of the ring, substantially as described.

2. The combination of the pattern having the reduced portion at its lower end and the contracting ring lying in the said reduced portion of the pattern and provided with the projecting flange or bead, substantially as described.

3. The combination of the pattern having the reduced lower portion, the rod movable longitudinally through the pattern, the centering cone or plug at the lower end of said rod, and the contracting ring lying in the reduced lower end of the pattern and provided with the projecting bead or flange, substantially as described.



4. The combination of the chill-plate having the opening C, the centering-plug fitting the said opening and having the flange at its upper edge, the rod extending upward from the said plug, the pattern having the longitudinal opening through which the rod extends, and provided at its lower end with the reduced portion, and the contracting ring lying in reduced portion of the pattern and provided with the projecting bead or flange, substantially as described.

396,507. STEAM-MUFFLER. WILLIAM B. PEARSON, Saugus, assignor to Nathan H. Daniels, Boston, Mass. Filed Dec. 12, 1887. Serial No. 257,602. (No model.)

Claim.—In a steam-muffler, the combination, with the feed-water tank, of the upper longitudinally-disposed head or steam-receptacle having a pipe, *d*, opening into said head and a plurality of long nozzles extending from the said head or steam-receptacle, the combined area of said nozzles being equal to or greater than that of the said head or receptacle, substantially as shown and described, said nozzles being open at their outer ends only, whereby the steam in traversing said nozzles raises the temperature of the water, as set forth.

396,508. COVER FOR WRITING-TABLETS. WILLIAM B. PEARSON, Jacksonville, Ill. Filed Feb. 6, 1888. Serial No. 263,094. (No model.)

Claim.—1. The combination, with a binder or cover provided with buttons, of a tablet provided with button-holes for permitting

the attachment and detachment of said tablet to and from said binder or cover, substantially as described.

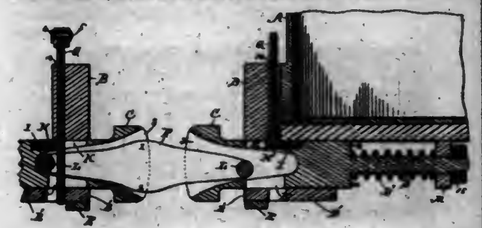
2. The combination, with a binder or cover provided with buttons, of a tablet provided with a supporting-board formed with button-holes for permitting the attachment and detachment of said tablet to and from said binder or cover, substantially as described.

3. The combination of a binder or cover provided with buttons with a tablet provided with a supporting-board formed with button-holes which are wider at one end than the other for permitting the attachment and detachment of said tablet to and from said binder or cover, substantially as described.

4. The combination, with a binder or cover provided with buttons, of a tablet provided with a supporting-board formed with button-holes for the admission and removal of said buttons, and a tilting arm or stop for retaining and releasing said tablet in and from said binder or cover, substantially as described.

5. The combination of the cover provided with the block in its back and the buttons upon the inner face of its lower lid, the tablet provided with the supporting-board formed with button-holes, and the arm pivoted in the end of said block and serving as a stop for said tablet, substantially as and for the purpose described.

6. The combination of the cover provided with the buttons upon the inner face of its lower lid and with the block secured to its back and lower lid and formed with the groove 13, having the recess 14 at its inner end, the tablet provided with the supporting-board, formed with the button-holes, and the tiltable wire 12, arranged in said groove 13, with its bend 15 in said recess 14, and having its retaining arm or stop 16 at its outer end, substantially as and for the purpose described.

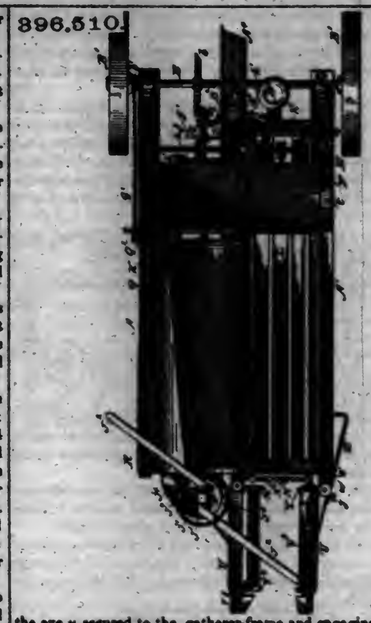


7. The combination of the cover and the stiffening-block secured to the back and to the lower lid thereof, and having the beveled inner face, with the tablet and devices for securing the same to the lower lid of said cover, substantially as and for the purpose as described.

8. The combination of the binder or cover, the tablet secured to the same, the block secured to the back of said binder or cover and formed with the groove 18, the wire 17, arranged in said groove and having the arms at its ends bent to form pintles, and the blotter having the folded or doubled portion at its inner or upper edge for the reception of said pintles, substantially as described.

9. The combination, with the cover, the tablet removably secured thereto, and the block formed with the groove 18, of the wire 17, adapted to be tilted or rocked in said groove, and having the arms at its ends bent to form registering or corresponding pintles, and the removable blotter having the fold at its inner or upper edge for the reception of said pintles, substantially as described.

10. The combination of the cover provided with the buttons upon the inner side of its lower lid and with the block having the beveled inner face, the tablet having the supporting-board formed with the button-holes, the retaining arm or stop pivoted in said block, the wire having arms formed with pintles adapted to be tilted or rocked in said block, and the blotter having the fold at its inner or upper edge for the reception of said pintles, substantially as described.



396,509. CAR-COUPLING. RICARD L. POWER, Silver City, N. Mex. Filed May 12, 1888. Serial No. 273,646. (No model.)

Claim.—In a railway-car coupling consisting of the recessed buffer-head C, shank D, with spring D', and sill B, having the socket for the pin, and the sill B', for the support of the coupling-head, the combination of block H with spring I, coupling-pin G, and a link, whereby the draft is taken off the draw-head entirely and transferred exclusively to the front sills or frame-work of the car, and the coupling of the cars is effected automatically by the contact of the buffer-heads without the pressure of the link, all constructed and arranged as and for the purpose shown and described.

396,510. COMBINED CORN HARVESTER AND HUSKER. ANDREW L. RASMUSON, Clermont, Iowa. Filed Jan. 24, 1887. Serial No. 225,205. (No model.)

Claim.—1. In a corn-harvester, the combination of the main frame having eye Y, the gatherer-frame formed with a lower portion or base-bar provided at its ends with upwardly-extended portions forming supports for the belt, the belt extended between said supports,

the eye *y*, secured to the gatherer-frame and engaging the eye Y of the main frame, whereby said frames are pivotally connected, and an adjustable brace or support between the lower portion of the gatherer-frame and the harvester main frame, substantially as and for the purposes specified.

2. The combination of the main frame having the eye Y, the gatherer-frame having the eye *y*, engaging said eye Y, the adjustable brace Z, connecting the gatherer-frame with the main frame, and the rod 3, connected with the gatherer-frame and extended rearwardly therefrom and joined with an operating device, substantially as set forth.

3. In a corn-harvester, a gatherer comprising the base-plate V, the upright bar *v*, projected from the front end thereof, the upright bar *v'*, projected from the rear end of said base-plate, the extension V', connected adjustably with the rear upright, *v'*, the shafts journaled in the parts *v* V', and the belt passed around said shafts, substantially as set forth.

4. In a corn-harvester, the combination, with the gatherer-frame, of the V-shaped point having its base-plate pivoted at its rear end to the gatherer-frame and its top plate extended rearwardly from the forward end of said base-plate, and the spring 8, bearing between the said point and the gatherer-frame and inclosed between the base and top plates of the point and the gatherer-frame, whereby such spring is protected from contact with obstructions in the path of the machine, substantially as and for the purposes specified.

5. The combination, with the main frame having bearing W^3 and the gatherer-frame having shafts V^3 V^3 and bearing W^3, and connected adjustably with the main frame, of the shaft W, formed in sections united by a universal joint, and having such sections journaled in bearings W^3 and W^3, each shaft being geared with shaft V^3 and with the drive-shaft, substantially as set forth.

6. The combination of the main frame having eye Y and bearing W^3, the gatherer-frame having plate V, provided with uprights or bars *v v'*, the extension V', connected adjustably with upright or bar *v'*, the shafts V^3 V^3, the latter having pinion V^4, the belt V^5, the bearing W^3, the eye *y*, and the shaft W, formed in sections united by universal joint W' and journaled in bearings W^3 W^3, substantially as set forth.

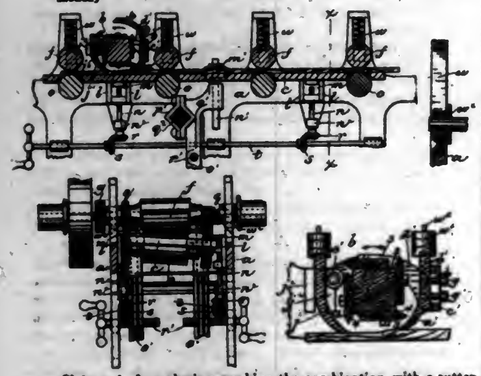
7. The combination of the drive-shaft B, having gear *b*, the shaft I, having pinion *i* and a clutch-section, *i'*, whereby said pinion may be keyed to the shaft, the shafts E, G, and H, gearing between said shafts and the shaft I, the reel-shaft, the carrier-apron, the gatherer-frame, a pinion, i^2, on shaft I, arranged to engage the pinion on the reel-shaft, a clutch, I^2, for keying pinion i^2 to shaft I, and means whereby clutches i' I^2 may be independently operated, substantially as set forth.

396,511. MANUFACTURE OF WINDOW AND PLATE GLASS. JACOB REESE, Pittsburg, Pa. Filed Aug. 8, 1887. Serial No. 246,410. (No model.)

Claim.—1. The process of manufacturing window and plate glass which consists in subjecting the glass to a rolling operation while the glass and the rolling apparatus are inclosed within a furnace or chamber which is maintained at or near the lowest temperature the glass is ductile at.

2. The method of manufacturing window and plate glass, which consists in forming molten glass into plates, slabs, or molds, then placing the plates, slabs, or molds in a furnace, and then subjecting the glass to the action of rolls until it has been reduced to the desired thickness while the temperature of the glass and the rolls during the operation is maintained at or near the lowest degree the glass is ductile at.

396,512. MANUFACTURE OF GLASS. JACOB REESE, Pittsburg, Pa. Filed Aug. 8, 1887. Serial No. 246,411. (No model.)



Claim.—1. A plant for rolling glass, comprising a set of reducing-rolls inclosed within a chamber capable of being maintained at the temperature of ductility of the glass.

2. A plant for rolling glass, comprising a set of reducing-rolls provided with feeding-tables inclosed within a chamber capable of being maintained at the lowest temperature at which glass is ductile.

3. A plant for rolling glass, comprising a set of reducing-rolls inclosed within a chamber capable of being maintained at the lowest temperature that glass is ductile, in combination with mechanism for revolving said rolls.

396,513. PLANING-MACHINE. JOSEPH A. SAUCIER, Holland, Vt. Filed Jan. 20, 1887. Renewed June 23, 1888. Serial No. 278,083. (No model.)

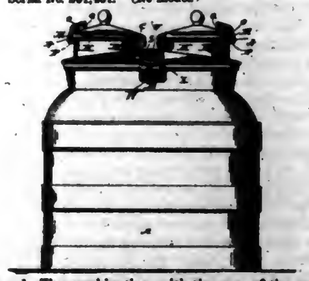
Claim.—1. In a planing-machine, the combination, with a cutter-head revolving in a constant plane, and a series of upper feed-rolls and gear-wheels, of a table supported adjustably at both its side edges, a series of lower feed-rolls journaled in bearings secured to said table, and gear-wheels on the shafts of said feed-rolls, all constructed and arranged so that the table, lower feed-rolls, and gearing may be inclined from the horizontal in either direction, substantially as set forth.

2. In a planing-machine, the combination, with the main frame, upper feed-rolls and gearing supported thereby, and vertically-adjustable slides *m*, of a table having its opposite edges supported by said slides, and a series of lower feed-rolls and gear-wheels supported by and below said table, whereby the table, lower driving-gearing, and lower feed-rolls may be inclined in either direction from the horizontal by the vertical movement of the slides *m* upon one side, substantially as described and shown.

3. In a planing-machine, the frame having the slots or guides for the sliding boxes of the feed-rolls, the lower ends of said slots being inclined, as and for the purpose specified.

396,514. VEHICLE-WHEEL. NICOLAS SCHAUS and FRANK MAYER, Collins, N. Y. Filed Mar. 29, 1888. Serial No. 268,908. (No model.)

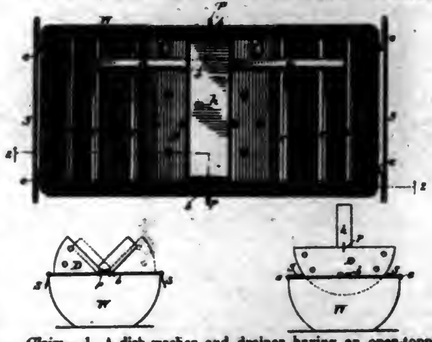
Claim.—1. In a wheel, the combination of the felly having a spoke-socket flattened laterally to the felly, the spoke, a non-rotatable cap secured to the outer end of the spoke and provided with a socket-pin corresponding in cross-section to that of said socket, a threaded portion between said pin and the spoke, and a nut engaging said



396,514.

threaded portion and bearing against a clip or washer seated on the inner edge of the felly, whereby the latter may be moved outward from the hub, substantially as specified.

2. In a wheel, the combination, with a felly provided with the spoke-socket *a*, flattened laterally to the felly, and the clip C, provided with the opening *c'* and surrounding shoulder c^2, and having lateral wings, by means of which it may be shrunk in position on the felly, of a spoke, the non-rotatable cap D thereon, which cap is provided with the socket-pin d^3, flattened on its sides and fitting in the socket, and with the threaded portion *d'*, and the nut E, engaging on said threaded portion and fitting against the seat c^2 of the clip, substantially as specified.

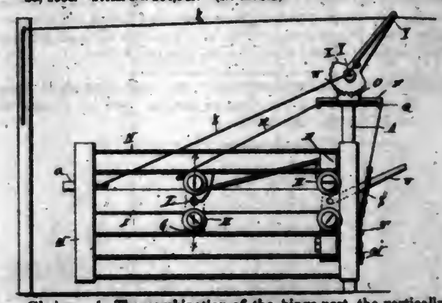


396,515. CAN. ANDREW D. SHUMAN, Toledo, Ohio. Filed Jan. 20, 1888. Serial No. 261,401. (No model.)

Claim.—1. The combination, with the can, of the curved lid fitting in the upper end of the same and having the necks H H, the band passing transversely over the curved face of the lid between said necks, and the clutches mounted in the ends of said band and engaging catches at the upper end of the can, as set forth.

2. The combination, with the can, of the curved lid fitting in the upper end of the same and having the necks H H, the covers hinged to the upper ends of said necks and adapted to close the same, catches carried by said covers and adapted to engage the necks, a band passing transversely over the curved face of the lid between the necks, and clutches mounted in the ends of said band and adapted to engage catches at the upper end of the can, as set forth.

396,516. DISH WASHER AND DRAINER. URIAH B. SMITH, West Liberty, Iowa. Filed May 4, 1888. Serial No. 272,846. (No model.)

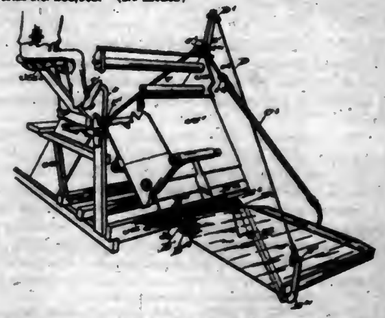


Claim.—1. A dish washer and drainer having an open-topped water-holder with central open pivot-bearings at its upper edge, and an open-topped semi-cylindrical dish-holder within said water-holder, having central pivots which rest in said bearings, a rigid handle at the top connecting the sides of the dish-holder at said pivots, and an externally-smooth bottom that is concentric with said pivots, provided with stop-ribs on its inner surface and perforated for the free admission of water and the escape therewith of crumbs and the like, substantially as hereinbefore specified.

2. In combination with an open-topped water-holder, a swinging dish-holder within the same, perforated for the free admission of water and the escape therewith of crumbs and the like, and provided internally with agitator-bars near one side thereof, substantially as hereinbefore specified.

3. In combination with an open-topped water-holder and a swinging dish-holder perforated for the free admission of water and the escape therewith of crumbs and the like, a pair of supports which rest upon the upper edges of the water-holder to support the dish-holder in elevated position for draining the dishes, substantially as hereinbefore specified.

396,517. GATE. JOEL R. STANBROUGH, Sheridan, Ind. Filed Sept. 25, 1888. Serial No. 286,345. (No model.)



Claim.—1. The combination of the hinge-post, the vertically-movable frame mounted thereon, the gate carried by said frame, the collar secured to the upper end of the hinge-post, the rope and chain having one end secured to the frame, supported by said collar, and engaging a hook on the gate, and the lever pivoted to the frame and having a hook adapted to engage the chain, as set forth.

2. The combination of the hinge-post, the frame mounted thereon, the gate carried by the frame, the lower hinge of the frame provided with a hook, T, the collar at the upper end of the hinge-post having the arms P, provided with the eyes Q, the rope secured to the frame passing through said eyes, the chain connected to said rope and adapted to engage the hook T, and a lever pivoted on the frame and having a hook, V, adapted to engage one of the links of the chain, as set forth.

3. The combination of the hinge-post, the gate supported thereby, the collar at the upper end of the hinge-post, connections between said collar and the gate, the segmental rack-bar fulcrumed at the upper end of the hinge-post and engaging said collar, the latch at the front end of the gate, and the operating-rope secured to the latch and passing through the segmental rack-bar, and then in opposite directions from said rack-bar, as set forth.

4. The combination of the hinge-post, the frame D, mounted thereon, the gate carried by said frame, the collar on the upper end of the hinge-post, the rope and chain connected to the frame D and operated by said collar, the segmental rack-bar pivoted at the upper end of the hinge-post and engaging said collar, the latch at the front end of the gate, and the operating-rope secured to the latch and passing to the rack-bar and in opposite directions therefrom, as set forth.

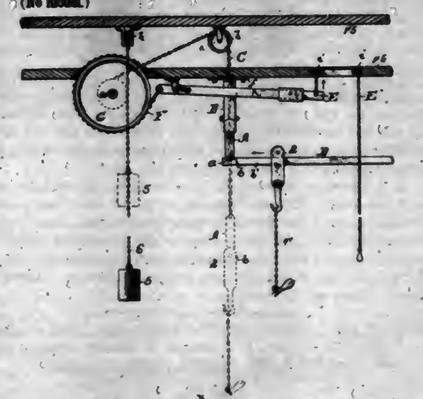
396,518. BUNDLE-CARRIER FOR GRAIN-HARVESTERS. JOHN F. STEWARD, Chicago, Ill. Filed July 9, 1885. Renewed Oct. 10, 1888. Serial No. 288,602. (No model.)

Claim.—1. In combination, substantially as set forth, the gibbet having the vertical post pivoted to the harvester-frame, the carrier-platform pivoted on and rocking over the horizontal arm of said gibbet, a cranked rock-shaft journaled on the harvester-frame, having a crank-arm higher than the carrier-platform and farther forward than the gibbet-post, and an arm for rocking it at will, and a link connected to the first crank-arm at one end and at the other end to the carrier-platform at a point forward of the vertical plane of the axis over which it rocks, whereby said link causes that either the swinging of the gibbet or the rocking of the cranked shaft dumps the carrier-platform.

2. In combination, substantially as set forth, the gibbet having the vertical post pivoted to the harvester-platform and its horizontal arm extending from the post forward and thence bent outward, the carrier-platform pivoted on and rocking over said outwardly-bent part, and a link connected at one end to the carrier-platform at a point forward of the vertical plane of the axis over which it rocks and at the other end pivoted at a point higher than the carrier-platform and farther forward than the gibbet-post.

3. In combination, substantially as set forth, the gibbet having its vertical post pivoted to the harvester-frame and its horizontal arm extending from the post forward and thence outward and backward at an acute angle to its first or inner portion, and the carrier-platform pivoted on and adapted to rock over said outwardly-extended portion.

396,519. PAPER-WEIGHT. ALBERT E. SWIFT, Buffalo, N. Y. Filed May 14, 1888. Serial No. 273,771. (No model.)



Claim.—1. The combination, with a box or casing, of a removable ring applied to one end of the box and provided with an inwardly-projecting flange or rim, and a picture, mirror, or advertising-card arranged between the end of the casing and the flange of the ring, substantially as set forth.

2. In a paper-weight, the combination, with the inner body or casing, of removable rings applied to opposite ends of said casing and provided at their outer ends with inwardly-projecting flanges or rims, and removable pictures, mirrors, or advertising-cards arranged between the ends of the casing and said flanges or rims and exposed through said rings, substantially as set forth.

3. In a paper-weight, the combination, with the box or casing A, containing a suitable weight or filling, C, and having a cover, B, of the removable rings D D', applied to opposite ends of the casing A and provided at their outer ends with inwardly-projecting flanges or rims *d d'*, and removable pictures, mirrors, or advertising-cards E E', interposed between the ends of the casing A and the rims or flanges of said rings, substantially as set forth.

396,520. APPARATUS FOR USE IN DRESSING HOGS. JOHN THOMAS, Kansas City, Kans. Filed Mar. 21, 1888. Serial No. 268,080. (No model.)

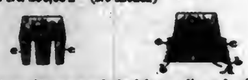
Claim.—1. In a slaughtering apparatus, the combination of a suitable supporting-track suspended from overhead, traveling hooks adapted to engage said track, and a vertically-movable lowering-cage upon which said traveling hooks are discharged from said track, substantially as set forth.

2. In a slaughtering apparatus, the combination of a suitable supporting-track suspended from overhead, wheeled hooks adapted to travel on said track, a vertically-movable lowering-cage which

registers with the end of said track when at the limit of upward movement and upon which such wheeled hooks are discharged to be lowered, a counter-weight which returns the cage to its normal position at end of the track after being lowered, and a suitable brake which controls the downward movement of the cage when loaded, substantially as set forth.

3. In a slaughtering apparatus, the combination of supporting-track D, suspended from overhead and provided with angular end *b'*, vertically-movable lowering-cage A, provided with depression *a* and angular projection *b*, which latter is adapted to come into contact with the end *b'* of said rail when said cage is at the limit of upward movement, a suitable guiding-bracket for said cage suspended near the point of contact of the cage and track, a counter-weight for said cage, and suitable brake mechanism which controls the downward movement of said lowering-cage, substantially as set forth.

4. In a slaughtering apparatus, the combination of overhead track D, having angular end *b'*, lowering-cage A, provided with angular projection *b* and curved depression *a*, guiding-hanger B, chain C, to the free end of which chain said cage is attached, chain 6, carrying weight 5 at its free end, lowering-drum 60, around which said chains C and 6 are wound in reverse directions, friction-drum G, arranged to revolve with said lowering-drum, strap-brake F, which encircles said friction-drum, weighted lever E, and hand rope or chain E', all constructed substantially as set forth.

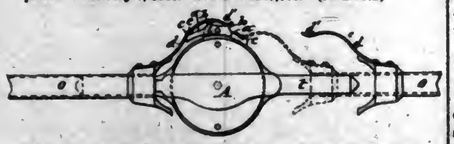


5. In a slaughtering apparatus, the combination of a hoisting-chain having a hook at its lower end, a wheeled hook attached to the hook at the lower end of this chain, and a flexible supporting-track hung in the vertical path of said wheeled hook, substantially as set forth.

6. In a slaughtering apparatus, the combination of a wheeled hook adapted to be moved in a vertical path, a supporting-track hung in the path thereof, so as to be moved to one side thereby, suitable devices for elevating the wheeled hook to said track, a lowering-cage upon which said hook is discharged from the end of said track, and suitable lowering devices for said cage, substantially as set forth.

7. In a slaughtering apparatus, the combination of parallel suspended tracks, wheeled hooks adapted to travel on said tracks and provided with eyes at their upper ends, the detachable combined tree and support *y*, provided with arms 12, which project in opposite directions from its ends and engage the eyes of the hooks, and a suitable hoisting-chain, H', and drum H, all constructed and operated substantially as set forth.

8. The combined tree and support *y*, consisting of main horizontal bar 11, bail 14, having eye 15 formed at the middle of its length and having its ends attached to said main bar, arms 12, located at the ends of said bar 11; so as to project from opposite sides thereof, and bent guide-lugs 13, located at a short distance from said arms and projecting in opposite directions from said bar 11, substantially as set forth.

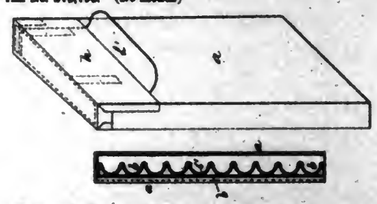


396,521. HORSESHOE. GEORGE W. WEMPLE, Boston, Mass., assignor of nine-twentieths to Brainard W. Child, same place. Filed Dec. 1, 1887. Serial No. 256,634. (No model.)

Claim.—1. A horseshoe provided with two diverging inclined holes passing through or partially through the same, in combination with a calk provided with two tenons at right angles to the under surface of said calk and constructed and arranged to be driven into said holes and follow the inclination thereof, bending upon themselves to form a clinch to firmly hold the calk in position.

2. A horseshoe provided with two diverging inclined holes and a central hole at right angles with the surface of said shoe, in combination with a calk provided with three tenons at right angles to the under surface of said calk and constructed and arranged to be driven into said holes, the outer tenons bending upon themselves and following the inclination of said diverging holes, thus forming a clinch to firmly hold said calk in position.

396,522. POSITIVE SHUTTLE-MOTION FOR LOOMS. CHESTER F. WICKWIRE, Cortland, N. Y., assignor to Wickwire Brothers, same place. Filed July 5, 1888. Serial No. 278,060. (No model.)

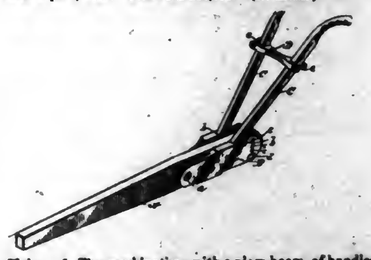


Claim.—1. In combination with the shuttle and its carrier-arms, a catch-lever mounted on the shuttle movably in a plane parallel with the plane of the shuttle, and spring-latches extending from the carrier-arms and movable in the aforesaid plane and adapted to interlock with the catch-lever, substantially as described and shown.

2. In combination with the shuttle and its carrier-arms O O, the two-armed lever *l*, pivoted to the shuttle to rock in the plane thereof, and provided with hooks *e e* on its extremities, and the spring-latches *d d*, extending from the carrier-arms and movable in planes parallel with that of the shuttle and provided with the apertures *e e*, adapted to engage the hooks *e e*, substantially as described and shown.

3. In combination with the shuttle and its carrier-arms O O, the two-armed lever *l*, pivoted to the shuttle to rock in the plane thereof and formed with the cams *b b*, and having its arms *a a* inclined toward the ends of the shuttle and terminating with hooks *e e*, and the spring-latches *d d*, extending from the carrier-arms and formed with the apertures *e*, and bowed outward from their free ends rearward, substantially as described and shown, for the purpose set forth.

396,523. CARTRIDGE-FEED CASE. JAMES G. ACCLES, 41 Craven Street, Strand, County of Middlesex, England. Filed July 2, 1888. Serial No. 278,796. (No model.)

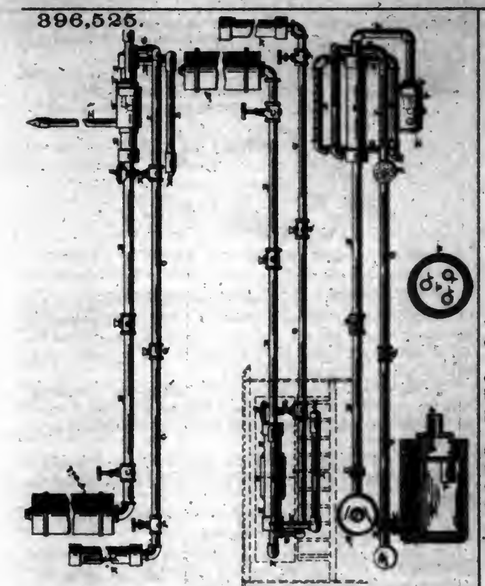


Claim.—1. The combination of a cartridge box or case and a slide or slides within the box, provided with grooves or recesses in which the cartridges lie, and adapted to be withdrawn longitudinally from the box, substantially as and for the purpose set forth.

2. The combination of the cartridge-box, the longitudinally-adjustable cartridge-carrying slide, the removable cover on the front end of the box, the flap at the end of the cover, and the flexible or yielding retainer beneath the cover, secured to the box and engaging with the cartridges, substantially as set forth.

3. The combination of the cartridge-box having a slot, *f*, at its front end to permit of the removal of the cartridges one at a time, the cartridge carrying slide moving longitudinally in the box, the yielding retaining device on the front end of the box, and the cover for closing the front end of the box, substantially as set forth.

396,524. PLOW-HANDLE. STANDISH I. ALLEN, Crossville, Ala. Filed Sept. 4, 1888. Serial No. 284,530. (No model.)



Claim.—1. The combination, with a plow-beam, of handles adjustably secured to the beam, and a vertically-adjustable brace, D, secured between the handles, the ends of this brace being bifurcated to embrace the handles and provided with securing-bolts, substantially as described.

2. The combination, with a plow-beam and handles, of a pair of clamping-plates pivotally bolted upon opposite sides of the said plow-beam, these plates being provided with grooves in their inner faces for the reception of the plow-handles, and each plate being also provided with a vertical series of apertures, a removable bolt, *d*, passed through the plow-beam and the apertures in the plates, an adjustable brace D, placed between the handles, the ends of this brace being bifurcated to embrace the handles, and clamping-bolts *c c*, passed through the bifurcated ends of the said brace, substantially as described.

396,525. OIL-BURNER. JAMES RAINS, Cincinnati, Ohio. Filed Aug. 8, 1888. Serial No. 282,196. (No model.)

Claim.—1. The combination of a reservoir for holding oil, a pipe extending therefrom, a generator to which this pipe is connected, a second reservoir for holding gasoline, a pipe, O, extending therefrom, and a pipe, G, for connecting the pipe O also with the generator, the gasoline-pipe being provided with perforations, so as to form a burner,

396,525.

I, and a burner pipe, L, which is connected to the generator, substantially as shown.

2. The combination of a reservoir or tank, a pipe leading therefrom, the retort to which one end of the supply-pipe is connected, a pipe, F, extending from the opposite end of this retort, a vaporizing-chamber connected to this pipe and located to one side of the burners, the chamber U, formed at one end of the vaporizing-chamber, and two or more pipes extending from the inner end of the chamber U into the vaporizing-chamber, substantially as described.

396,526. SULPHUR COMPOUND. ROBERT RAUMANN, Freiburg, Baden, assignor to Farbenfabriken, vormals Fr. Bayer & Co., Elberfeld, Germany. Filed Nov. 22, 1883. Serial No. 291,582. (No specimens.)

Claim.—The product herein described, being a new sulphone, which has the chemical name diethylsulphonemethylethylmethan, melting at 76°, crystallizing in silvery gleaming scales, difficultly soluble in cold water, easily in other, alcohol, and benzine, being without smell but of a weak, bitter taste, and melting in boiling water, substantially as described.

396,527. PRODUCTION OF COLORING-MATTER. FRITZ REINDER, Frankfort-on-the-Main, assignor to A. Leonhardt & Co., Mühlheim-on-the-Main, Germany. Filed Apr. 12, 1888. Serial No. 270,455. (No specimens.)

Claim.—The coloring-matter herein described, which is produced by the action of caustic alkalies upon paranitrotoluolsulpho-acid in presence of water, alcohol, or glycerine with an oxidable substance, and which is a brownish powder, giving, when dissolved in water, a yellowish solution the color of which is scarcely altered by the addition of caustic soda-lye, dissolving in concentrated sulphuric acid with a violet color, and the watery solution of which, when heated with a chloride of barium, yields a brownish-red precipitate, and when boiled with caustic soda-lye and zinc-dust gives a colorless solution which in presence of air assumes an intensely-red color, substantially as herein specified.

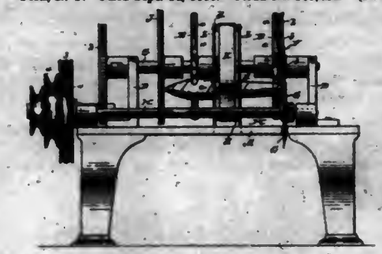
396,528. BELT-FASTENER. HENRY BLAKE, East Pepperell, Mass., assignor to himself, and J. Ashton Greene, Brooklyn, N. Y. Filed Mar. 3, 1888. Serial No. 266,095. (No model.)

Claim.—As an improved article of manufacture, a belt-fastener consisting of a curved bar or shank circular in cross-section, having on each end and in one piece with it a T-shaped or segmental head formed with square shoulders, substantially as described.

396,529. TYPE-WRITER CIPHOGRAPH. GUSTAV BOTTGER, New York, N. Y. Filed Feb. 28, 1887. Serial No. 229,074. (No model.)

Claim.—1. The combination, with the actuating-keys of a type-

396,529.

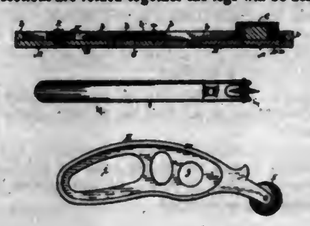


writing machine, of finger-pieces provided with indicating letters or characters disposed in abnormal relation to the normal keys.

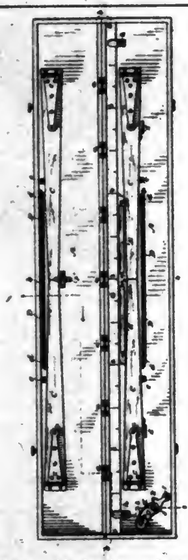
2. The combination, with the key-board of a type-writing machine, of an auxiliary key-board, the keys of the auxiliary key-board being provided with indicating letters or characters which are disposed in abnormal relation to the keys of the normal key-board.

3. A ciphographic attachment for a type-writing machine, consisting of a frame or casing for adjustment over the key-board of a type-writing machine, and a series of auxiliary keys supported in said casing, and provided with indicating letters or characters which are disposed in abnormal relation to the keys of the ordinary key-board.

396,530. CIGAR-TRIMMING MACHINE. CLARK W. BOBAR, New York, N. Y. Filed Sept. 14, 1888. Serial No. 285,411. (No model.)



Claim.—1. The combination of the power-driven endless bed provided with pockets for the reception of individual cigars, the presser consisting of a yielding endless belt which moves by reason of its frictional contact with the cigars, the shearing-wheel moving in unison with the endless bed and provided with peripheral recesses *b*, and the knife G, co-operating with said shearing-wheel, as and for the purposes hereinbefore set forth.



2. The combination of the power-driven endless bed provided with pockets for the reception of individual cigars, the yielding presser actuated by contact with the cigars, the gage plate or disk placed at one end of the endless bed and moving in unison therewith, the shearing-wheel located at the other end of said bed, and also moving in unison therewith, and the co-operating knife G, substantially as and for the purposes hereinbefore set forth.

396,531. FOLDING TABLE FOR THE USE OF PAPER-HANGERS. GEORGE H. BOTHER, Philadelphia, Pa. Filed Apr. 18, 1888. Serial No. 271,063. (No model.)

Claim.—The folding and hinged longitudinal sections A A, having downwardly-projecting strips *b b*, in combination with the folding legs C C, each of which is thicker than the distance which the said strips *b b* project beneath said sections A A, two of which legs are hinged to the under side of each section, the legs on one side being hinged to their section close to the edge thereof, and the legs on the other section being hinged centrally thereto, substantially as set forth, so that when the sections are folded together the legs will be nested therein.

396,531.

the legs of one section lying side by side with the legs of the other section.

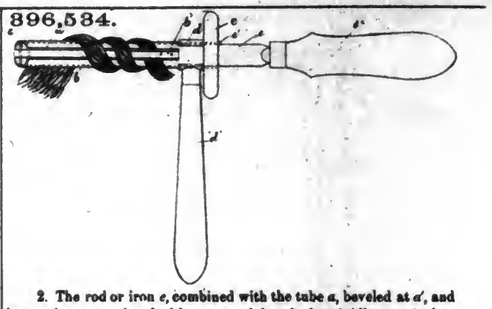
396,532. ENDLESS APRON FOR FEEDING OR OTHER MACHINES. WILLIAM C. BRAMWELL, Hyde Park, Mass. Filed June 14, 1887. Serial No. 241,317. (No model.)

Claim.—1. In an endless apron or carrier, the slats or bars and connecting metal links and pins, said slats having recessed and beveled edges, for the purpose described, in combination with pulleys or rolls supporting said apron and having teeth or projections fitting in between said slats, whereby a positive motion will be imparted to the apron by the pulleys.

2. An endless apron composed of slats or bars having beveled edges and formed with recesses *e*, in combination with links having their pivotal bearings situated within the recesses *e*.

3. An endless apron or carrier composed of the slats having beveled edges and formed with recesses *e*, in combination with a series of metal links formed with heads and pins passing through the said heads, forming hinges at this point, situated within the recesses *e*, substantially as and for the purposes shown and described.

396,533. GARMENT-STAY. MORRIS P. BRAY, Ansonia, Conn., assignor of one-half to John Kendrick, Chicago, Ill. Filed Oct. 22, 1888. Serial No. 288,787. (No model.)



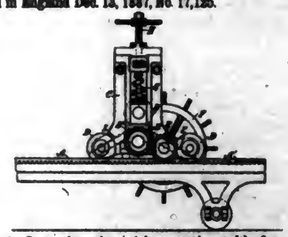
Claim.—The herein-described dress-stay, consisting of a woven covering forming two longitudinal parallel pockets, combined with a cord between the two pocket sand a cord at each edge of the stay, the said cords introduced in the process of weaving, and with bones in said pockets, substantially as described, and whereby the stay is provided with a flexible cord at both its edges and center as a means of attaching the stay to the dress.

396,534. DEVICE FOR CURLING HAIR. WALTER I. BRIGHAM, South Framingham, Mass. Filed Dec. 20, 1887. Serial No. 258,696. (No model.)

Claim.—1. In a device for curling hair, the rod or iron *e*, and the handle *d'*, having an attached bearing, combined with the rotatable cylindrical tube *a*, having the disk *c*, the tube rotating in the said bearing, substantially as described.

396,534.

2. The rod or iron *e*, combined with the tube *a*, beveled at *a'*, and its contiguous spring locking or retaining device rigidly attached to the tube at its inner end and extended longitudinally thereon, the free end of said locking device overlying said beveled portion, substantially as and for the purpose described.



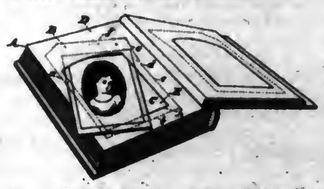
3. The cylindrical rod *e*, having the limiting-stop *d'*, combined with the rotatable tube or cylinder *a*, a detachable bearing, *d*, therefor, and the disk *c*, against which said stop abuts, substantially as described.

4. The rod *e*, combined with the tube or cylinder *a*, having a beveled end, and the locking device, as the spring *b*, substantially as described.

5. The rod *e* and tube *a*, combined with the removing device encircling the tube, substantially as described.

6. The rod *e* and tube *a* and its locking device, as the spring *b*, combined with the removing device, as the ring *d*, cut away at d^2, and its handle *d'*, substantially as described.

396,535. APPARATUS FOR ROLLING GLASS PLATES. ANTHONY D. BROGAN and ANDREW M. MALLOCH, Firhill, Glasgow, County of Lanark, Scotland. Filed July 23, 1888. Serial No. 280,775. (No model.) Patented in England Dec. 13, 1887, No. 17,126.



Claim.—1. In conjunction with a casting-table for rolling glass, a pair or pairs of rollers carried on a framing adapted to be traversed over said table, the said rollers being operated so that the glass plate rolled upon the table is drawn through between them and thereby impressed with a surface-pattern.

2. In combination with the casting-table A, the framing C, carrying pattern-impressing rollers B B and adapted to be traversed over the table, substantially as and for the purpose set forth.

3. In conjunction with a casting-table for rolling glass, pattern-impressing apparatus composed of the following elements in combination, to wit: the framing C, rollers B B, guide-plates I I', and gearing, such as E E', for driving the rollers, substantially as described.

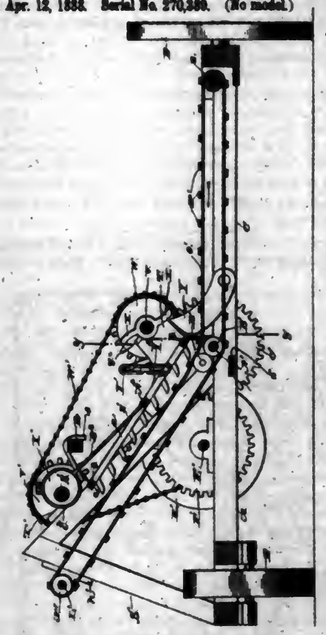
396,536. ALBUM. ROBERT BROWN, Miamisburg, Ohio. Filed Sept. 20, 1888. Serial No. 285,905. (No model.)

Claim —1. The album-leaf consisting of the body portion provided with an opening having the edges *a b* parallel with the outer edge, the portional edge *c*, parallel with the edge *a*, the inclined edge *e*, and the top edge, in combination with the facing having the opening, substantially as specified.

2. The album-leaf consisting of the body portion having the opening provided with edges parallel to the outer edges, the angle edge *c*, the top edge at right angles thereto, and the obtuse angle, the facing

having the projecting keeper edges, and the backing, substantially as specified.

396,537. RUBBER-DAM CLAMP. WALKER G. BROWER, Atlanta, Ga., assignor of one-half to Richard B. Winder, Baltimore, Md. Filed Nov. 5, 1888. Serial No. 290,007. (No model.)



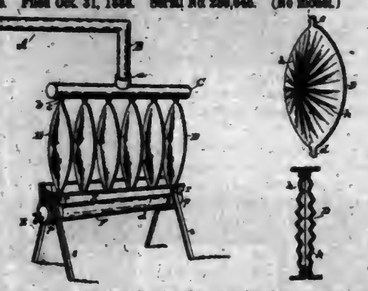
Claim.—1. In a clamp of the character described, the two arms pivoted together, a set-screw passing through one bar and swiveled in the other, and longitudinally-adjustable clasps arranged in pairs and movable longitudinally of the bars, all in combination, substantially as described.

2. The combination, with the bars *a d* and means for opening and closing the same, of the clasps *n n*, having mortises to pass over said bars, and projections which bear on the bars and on which the clasps may have a rocking movement, substantially as described.

3. The combination, with the bar, as *a*, of a clamp, of a friction-spring extending along said bar, and the clasp *n*, having a mortise to embrace said bar and spring, substantially as described.

4. The combination, with the clasping-bars *a d* and means for operating the same, of the spreader *r*, movably supported on one of said bars, said spreader having a wedge or blade, *s*, to extend between the teeth, substantially as described.

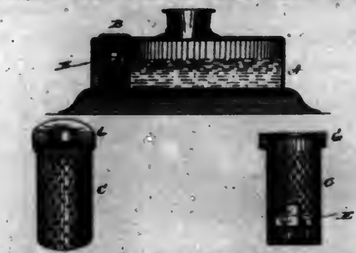
396,538. CORN-HARVESTER. EDWARD W. CADY, Rockwell, Iowa. Filed Apr. 12, 1888. Serial No. 270,389. (No model.)



Claim.—1. The combination of the main frame, the platform-frame, the inclined frame mounted on the main frame, the endless carrier-belt supported by said frames, the rake arranged over the belt and provided with downwardly-projecting teeth, the shaft S', journaled in the inclined frame and above the belt, the eccentric on said shaft, the transverse rock-shaft in the rake, and the pitman connecting said rock-shaft and the eccentric, as set forth.

2. The combination of the main frame, the platform-frame, the inclined frame mounted on the main frame, the cross-bar Y' thereon, the endless belt supported by said frames and passing under the cross-bar, the shaft S' above the belt, the eccentric on said shaft, the rake arranged over the belt, the pitman extending between the rake and the eccentric, and the links depending from the cross-bar Y' and connected to the rake, as set forth.

3. The combination of the main frame, the platform-frame, the inclined frame mounted on the platform-frame, the endless carrier-belt supported by said frames, the transverse shaft V, mounted on said inclined frame and extending over the belt, the radial vertical cutters secured on said shaft, the stationary cutter secured to the inclined frame adjacent to the radial cutters and shearing against the same, and the rake supported by the inclined frame over the belt, as specified.



396,539. CONDENSING APPARATUS. JOHN F. CHASE, Augusta, Me. Filed Oct. 31, 1888. Serial No. 289,646. (No model.)

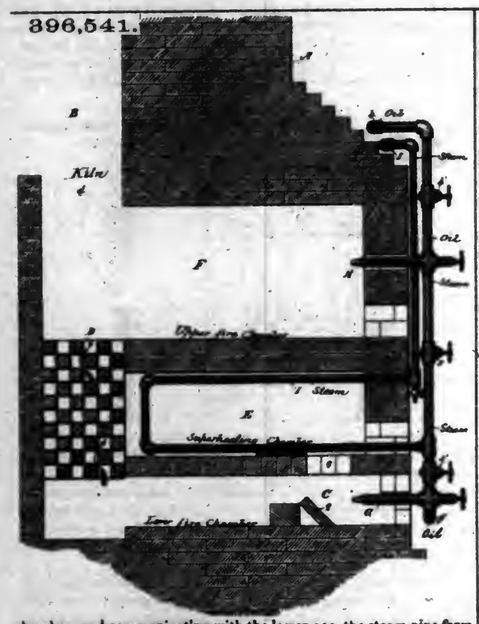
Claim.—1. The combination, in a condensing apparatus, of the pipes A B, the tube C, centrally connected with said pipe B and having a series of lips formed on one side thereof, the series of disk-shaped condensing-chambers formed of the concavo-convex plates joined at their peripheries connected to said lips, the receiving-tube having a series of lips on one side connected with said condensing-chambers, and means for supporting said receiving-tube, substantially as described.

2. The combination, in a condensing apparatus, of the pipes A B, the tube C, connected with said pipe B, a series of upright condensing-chambers formed by the disk-shaped concavo-convex plates having the tapering corrugations therein, and the receiving-tube communicating with said chambers, substantially as described.

396,540. INDICATOR FOR LAMPS, LANTERNS, &c. WILLIAM A. CHASE, Morrisville, Vt., assignor of one-half to Fred. B. Livingston, same place. Filed Mar. 21, 1887. Serial No. 231,724. (No model.)

Claim.—The herein-described indicator for lamps, consisting of a perforated cylinder or tube having a closed lower end and an open exteriorly screw-threaded upper end, and a luminous float within said cylinder in the form of a six-pointed cubical cross, substantially as specified.

396,541. OIL-BURNING LIMEKILN. ALBERT V. CLARK and ELISHA T. MAPES, Alameda, Cal. Filed Aug. 17, 1883. Serial No. 283,005. (No model.)



Claim.—1. In an oil-burning furnace, the combination of an upper and lower fire-chamber, the oil-burners therein, a separate chamber communicating with the lower fire-chamber, and a steam-pipe in said separate chamber connected with and supplying superheated steam to the oil-burner, substantially as herein described.

2. In an oil-burning furnace, the combination of the lower fire-chamber, the checker-work communication at its inner end with the kiln, the oil-burner in the front of the fire-chamber, the separate chamber above and communicating with the fire-chamber, and the steam-pipe within said separate chamber connected with the oil-burner, substantially as herein described.

3. In an oil-burning furnace, the combination of the lower fire-chamber, an oil-burner therein, the upper fire-chamber and the oil-burner therein, the intervening separate chamber communicating with the lower fire-chamber, and the steam-pipe within said separate chamber and connected with the two burners, substantially as herein described.

4. In an oil-burning furnace having a shell inclosing the kiln, the combination of the lower fire-chamber of the shell and the upper fire-chamber, both communicating with the kiln, the separate oil-burners inserted in said fire-chambers, the separate chamber between the fire-

396,541.

chambers and communicating with the lower one, the steam-pipe from the boiler within the intervening chamber, and valve-controlled connections between said steam-pipe and the burners, substantially as herein described.

396,542. BOOT OR SHOE. DAVID B. CLOSSON, Boston, assignor of one-half to William B. Rice, Quincy, Mass. Filed June 18, 1888. Serial No. 277,419. (No model.)

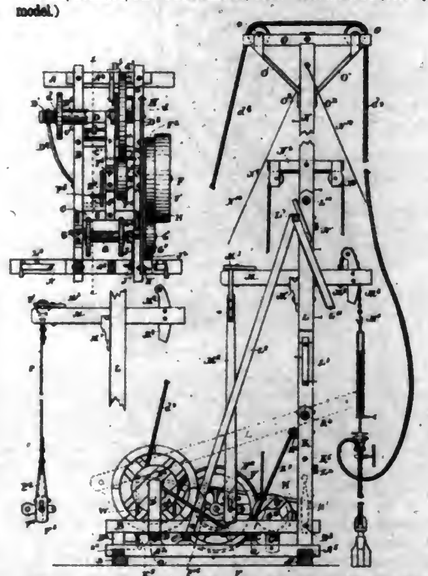
Claim.—The herein-described Balmoral or laced boot, having the sections A and A', the edges of which abut, but do not overlap, the lower portions of the said sections being provided with eyelet-holes c' c^2 and the upper portions thereof with lacing-studs or eyelet-holes, an elastic piece, B, and elastic cord C, connecting the said lower portions of said sections, a non-elastic lacing cord or cords for the upper portions of said sections, and a tongue, E, covering the space or opening between said sections, substantially as shown and described.

396,543. UNDERGROUND SYSTEM OF ELECTRIC WIRES. HENRY B. COHB, Wilmington, Del. Filed Apr. 19, 1888. Serial No. 271,165. (No model.)

Claim.—1. The combination of an insulated electric conducting-wire, B, a metal ferrule, C, surrounding the wire B near its end, an insulated conducting-wire, B', having a metal ferrule, C', surrounding it near its end, and a metal thimble, E, substantially as and for the purpose set forth.

2. The combination of an electric conducting-wire, B, inclosed within an insulating-tube, A, a metal ferrule, C, surrounding the wire B near its end in the insulating-tube, a conducting-wire, B', inclosed within an insulating-tube, A', having a metal ferrule, C', surrounding the wire B' near its end in the insulating-tube, and a metal thimble, E, substantially as and for the purpose set forth.

3. In an underground system of electric wires having an insulated conductor extending into a man-hole, vault, or the like, the combination, with the said conductor, of a removable and adjustable cap, F, to cover its end, substantially as and for the purpose set forth.



4. The combination of an electric conducting-wire, B, a metal ferrule, C, in a tube, A, of insulating material and surrounding the wire B near its end, and a cap, F, substantially as and for the purpose set forth.

5. The combination of an insulated electric conducting-wire, B, a metal ferrule, C, surrounding the wire B near its end, and a cap, F, comprising a section of insulating-tube, F', having a thimble, E', and containing a filling, p, substantially as and for the purpose set forth.

6. The combination of an electric conducting-wire, B, inclosed within an insulating-tube, A, a metal ferrule, C, having an enlarged portion, r, a reduced portion, r', and shoulder r^2, and surrounding the wire B near its end in the insulating-tube and secured to the said wire, a coupler, D, comprising a conducting-wire, B', inclosed within an insulating-tube, A', metal ferrules C', surrounding the wire B' near each end in the insulating-tube, secured to the said wire and formed like the ferrule C, and a metal thimble, E, substantially as and for the purpose set forth.

7. The combination of an electric conducting-wire, B, inclosed within an insulating-tube, A, a metal ferrule, C, having an enlarged portion, r, a reduced portion, r', and shoulder r^2, and inserted around the wire B into the insulating-tube to cause its extremity to be flush with that of the said insulating-tube, a coupler, D, comprising a conducting-wire, B', inclosed within an insulating-tube, A', metal ferrules C', formed like the ferrule C and inserted around the wire B' into opposite ends of the insulating-tube to cause their extremities to be flush with those of the said insulating-tube, and metal thimbles E, inserted around the reduced portions of the ferrules C into the opposite ends of the tubing A' and extending beyond the latter, substantially as and for the purpose set forth.

396,544. RIG FOR DRILLING AND PUMPING WELLS. GEORGE CORBETT, Bradford, Pa. Filed June 27, 1887. Serial No. 242,613. (No model.)

Claim.—1. In a rig for drilling and pumping wells, the derrick consisting of a bed-frame, samson-posts rigid thereon, and a mast in two sections pivoted together and one pivoted to the samson-posts, substantially as set forth.

2. The combination, with the driving-shaft, of a friction-wheel thereon, a bull-wheel, a friction-wheel thereon, a pivoted lever in which the bull-wheel at one end is mounted, means for oscillating said lever for disengaging said friction-wheels, and a strap-brake immovably secured at one end and connected at the other to the lower end of said pivoted lever and partially surrounding said bull-wheel friction-wheel, substantially as set forth.

3. In combination with the driving-shaft and friction-wheel thereon, the bull-wheel mounted in a pivoted lever at one end, a friction-wheel on said bull-wheel, a strap-brake partially surrounding the friction-wheel of the bull-wheel, a lever with which both the pivoted supporting-lever and the strap-brake are connected, and means for operating said lever, substantially as set forth.

4. The combination, with the bull-wheel having a friction-wheel, of a pivoted lever in which the bull-wheel is mounted, a strap-brake partially surrounding said friction-wheel, and a crank-shaft having connection with said lever and with one end of said brake and having means of operation whereby the wheel and the brake are moved in opposite directions.

5. In a rig, the combination, with the bull-wheel having a friction-wheel thereon and a pivoted lever in which it is mounted, of an extension, D^4, at one end of said lever, a crank-shaft journaled in the bed-frame and connected with said extension D^4, a strap-brake partially surrounding said friction-wheel and immovably secured at one end and connected at the other to the crank of said shaft, and means for operating said crank-shaft, substantially as set forth.

6. The combination, with the friction-wheel and the strap-brake E, having a series of holes, e, embracing said wheel, of a shaft having a crank in its length, and the clamp E^3, adapted to be secured to said strap-brake in any of the holes e, and having a groove for the passage of said crank between the clamp and the strap-brake, as set forth.

7. The combination, with the derrick and driving-shaft having a crank, of a walking-beam having bifurcated ends with a segment, M^3, mounted in one end, a chain secured to said beam and passing over said segment and through the bifurcation, and a pitman pivoted to said crank and secured to the walking-beam by means of the cap M^3, as set forth.

8. In combination with the driving-shaft having a friction-wheel, a bull-wheel having a friction-wheel and a strap-brake partially surrounding the latter friction-wheel, and a stirrup fixed to one end of said strap-brake, straddling one of the friction-wheels, and pivotally connected to the bed-frame, substantially as set forth.

9. In a well-drilling rig, the combination, with the derrick and the necessary ropes, of a walking-beam and a saddle for pivotally supporting said beam, the saddle consisting of a pair of plates placed upon opposite sides of the beam, having flanges engaging beneath the beam, and trunnions or pivots supported by the derrick, substantially as set forth.

10. In combination with the derrick, a bull-wheel, and a spudding-rope fixed to the bull-wheel and running over pulleys on the derrick, a crank-shaft, a block pivoted on the wrist-pin of the crank, and a flat hook pivoted to said block and engaging with the spudding-rope, substantially as set forth.

11. In a well-drilling rig, the combination, with the derrick, a bull-wheel, and a single continuous spudding-rope fixed to the bull-wheel, so as to be capable of winding thereon, passing over suitable guiding devices, and having the drilling-tool attached thereto, of a crank-shaft and a hook pivotally connected to the wrist-pin of the crank and having the spudding-rope passing through it, the arrangement being such that the rope may be paid out or unwound without disengaging the same from said hook, substantially as set forth.

12. The combination, with the mud-sills A A', the longitudinal sills A^3 A^3, having blocks a and held together by notched sills A^4 A^5, the plates B B', having supports B^2, B^3, B^4, and B^5, cross-ties C C', and sill D, resting on blocks a and supporting the crank-sill C^2 and plates B B', a bull-wheel post, D^3, planted on sill D and braced by bar D^5, and the fixed posts K K', tenoned in sills A^4 and A^5 and having cross-bar K^3, to which and to the plates B B' braces K^2 are secured.

13. The combination, with a shaft having a key-seat and a wheel mounted on said shaft and having a key-seat, of a key for fitting in said seats, consisting of two wedge-shaped pieces whose outer or remote edges are parallel when the pieces are placed together, substantially as set forth.

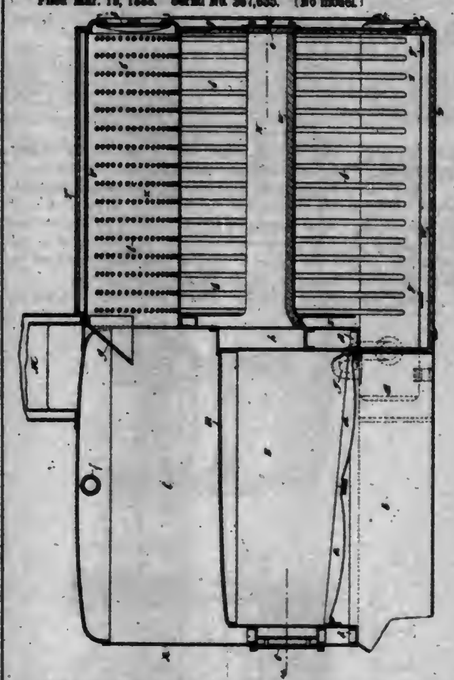
14. The combination, with a mast or derrick formed in sections and pivoted together, of a transverse block secured to the pivoted section and adapted to strike against the other sections of said mast, whereby it is prevented from passing the perpendicular when being erected.

15. The combination, with the beam M, the derrick, and the sucker-rod, of the brackets Q^4 Q^5, having slots and rollers mounted in said slots at unequal distances from the derrick for guiding the sucker-rod in a vertical plane, as set forth.

16. The combination, with the beam M, mounted in blocks M', the derrick, and the sucker-rod connected to said beam, of the block M^7, located above the blocks M', substantially as and for the purposes set forth.

17. The combination, with the post D' and the truss D^4, of the lever D^6, pivoted to the truss D^4, and bull-wheel journaled at its respective ends in said lever and post, of a friction-drum on one and a flexible brake on the other side of said bull-wheel, the said brake being connected with the end of said lever, whereby when said lever is operated in one direction it will push the brake away from the bull-wheel and force the latter in contact with the friction-drum, and when operated in the other direction will cause the bull-wheel and brake to move toward each other, substantially as set forth.

18. In a rig, the combination, with the mast or derrick and the pumps having a sucker-rod, of brackets secured to said mast and pulleys journaled to said brackets and bearing upon opposite sides of said sucker-rod, as set forth.



19. In a rig, the combination, with the mast and the beam M, having a bifurcated end mounted thereon, and a pump having a sucker-rod, of a clamp secured to said sucker-rod and having a bifurcation, and the rod R, passing through the bifurcation of said beam and clamps and having the T-head at each end, substantially as and for the purposes set forth.

20. In a rig, the combination, with the mast and a pump having a sucker-rod, of the brackets Q^4 Q^5, secured to said mast, having bifurcated ends through which said sucker-rod passes, and grooved pulleys journaled in said brackets upon opposite sides of the said rod, as set forth.

21. In a rig, the combination, with the mast, a walking-beam journaled thereon, and a pump having a sucker-rod, of guides for restricting said rod to a vertical movement and a clamp adjustably secured to said rod and pivotally connected to said beam, substantially as set forth.

22. In a rig for drilling and pumping wells, the combination, with the frame, a walking-beam having a bifurcated end, and the means for imparting to said beam an oscillatory motion, of a segment mounted perpendicularly in said bifurcation at a distance from the end of the beam, whereby the sucker-rod of the pump may be attached to said end, or a rope or chain may be secured to the beam and passed over the curved surface of said segment for suspending the tools, substantially as set forth.

396,545. STEAM-BOILER. WILLIAM COWLES, Brooklyn, N. Y. Filed Mar. 19, 1888. Serial No. 267,635. (No model.)

Claim.—1. In a steam-boiler, the combination, with horizontal water and steam drums and vertical or substantially vertical circulating-tubes connecting said drums, of the shell A, communicating with said drums and forming with the steam-drum a steam-chamber, C, substantially as described.

2. In a steam-boiler, the combination, with horizontal water and steam drums, of vertical or substantially vertical circulating-tubes connecting said drums and located in rows, with space between adjacent rows for the removal and insertion of any one tube without disturbing any of the others, and the shell A, communicating with said drums and forming with the steam-drum a steam-chamber, C, substantially as described.

3. In a steam-boiler, the combination, with horizontal water and steam drums and vertical or substantially vertical circulating-tubes connecting said drums, of the shell A, communicating directly with said steam-drum and forming a steam-chamber, C, and with said water drum or drums by a water leg or legs, substantially as described.

4. In a steam-boiler, the combination, with horizontal water and steam drums, of vertical or substantially vertical circulating-tubes connecting said drums and located in rows, with space between adjacent rows for the removal and insertion of any one tube without disturbing any of the others, the shell A, communicating directly with said steam-drum and forming a steam-chamber, C, and communicating also with said water drum or drums by a water leg or legs, substantially as described.

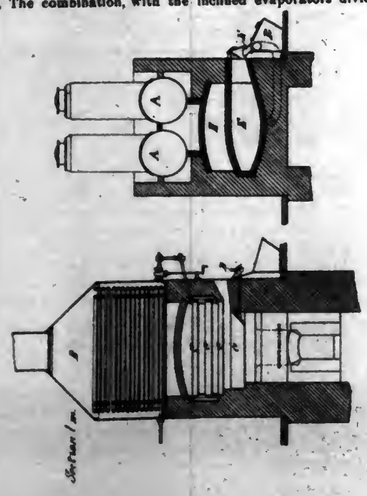
5. The combination, with the steam-drum F and the steam-chamber C, of the baffle-plate *y*, for directing the steam and water downward from the mouth of the steam-drum, substantially as described.

6. The combination, with the water drum or drums and the vertical or substantially vertical circulating-tubes G, of the baffle plate or plates *n*, for arresting the sediment in the water drum or drums, substantially as described.

7. The combination, with the horizontal steam and water drums and the vertical or substantially vertical circulating-tubes G, of the shell A, the water leg or legs, and the feed-water pipe or pipes *l*, entering said water leg or legs, substantially as described.

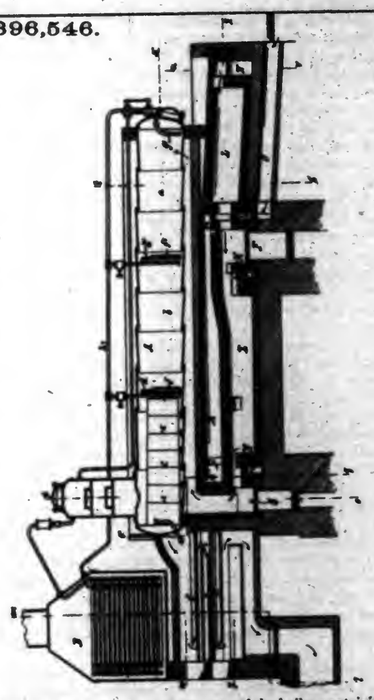
8. The combination, with the horizontal water and steam drums and the vertical or substantially vertical circulating-tubes, of the casing D, inclosing the same, and the horizontal deflector H, substantially as described.

9. The combination, with the horizontal water and steam drums and the vertical or substantially vertical circulating-tubes, of the casing D, inclosing the same, and the vertical deflector I, substantially as described.



10. The combination, with the horizontal water and steam drums and the vertical or substantially vertical circulating-tubes, of the casing D, inclosing the same, the horizontal deflector H, and the vertical deflector I, substantially as described.

11. The combination, with the water drum or drums and the vertical or substantially vertical circulating-tubes G, of the baffle plate or plates *n*, for arresting the sediment in the water drum or drums, and the blow-off pipe or pipes, substantially as described.



396,546. RECOVERING SODA. CARL F. DAHL, Dantzic, Prussia, Germany. Filed Apr. 16, 1887. Serial No. 235,131. (No model.)

Claim.—1. In an apparatus for inspissating lyes used in the manufacture of cellulose, the combination, with inclined evaporators divided by partitions into several compartments, of a boiler, a worm contained therein, and a connection between said worm and the dome of the evaporator, whereby the worm is supplied with vapor produced by the action of the evaporator, substantially as described.

2. The combination, with the inclined evaporators divided by

396,546.

partitions into several compartments, of the boiler containing a worm connected to the dome of the evaporator, and the flat open pans arranged below the evaporators, and one beneath the next preceding one, substantially as described.

3. The combination, with the melting-furnace L and the inspissating-vat E, of the kettle A, boiler B, and evaporating-pans C, said parts being so arranged that the heat from one part serves to heat the succeeding part, suitable fire-places or heaters, N P G, and a receiver, K, communicating with one of said fire-places, substantially as described.

396,547. FOUNTAIN-PEN. SAMUEL A. DE NORMANVILLE, Kensington, County of Middlesex, England. Filed Dec. 20, 1887. Serial No. 258,523. (No model.)

Claim.—1. In a fountain-pen, the combination, with the ink-reservoir, of a writing-nib composed of two substantially half-tubular sections joined edge to edge and fitted in a reservoir, the outer ends of both sections projecting the same distance from the reservoir and being tapered to equal degree, so as to meet and form a point, substantially as described.

2. In a fountain-pen, a writing-nib consisting of two half-tubes of equal length and size, both tapering at one end to equal degree and fitted together edge to edge throughout their entire lengths, substantially as described.

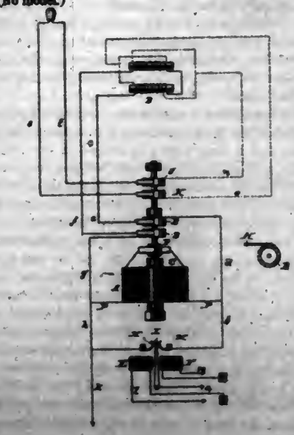
3. In a fountain-pen, the combination, with a reservoir in the handle of the pen and a supplementary reservoir, K, fitted to said handle, of a tubular cap, L, closing the end of said reservoir, and a writing-point passing through a hole in the end of said cap, substantially as described.

4. In a fountain-pen, the combination, with reservoir B, supplementary reservoir K, and cap L, closing the end of said reservoir K, of tubular writing-nib D, projecting through said reservoir K, and having an opening, H, within said cap, substantially as described.

5. In a fountain-pen, the combination, with elastic reservoir B and casing A, inclosing said reservoir and having hole A′, of ink-supply tube C and writing-point D, all constructed and arranged substantially as described.

6. In a fountain-pen, the combination, with reservoir B, supply-tube C, and writing-point D, communicating with said reservoir and having slot H, of supplementary reservoir K, having port P, and cap L, embracing said writing-point and closing the end of reservoir K, substantially as described.

396,548. SASH-FASTENER. CHARLES H. DEXTER, Annapolis, Md. Filed July 6, 1888. Serial No. 279,196. (No model.)



Claim.—1. The combination of the spring-actuated bolt E, having collar *e*, and the gravitating locking-plate D, substantially as described.

2. The keeper-socket F, formed with a flared entrance, a roller-bearing concave surface, a groove, and a screw-shank, in combination with the spring-actuated bolt B and its roller e^2, and the gravitating locking-plate D, substantially as and for the purpose described.

3. The gravitating locking-plate D, having the angular flanges, thumb-button *d*, having shank *d′*, and the plate C, provided with an inclined surface, c^3, and slot c^2, substantially as and for the purpose described.

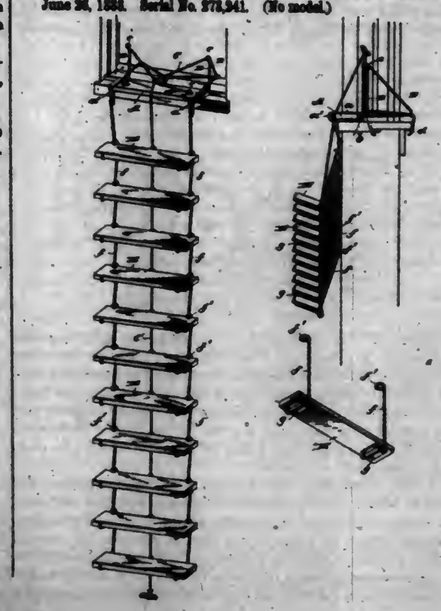
4. The combination of the spring-actuated bolt having a locking-collar and a roller, the gravitating locking-plate, and a keeper-socket, substantially as and for the purpose described.

396,549. SYSTEM OF ELECTRICAL DISTRIBUTION. EDWARD N. DICKERSON, Jr., New York, N. Y. Filed Nov. 7, 1887. Serial No. 254,565. (No model.)

Claim.—1. The system of electrical conversion herein described, which consists in causing a direct current to flow upon the line-wire in locally reversing the same by a reverser independent of the generator, the said reverser being driven by the electricity generated in the main generator, in causing the said reversed current to flow through a converter, thereby producing a series of secondary reversing currents, and in rectifying said currents through a second reversing-commutator moving synchronously with the first commutator, substantially as described.

2. The system of electrical conversion herein described, which consists in causing a direct current to flow upon a main circuit and through a current-reverser in reversing a subordinate circuit supplied from the main circuit, in converting the said reversing-circuit into a circuit of different tension by means of a converter, and in again straightening said converted circuit by a reversing-commutator moving synchronously with the commutator which reverses the primary circuit, substantially as described.

396,550. PIPE-COUPLING. JOHN P. DILL and SAMUEL A. ROTE, Ridgway, Pa. Filed Aug. 6, 1888. Serial No. 282,114. (No model.)



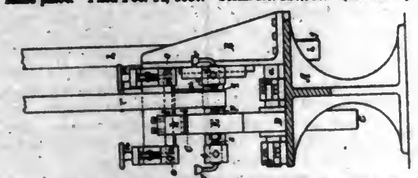
Claim.—The combination of the pipes A, having the threaded portions at their meeting ends and having the shoulders *a*, the collars C, secured to said pipes, the interiorly-threaded sleeves or nuts E, engaging the threaded portions of the pipes and having the shoulders *b* at their inner ends, for the purpose set forth, one of said sleeves or nuts engaging both pipes and serving to couple the same, and the other nut being jammed against the coupling-nut, and the coiled extensile springs arranged on the pipes and bearing between the collars C and the sleeves or nuts, substantially as described.

396,551. PROCESS OF BLEACHING COTTON. FREDERICK R. DROWN, Pawtucket, R. I. Filed May 2, 1888. Serial No. 272,506. (No specimens.)

Claim.—The improvement in the art of bleaching, consisting in passing cotton fabric spread out wide through a boiling solution of caustic soda, then subjecting it to the action of steam by passing it over perforated steam-pipe, then cooling it by passing it into a cold solution of caustic soda, then boiling in a solution of soda-ash and washing, then subjecting the material to the action of chlorine liquor, then steaming, souring, and finally washing, substantially as set forth.

396,552. FIRE-ESCAPE. CHARLES RESSEY, Ryota, Minn. Filed June 26, 1888. Serial No. 278,241. (No model.)

Claim.—1. The combination, in a folding ladder, of the steps E E, having bars *f* pivotally secured to the under side thereof, the upper ends of said bars being formed into eyes which encircle corresponding bars attached to the step immediately above, substantially as shown, and for the purpose set forth.



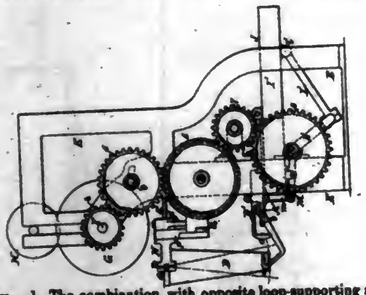
2. In a fire-escape or folding ladder, the combination of the step A, pivotally attached by means of loops *a* to a frame made up of bars B and D, which are bent substantially as shown, and provided with hooks *d d*, and a ladder constructed substantially as shown, adapted to be suspended therefrom, the parts being organized substantially as shown, and for the purpose set forth.

3. In a ladder, the steps E, provided with bars *f*, the lower ends of which are pivoted to the steps, their upper ends being formed into eyes which slide upon the bars attached to the adjacent step, and a cord, C, passing through eyes projecting from the rear edges of the steps and connected to a supporting-frame having upwardly-projecting arms, substantially as shown, and for the purpose set forth.

4. The combination, with a flexible ladder, of a step, A, provided with loops *a*, having eyes *a'* and *b* formed on opposite sides thereof, a central eye, *c*, and bar B, having ends formed into eyes *c c*, loop *c'*, passing through the eyes *b b*, hooks *d d*, and members extending from the upper portion of said hooks to the eye *c*, and brace-rods D D, extending from the upper portion of the hooks to the eyes *c c*, the parts being organized substantially as shown, and for the purpose set forth.

396,553. MACHINERY FOR GRINDING METALLIC BANDS.

JOHN L. FOWLE, Woburn, Mass., assignor to Walter Franklin Fowle same place. Filed Feb. 14, 1887. Serial No. 227,596. (No model.)



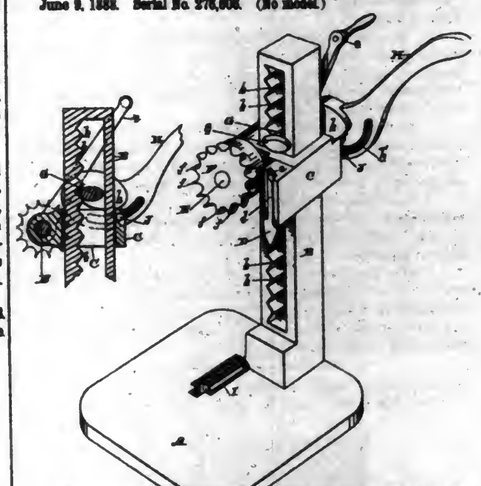
Claim.—1. The standard B on the frame A with extended arms and having adjustable boxes *m* attached thereto, in combination with the loose shaft *l*, having a longitudinal and transverse adjustment and supporting the rest *i*, as and for the purpose set forth.

2. The combination of the grinding-wheels E E', situated relatively to each other, as described, the rest *i* in an adjustable block, *k*, supported on the shaft *l*, with longitudinal and transverse adjustments in the boxes *m m*, as and for the purpose described.

396,554. WARP-LINKING MACHINE.

RICHARD GARNED, JOSHUA GARNED, and WILLIAM MASON, Philadelphia, Pa. Filed Apr. 11, 1887. Serial No. 234,383. (No model.)

Brief.—The object of the invention is to form by machinery a double-linked warp, and the invention is an improvement upon the machine shown in Letters Patent No. 25,501, dated September 20, 1859.



Claim.—1. The combination, with opposite loop-supporting arms and means for looping a warp around first one arm and then the other, of a reciprocating finger co-operating with each of said arms, provided with a hook for engaging the loops as laid upon the arm and drawing the same rearwardly thereon, and with a projection for lifting said loops and throwing them over the end of the arm in the forward movement of the finger, and means for actuating said fingers alternately, substantially as described.

2. The combination, with opposite loop-supporting arms and means for looping a warp around first one arm and then the other, of a reciprocating finger co-operating with each of said arms, provided with a hook for engaging the loops as laid upon the arm and drawing the same rearwardly thereon, and with a projection for lifting said loops and throwing them over the end of the arm in the forward movement of the finger, and means for reciprocating said fingers alternately and raising the free ends thereof after engagement of the throwing-off projections with the loops, all substantially as set forth.

3. The combination of the loop-supporting arm A, a reciprocating slide, a linking-finger pivoted thereto, a pin, *m*, acting on said finger, and means for reciprocating said pin, all substantially as and for the purpose described.

396,555. CAN-OPENER.

THOMAS H. GILHAM, Cortez, Nev. Filed June 9, 1888. Serial No. 276,606. (No model.)

Claim.—1. In a can-opener, the combination of a fixed knife, against which the can is forced, a rotary gripping-disk located to one side of said knife for turning the can, and means for rotating said disk, substantially as herein described.

2. In a can-opener, the combination of a fixed knife for penetrating the can, and against which said can is forced, a rotary disk to one side of said knife, provided with teeth for piercing the can and turning it, and means for imparting rotary motion to said disk.

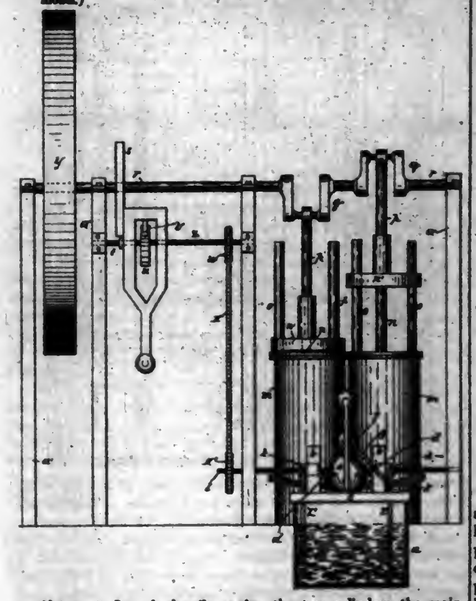
3. In a can-opener, a fixed standard and a carrying-head mounted thereon so as to move up and down, in combination with a rotary gripping-disk carried by said head for engaging and turning the can, and a fixed knife, also carried by the head, and against which the can is forced, substantially as herein described.

4. In a can-opener, a fixed standard and a vertically-movable carrying-head thereon, in combination with a crank-shaft carried by the head, a gripping or piercing disk on and operated by the crank-shaft for engaging and turning the can, and a fixed knife, also carried by the head, and against which the can is forced, substantially as herein described.

5. In a can-opener, a base-plate having a standard and a vertically-movable carrying-head on said standard, in combination with a crank-shaft in the head, having a gripping or piercing disk for turning the can, a fixed knife carried by the head and against which the can is forced, and a roller in the base-plate and upon which the can rests, substantially as herein described.

6. In a can-opener, a fixed standard and a vertically-movable carrying-head thereon, in combination with a rotary gripping-disk and fixed knife on the head, and a cam-lever on the standard bearing upon the head for forcing its disk and knife into the can, substantially as herein described.

7. In a can-opener, a fixed slotted standard having notches in its slot, a movable pin passing through the slot and adapted to engage the notches, and a lever with a cam-head on the end of the pin, in combination with a vertically-movable carrying-head on the standard, upon which the cam-head of the lever bears, a crank-shaft with gripping or piercing disk carried by the head, and a fixed knife, also carried by the head, substantially as herein described.



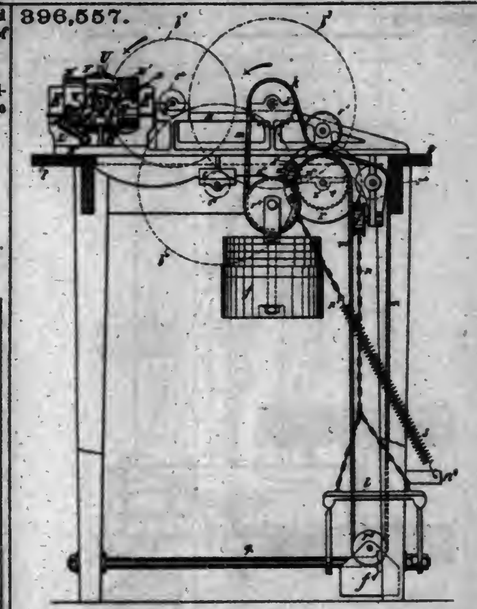
8. A can-opener consisting of a base-plate having a slotted notched standard and a roller for the can to rest upon, a movable carrying-head on the standard, having a crank-shaft with a gripping or piercing disk and a fixed knife on said head, a movable pin in the slotted standard adapted to engage its notches, and a lever with a cam-head on the end of the pin, said lever being adapted to bear down upon the carrying-head and to force its gripping or piercing disk and its knife into the can, substantially as herein described.

9. In a can-opener, a fixed standard and a vertically-movable carrying-head thereon, in combination with a rotary gripping-disk and fixed knife on the head, a lever on the standard, having a cam-head

bearing on the carrying-head and provided with a groove, and a fixed pin projecting from the carrying-head and playing on the groove of the cam-head, substantially as herein described.

396,556. HYDRAULIC ENGINE.

HENRY G. T. GLASSBROOK, Westhouse, Ontario, Canada. Filed Oct. 4, 1886. Serial No. 215,314. (No model.)



Claim.—1. In a hydraulic engine, the two cylinders, the main shafts actuated by two pistons fitting in said cylinders, the inlet-pipes, outlet-pipes, and blocks in which said inlet and outlet pipes are fitted, in combination with the regulating-shaft fitted into said blocks as bearings, and pierced at its intersections with said blocks, so that the apertures opening into the inlet-pipe of one cylinder and the outlet-pipe of the other cylinder are parallel and at right angles to the outlet-pipe of the former cylinder and the inlet-pipe of the latter cylinder, the gear-wheel mounted upon said regulating-shaft, a second gear-wheel gearing with said wheel, a shaft upon which said second wheel is mounted and carrying a swinging weighted frame bearing a pawl and a ratchet-wheel engaging with said pawl, and an arm rigidly mounted upon said main shaft and engaging with said weighted frame at intervals, substantially as described.

2. In a hydraulic engine, the two cylinders, the main shaft actuated by two pistons fitting in said cylinders, the inlet-pipes, outlet-pipes, blocks in which said inlet and outlet pipes are fitted, and a regulator in the path of said inlet-pipes, in combination with the regulating-shaft fitted into said blocks as bearings, and pierced at its intersections with said blocks, so that the apertures opening into the inlet-pipe of one cylinder and the outlet-pipe of the other cylinder are parallel and at right angles to the outlet-pipe of the former cylinder and the inlet-pipe of the latter cylinder, the gear-wheel mounted upon said regulating-shaft, a second gear-wheel gearing with said wheel, a shaft upon which said second wheel is mounted and carrying a swinging weighted frame bearing a pawl and a ratchet-wheel engaging with said pawl, and an arm rigidly mounted upon said main shaft and engaging with said weighted frame at intervals, substantially as described.

396,557. DYNAMO FOR TELEGRAPHIC PURPOSES.

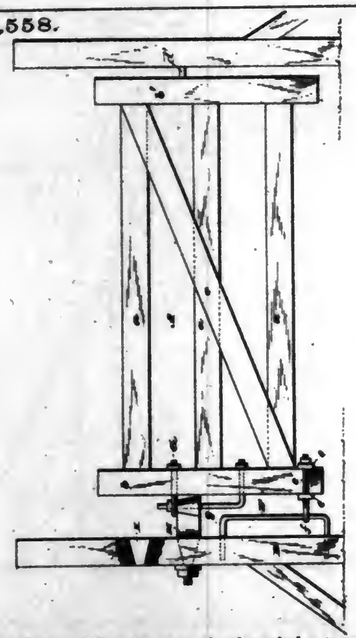
REINHOLD GUHR, Schiers, and OTTO PLATE, Niederurnen, Switzerland, assignors of one-half to Bronislav Dutenberg, Travalt, Bosnia, and Joseph Guhr, Schiers, Switzerland. Filed June 9, 1888. Serial No. 276,564. (No model.)

Claim.—1. A weight-motor consisting of a train of gearing containing a chain-wheel, *k*, an endless chain, *m*, having two loops, one of said loops engaging the wheel *k*, a weight, *f*, carrying a roller, r^4, that is placed in one of the loops of the chain *m*, and chain-wheel *k'*, for the chain *m*, ratchet s^3, rigid with said wheel *k'*, and pulley *r*, having a pawl, s^2, to engage the ratchet-wheel s^3, and a treadle, *l*, connected by a chain, *n*, to the pulley *r*, combined with a dynamo-electric machine provided with a field-magnet made of a metallic conductor for retaining magnetism, said field-magnet being wound with shunt-coils of high resistance and magnetized with small current-power, whereby the dynamo will give quick and certain currents with the speed obtained from said weight-motor, substantially as described.

3. A weight-motor consisting of a train of gearing containing a chain-wheel, *k*, an endless chain, *m*, having two loops, one of said loops engaging the wheel *k*, a weight, *f*, carrying a roller, r^4, that is placed in one of the loops of the chain *m*, and chain-wheel *k'*, for the chain *m*, ratchet s^3, rigid with said wheel *k'*, and pulley *r*, having a pawl, s^2, to engage the ratchet-wheel s^3, and a treadle, *l*, connected by a chain, *n*, to the pulley *r*, combined with a dynamo-electric machine having a field-magnet consisting of a cast-iron bed-plate, two iron cores secured to said bed-plate, said cores being wound with shunt-coils of high resistance that are magnetized with small current-power, all arranged and operating substantially as herein shown and described.

4. A weight-motor consisting of a train of gearing containing a chain-wheel, *k*, an endless chain, *m*, having two loops, one of said loops engaging the wheel *k*, a weight, *f*, carrying a roller, r^4, that is placed in one of the loops of the chain *m*, and chain-wheel *k'*, for the chain *m*, ratchet s^3, rigid with said wheel *k'*, and pulley *r*, having a pawl, s^2, to engage the ratchet-wheel s^3, and a treadle, *l*, connected by a chain, *n*, to the pulley *r*, combined with a dynamo-electric machine having a field-magnet that is wound with shunt-coils of about one-third to one-fifteenth as much resistance as that of the respective outside circuit, substantially as herein shown and described.

5. In a dynamo-machine, the cores E, having shunt-coils E' E', combined with the switch U, having contact-pieces 1, 2, 3, and 4, that are connected to the shunt-coils and brushes, as described, and with the cross-switch F, that is adapted to engage two or more of the contact-pieces 1 2 3 4 at a time, whereby the field-magnet may be switched into series or multiple arc, and whereby the coils of the dynamo may be cut off from the outside circuit to protect the dynamo from lightning, substantially as described.



6. In a dynamo or magneto electrical machine for telegraphic or telephonic purposes, the armature-shaft e^6 and the disk E', carried by said shaft, combined with the brake consisting of the bar N', handle L, and elastic tongue N, all arranged substantially as herein shown and described.

396,558. GATE.

ALFRED H. COMPERT, Jamaica, Iowa. Filed Sept. 20, 1888. Serial No. 285,570. (No model.)

Claim.—The combination, in a swinging gate, of a post provided

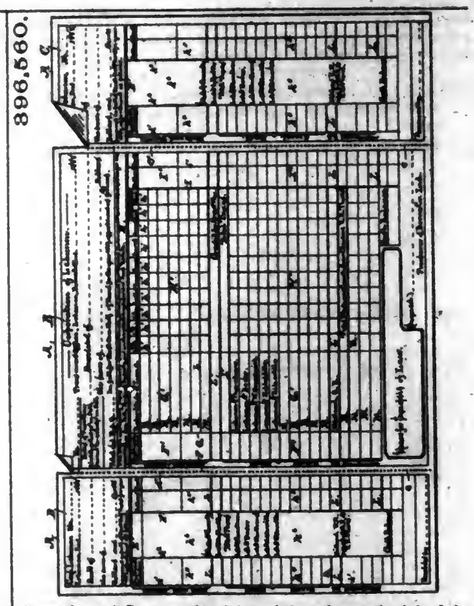
896,558.

with parallel bars F F, having inturned ends, conical or tapered openings I, located above and between the bars F F, an iron, H, adapted to fit within said openings and provided with a screw-threaded portion and nut for wedging the same in position, the end of said iron having a conical opening, the gate-batten A having irons with recesses secured near the lower portion of the batten, an angle-iron, *g*, adapted to pass through the opening in the iron H, and an eyebolt, G, embracing the upper end of said angle-iron, the parts being organized substantially as shown, and for the purpose set forth.

896,559. GRINDING-MILL. FRANK C. HALL, Philadelphia, Pa. Filed May 5, 1888. Serial No. 273,181. (No model.)

Claim.—1. In combination, the runner of a mill having a grinding-surface, a crushing-surface above the grinding-surface, the shell or casing, and a series of crushing-rollers arranged around and bearing upon said crushing-surface.

2. In combination, the revolving runner, the casing O, having the central feed-opening, *i*, and the series of conical crushing-rollers arranged around said opening, the said casings having the bearings for the rollers, substantially as described.



3. In combination with the casing and the runner of a mill having an annular rack upon the upper margin of its grinding-surface and a conical surface above the said rack, a series of conical crushing-rollers having teeth engaging with said rack, and bearings in the casing, substantially as described.

4. In combination, a suitable hopper, a runner arranged beneath the same, having a grinding-surface and a crushing-surface above the grinding-surface, a shell or casing, rollers adapted to bear on said surfaces, and a yielding support for the runner.

896,560. TAX-RECEIPT BLANK. JOHAN S. HARRISON, Lebanon, and JOHN M. HOWARD, Thorntown, Ind. Filed May 14, 1888. Serial No. 273,842. (No model.)

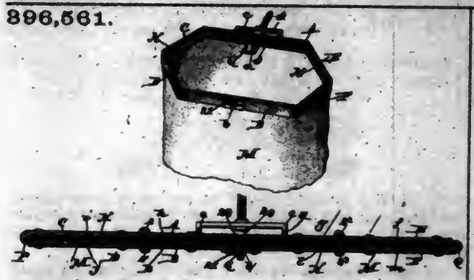
Claim.—1. A combined tax-receipt duplicate coupon and duplicate stub consisting of a single sheet of paper ruled and printed and divided by the perforations *d' d'* into three distinct parts or elements—*i. e.*, the main or central tax-receipt blank, B, having a suitable heading and suitable spaces for a plurality of complete accounts, the coupon

896,560.

C, and the stub D, one at the right and the other at the left of the main receipt-blank B, both of which are duplicates in brief of said main receipt and are detachable, substantially as shown and described.

2. The sheet of paper, A, (in one piece,) comprising the ruled and printed tax-receipt B, the duplicate coupon C, and duplicate stub D, and having the perforations extending vertically from the lower to the upper edge of the sheet A midway, or approximately so, between said receipt B and coupon C, and between the receipt B and duplicate stub D, whereby either the coupon or main receipt, or both, may be detached, substantially as described.

3. A combined tax-receipt, coupon, and stub consisting of the single sheet A, separated or divided by vertical perforations *d' d'*, as shown, to form three distinct connected but detachable parts—*i. e.*, the main-receipt blank B, having a suitable heading and ruled or printed to form the vertical columns F' G' H' I', the duplicate coupon C, and duplicate stub D, one at the right and the other at the left end of said sheet A, and each having a heading similar to the heading in the main-receipt blank B, and each being ruled or printed to form the vertical columns L^4 L^5 L^6, which correspond to the columns F' G' I' in the main-receipt blank, all substantially as shown, and for the purpose described.



4. The continuous sheet A, ruled and printed to form and combine the three followingly-arranged parts—*i. e.*, the main-receipt blank B, having suitable vertical entry-columns divided horizontally by lines L M, as described, the duplicate coupon C and stub D at the right and left of the main-receipt blank B, having duplicate vertical entry-columns, and having horizontal spaces and horizontal lines to correspond to and in a line with the horizontal spaces and lines in the main blank receipt B, and being detachably divided off from the blank receipt by vertical perforations *d' d'*, substantially as described, and for the purpose set forth.

5. In a tax-receipt, the continuous sheet A, the main-receipt blank B, having the vertical dividing-lines F G H I, to form the number, descriptive, and amount columns F' G' I', and the intermediate recording-columns, H', and having the horizontal lines L M, to divide the entire main-receipt blank B into a given number of parts or spaces, whereby the real tax, gravel-road tax, railroad tax, &c., may be recorded, so as to be independent of each other, and the removable coupon C and stub D, having columns and lines to correspond with the columns and lines in the main receipt B, and each of said parts—*i. e.*, the main receipt B, coupon C, and stub D—having lines and spaces at the lower end on or in which signatures or remarks may be written, substantially as described, and for the purpose set forth.

896,561. BAG-HOLDER. THOMAS W. HARRISON, Emmetsburg, Iowa. Filed May 18, 1887. Serial No. 238,711. (No model.)

Claim.—1. The herein shown and described frame for a bag or sack, composed of two side sections, A and B, the folding end sections, C and D, uniting the side sections at one end, and the folding end sections, E and F, uniting the side sections at their other end, substantially as set forth.

896,561.

2. The herein shown and described frame for a bag or sack, composed of the side sections, A and B, and their folding end sections, C D and E F, the joints P and Q of the end sections projecting inward, and the joints *a*, *a'*, a^2, and a^3 between the end and the side sections projecting outward, substantially as and for the purpose described.

3. The combination, with the frame composed of a series of sections hinged together, one section having an oblong opening, of the rotatable lock-bolt having an oblong head and secured to a corresponding opposite section of the frame and adapted to have its head thrust through and set crosswise of the said opening, and the spring for engaging with the said head, substantially as and for the purpose described.

4. The combination, with the frame composed of a number of sections hinged together, one section having an oblong opening, of the lock-bolt having an oblong head and a groove, 28, the pin 20, for securing the lock-bolt to a section of the frame and permitting a partial rotary movement of the said bolt, and the spring 21 to prevent the back movement of the said bolt, substantially as and for the purpose described.

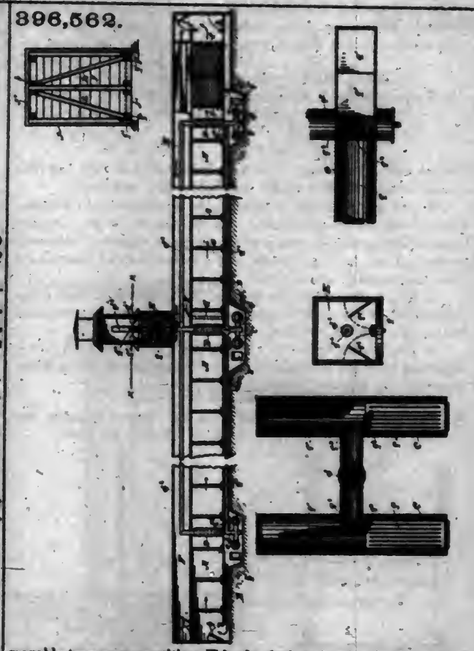
5. The combination, with the frame, of the holder secured to the side of the frame by rule hinge-joints and adapted to hold the frame in a horizontal position and to fold upward, substantially as and for the purpose described.

6. The combination, with the frame and the holder or bail C, angular in cross-section, of the bracket-support having its head provided with the depression *v*, which corresponds to the holder in cross-section, substantially as and for the purpose described.

7. A combined frame and holder for sacks, composed of a series of sections hinged together, one of the sections having lugs *d* and *e*, and the holder hinged by a rule-joint to the said lugs, substantially as and for the purpose described.

8. The combination, with the frame composed of a series of sections hinged together, the hinge-joints projecting beyond the opposing sides of the sections, of the bag secured to the frame and the packing-strips secured to the opposing sides of the frame, substantially as and for the purpose described.

896,562. DRIER. ANDREW J. HATCH, San Francisco, Cal. Filed Apr. 2, 1888. Serial No. 269,338. (No model.)



Claim.—1. In a drier, the combination of a drying-chamber having valve-controlled openings at each end for the passage of the air into either end of the chamber, a conduit or air-passage on the top of said chamber parallel therewith and extending its full length, valve-controlled apertures connecting the ends of the drying-chamber with the ends of the conduit or air-passage, and an exhaust passage or aperture in the conduit or air-passage, whereby the course of the air in the drying-chamber may be reversed in direction by manipulating the valves, substantially as herein described.

2. In a drier, a drying-chamber having valve-controlled openings at each end for the passage of the air, and an air passage or conduit above connected at each end with the ends of the drying-chamber by gate-controlled apertures, in combination with a tower or vertical passage communicating with the air passage or conduit, a suction-fan in the side of said passage for creating an artificial draft, the gates *c'*, for closing the tower or passage above the fan, and the gates c^2, for shutting off the fan when the natural draft is desired, substantially as herein described.

3. In a drier, a drying-chamber having valve-controlled end openings for the passage of the air, the air passage or conduit on top of said chamber and communicating at each end by gate-controlled apertures with the ends of the drying-chamber, and the single exhaust-tower connected with the air-conduit above, in combination with a vertical partition dividing the drying-chamber into two parts, and the gate-controlled aperture in the top of the drying-chamber and communicating with the air-conduit above, whereby but half of the drying-chamber may be utilized, substantially as herein described.

4. In a drier having a drying-chamber, the cars I therein having compartments divided by air-tight partitions, in combination with removable transverse partitions H in the drying-chamber having openings communicating with one of the compartments of the cars, substantially as herein described.

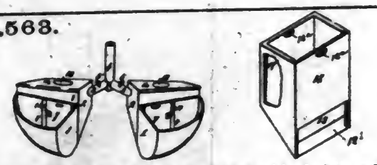
896,562.

5. In a drier having a drying-chamber, the cars I therein having compartments separated by air-tight partitions, in combination with the removable transverse partitions H in the drying-chamber having openings in alignment with one of the compartments of the car, and casings *K'*, surrounding said openings and joining with the partitions of the car, whereby a practically air-tight continuous flue is formed in the main drying-chamber and of reduced capacity, substantially as herein described.

6. In a drier having a chamber and open-sided cars adapted to move in and out, the means for closing the open sides of the cars as they are moving in and out, consisting of curtains attached to the chamber-frame and to the front of the car and covering its sides as it is drawn out, substantially as herein described.

7. In a drier having a drying-chamber with openings, and open-sided cars moving in and out of said openings, the means for closing the open sides of the car as they are moving, consisting of rollers mounted within the drying-chamber, and curtains attached to said rollers and to the front end of the cars, whereby they cover their open sides as they are drawn out, substantially as herein described.

8. In a drier, the drying-chamber having door-frames and the open-sided cars passing through the door-frames into and out of the chamber, in combination with the spring-rollers mounted within the door-frames and on each side thereof, and the curtains attached to the rollers and to the front end of the cars, substantially as herein described.



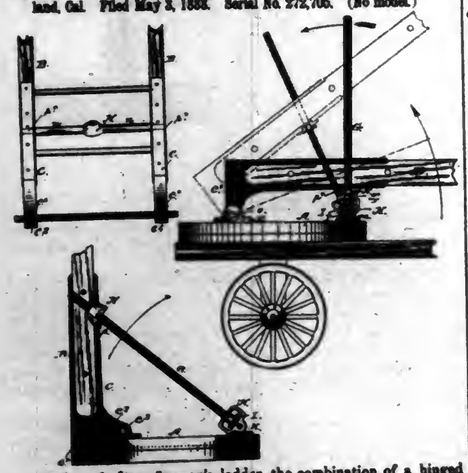
9. In a drier, the furnaces or heaters having the transverse partition c^3 forward of the outlet, in combination with the sliding longitudinal partition *c'*, made of independent and separately-movable sections, whereby a route is formed for the passage of the products of combustion, more or less direct, substantially as herein described.

10. In a drier, the drying-chamber, the heating-chamber below, the furnaces or heaters within the heating-chamber, and the radiators within the drying-chamber, in combination with the means for varying the radiation from the furnaces or radiators, respectively, consisting of the transverse partition c^3 in the furnaces forward of the outlet, and the sliding longitudinal partition or partitions movable to and from the transverse partition, whereby the course of the products of combustion is made more or less direct, substantially as herein described.

896,563. FEED-TROUGH. WILLIAM HAWKINS, St. Louis, Mo. Filed Feb. 16, 1888. Serial No. 264,196. (No model.)

Claim.—1. In a device for feeding animals, the combination, with a feed bin and box communicating therewith, of a removable close receptacle, 12, fitting the box and having a shutter whereby it may be

896,563.



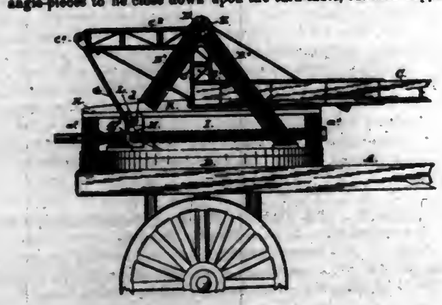
filled at a distant point, conveyed to and inserted in the box, and then opened to allow the flow of the material, as fully explained.

2. In a feeding device for animals, the combination of a feed-bin, a provisional feed-box connected with one side of the bin, a shutter located between the bin and provisional box, a mash-box within the provisional box, having an outlet, and a shutter located between the boxes, substantially as described.

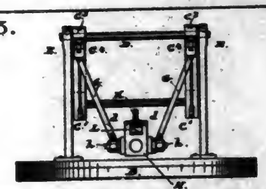
3. In a feeding device for animals, the combination, with a provisional box, of the removable mash-box fitting within the provisional box, substantially as described.

4. In a feeding device for animals, the combination of a provisional feed-box and a removable mash-box fitting therein, having downwardly-flaring chamber, substantially as described.

896,564. FIRE EXTENSION-LADDER. HENRY T. HAYES, Oakland, Cal. Filed May 3, 1888. Serial No. 272,705. (No model.)



Claim.—1. In a fireman's ladder, the combination of a hinged ladder having its hinge or pivot located at one side of the ends or feet of the side bars and a lifting mechanism consisting of the screw-shaft capable of movement in a vertical arc, the swiveled nut located in the center of the ladder or midway between the side bars and the power-shaft, constructed and arranged for operation substantially as set forth.



2. In combination, the fire-ladder mounted on a turn-table, the centrally-placed lifting-screw, swiveled nut, and transverse power-shaft geared into said screw and adapted to apply power to the same from either side.

896,565. FIRE EXTENSION-LADDER. HENRY T. HAYES, Oakland, Cal. Filed June 25, 1888. Serial No. 277,940. (No model.)

Claim.—1. In combination with a fire-ladder of the hinged or pivoted kind, the angle-pieces on the foot of the ladder, having the pivot D at the angle, and the ladder-beams secured at one end of the angle-pieces to lie close down upon the turn-table, suitable supports

896,565.

on the turn-table adapted to support the pivot above the turn-table, and lifting mechanism consisting, essentially, of the screw I and traveling nut H and connecting-links G G, substantially as hereinbefore described.

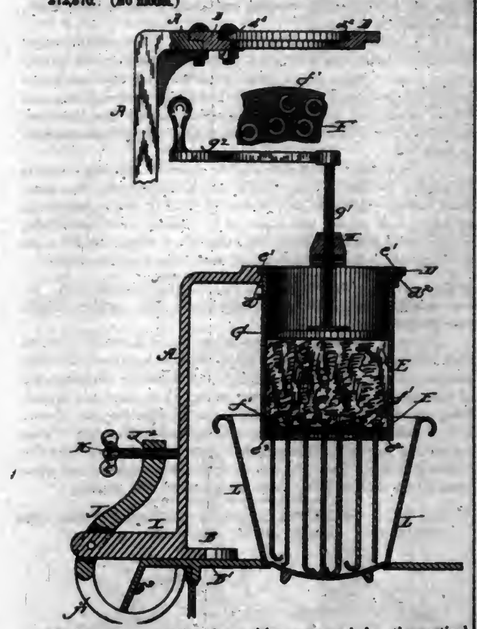
2. In an extension-ladder which is mounted for use on a truck, substantially as described, the combination of the supports for the pivot D, the angle-pieces composed of the parts C', adapted to be secured to the foot of the ladder and having the pivot D at the end, and the arms C^3, extending forward and on the opposite side of the pivot and attached at their outer ends to a lifting mechanism, as a screw and traveling nut, arranged for operation as set forth.

3. In an extension-ladder of the hinged or pivoted kind, the lifting mechanism consisting of the screw I, the traveling nut H, having the recess and friction-roller L, and the guide-rail K, arranged for operation substantially as set forth.

896,566. DENTAL ARTICULATOR. RICHMOND S. HAYES, East Bloomfield, N. Y. Filed Sept. 10, 1888. Serial No. 285,018. (No model.)

Claim.—1. The combination, with a dental articulator having holding-frames one above the other, the upper frame having a bar at its rear end of a length to correspond with the average distance from one condyle to the other, provided with projections on its front and rear sides at right angles thereto, the front projection being longer than the rear one, and the two forming ear-shaped cavities, of arms connected with the lower holding-frame having outwardly-extending processes working in said cavities, the bar of the upper holder being yieldingly secured to the lower holder and adapted to be tilted or rocked from side to side upon said processes, as set forth.

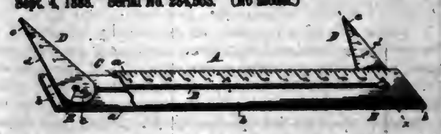
2. The combination, with holders adjustable one upon the other, having straight bars extending laterally across their rear ends, of a spring adjustment uniting said bars at their center, the upper bar having near its ends front and rear projections, forming ear-shaped cavities, and the ends of the lower bar forming condyles working in said cavities, adapting the upper holder to be tilted or rocked from side to side, as set forth.



3. The combination, with holders one of which is adjustably held over and at a parallel distance above the other, with straight bars extending laterally across their rear ends, of a spring-hook secured to the center of the lower bar, having its shank extending through the upper bar, with a spring thereon, and a socket-nut yieldingly holding said spring down upon the upper bar, as set forth.

4. The combination, with holders one above the other, of a post in the lower holder, a re-enforced sleeve on said post having curved arms extending outward and backward, the ends of the arms united by a lateral bar having condyles on its ends, and an adjusting-screw in the re-enforced portion of the sleeve, the upper holder having a bar with cavities near its ends adapted to work over said condyles and yieldingly secured to the lower bar at its center, as set forth.

5. The combination, with adjustable holders one over the other, having lateral bars at their rear ends yieldingly secured together at their center, of front and rear projections near the ends of the upper bar forming an ear-shaped cavity, the rear projections having adjusting-screws extending into the cavities, and condyles on the lower bar working in said cavities, as set forth.

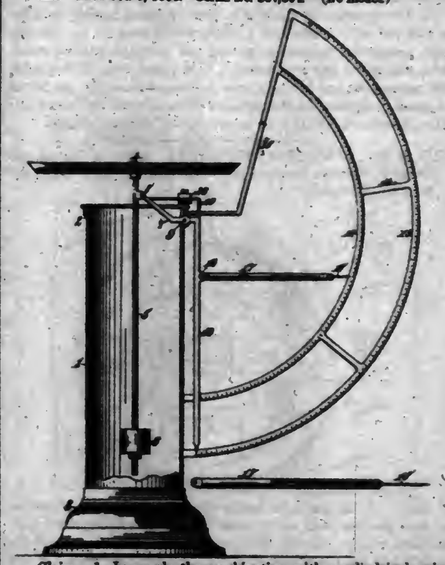


6. The combination, with holders one above the other, yieldingly secured together by bars at their rear ends, of a tongue extending forward from the upper bar, having its edges recessed downward and outward from the top to a lateral flange beneath, the tongue having a set-screw therein and collar on the screw, and a beveled slotted tongue on the upper holder resting on said flange and extending above its tongue under the collar, adapted to be adjusted back and forth and to be held in place by the said screw, as set forth.

896,567. MACHINE FOR MAKING MACARONI AND NOODLES. CHRISTIAN HELD, Indianapolis, Ind. Filed Apr. 30, 1888. Serial No. 272,370. (No model.)

Claim.—In a machine for making macaroni, &c., the vertical standard A, having the outwardly-projected upper end, the horizontally-extended base B, and the rearwardly-projected bar I at the lower end, the ring D, removably secured to the upper end of the standard A, the cylinder E, (or receptacle,) having mechanism for forming macaroni or noodles, removably secured to the ring D, and the clamp J, pivoted to the bar I of the standard and having two upwardly-curved fingers at its forward end remote from each other, adapted to encircle the rim of the stove and press against the under side of the stove-top, and the adjusting-screw K, extended through the upper end of the clamp and pressing against the standard to force the bifurcated or fingered end of the clamp closely in contact with the stove-top, substantially as shown, and for the purpose set forth.

896,568. DRAFTING-RULER. WILLIAM F. HELLER, Washington, D. C., assignor of one-half to Thomas A. Mitchell, same place. Filed Sept. 4, 1888. Serial No. 284,503. (No model.)

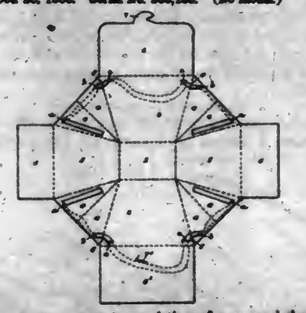


Claim.—1. The combination, with a drafting-ruler having a scaled bar, of reversible and adjustable graduated arms thereon having their inner edges straight and at an obtuse angle extending outward from the bar and their outer edges at a right angle to the edge of the bar, as set forth.

2. The combination, with a scaled bar having pockets in its edge and slots in its sides, of scaled arms pivoted in said slots and adapted to be folded into the pockets or opened to form an obtuse angle at their inner edges and a right angle at their outer edges with the edge of the bar, as set forth.

3. The combination, with a scaled bar composed of two sections having slots in their sides united together with spacing-strips between their ends and center, forming pockets therein, of scaled arms pivoted in said slots and adapted to be folded into the pockets or opened so their inner edges will form obtuse angles and their outer edges right angles with the edge of the bar, as set forth.

4. The combination, with a scaled bar composed of two sections having slots in their sides extending from near one end to the other, said sections being united with spacing-strips between them at their ends and center, forming pockets therein, of triangular-shaped scaled arms having holding-lips on their outer edges near their ends pivoted and adjustable in said slots and adapted to be folded into the pockets or to be opened, so their inner edges will form obtuse angles with the edges of the bar, as set forth.

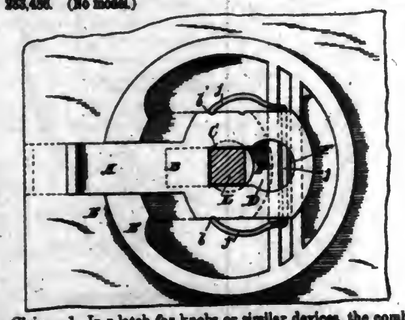


896,569. WEIGHING-SCALE. THOMAS H. HERNDON, Birmingham, Ala. Filed Oct. 9, 1888. Serial No. 287,664. (No model.)

Claim.—1. In a scale, the combination, with a cylindrical casing, of a central spindle having a weight at its lower end and a scale-pan at the upper end, an arm or index fulcrumed on the casing and pivotally connected to the spindle, said arm being bent beyond its fulcrum and extended down vertically to give indications on a curved graduated plate, and an auxiliary index pivotally mounted on said arm and having an extensible needle indicating the graduations of the curved plate or of an outer parallel plate, substantially as specified.

2. In a scale, the combination, with a cylindrical casing, of a central spindle carrying the pan and having a weight at its lower end, an arm pivotally connected to the spindle, fulcrumed on the casing and bent beyond the fulcrum vertically downward, an auxiliary arm or index pivotally mounted on said arm and having an extensible needle, an auxiliary or counterbalancing weight moving upon an arm rigidly mounted on the arm pivoted to the spindle, and two graduated arc-shaped plates having their center at the fulcrum of said arm and rigidly mounted on the casing, substantially as specified.

896,570. PAPER BOX. FREDERICK G. HOVENDEN, Brooklyn, N. Y. Filed Oct. 25, 1888. Serial No. 289,132. (No model.)



Claim.—1. A receptacle consisting of a creased sheet of paper, having a body comprising a bottom, two sides, two ends, creased gussets at the corners connecting the sides and ends, and tapes secured at their ends to one of the two plies of each gusset, and threaded through slits in the plies of the gusset and the adjacent side of the box, substantially as set forth.

2. A receptacle consisting of a creased sheet of paper, having a body comprising a bottom, two sides, two ends, and inwardly-folded creased gussets at the corners, connecting the adjacent sides and ends,

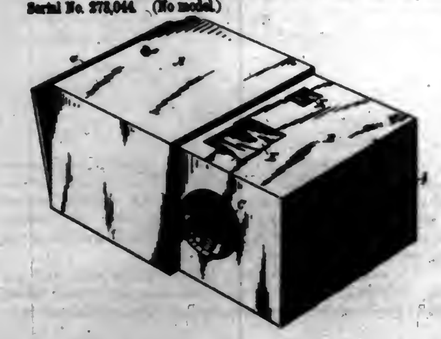
and having, also, end cover-flaps on the box ends overlapping main cover-flaps 6 6' on the box sides, a fastening for the outer main cover-flaps, and handles formed of tapes 8 8, threaded through slits in the box sides and in the plies of the gussets, said tapes being secured at their ends to the gusset-plies, as described, whereby the said tapes serve as a means for folding the body of the receptacle and retaining it when folded, as set forth.

3. A receptacle consisting of a sheet of paper, having its adjacent side and end connected by a gusset with creases at the junction of said gusset with the respective side and end, and a crease which divides said gusset into two plies, 4 4, said gusset being folded inside of the receptacle, and having a tape secured at its end to one ply of said gusset, and threaded through slits in the plies of the gusset and in the adjacent side of the box, as and for the purpose set forth.

396,571. DOOR-KNOB ATTACHMENT. HENRY A. IDDINGS and JOSEPH P. MEENATH, Omaha, Nebr. Filed Aug. 22, 1888. Serial No. 283,456. (No model.)

Claim.—1. In a latch for knobs or similar devices, the combination, with the rose-plate, of the cross-bars F F, the sliding catch A B, adapted to engage with the shank of a knob and supported on the bars F F, and the retaining-spring engaging with said bars F F and with the sliding catch, the latter having a handle projecting beyond the rose-plate, substantially as set forth.

2. The combination, with the base E, having the cross-bars F F, and the guide H, of the sliding catch mounted in said guide and upon said cross-bars and adapted to engage with the shank of the knob, and the rose-plate which secures in place both the base and the sliding catch, substantially as set forth.



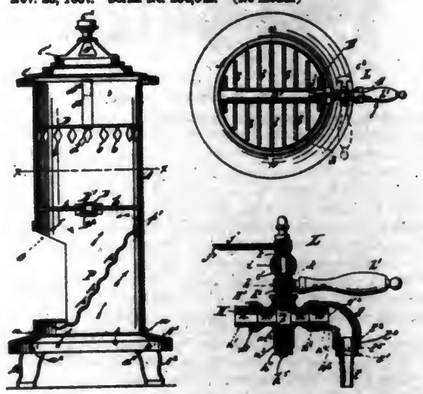
3. The combination, with the sliding catch adapted to engage with the shank of the knob, of the support upon which said catch slides, and a spring bent to have the part *j* below the catch, and the parts *j'* to engage therewith, substantially as described.

396,572. AXLE. JAMES JENCKES, Brooklyn, N. Y. Filed Feb. 15, 1886. Renewed May 10, 1888. Serial No. 273,391. (No model.)

Claim.—The combination, with the axle-bar having a hole in the end and a nut screwing upon such axle-bar, of a removable axle having a round inner end that fits the hole in the axle-bar, a conical collar that is clamped by the nut, and a tapering outer end, substantially as specified.

396,573. CAMERA-CARRYING CASE AND PLATE-CHANGING BOX. JAMES H. JOHNSON, San Francisco, Cal. Filed June 23, 1888. Serial No. 278,044. (No model.)

Claim.—1. A camera-carrying case and plate-changing box composed of an exterior frame with a lid or cover for affording access to its interior and an interior frame with a bottom and provided with hand-holes having wristbands, said frames telescoping to form when closed a complete case, and when extended a box within which the plates may be changed by inserting the hands through the wristbands, substantially as described.



2. A camera-carrying case and plate-changing box composed of an exterior frame with a lid or cover affording access to its interior and an interior frame with a bottom, and provided with hand-holes having wristbands and with a suitable non-actinic glass or glasses, said frames telescoping to form when closed a complete case, and when extended a box within which the plates may be changed, substantially as described.

3. The exterior frame with a lid or cover for affording access to its interior, the interior frame with a bottom and provided with hand-holes having wristbands, said frames telescoping, and the stop-strips by which their closing and extension are limited, the whole forming when closed a case for carrying the camera, and when extended a box in which the plates may be changed, substantially as described.

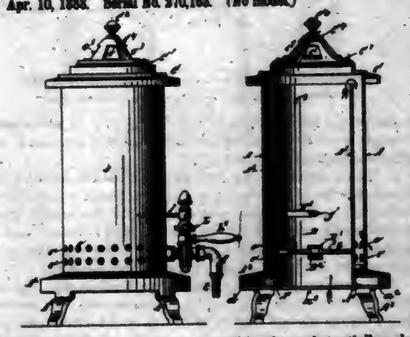
396,574. FORMATION OF PURPLE COLORING-MATTER. ALFRED KERN, Basle, Switzerland. Filed Apr. 11, 1888. Serial No. 270,294. (No specimens.)

Claim.—The purple coloring-matter herein described, obtained from the methylic ether of gallic acid and hydrochloric nitroso-dimethylaniline, showing the formula $C_{16}H_{14}N_2O_5HCl$, having the properties of dissolving in cold water and very easily in hot water, and crystallizing out of the cooled concentrated solutions when they are allowed to cool and stand or when common salt is added, the crystals being slender and brownish brilliant, and, if pressed out, showing brownish brilliantly-shining scales, the solutions becoming fuchsine red when treated with acids and blue violet when treated with alkalies.

396,575. GAS-STOVE. LANDON KETCHUM, Bridgeport, Conn. Filed Nov. 25, 1887. Serial No. 256,042. (No model.)

Claim.—1. In a gas-stove, the combination, substantially as hereinbefore set forth, with a gas-burner composed of a series of horizontal and parallel gas-supply pipes provided on their upper surfaces with openings or jets for the escape of the gas and connected with a central supply-pipe, of a horizontal diaphragm placed in the interior of the stove above the burner, a space being left around the periphery of the diaphragm for the passage of gases, the exterior shell of the stove being provided with a series of horizontal openings immediately below the diaphragm and one or more openings in the top of the stove above the diaphragm, for the purposes set forth.

2. In a gas-stove, the combination, as described, of a gas-burner composed of a series of horizontal and parallel gas-supply pipes provided upon their upper surfaces with openings for the escape of gas, an inclined plate placed below the burner, an outer shell provided with an opening in the front of the stove and opposite said plate, and an open bottom back of said plate for admitting air to the space back of the same, a space being provided for the passage of air between the top of the inclined plate and the shell of the stove and immediately under the burner, for the purposes set forth.



3. In a gas-stove, the combination, substantially as hereinbefore set forth, with the spindle and handle of the gas-supply valve, of an igniter having the horizontal hollow igniting-arm *j* attached to the passage *k* in the valve-spindle, there being an opening, m^3, in the walls of the valve-spindle for connecting said passage with the main gas-supply passage, the thumb-screw *l*, and the valve *i*, placed in the passage *k* for cutting off the gas-supply from the same, so constructed and arranged that the opening of the supplying-valve causes the igniter to enter the stove and light the burner.

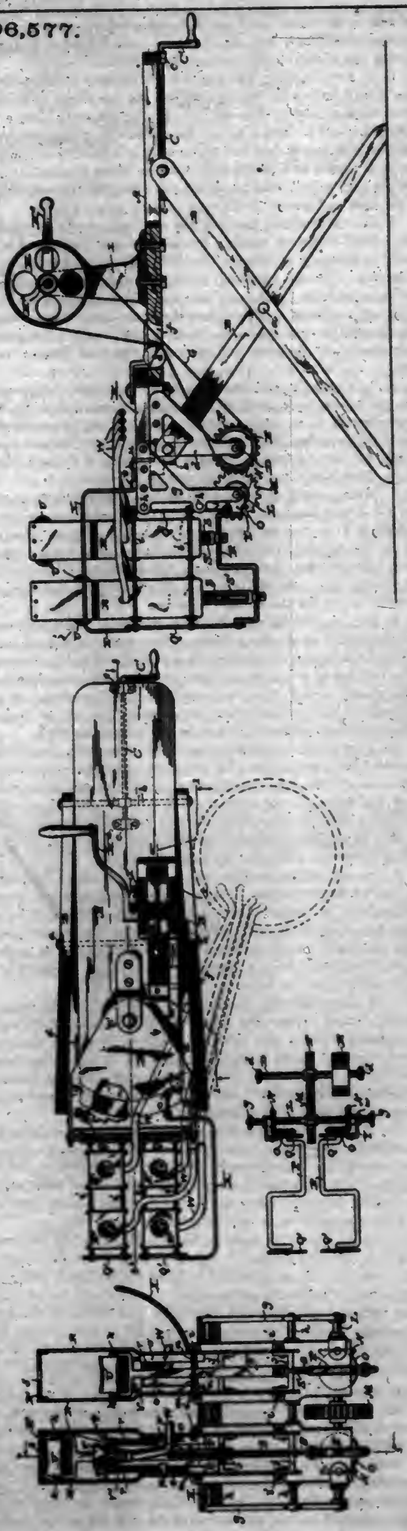
4. In a gas-stove, the combination, with the shell and with the horizontal gas-burner composed of a series of horizontal and parallel gas-supply pipes, of a horizontal diaphragm placed within the stove above and parallel to the gas-burner, said diaphragm being of such size that a passage is left between its periphery and the shell of the stove for the escape of the heated gases, the outer shell being provided with a series of openings in close proximity to the diaphragm for the escape of the heated gases.

5. In a gas-stove, the combination, substantially as hereinbefore described, with the shell of the stove provided with openings in the top above the diaphragm and means for regulating the size of said openings, as described, of a diaphragm placed in the interior of the stove above the burner of such relative size that a passage is left between its periphery and the shell of the stove, the said shell being provided with a series of openings for the discharge of hot gas immediately below said diaphragm.

6. In a gas-stove, the combination, substantially as hereinbefore set forth, with the shell of the stove provided with the openings *o' o'* in its top and the openings *o o* in its side walls, of the diaphragm D in the interior of the stove, so arranged that its periphery shall be in close proximity to and immediately above said openings for throwing the heated air to the sides of the stove and through said openings.

396,576. GAS-STOVE. LANDON KETCHUM, Bridgeport, Conn. Filed Apr. 10, 1888. Serial No. 270,163. (No model.)

Claim.—1. In a gas-stove, the combination, substantially as hereinbefore set forth, of an outer hollow shell or cylinder surmounted by a closed top having an adjustable opening therein and provided with one or more openings at or near the bottom of the same for the escape of gas, an inner hollow shell or cylinder within the said outer shell open at both top and bottom and unobstructed throughout its entire length except by the burner, so as to permit a free escape of the hot air and gas, means, substantially as described, for closing the space between the two shells at the bottom, and a gas-burner in the hollow interior of the inner shell at or near the base of the same.



2. In a gas-stove, the combination, substantially as hereinbefore set forth, of an outer hollow shell or cylinder closed at the top and provided with one or more openings at or near the bottom of the same for the escape of the hot gases, an interior hollow shell or cylinder within the said outer shell open at both top and bottom and unobstructed throughout its entire length except by the burner, so as to permit of the free escape of hot air and gas, means, substantially as described, for closing the space between the two shells at the bottom, and a gas-burner in the hollow interior of the inner shell at or near the base of the same.

3. In a gas-stove, the combination, as hereinbefore set forth, of an outer shell or cylinder closed at the top, provided with one or more openings at or near the bottom of the same, an inner hollow shell or cylinder within said outer shell open at both top and bottom and unobstructed throughout its entire length except by the burner, so as to permit of free escape of hot air and gas, means, substantially as described, for closing the space between the two shells at the bottom, and the gas-burner in the hollow interior of said shell at or near the base of the same, composed of a series of horizontal and parallel gas-supply pipes having openings or jets on their upper surfaces for the burning of the gas, said pipes being connected with the central gas-supply pipes.

396,577. COW-MILKING MACHINE. JOHN J. LAWRENCE, Jonesburg, Wis. Filed Aug. 24, 1888. Serial No. 283,602. (No model.)

Claim.—1. In a cow-milking machine, the combination of a milking apparatus, a supporting-base having front and rear cleats upon its under side, four legs that cross each other in pairs and are pivoted together at their crossing-points and individually pivoted at their up-

396,577.

per ends to the cleats, and a screw-threaded adjusting-rod having its bearings on said base and engaged by a screw-threaded opening in the rear one of said cleats, substantially as set forth.

2. In a cow-milking machine, the combination of a supporting-base, a shaft having its bearings thereon and carrying a gear-wheel, means, substantially as described, for driving the shaft, a table pivoted to the base to have a lateral movement with relation thereto, a latch for locking said base and table together, a shaft having its bearings on the table and provided with a gear-wheel arranged to mesh with the gear-wheel on the base-shaft, and a milking apparatus carried by the table and geared to the shaft thereon, as set forth.

3. In a cow-milking machine, the combination of a supporting-base, a shaft having its bearings thereon and carrying a gear-wheel, means, substantially as described, for driving the shaft, a table pivoted to the base, a pivotal guard-rail having one end thereof arranged to serve as a latch for locking said base and table together, a shaft having its bearings on the table and provided with a gear-wheel arranged to mesh with the gear-wheel on the base-shaft, and a milking apparatus carried by the table and geared to the shaft thereon, as set forth.

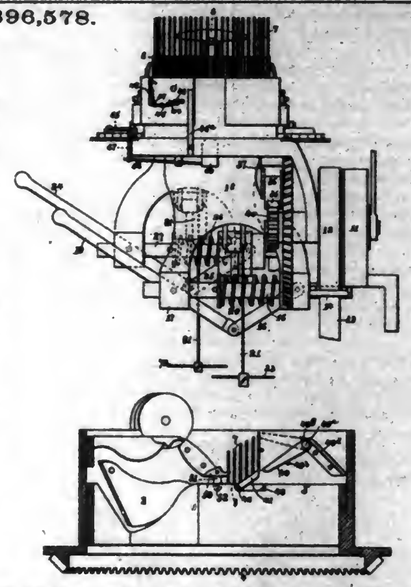
4. In a milking-machine, the combination, with a supporting-base and driving mechanism, of spring-plates connected to the driving mechanism to be reciprocated thereby, opposing pressure-rollers carried by the spring-plates, anti-friction rollers carried by said spring-plates, and inclined tracks arranged in the path of the anti-friction rollers, substantially as and for the purpose set forth.

5. In a cow-milking machine, the combination, with a supporting-base and driving mechanism, of spring-plates connected to the driving mechanism to be reciprocated thereby, opposing pressure-rollers carried by the spring-plates, anti-friction rollers carried by said spring-plates, inclined tracks arranged in the path of the anti-friction rollers, and spouted cups arranged beneath each pair of pressure-rollers, substantially as and for the purpose set forth.

6. In a cow-milking machine, the combination, with a supporting-base and driving mechanism, of spring-plates arranged in pairs, crank-shafts geared to the driving mechanism, sliding rods fast to the spring-plates and linked to the crank-shafts, opposing pressure-rollers journaled to said spring-plates, and anti-friction rollers carried by said spring-plates, and inclined tracks arranged in the path of the anti-friction rollers, substantially as and for the purpose set forth.

7. In a cow-milking machine, the combination, with a supporting-base and driving mechanism, of spring-plates arranged in pairs, crank-shafts geared to the driving mechanism, sliding rods fast to the spring-plates and linked to the crank-shafts, opposing rollers journaled to said spring-plates, means, substantially as described, for compressing the latter at predetermined intervals, spring-supported cups, and spouts leading therefrom, as and for the purpose set forth.

8. In a cow-milking machine, the combination, with a supporting-base and driving mechanism, of spring-plates connected to the driving mechanism to be reciprocated thereby, opposing pressure-rollers carried by the spring-plates, anti-friction rollers, also carried by said spring-plates, and tracks for the anti-friction rollers arranged at an angle to a vertical plane and having oppositely-beveled ends, substantially as and for the purpose set forth.



9. In a cow-milking machine, the combination of a base, A, table K, pivoted thereto, the guard-rail X, having the latch end u, for engaging the base and table, the plates Q, Q', and R, the transverse tent-guides R', the tracks o on the plates R, the sliding rods S, links S', and crank-shafts P, the spring-plates T, carrying rollers U, the spring-supported cups V, and a driving mechanism geared to said crank-shafts, substantially as set forth.

10. In a cow-milking machine, the combination of the plates Q Q', connected by longitudinal rods *i*, and said plates Q loosely arranged on transverse rods *h*, the plates R, loosely arranged on the rods *i*, the reciprocating spring-plates T, carrying rollers U, means, substantially as described, for compressing said plates at predetermined intervals, and driving mechanism, as and for the purpose set forth.

11. In a cow-milking machine, the combination of the adjustable plates Q R, the spring-plates T, carrying-rollers U and connected to sliding rods S, means, substantially as described, for compressing said spring-plates at predetermined intervals, crank-shafts P, linked to said sliding rods and provided with the bevel gear-wheels O, the bevel gear-wheels N, adjustably arranged on a shaft, L, and in mesh with said gear-wheels O, and a driving mechanism, substantially as described, geared to the shaft L, as and for the purpose set forth.

396,578. CIRCULAR-KNITTING MACHINE. ELIAS LIPPITT, Zanesville, assignor to Anna L. Lippitt, Muskingum County, Ohio, and H. H. Sturtevant and John Martin. Filed Sept. 5, 1887. Serial No. 248,871. (No model.)

Claim.—1. In a circular-knitting machine, the combination, with the needles, a needle-holder, and a cam-cylinder, of a cam, as 41, pivoted to said cylinder below the path of the needles for throwing the needles up out of action, a lever connected with the pivotal shaft of

said cam on the outside of the cylinder, a lever, as 45, and a spring and toggle-levers for actuating said lever, whereby the cam is operated, substantially as described.

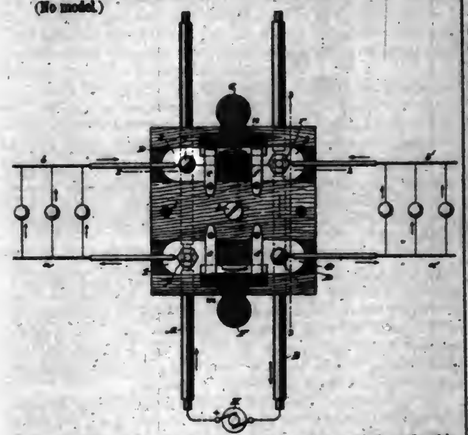
2. The combination, with the main frame, needles, needle-holder, and cam-cylinder, of throwing-up cams, arms pivoted to said cylinder on which said cams are pivoted, arms secured to the journals of said first-mentioned arms on the outside of said cylinder, vertically-moving rods arranged on said cylinder beneath said arms, and cams on the main frame for moving said rods, substantially as described.

3. The combination of the needles, the needle-holder, the cam-cylinder, throwing-up cams having pivotal connections with carrying-arms pivoted to the cylinder on each side of the stitch-cams, arms connected with said carrying-arms, cams on the main frame, vertically-moving rods mounted on the cam-cylinder operated by said cams on the main frame for moving the said arms, and thus operating the throwing-up cams, and ratchet-wheels and pawls for rotating the cams on the main frame by the movement of the cam-cylinder, substantially as set forth.

4. The combination of the needles, needle-holder, cam-cylinder, throwing-up cams, and arms on which said cams are pivoted, levers secured to said arms outside the said cylinder, cams on the main frame, rods between said last-named cams and said levers, a lever pivoted on the main frame and operated by said cams on the main frame, a lever and cam operated by said last-named lever, swinging arms, as 70, on said cylinder operated by the last-mentioned cam, throwing-down cams located near the upper inner portion of the said cylinder, studs secured to the same, vertical rods resting on said arms 70 for moving said studs, whereby the throwing-down cams are operated, springs on said rods, and the ratchets and pawls, substantially as described.

5. The combination of the needles, the needle-holder, the cam-cylinder, the stitch-cams, a throwing-down cam on each side of the stitch-cams, a cam supported on the main frame, swinging arms secured on the cylinder, spring-actuated rods supported on said arms and placed in contact with studs formed on said throwing-down cams, said cam on the main frame coming in contact with said arms, whereby said cam operates the throwing-down cams, and a lever and cam secured on the main frame for operating said cam supported on the main frame, substantially as set forth.

6. The combination, in a circular-knitting machine, of throwing-down cams having studs projecting out therefrom, springs and rods for forcing said studs upward, arms, as 70, supporting said rods and springs, a cam located on the main frame for operating said arms 70, and levers and a cam located on the main frame for operating said other cam, whereby the same is raised and lowered, substantially as described.



7. The combination, in a circular-knitting machine, of the throwing-down cams, disks whereon the same are mounted, studs on said disks, spring-pressed rods bearing under said studs, spring-supported arms for operating said rods, and a cam on the main frame for operating said rods, substantially as described.

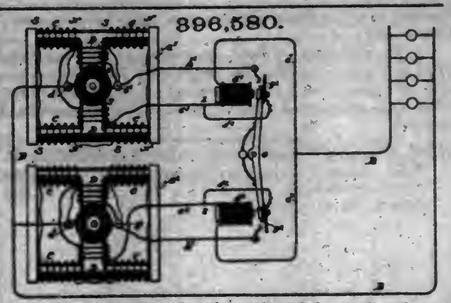
8. In a circular-knitting machine, the combination, with the main frame, of a cam-cylinder, 1, ratchet-cams mounted on the main frame, pawls carried by the cam-cylinder for operating said ratchet-cams, throwing-up and throwing-down cams secured to the cam-cylinder, a lever having a cam, 69, secured thereto, swinging arms secured to the cylinder and with which said cam comes in contact, spring-actuated rods supported on said arms and acting against studs connected with said throwing-down cams, vertically-moving rods carried by said cylinder, having contact with arms connected with the throwing-up cams and operated by said ratchet-cams, the lever 65, and the rod 67, substantially as described.

9. The combination, in a circular-knitting machine, of the cam-cylinder, circular driving-rack 4 thereon, bevel-gear 9, shaft 10, pinion 40, rack-bar 35, pulley 31, connected to said rack-bar, loose pulley 30, belt 29, belt-shifting mechanism and pan 79, and rod 80, for operating said belt-shifting mechanism, substantially as described.

10. The combination of a cam-cylinder, 1, driving-rack 4 thereon, gear 9, shaft 10, pinion 40, rack-bar 35, mechanism for reciprocating said rack-bar, bracket 37, sliding block 36, supporting said rack-bar and supported by said bracket, and handle 38, with cam 39, for throwing said rack-bar into and out of engagement, substantially as set forth.

396,579. WIRING-BLOCK FOR ELECTRICAL CIRCUITS. ORSON P. LOOMIS, Somerville, Mass., assignor to the Loomis Electric Manufacturing Company, of New York. Filed Aug. 17, 1888. Serial No. 282,164. (No model.)

Claim.—1. A safety-strip for electric circuits, consisting of a thin piece of vulcanized non-conducting fiber of the form shown and described, with a projecting thumb-piece and a cut-away edge having tin-foil wrapped around the same, and spring terminals adapted to hold the same in place and complete the circuit by way of the tin-foil, substantially as described.



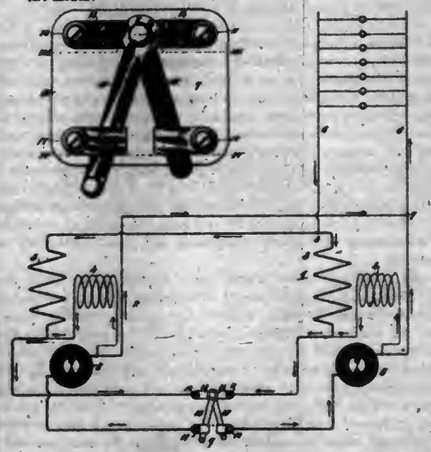
2. The combination of the conductors A B, the metal pieces 1 2 3 4, mounted in a grooved block of non-conducting material, the subsidiary conductors *a b a' b'*, clamping devices *p r*, for the main conductors and one terminal of the subsidiary conductors, binding-screws *q s*, for the other terminals thereof, and fusible connections between said metal pieces 1 3 and 2 4.

3. The combination of the conductors A B, the metal pieces 1 2 3 4, mounted in a grooved block of non-conducting material, the subsidiary conductors *a b a' b'*, clamping devices *p r*, for the main conductors and one terminal of the subsidiary conductors, binding-screws *q s*, for the other terminals thereof, springs *c d e f*, mounted upon said block over said metal pieces, and removable tongues or strips F G of non-conducting material or fiber bearing tin-foil, bridging the space between the metal pieces and springs, in the manner and for the purpose described.

396,580. COUPLING DYNAMOS. ORSON P. LOOMIS, Somerville, Mass., assignor to the Loomis Electric Manufacturing Company, of New York. Filed Sept. 13, 1887. Serial No. 249,573. (No model.)

Claim.—1. The combination, with dynamo-machines supplying current to an electric current in multiple arc, of electro-magnets arranged in the circuits emanating from said dynamo-machines, and contacts controlled thereby to modify the magnetizing effect of the field-magnet coils thereof, so as to produce an equalizing effect between the same.

2. The combination, with dynamo-machines arranged in multiple arc in an electric circuit, of electro-magnets arranged in the circuits emanating from said dynamos, contacts controlled by said electro-



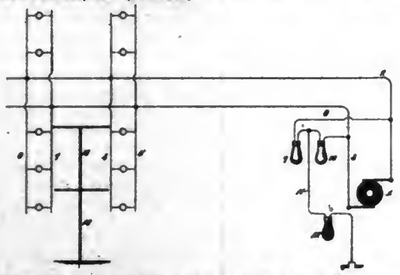
magnets as one or the other dynamo overbalances the other, and electrical connections from the field-magnet coils having their terminals arranged in the path of said contacts, for the purpose described.

3. The combination of the dynamos A' and A² of any suitable type arranged in multiple arc in an electric circuit, the electro-magnets *d'* *d²* in the circuits leading from said dynamos, a pivoted lever, *e*, disposed between the same, and electrical connections from said dynamos controlled by said electro-magnets and lever to equalize the current supplied by said dynamos upon a rise of potential in either.

4. The combination, with the compound-wound dynamos A' and A² of any suitable type arranged in multiple arc in an electric circuit, of the electro-magnets *d'* and *d²* in the circuits emanating from said dynamos, a normally-open short circuit around the series coils of said dynamo, and contact devices controlled by the preponderance of current circulating in said electro-magnets to close the short circuit of the series coils of the preponderating dynamo to equalize the current supplied by the two.

5. The combination, with the compound-wound dynamos A' and A² of any suitable type supplying an electric circuit in multiple arc, of a normally-open short circuit around the series coils of each, electro-magnets arranged in the circuits emanating from said dynamos and in the circuit of said short circuit when established, and a pivoted lever maintained in normal position bearing armatures for said electro-magnets, and controlled thereby to establish one or the other short circuit as one or the other dynamo preponderates in electro-motive force.

396,581. COUPLING OF DYNAMOS AND MOTORS. ORSON P. LOOMIS, Somerville, Mass., assignor to the Loomis Electric Manufacturing Company, of New York. Filed Apr. 19, 1888. Serial No. 271,216. (No model.)



Claim.—1. The combination of the dynamos 1 and 2, supplying a working-circuit in multiple arc and having shunt and series coils, the terminal 11, connected to one end of the shunt and series coils of the dynamo 1, the terminal 10, connected to one end of the shunt and series coils of the dynamo 2, switch-levers 15 and 16, pivoted one above the other to metal pieces 13 and 14 in electrical connection with said terminals, respectively, and terminals 17 and 18, arranged within the path of said switch-levers and connected to one of the commutator-brushes of the dynamos 2 and 1, respectively, substantially as described, whereby the shunt and series coils of each dynamo may be connected to a terminal of the other dynamo for the purpose

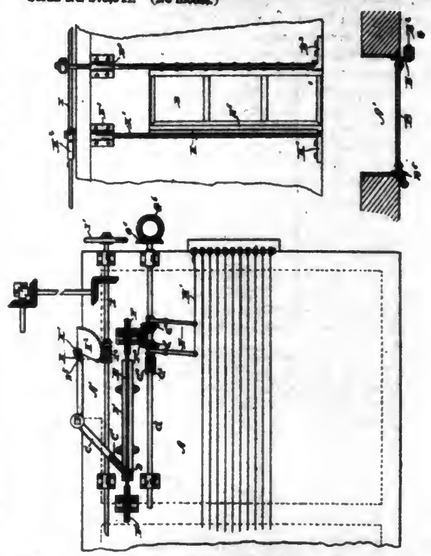
described, or may be disconnected therefrom and the dynamos worked independently.

2. The combination of the binding-posts 10 11, the metal pieces 13 14, arranged as described, the switch-levers 15 16, pivoted one above the other to said metal pieces, respectively, and two sets of spring-terminals connected to the binding-posts 17 18, substantially as described.

396,582. AUTOMATIC GROUND-DETECTOR FOR ELECTRIC CIRCUITS. OSBORN P. LOOMIS, Somerville, Mass., assignor to the Loomis Electric Manufacturing Company, of New York. Filed Aug. 7, 1888. Serial No. 282,182. (No model.)

Claim.—An automatic ground-detector for electric-light circuits, consisting of a wire, 8, connected, preferably, between the mains of said circuit at the central station, electric lamps 9 and 10 in series in said circuit 8, a ground-connection between the two, for the purpose described, and a signal-giving device located in said ground, substantially as and for the purpose described.

396,583. INCANDESCENT-LAMP SOCKET. OSBORN P. LOOMIS, Somerville, Mass., assignor to the Loomis Electric Manufacturing Company, of New York. Filed Sept. 3, 1888. Serial No. 284,400. (No model.)



Claim.—1. In an incandescent electric lamp, the combination, with the lamp-stem provided with the insulating projecting post carrying the lamp-terminals, which are formed with transverse coupling-corrugations, the said post and terminals together having a cross-section of greater length than breadth, of the lamp-socket adapted to receive the lamp-stem, a pair of spring-clutching contact-jaws arranged within the socket and connected to line and spaced correspondingly with the terminals and suitably corrugated, and a guard-plate located within the socket and formed with an opening of greater length than breadth, so as to allow said lamp-terminals to be entered therethrough only when properly presented, the said contact-jaws being accessible to the terminals through the opening of said plate, substantially as described.

2. In an incandescent electric lamp, the combination, with the lamp-stem 6 and the post 9, made of insulating material and having the lamp-terminals 10 and 11 attached thereto, said terminals formed with the transverse coupling-corrugations 13 and connected to the leading-in wires, and the post and terminals together having a cross-section of greater length than breadth, of the lamp-socket 14 and the spring contact-jaws 15 16, located therein and connected to line and formed with the transverse coupling-corrugations 17 17, and the guard-plate 19, formed with the opening 18 of greater length than breadth, and through which the contacts are accessible to the lamp-terminals, substantially as and for the purpose set forth.

3. In an incandescent electric lamp, the combination, with the lamp-stem having the lamp-terminals projecting therefrom, the lamp-socket for receiving the stem, and the line-contacts arranged within said socket and adapted to be engaged by the lamp-terminals when the lamp is put together, of the insulating guard-plate 19, formed with an opening, such as 18, and set within the lamp-socket, the line contacts being only accessible to the lamp-terminals through said opening 18 of the guard-plate, whereby false contact may be obviated in putting the lamp together, substantially as and for the purpose set forth.

396,584. STRENGTHENING AND LOCKING APPLIANCE FOR DOORS. GEORGE H. MARTIN, Columbus, Ohio. Filed May 28, 1888. Serial No. 275,241. (No model.)

Claim.—1. In a cell such as described, the combination of a door, an angle-iron riveted to the hinge edge of the door, and a bar rigidly attached to the said angle-iron and mounted in bearings, the lower of which is removed from the wall of the cell and the upper is secured to the wall of the cell at or near the top of the same, substantially as described.

2. In a cell such as described, the combination of a door, an angle-iron rigidly attached to the hinge edge of the door, a bar rigidly attached to the said angle-iron and mounted in bearings, the lower of which is removed from the wall of the cell and the upper is secured to the wall of the cell at or near the top of the same, a flange rigidly attached to the opening edge of the door and extending over the jamb, and any suitable means for securing the door when closed passing over the said flange, substantially as described.

3. In a cell such as described, the combination of a door, an angle-iron rigidly attached to the hinge edge of the door, and a T-iron rigidly attached to the opening edge, both irons extending the whole length of the door, to brace the same, substantially as set forth.

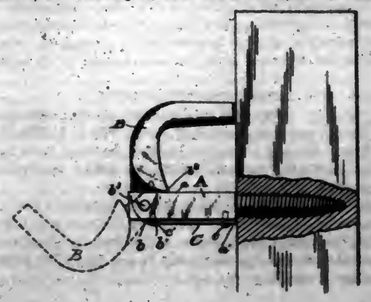
4. In a cell such as described, the combination of a door provided with angle-irons rigidly attached to the opposite edges, a bar forming the hinge rigidly attached to one of the said angle-irons and mounted in bearings which are removed from the wall of the cell, a bar similarly mounted in bearings at the opening side of the door and having a flange or fingers adapted to rest over the adjoining angle-iron on the door, and mechanism for rotating the said bar to bring the flange over the said angle-iron and for maintaining the same in position, substantially as described.

396,585. CAR-WINDOW. FRANK B. MALLORY, Flemington, N. J., assignor of one-fourth to Clarkson C. Dunham, same place. Filed May 31, 1888. Serial No. 275,547. (No model.)

Claim.—1. The combination, with the up and down sliding sash-frames of car-windows on both sides of a car, of two series of reversely-swinging and separately-adjustable glazed frames hinged to the sliding frames, one series on both sides of the car being adjustable to oblique positions adapted to one direction of movement of the car, and the other series adjustable to reverse oblique positions adapted to an opposite direction of movement of the car, substantially as and for the purpose described.

2. The combination, with a single up and down outer sliding sash-frame of a car-window, of two inner glazed frames hinged, respectively, to the uprights of the outer sliding sash, and separately adjustable to reverse oblique positions relatively to the side of the car, substantially as and for the purpose described.

396,586. VESSEL FOR HOLDING LIQUID GLUE. DAVID H. MARTIN, Gloucester, Mass., assignor to the Le Page Glue and Cement Company, same place. Filed Aug. 30, 1888. Serial No. 284,141. (No model.)



Claim.—1. As a new article of manufacture, a vessel for holding liquid glue and similar substances, consisting of a receptacle having a contracted neck surmounted by an annular shoulder, a top rising above said shoulder and having an opening, a cap or cover having a substantially central box provided with a central opening to receive the shank of the brush, and a wire fastener having arms 15, the ends of which are pivotally and positively fastened in opposite sides of said box, said arms extending laterally or in opposite directions from said box, and being bent downward beside the sides of the top, and provided with shoulders 17, lying beneath and in engagement with the shoulder above the neck, and connected by a yoke, 18, partly surrounding said neck, substantially as described.

2. In a bottle for holding liquid glue or other similar substance, said bottle having a neck surmounted by an annular shoulder, a cover seating upon the top of said neck and provided with a box, and a fastening having its ends pivotally mounted and positively fastened within said box, and extending laterally therefrom, thence bent downward, the lower ends of the converging arms being bent inwardly under the annular shoulder, and connected by a spring-yoke having a diameter slightly less than that of the neck beneath the shoulder, and lying in a plane which forms an angle of less than ninety degrees with the plane of the depending arms, the parts being combined to operate substantially as described.

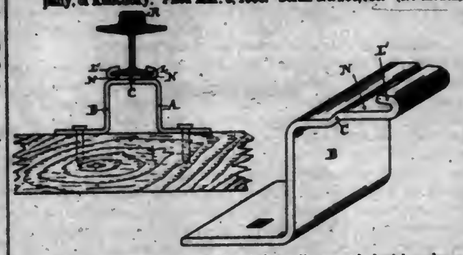
3. The combination, with a bottle or other vessel for holding liquid glue, said bottle having a neck surmounted by an annular shoulder formed upon a portion having the shape of an inverted frustum of a cone, of a cover seating upon the top of said frustum and provided with a circular box, and a fastening having two laterally-extending arms pivotally mounted in and positively engaged with said box, the said arms being bent into approximate parallelism with the opposite sides of the inverted frustum, their lower ends curved under the annular shoulder, and connected by a spring-yoke in a plane forming an angle of less than ninety degrees with the depending converging arms which engage the upper part of the frustum, substantially as described.

4. The combination, with a bottle, 1, having a neck, 2, surmounted by a flat shoulder, 3, formed on a portion, 4, having the shape of an inverted frustum, of a cover, 8, seating upon a circular flange, 9, on the top of the portion 4, said cover having a box, 12, and a fastening having laterally-extending arms 15, pivotally mounted in and positively engaged with said box, said arms having depending arms 16, bent to converge downwardly, and having elbows 17, curving under the shoulder 3, and connected by a spring-yoke, 18, of slightly less diameter than the neck 2, and bent to lie in a plane forming an angle of less than ninety degrees with the plane of the converging arms 16, substantially as described.

396,587. HOOK FOR AWNINGS, &c. WILLIAM F. MAULICK, Columbia, Pa. Filed July 16, 1888. Serial No. 280,052. (No model.)

Claim.—The combination of the shank provided at one end with screw-threads and the other end with a longitudinal slot, a hook having a tenon formed thereon for engaging the said slot and a shoulder to prevent its falling inward, and a spring secured to the under side of the shank and adapted to engage a shoulder of the tenon to prevent the hook from falling outward, substantially as described.

396,588. JOINT FOR FURNITURE. CHARLES P. MCGREGOR, Arkadelphia, Ark., assignor of one-half to Hubert R. Estes, St. Louis, Mo. Filed May 23, 1888. Serial No. 274,048. (No model.)

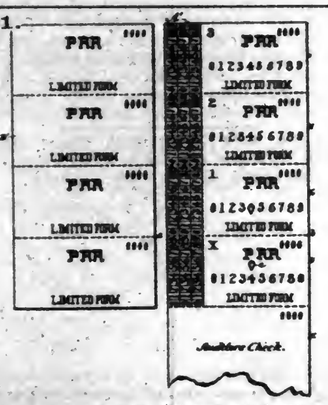


Claim.—In a joint for furniture, the combination of the members 1 and 2, meeting at right angles and having interlocking wings 4 and 10 projecting downwardly and upwardly from the contiguous faces of each member respectively, and each having a flat face lying against the inner face of the contiguous member, said wings having triangular bases at their juncture with the faces of the members, said triangular bases having their bases *a* at right angles to the inner contiguous edges of the members, (their altitudes *c* being portions of the lengths of the inner contiguous edges of the members,) the hypotenuses *b* of the triangles extending from the outer ends of the bases *a* to the ends of the altitudes, where they form with the latter the apexes of the triangles, said wings also having inner edges, *d*, extending from the apexes of the triangles to the points 5 of the wings, and said wings also having outer sides, 10, extending from the bases of the triangles, and beveled meeting faces 8, extending from the edges *d* and hypotenuses *b* to the edge 9 of the sides 10, the relative arrangement of said parts being such that when joined the edges *d* and hypotenuses *b* will be contiguous, substantially as shown and described.

396,589. PROCESS OF MAKING ROLLS FOR EMBOSSING PLASTIC MATERIAL. HUGH MCHUGH, New Bedford, Mass. Filed Dec. 16, 1887. Serial No. 258,114. (No model.) Patented in England Dec. 31, 1887, No. 18,019.

Claim.—The herein-described process of making rolls for embossing plastic material, by engraving a complete section of the desired pattern or design in wood, taking molds therefrom of elastic plastic material and arranging them around the inside of a cylinder in such a manner as to form a complete strip of ornamentation, then depositing thereon a skin of copper, and then giving the copper skin a suitable backing in order that it may be used on an arbor of a machine for embossing plastic material, as described.

396,590. TWO-PART SELF-LOCKING-LUG CHAIR. WILL MCLAIN, Johnstown, Pa., assignor to The Johnson Steel Street Rail Company, of Kentucky. Filed Mar. 3, 1888. Serial No. 266,613. (No model.)

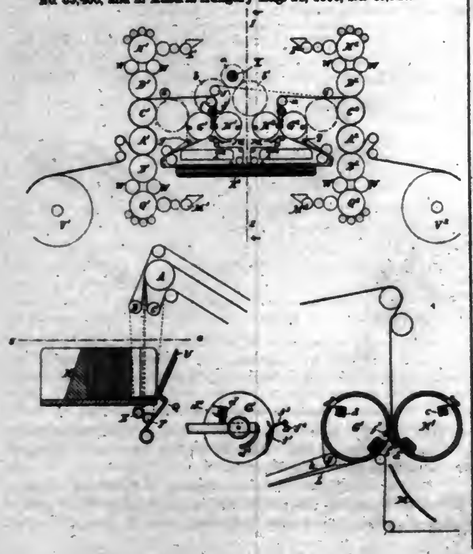


Claim.—A two-part chair for girder-rails, provided with a clamping-lug on each part for connecting rail and chair together by the interlocking of the parts without other fastenings, substantially as set forth.

396,591. RAILROAD-TICKET. WILLIAM A. MEGRATH, Macon, Ga. Filed Feb. 14, 1888. Serial No. 264,018. (No model.) Patented in Belgium Apr. 3, 1888, No. 81,378.

Claim.—1. A railroad-ticket consisting of a series of coupons having distinguishing characters, each coupon being provided with a series of numbers, each number indicating a mile of travel, and corre-

396,591.



sponding numbers being arranged in a line one above the other upon the several coupons, and at such a distance from the dividing-line between the coupons that on folding the coupons back to back upon said dividing-line a punch-mark through the number upon the upper coupon will be reproduced exactly above and in immediate proximity to the corresponding number on the lower coupon, substantially as set forth.

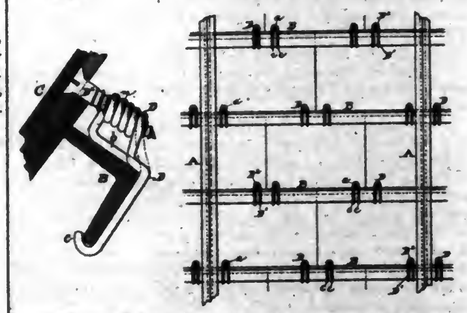
2. A railroad-ticket consisting of a series of coupons bearing distinguishing characters, each coupon being provided with a series of numbers, each number indicating a mile of travel, said series being arranged immediately below the longitudinal center of its coupon, and corresponding numbers in the several series being arranged in a line one above the other, substantially as and for the purposes set forth.

3. A railroad-ticket consisting of a series of coupons provided with numbers indicating miles of travel, and each coupon being provided with additional numbers representing hundreds, tens, and units, whereby on the last undetached coupon an indication may be given of the number of miles just honored by the conductor, substantially as set forth.

4. A railroad-ticket consisting of a series of coupons bearing distinguishing characters, each coupon being provided with a series of numbers, each number indicating a mile of travel, said series being arranged immediately below the longitudinal center of its coupon, and corresponding numbers in the several series being arranged in a line one above the other, and additional rows of numbers representing hundreds, tens, and units upon each of said coupons, substantially as set forth.

396,592. ROTARY PRINTING-MACHINE. JULES MICHAUD, Paris, France. Filed June 6, 1887. Serial No. 240,374. (No model.) Patented in France June 5, 1886, No. 169,380, and Sept. 18, 1886, No. 173,606; in Belgium Feb. 22, 1886, No. 72,096; in England Feb. 25, 1886, No. 2,773, and May 25, 1887, No. 7,464; in Germany Apr. 1, 1886, No. 39,460, and in Austria-Hungary Aug. 21, 1886, No. 40,547.

Claim.—1. The combination of two rotary printing-machines for printing from separate continuous webs of paper, the two machines being arranged symmetrically and each having the impression-cylinders, the printing-cylinders and the inking-cylinders arranged in the same vertical line at opposite ends of the combined machine, the cutting and folding cylinders of each being arranged in a horizontal line toward the center of such combined machine, whereby the paper from one reel after being printed by the printing-cylinders at one end of the machine can be led to either pair of cutting and folding cylinders so that the webs of paper after being printed may either be separately cut into sheets of the same dimensions and then separately folded and delivered or be superposed, cut, and folded together without any change in the direction of the travel of either web, substantially as described.



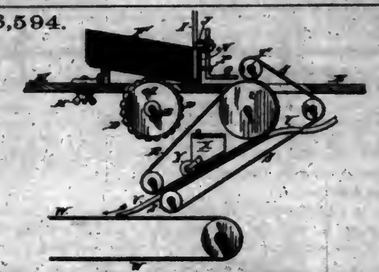
2. The combination, with one of the cutting and folding cylinders, of a movable bar journaled in said cylinder and located close to and in the rear of the cutting apparatus in the direction of rotation of such cylinder, blades carried by said bar, and cams for projecting said blades from the cylinder after the cut is effected to complete the separation of the sheets, and at the same time to direct the forward end of such sheets away from the cylinder which effects the fold, substantially as set forth.

3. In a printing-machine provided with two sets of printing, cutting, folding, and delivering appliances, a shaft provided with two gear-wheels, each capable of being made fast with or to revolve loose upon such shaft, one of such wheels serving to transmit motion to one half of the machine and the other wheel to the other half thereof, in combination with fast and loose pulleys on said shaft and a driving-belt adapted to be shifted from one to the other, substantially as described.

4. In a delivery apparatus, the combination, with a set of tapes, the middle tapes of which proceed only to a point above the delivery-table clear of the flier, while the end tapes pass down below the table, whereby the sheet is arrested by coming in contact with the table, of the oscillating flier and the angle-pieces O P in advance of the plane of the falling sheet, the whole arranged for operation substantially as described.

5. The herein-described cutting apparatus, comprising a cutting-cylinder, a knife carried by said cylinder, a maiden, a strip of india-rubber thereon, a working-surface of leather over said india-rubber strip, and a bar removably securing said leather in position, so as to oppose a yielding elastic pressure to the action of the knife, substantially as described.

396,593. FASTENING FOR ROOF-SLATES. ORLANDO W. NORCROSS, Worcester, Mass. Filed Nov. 23, 1883. Serial No. 291,701. (No model.)



Claim.—A fastening device for roof-slates, comprising, in combination, a wire spring part bent in such manner as to be hooked over or around the purlin and adapted to bear upon the upper side thereof, also to form a spiral coil or spring-nut at or about right angles to the slate and at a short distance above the purlin when fitted thereto, and a suitable screw adapted to be passed down through the slate and turned into the aforesaid spring-nut, substantially as set forth and shown.

396,594. APPLIANCE FOR SPACING OR PANNING OUT ENVELOPE-BLANKS OR SHEETS OF PAPER FOR GUMMING OR BORDERING. WILLIAM C. PELLATT, Brockley, County of Kent, England. Filed Jan. 26, 1888. Serial No. 262,057. (No model.) Patented in England Feb. 7, 1887, No. 1,897.

Claim.—The combination, with the table E, of the roller A having studs D, projecting through and above a slot in said table, the adjustable check-bar f, the leather or rubber strip N, held against the back of said check-bar, the back guide, Q, and the endless tapes R S, substantially as described.

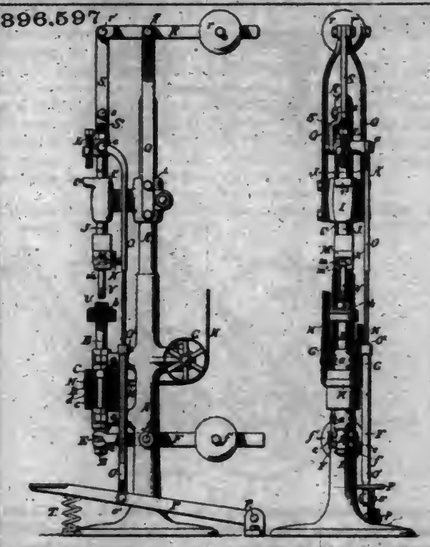
396,594.

396,595. TROUGH FOR WATERING STOCK. THOMAS A. PERRY, Abilene, Kans. Filed Aug. 15, 1888. Serial No. 282,779. (No model.)

Claim.—1. The hereinbefore-described trough for water stock having a water-compartment at one end formed by the wall B, the short tube E, secured at one end to the wall B, the check-valve G, of yielding or flexible material, the float H, having the arms A A, which are connected with the wall B by leather, the rod J, having its upper end connected with the said float and having its lower end extended through the tube E and connected with the valve G, substantially as described.

2. The herein-described watering-trough having a water-compartment at one end formed by the wall B, the double-inclined top having openings in its lower edge, which openings extend into the sides of the trough and flare on their inner edges, the short tube E, placed in the wall B, the check-valve G, of flexible material, the float H, having its inner end cut away to form the arms A A, which are hinged by leather to the wall B, and the rod J, having the guide-sleeve *g* at its lower end, which end is connected with the check-valve G, and having its upper end bent at right angles and connected with the said float, substantially as set forth.

396,596. PADLOCK. ALFRED PETERSON, St. Paul, Minn. Filed June 23, 1888. Serial No. 278,485. (No model.)



Claim.—1. The combination, with the case formed with hole *a*', of the frame carrying the operating parts of the lock, and the movable spring-actuated pin carried by said frame and adapted to engage said hole and hold the parts in place in said frame, substantially as and for the purpose specified.

2. The combination, with the case and the removable frame, of the tumblers pivoted to said frame, the locking-bolt movable lengthwise in said frame, and the transverse pin carried by said locking-bolt and projecting beneath said tumblers, substantially as shown and described.

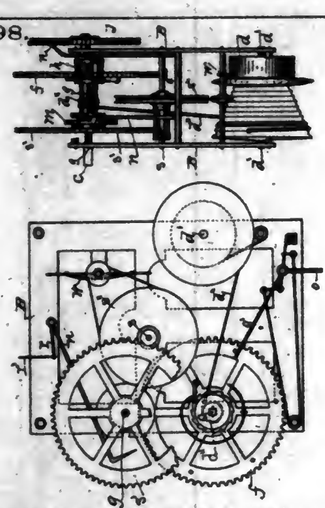
396,597. MACHINE FOR FITTING NUTS ON BOLTS. FERDINAND PHILIPS, Philadelphia, Pa. Filed Nov. 5, 1883. Serial No. 289,977. (No model.)

Claim.—1. In a machine for fitting bolts in nuts, the combination of a vertical longitudinally-movable shaft having a chuck for holding the nut at its upper end, a counter-balance arranged to hold it normally in its uppermost position, a driving-drum, a clutch arranged to connect the shaft and drum when the shaft is moved downward, a longitudinally-movable shaft arranged above and concentric with the shaft holding the chuck, a counter-balance arranged to hold this shaft normally in its uppermost position, a device at the bottom of the shaft for holding a bolt by its head, and mechanism for drawing down the upper shaft, all substantially as and for the purpose specified.

2. In a machine for fitting bolts in nuts, the combination of a vertical longitudinally-movable shaft having a chuck for holding the nut at its upper end, a counter-balance arranged to hold it normally in its uppermost position, a driving-drum, a clutch arranged to connect the shaft and drum when the shaft is moved downward, a longitudinally-movable shaft arranged above and concentric with the shaft holding the chuck, a counter-balance arranged to hold this shaft normally in its uppermost position, a device at the bottom of the shaft for holding a bolt by its head, an adjustable stop secured to the shaft for regulating the extent of its downward motion, and mechanism for drawing down the upper shaft, all substantially as and for the purpose specified.

396,597.

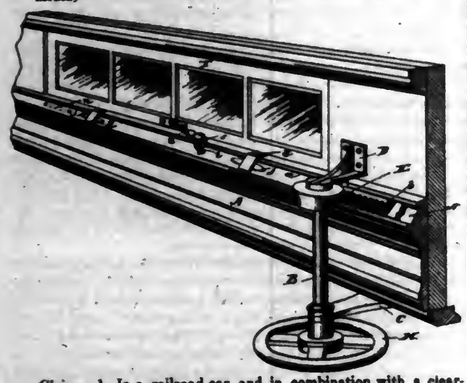
3. In a machine for fitting bolts in nuts, the combination of a vertical longitudinally-movable shaft having a chuck at its upper end, a counter-balance arranged to hold it normally in its uppermost position, a driving-drum, a clutch arranged to connect the shaft and drum when the shaft is moved downward, a longitudinally-movable shaft arranged above and concentric with the shaft holding the chuck, a counter-balance arranged to hold this shaft normally in its uppermost position, a device at the bottom of the shaft for holding a bolt by its head, an adjustable stop secured to the shaft for regulating the extent of its downward motion, and mechanism for drawing down the upper shaft, all substantially as and for the purpose specified.



4. In a machine for fitting bolts in nuts, the combination of a vertical longitudinally-movable shaft having a chuck for holding the nut at its upper end, a counter-balance arranged to hold it normally in its uppermost position, a driving-drum, a clutch arranged to connect the shaft and drum when the shaft is moved downward, a longitudinally-movable shaft arranged above and concentric with the shaft holding the chuck, a counter-balance arranged to hold this shaft normally in its uppermost position, a device at the bottom of the shaft for holding a bolt by its head, an adjustable stop secured to the bolt-holding device for regulating the position of the bolt therein, and mechanism for drawing down the upper shaft, all substantially as and for the purpose specified.

5. In a machine for fitting bolts in nuts, the combination of a vertical longitudinally-movable shaft having a chuck for holding the nut at its upper end, a counter-balance arranged to hold it normally in its uppermost position, a driving-drum, a clutch arranged to connect the shaft and drum when the shaft is moved downward, a vertically-adjustable supporting-block, a longitudinally-adjustable shaft journaled in said block so as to be above and concentric with the shaft having the nut-holding chuck, a counter-balance arranged to hold this shaft normally in its uppermost position, a device at the bottom of the shaft for holding a bolt by its head, a foot-lever, and a connecting-rod made in two pieces and adjustable in length, connecting the upper shaft and foot-lever, all substantially as and for the purpose specified.

396,598. CLOCK STRIKING MECHANISM. WILLIAM H. POOLE, Oxford, Iowa. Filed June 24, 1887. Serial No. 242,243. (No model.)



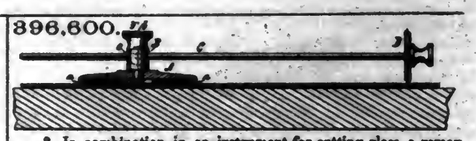
Claim.—An automatic counting-bell for lodge purposes, comprising the following elements, to wit: a driving-shaft having a fixed drum and a fixed wheel, *f*, a shaft, *g*, having a fixed lantern-wheel, *h*, and a one-toothed pinion, *l*, and a toothed wheel, *d*', a count-wheel, J, a cam-wheel, *m*, and a duplex detent, *n*, a rotating fan connected with the driving mechanism by means of a band and pulley, a shaft, *s*, having a fixed lantern-wheel and a fixed driver-pulley, *s*', a shaft, *d*', having

396,598.

a spring and fusee fixed thereto, and a bell and a striker arranged and combined with a frame in a case, substantially as shown and described, to operate silently, in the manner set forth, for the purposes stated.

396,599. WINDOW OPENER AND CLOSER. AUGUST RAPP, Pullman, assignor to the Pullman's Palace Car Company, Chicago, Ill. Filed Sept. 17, 1887. Renewed July 30, 1888. Serial No. 281,423. (No model.)

Claim.—1. In a railroad-car, and in combination with a clear-story window-sash pivotally supported, a sliding bar, *a*, a rod, *c*, connected at one of its ends with said bar by a joint admitting of vertical and lateral movements and at the other end hinged to the window-sash, a rack, *b*, connected with bar *a*, a pinion, E, for actuating said rack, a shaft, B, upon which said pinion is mounted, which shaft is provided with a hand wheel or crank, H, and plates *d*, provided with spring-extensions *j*, for retaining bar *a* in position, substantially as set forth.

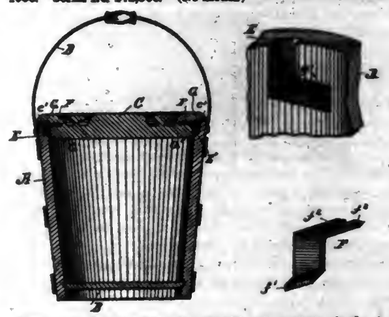


2. In a railroad-car, the combination, with a clear-story window the sash of which is pivotally supported, of a sliding bar, *a*, a rod, *c*, hinged or pivotally attached at its ends, respectively, to the bar and window, and a rocking plate, *e*, with which rod *c* engages, and so pivoted that the end of said rod in closing the window passes the pivotal point of the rocking plate, whereby a bearing is effected against the outer end of said plate *e*, and the inner end of the plate is brought into contact with the rod *c* to secure the latter and the window, substantially as set forth.

396,600. GLASS-CUTTER. ALEXANDER M. ROWLAND, Brooklyn, N. Y., assignor to Richard H. Oakman, Jr., Greenfield, and Warren P. Dustin, Turner's Falls, Mass. Filed Aug. 27, 1888. Serial No. 283,536. (No model.)

Claim.—1. In an instrument for cutting glass, an adjustable head to which is pivoted a series of cutters, A, as and for the purpose described.

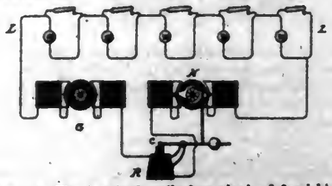
2. An instrument for cutting glass, consisting of two or more revolving steel cutters pivoted to an adjustable head fixed to an arm which revolves about a base, as and for the purpose described.



396,600.

3. In combination, in an instrument for cutting glass, a removable and adjustable head with two or more cutters, A, pivoted thereto, and a swivel whereby the cutters may move in an arc, as and for the purpose described.

4. In a glass-cutting instrument, the combination of the base A, binding-post B, rod C, and adjustable cutter-head D, provided with a series of steel cutters, *h*, as and for the purpose described.

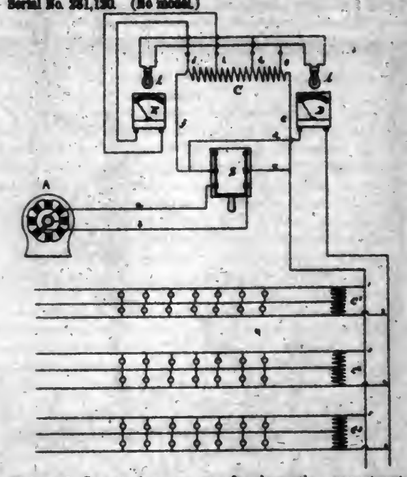


396,601. CLOSURE FOR BUCKETS. JOHN C. REED, Indianapolis, Ind., assignor of one-half to David W. Coffin, same place. Filed May 2, 1888. Serial No. 272,586. (No model.)

Claim.—1. In a bucket, the combination of the body A, having the inclined-faced grooves E E' formed therein at the opposite inner faces thereof, the lower or inclined portions of which are turned in opposite directions to each other, the cover C, and the locking-plates F, having the prongs f^2 extended into the periphery of the cover and having each a projecting portion to engage the inclined face of the grooves to hold the cover in close contact with the body, substantially as shown, and for the purpose described.

2. In combination, the body A, having the L-shaped grooves E E' formed in its inner face, with the lower ends inclined downward, the cover C, and the Z-shaped locking-plates F, having the barbs or points f^2 extended into the periphery of the said cover, and having the lower outwardly-inclined projection, f', to enter said inclined grooves in the body A, substantially as shown, and for the purpose described.

396,602. COMBINATION OF ELECTRIC GENERATORS. EDWIN W. RICE, Jr., Lynn, Mass. Filed Oct. 26, 1887. Serial No. 253,666. (No model.)



Claim.—1. The herein-described method of furnishing a regulated current from a number of dynamo-generators, consisting in keeping one or more of said generators constantly at work supplying a definite or fixed amount of electricity to the circuit and regulating the remaining generator to adapt the total current-supply to the demand of the circuit.

2. The herein-described method of furnishing a regulated current from two or more dynamo-generators coupled in series, consisting in keeping one or more of said generators constantly at work supplying a definite or fixed amount of electricity, and on a decrease of the demand upon the generators to a determinate extent converting one or more of the generators into a counter electro-motive-force generator, as and for the purpose described.

3. The herein-described method of regulating the current upon a circuit, consisting in supplying the bulk of the current from a generator or generators of suitable capacity doing continually a predetermined or constant amount of work, and controlling the variations of current by regulating a comparatively small regulable generator in series with the main generator or generators and of a capacity for regulation determined by the normal variations of load on the circuit.

4. The herein-described method of furnishing a regulated current to a circuit supplied from dynamo-generating sources in series, consisting in running one or more of said sources with its commutator in a fixed or invariable position, and adjusting the commutator of another generator or generators to vary the electro-motive force of the same.

396,608. SYSTEM OF ELECTRICAL DISTRIBUTION. E. WILBUR RICE, Jr., and ALBERT L. ROHNER, Lynn, Mass. Filed July 26, 1888. Serial No. 281,120. (No model.)

Claim.—1. In a station apparatus for alternating-current systems of distribution, a double-pole switch placed between the generator and the mains, and a branch between the mains connected thereto at the opposite side of the double-pole switch from the generator, said branch containing potential-indicating appliances, all as shown, whereby on operation of the switch both the mains and the potential-indicator are severed from connection with the machine at both terminals.

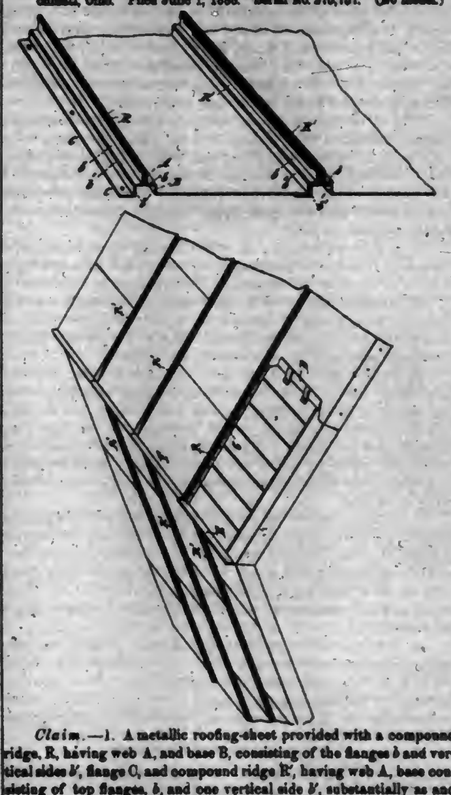
2. In a station apparatus for an alternating-current system of distribution, a branch from the supply-mains, containing a reactive coil, and indicating appliances connected to said coil.

3. In station apparatus for an alternating-current system of distribution, mains *a b*, connecting the alternating source to a double-pole switch, connections from the switch to the supply-mains, a current-indicator in said connections, and a branch from the switch and supply-mains, including a reactive coil with which indicating devices are connected.

4. A station apparatus for alternating-current systems of distribution, comprising a reactive coil connected in a branch across the mains, and having two local circuits connected to it, one leading to pilot-lamps and the other to a potential-indicator, a current-indicator in the supply-main, and a double-pole switch between the dynamo and the converter, the current-indicator, and the supply-mains.

5. In a station apparatus for alternating-current systems of distribution, the reactive coil in a branch across the supply-mains, and two local circuits connected to said coil, one containing a potential-indicator, E, and the other pilot-lamps *l*.

6. In an alternating-current system of distribution, supply-mains *c d*, having compensating-converters connected in multiple between them and in turn connected with the local wires, of translating devices, and a station apparatus consisting of a double-pole switch in the connection from the dynamo to the supply-mains, a current-indicator in the mains, and a branch having a compensating-converter with which a potential-indicator and pilot-lamps are connected.

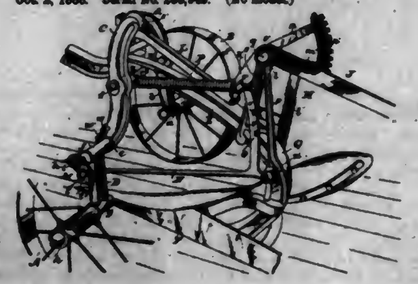


396,604. RING FOR CURTAIN-POLES. JULIUS REISS, Detroit, Mich. Filed Feb. 7, 1888. Serial No. 263,252. (No model.)

Claim.—1. A ring for curtain-poles and the like, consisting of two similar sections, A A, united by transverse screws or rivets B, and having their lower ends provided with attaching-eyes I, and their upper ends formed with roller-sockets D, having openings E, and located, respectively, at opposite sides of the median line of the sections, and rollers F, arranged in said sockets between the two sections comprising the ring, substantially as described.

2. A ring for curtain-poles and the like, consisting of the two similar sections, A A, united by screws or rivets B, and formed integral at their lower ends with attaching-eyes I, and at their upper ends with roller-sockets D, having openings E, and separated ridges or riders H on their walls, and rollers F in said sockets rotatable on the ridges or riders and arranged, respectively, at opposite sides of the median line of the ring, substantially as described.

396,605. METALLIC ROOFING. LOMBLEY L. SAGENDORPH, Cincinnati, Ohio. Filed June 1, 1888. Serial No. 276,737. (No model.)



Claim.—1. A metallic roofing-sheet provided with a compound ridge, R, having web A, and base B, consisting of the flanges *b* and vertical sides *b'*, flange C, and compound ridge R', having web A, base consisting of top flanges, *b*, and one vertical side *b'*, substantially as and for the purposes specified.

2. The combination of two sheets, each provided with compound ridges, substantially as described, of which the webs A are pinched together or approximated at their bases and bent at an angle from the vertical, substantially as and for the purposes specified.

3. In a sheet-metal roof, the combination of roofing-plates provided with flanges E, and the cone F, and compound ridges R, having web A and base B, and compound ridges R', substantially as and for the purposes specified.

396,606. WHEEL-PLOW. HANS H. SAYER, Dubuque, Iowa. Filed Oct. 2, 1888. Serial No. 286,949. (No model.)

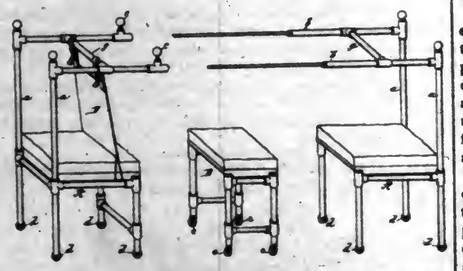
Claim.—1. A sulky-plow having an axle, C, a plow pivotally suspended beneath the same, a furrow-wheel, B, at one end of said axle, a swinging arm, D, at the other end of said axle, a land-wheel, A, at the lower end of said swinging arm D, and a rod, N, connecting said arm with the plow-beam, substantially as set forth.

2. A sulky-plow having an axle, C, a plow pivotally suspended beneath the same, a furrow-wheel, B, at one end of said axle, a swinging arm, D, at the other end of said axle, the land-wheel A at the lower end of said swinging arm, a cam, M, rigidly secured to said swinging arm, and a connecting-rod, N, connecting said cam with the plow-beam, substantially as set forth.

3. A sulky-plow having an axle, C, a plow pivotally suspended beneath the same, a furrow-wheel, B, at one end of said axle, swinging arm D at the other end of said axle, a land-wheel, A, at the lower end of said swinging arm, a cam, M, rigidly secured to said swinging arm D and provided with a series of openings or holes, *t t t t*, and a rod, N, provided with a cylindrical lug thereon and connecting said cam with the plow-beam, substantially as set forth.

4. A sulky-plow having an axle, C, a plow pivotally suspended beneath the same, a furrow-wheel, B, at one end of said axle, a swinging arm, D, at the other end of said axle, a land-wheel, A, at the lower end of said swinging arm D, a rod, N, connecting said swinging arm with the plow-beam, and a lever, J, pivoted above said plow-beam, and connected with the upper end of said axle, substantially as and for the purposes set forth.

5. A sulky-plow having an axle, C, a plow pivotally suspended beneath the same, a furrow-wheel at one end of said axle, a swinging arm, D, at the other end of same, a land-wheel, A, at the lower end of said swinging arm, a rod, N, connecting said swinging arm with the plow-beam, a lever, J, pivoted above said plow-beam and connected with said axle, and the curved rack *x'* at one side of said lever, for the purpose set forth, substantially as described.



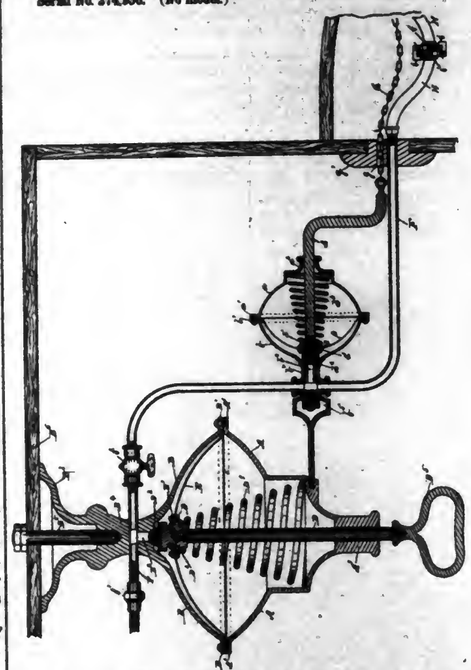
6. A sulky-plow having an axle, C, a plow pivotally suspended beneath the same, a furrow-wheel, B, on one end of said axle, a swinging arm, D, at the other end of the same, a land-wheel, A, at the lower end of said swinging arm, a rod, N, connecting said swinging arm with the plow-beam, a lever, J, pivoted above said plow-beam and connected with the upper part of said axle, a segment, H, on one side of said lever J, and a supporting-bracket, I, on the other side, substantially as set forth.

7. A sulky-plow having an axle, C, a plow pivotally suspended beneath the same, a furrow-wheel, B, on one end of said axle, a swinging arm, D, at the other end of said axle, a land-wheel, A, at the lower end of said swinging arm, a rod, N, connecting said swinging arm D with the plow-beam, a rod, O, extending upward from the rod N, and a spring, P, connecting said rod O with the axle C, substantially as set forth.

8. A sulky-plow having an axle, C, a plow pivotally suspended beneath the same, a furrow-wheel, B, on one end of said axle, a swinging arm, D, on the other end of the same, a land-wheel, A, on the lower end of said swinging arm, a lug, *w*, on the lower end of said axle, and a similar lug, *w'*, on the upper portion of said swinging arm, substantially as set forth.

396,607. INVALID-BED. WILLIAM SAUNDERS, West Point, N. Y.

Filed Apr. 6, 1888. Serial No. 269,843. (No model.)



Claim.—1. An invalid-bedstead composed of two end sections, the side rails of each section being entirely disconnected from the side rails of the other, in combination with an elevated extensible frame forming the sole means for connecting said sections and holding them in the proper relation to each other, substantially as specified.

2. An invalid-bedstead composed of two end sections, the side rails of each section being entirely disconnected from the side rails of the other, in combination with an elevated extensible frame forming the sole means for connecting said sections and holding them in the proper relation to each other, and sliding bars made adjustable upon the extensible parts of said frame, substantially as specified.

396,608. PNEUMATIC BELL-ALARM. CHARLES R. SAWYER, Braintree, and CHARLES PARENT, Boston, Mass. Filed May 24, 1888.

Serial No. 274,956. (No model.)

Claim.—1. The combination of an air-chamber, J, one of the walls of which is composed of a flexible diaphragm, K', a piston, L, attached to the diaphragm and connected with the hammer of a bell, an air-tube opening into the chamber J through the wall K opposite the diaphragm K', and a pump connected with the air-tube, whereby suction of air from chamber J will cause diaphragm K' to move inward and reciprocate the piston L, and thereby throw the bell-hammer, substantially as described.

2. The combination of an air-chamber, J, one wall of which consists of a flexible diaphragm, K', a piston, L, attached to the diaphragm and connected with the hammer of a bell, an air-tube opening into the chamber J through the wall opposite the diaphragm K', a pump connected with the air-tube, the operation of which causes suction of the diaphragm K', thereby reciprocating the piston L and throwing the bell-hammer, and a regulator for keeping the hammer under tension during a portion of its stroke, and then releasing the tension before the blow, substantially as and for the purpose described.

3. The combination of an air-pump, an air-tube connected at one end with the pump and at the other end opening into an air-chamber, the wall opposite the opening consisting of a flexible diaphragm, a piston with one end secured to the diaphragm and the other end pivoted to one end of a lever fulcrumed in a shaft which is journaled in a supporting-frame, the other end of the lever having a segmental rack thereon which engages with a pinion mounted on a shaft in said frame, a hammer attached to the pinion-shaft, and a bell, substantially as described.

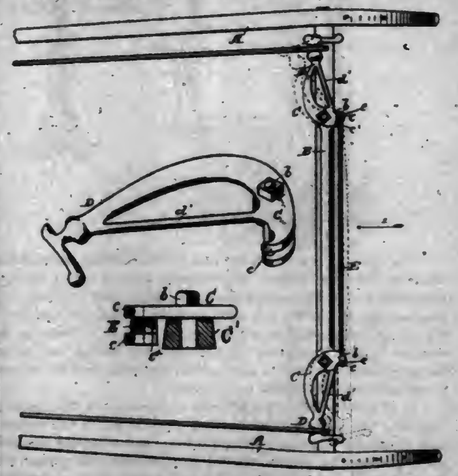
4. The combination of an air-pump, an air-tube connected at one end with the pump and at the other end opening into an air-chamber, the wall opposite the opening, consisting of a flexible diaphragm, a piston with one end secured to the diaphragm and the other end pivoted to one end of a lever fulcrumed in a shaft which is journaled in a supporting-frame, the other end of the lever having a segmental rack thereon which engages with a pinion mounted on a shaft in said frame, a hammer attached to the pinion-shaft, a bell, and a regulating device for holding the hammer under tension during a part of its upward movement and then releasing the tension before the blow, substantially as described.

5. The combination of an air-pump, an air-tube connected at one end with the pump and at the other end opening into an air-chamber, the wall opposite the opening, consisting of a flexible diaphragm, a piston with one end secured to the diaphragm and the other end pivoted to one end of a lever fulcrumed in a shaft which is journaled in a supporting-frame, the other end of the lever having a segmental rack thereon which engages with a pinion mounted on a shaft in said frame, a hammer attached to the pinion-shaft, a bell, and a regulating device for holding the hammer under tension during a portion of its upward movement and then releasing the tension before the blow, said regulating device consisting of a lever having an upwardly-turned arm and a fulcrum at the bend, the lower arm carrying a weight and the upper arm having pivoted at its end a tripping-lever, one end of which acts as a trigger and engages with a tripping-rod projecting from the pinion-shaft, so that when the hammer rises the tripping-rod will engage with the trigger and tip the weighted bent lever on its pivot, thus holding the hammer under tension in its upward movement until the tripping-rod escapes the trigger, and when the trigger releases the tripping-rod the hammer completes its stroke with an impulse, substantially as described.

6. An air-pump consisting of two metallic cups, A B, a flexible cup-shaped diaphragm, E, inside one of the cups, B, with its rim clamped between the rims of the two cups and forming an air-tight partition between the two cups, a piston working through base of cup A and having its inner end secured to the diaphragm, the cup B having a port leading to an air-tube, a stopper on the convex side of the diaphragm to close the passage from cup B to the air-tube, and a spring connected with the piston to keep it closed, substantially as described.

7. An air-pump consisting of two metallic cups, A B, a cup-shaped diaphragm in one of the cups, B, clamped at its edge between the rims of the two cups A B and forming an air-tight partition between the two cups, the cup B having a port leading to an air-tube, and the cup A having a piston working through the base of cup A, attached at its upper end to the diaphragm E, a stopper on the convex side of the diaphragm to close the port in the cup B, and a spring connected with the piston to keep the port closed, in combination with an air-tube leading from the port in cup B and an air-chamber at the other end of the tube, the wall of the chamber opposite the tube being composed of a flexible diaphragm, substantially as and for the purpose described.

8. An air-pump consisting of two metallic cups, A B, a cup-shaped diaphragm in one of the cups, B, clamped at its edge between the rims of the two cups A B and forming an air-tight partition between the two cups, the cup B having a port leading to an air-tube and the cup A having a piston working through the base of cup A, attached at its upper end to the diaphragm E, a stopper on the convex side of the diaphragm to close the port in the cup B, and a spring connected with the piston to keep the port closed, in combination with an air-tube leading from the port in cup B and an air-chamber at the other end of the tube, the wall opposite that through which the tube enters being composed of a flexible diaphragm, K', a piston with one end secured to the diaphragm K' and the other end connected with the hammer of a bell, whereby the operation of the pump will cause suction of the diaphragm K', reciprocating its piston and throwing the bell-hammer, substantially as described.



9. An air-pump consisting of two metallic cups, A B, a cup-shaped diaphragm in one of the cups, B, clamped at its edge between the rims of the two cups A B and forming an air-tight partition between the two cups, the cup B having a port leading to an air-tube, and the cup A having a piston working through its base and attached at its upper end to the diaphragm E, a stopper on the convex side of the diaphragm to close the port in the cup B, and a spring connected with the piston to keep the port closed, in combination with an air-tube leading from the port in cup B and an air-chamber, J, at the other end of the tube, the wall opposite that through which the tube enters consisting of a flexible diaphragm, K', a piston with one end secured to the diaphragm K' and the other end pivoted to one end of a lever fulcrumed in a shaft, which is journaled in a supporting-frame, the other end of the lever having a segmental rack thereon which engages with a pinion mounted on a shaft journaled in said frame, a hammer attached to the pinion-shaft, and a bell, substantially as described.

10. An air-pump consisting of two metallic cups, A B, a cup-shaped diaphragm in one of the cups, B, clamped at its edge between the rims of the two cups A B and forming an air-tight partition between the two cups, the cup B having a port leading to an air-tube, and the cup A having a piston working through its base and attached at its upper end to the diaphragm E, a stopper on the convex side of the diaphragm to close the port in the cup B, and a spring connected with the piston to keep the port closed, in combination with an air-tube leading from the port in cup B and an air-chamber, J, at the end of the tube, the wall opposite that through which the tube enters consisting of a flexible diaphragm, a piston with one end secured to the diaphragm and the other end pivoted to one end of a lever fulcrumed in a shaft, which is journaled in a supporting-frame, the other end of the lever having a segmental rack thereon which engages with a pinion mounted on a shaft journaled in said frame, a hammer attached to the pinion-shaft, a bell, and a regulating device for holding the hammer under tension during a part of its upward movement, and then releasing the tension before the blow, substantially as described.

11. An air-pump consisting of two metallic cups, A B, a cup-shaped diaphragm in one of the cups, B, clamped at its edge between the rims of the two cups A B and forming an air-tight partition between the two cups, the cup B having a port leading to an air-tube, and the cup A having a piston working through its base and attached at its upper end to the diaphragm E, a stopper on the convex side of the diaphragm to close the port in the cup B, and a spring connected with the piston to keep the port closed, in combination with an air-tube leading from the port in cup B and an air-chamber, J, at the other end of the tube, the wall opposite that through which the tube enters consisting of a flexible diaphragm, a piston with one end secured to the diaphragm and the other end pivoted to one end of a lever fulcrumed in a shaft which is journaled in a supporting-frame, the other end of the lever having a segmental rack thereon which engages with a pinion mounted on a shaft journaled in said frame, a hammer attached to the pinion-shaft, a bell, and a regulating device for holding the hammer under tension during a part of its upward movement, and then releasing the tension before the blow, substantially as described.

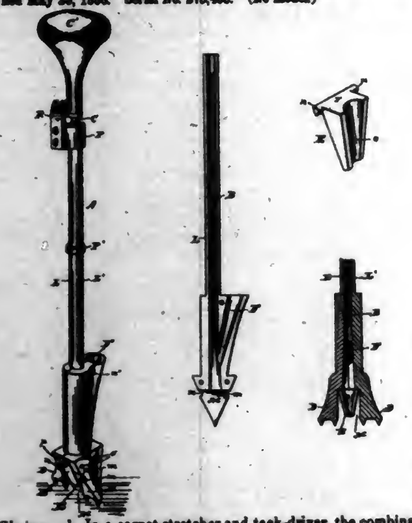
12. An automatic bell-ringing apparatus consisting of an air-pump composed of two metallic cups, one of which has a port connecting with an air-tube, a flexible cup-shaped diaphragm within said cup and clamped at its edge between the rims of the two cups, a piston working through a hole in the base of the second cup, the inner end of the piston being secured to the diaphragm, a stopper on the convex side of the diaphragm to close the port leading to the air-tube, a fragile connection of the piston with the piston of a similar pump in an adjoining car, a flexible hose-connection between the air-tubes of the two cars, and an air-chamber into which the end of the air-tube opens, said air-chamber having a flexible diaphragm connected with a bell, the bell being operated by suction of air from the air-chamber by means of the said pump, the hose-connection between the cars being so adjusted that the separating of the cars will cause the chain connecting the pistons of the pumps to pull the piston and ring the bell before the hose breaks, substantially as described.

396,609. DRAFT-EQUALIZER. EDWARD SOBERICK, Columbus, Ohio, assignor to the Lochner Manufacturing Company, same place. Filed Oct. 12, 1886. Serial No. 216,013. (No model.)

Claim.—1. In combination with the shafts and the cross-bars, the levers provided with the downwardly-projecting hollow hubs, and with the throats below the parts C C, and the bar E, provided with the cross-pivots mounted in the throats, substantially as set forth.

2. In combination with the shafts and the cross-bars, the levers provided with the downwardly-projecting hollow hubs C', with the throats below the parts C C, and with the shoulders *c' c'*, and the elastic bar pivoted in the throats, substantially as set forth.

396,610. TAG-FASTENER. CHARLES SCHOOLEDER, Beatrice, Nebr. Filed July 31, 1888. Serial No. 281,560. (No model.)



Claim.—1. The fastener having an outer frame, C, provided at its lower side with a hook or catch, *c*, and the pin connected to the frame and adapted to engage the hook or catch, combined with a tag arranged between the frame and the pin and provided in its lower edge with a notch, *g*, to fit over the hook or catch, substantially as specified.

2. A fastener provided with a frame, C, pressure-fingers connected to the frame and bearing toward the same, and the pin B, substantially as specified.

3. A fastener comprising the frame C, provided with a hook or catch, *c*, at its lower side, the angular pressure-fingers F, having their outer sides connected to the frame and their inner sides connected together, and the pin B, connected at its upper end to the inner sides of the fingers, substantially as specified.

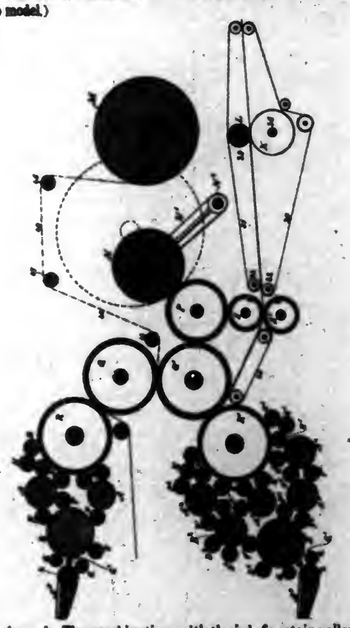
4. The herein-described fastener, formed from a single piece of spring-wire and comprising the frame C, having the hook or catch *c* at its lower side, the pressure-fingers F F, arranged between the sides of the frame and comprising the outer sides, *f*, formed on the upper ends of the sides of the frame C by bends *f*³, and inner sides, *f'*, joined together, and the pin B, integral with one of the sides *f'* and engaging the hook or catch *c* at its free end, substantially as specified.

396,611. CARPET-STRETCHER AND TACK-DRIVER. HENRY L. SOUTHER, Rochester, N. Y., assignor to Freeman Clarke, same place. Filed May 20, 1888. Serial No. 275,455. (No model.)

Claim.—1. In a carpet-stretcher and tack-driver, the combination, with the stock divided longitudinally, formed in two sections, each section containing a portion of the plunger and tack-receiving channels, one of the stretcher-prongs and the recessed portions beside the prongs, and the sockets or bearings for the jaws, of fastening devices for holding the sections together, the tack-holding jaws having the projections or trunnions arranged to co-operate with the recesses in the sections, substantially as described.

2. In a combined carpet-stretcher and tack-driver, the combination, with the stock divided longitudinally, formed in two sections, each containing a portion of the plunger and tack-receiving channels, one of the stretcher-prongs, recessed portions beside the prongs, and the recesses for the bearings for the tack-holding jaws, of fastening devices for holding the sections together, the tack-holding jaws having the trunnions or projections arranged to co-operate with the recesses in the sections when placed in them, and springs for pressing the jaws toward each other, substantially as described.

3. In a carpet-stretcher and tack-driver, the combination, with the stock, of a collar or ring on the upper end thereof, having a tack-drawing claw formed upon or attached to it, substantially as described.



4. In a carpet-stretcher and tack-driver, the combination, with the stock constructed in two parts, of a collar or ring for binding them together, having a tack-drawing claw formed upon or attached to it, substantially as described.

5. The combination, with the stock having the plunger-channel, an opening communicating therewith for the insertion of tacks, and the open-sided recesses formed at the sides of the end of the plunger-channel, of the tack-holding jaws having bearing portions formed thereon arranged to enter the recesses in the stock, and the springs bearing upon the jaws for holding the bearing portions in the recesses and pressing them together, substantially as described.

6. The combination, with the stock having the plunger-channel, an opening communicating therewith for the insertion of tacks, and the open-sided recesses formed on the sides of the plunger-channel, of the tack-holding jaws having bearings fitting said recesses, and a face engaging the stock and preventing movement too far inward, and the springs bearing on said jaws, holding their bearing portions in the recesses, and pressing them toward each other, substantially as described.

7. The combination, with the stock having the plunger-channel, an opening communicating therewith for the insertion of tacks, and the open-sided recesses formed on the sides of the plunger-channel, of the tack-holding jaws having bearings fitting said recesses, and the flat springs secured to the stock and bearing upon the jaws, holding their bearing portions on the recesses, and pressing them toward each other, substantially as described.

396,612. INKING APPARATUS FOR PRINTING-MACHINES. WALTER SCOTT, Plainfield, N. J. Filed Oct. 10, 1887. Serial No. 251,872. (No model.)

Claim.—1. The combination, with the ink-fountain roller and the ink-distributing cylinder, of two ductor-rolls, a rock-shaft between the ductor-rolls, and arms extending out in opposite directions and supporting such ductor-rolls, and mechanism for vibrating the rock-shaft and moving the ductor-rolls simultaneously into contact with the fountain-roll and distributing-cylinder, respectively, substantially as set forth.

2. The combination, with the ink-fountain roll and the ink-distributing cylinder, of two ductor-rolls, a rock-shaft and arms extending out in opposite directions and carrying the ductor-rolls, and adjustable bearings upon the arms for one of the ductor-rolls, substantially as set forth.

3. The combination, with the ink-fountain roll and ink-distributing cylinder, of two ductor-rolls, a rock-shaft and arms carrying the ductor-rolls, a crank-arm upon the rock-shaft, an adjustable link, a lever, and a cam and connecting-link for giving motion to the parts, substantially as set forth.

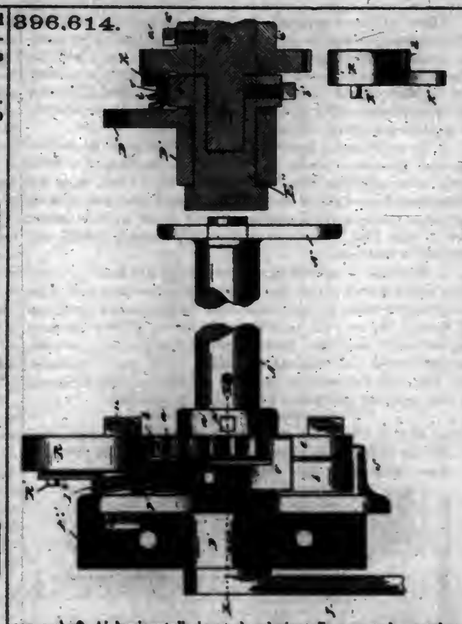
4. The combination, with the two ink-fountains and their rolls and the ink-distributing cylinders, of two ductor-rolls to each ink-fountain roll, a rock-shaft and arms for the ductor-rolls, crank-arms on the ends of the respective rock-shafts, adjustable links connected

to the said rock-shaft and connected to each other at their ends, and mechanism, substantially as specified, for giving motion to the adjustable links and moving the ductor-rolls simultaneously, substantially as set forth.

396,613. STREET OR STATION INDICATOR. WILLIAM F. SEELEY, Detroit, Mich. Filed Sept. 20, 1888. Serial No. 285,882. (No model.)

Claim.—1. In a street and station indicator, the combination, with the casing, the rollers C C', the apron, and the rollers B B', having the ratchet-wheels and pawls, of the bevel-gear H on the ends of the roller-journals, the bevel-gears H' on the shaft A, meshing with the gears H, the shaft projecting through the rear of the casing and provided with the handle K', and the spring-controlled stop-pin passing through the handle K', substantially as specified.

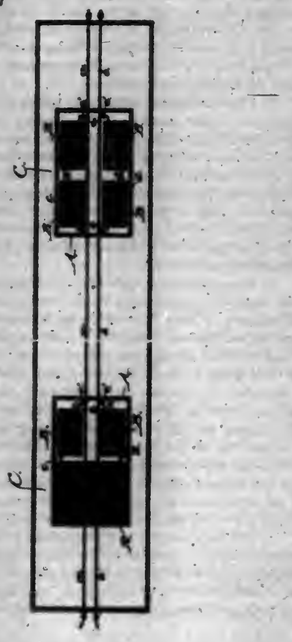
2. In a street or station indicator, the combination, with the casing, the rollers C C', the apron, and the rollers B B', having the ratchet-wheels, of the dials provided with the depressions *i* and secured to the outer face of the casing, the cranks J on the roller-journals, the spring-controlled pins passing longitudinally through the handles, and the projections *j* on the knobs, adapted to enter the depressions *i* in the dials I, substantially as specified.



396,614. MECHANISM FOR OPERATING CAR BRAKES AND COUPLINGS. HENRY H. SIMMONS, Pullman, assignor to the Pullman's Palace Car Company, Chicago, Ill. Filed Jan. 30, 1888. Serial No. 262,209. (No model.)

Claim.—1. In railway-car construction, a shaft pivotally mounted in a horizontal position in the timbers of the car-platform that is adapted for winding thereon, a chain or cable for operating the brakes or coupling of the car, a ratchet rigidly mounted on said shaft, an actuating-pawl having a movable bearing and adapted to engage with said ratchet, a retaining-pawl having a permanent bearing and adapted to engage with the ratchet, a lever connected with the actuating-pawl, adapted by a reciprocating movement thereof to impart a like movement to the said actuating-pawl, a stationary tripping part by which the ratchet end of the actuating-pawl is disengaged when the lever is brought to a given position, and a movable tripping point or cam actuated by the lever and adapted to disengage the retaining-pawl from the ratchet when the parts operated by the lever are in such position that the actuating-pawl is also disengaged.

2. In railway-car construction, a shaft to which is attached a chain or cable, the latter adapted for operating the brakes or coupling, said shaft having a horizontal position and pivotally bearing on the car-timbers, a ratchet-wheel mounted rigidly on said shaft, a pivotal sleeve or shank that serves as a bearing for one end of the shaft to which the chain or cable is attached, a cam rigidly secured on said sleeve or shank, a pawl mounted on said cam and adapted to engage with the ratchet-wheel, a retaining-pawl, also adapted to engage with the ratchet having a permanent bearing, and a lever so connected with the mechanism as to be adapted to operate the actuating-pawl.

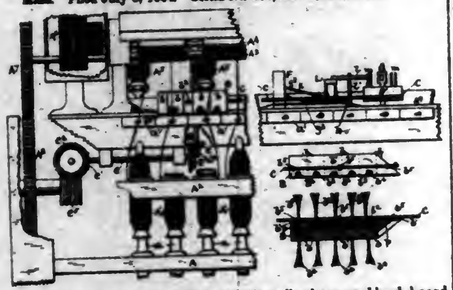


3. In railway-car construction and applied to the platform of a

396,614.

car, a shaft, A', horizontally located and pivotally mounted, a ratchet, *c*, rigidly mounted on said shaft, a bearing, D', a pivotal shank or sleeve, E', adapted as a journal-bearing for the end E of the shaft, a cam, *b*, rigidly mounted on the shank or sleeve E', a pawl, E, secured to said cam, a pawl, R, attached to the permanent structure, a spring, *i*, for holding said pawl in engaged position, a movable toe or tripping part, *b'*, for disengaging the pawl R, a permanent tripping part, S, for disengaging the pawl *c*, and the lever J, adapted when not in use to occupy a horizontal position at the side of the platform that is so connected with the actuating mechanism as to be available for operating the same, substantially as described.

396,615. APPARATUS FOR HEATING RAILWAY-CARS. PATRICK H. SEARNOS, Jamestown, N. Y., assignor of one-half to Fred Bates and Henry H. Cooper, same place. Filed Nov. 5, 1887. Serial No. 254,593. (No model.)



Claim.—1. In an apparatus for heating railway-cars, the caloriferes consisting of external boxes or receptacles and internal independent chemically-filled flasks or receptacles, in combination with the steam-pipes leading from the engine, and branch pipes connecting with the main pipes at points inside of the caloriferes passing through and independently coiled in each internal flask or receptacle, whereby its contents are heated, substantially as described.

2. In a car-heating apparatus, the main steam-pipes, in combination with caloriferes secured in the cars and consisting of exterior boxes, chemically-filled flasks or receptacles within said boxes but independent thereof and of each other, and pipes connected with the main pipes having a plural number of coils, one of which is located inside of each flask, whereby its contents are internally heated, substantially as described.

3. The boxes or caloriferes, and the independent flasks or receptacles placed therein so as to leave a surrounding air-space, said boxes containing chemicals, in combination with the main steam-pipes passing through the cars and caloriferes, and branch pipes of the same diameter as the main pipes connected with said pipes at points inside the outer boxes and independently coiled within each chemically-filled flask, and the cocks in the main and branch pipes for directing the course of the steam, substantially as described.

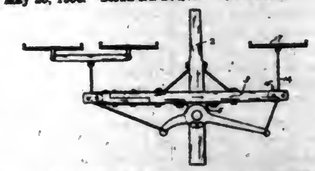
396,616. CLEARER FOR REMOVING WASTE, &c., FROM THE TOP OF SPINNING-FRAMES, &c. WILLIAM E. SHARPLES, Fall River, Mass. Filed July 5, 1884. Serial No. 136,813. (No model.)

Claim.—1. The combination, with the roller-beam and back board of a ring-spinning frame, twisting-frame, speeder, or similar machine, of the cleaning device and an endless belt or band connected to said device for moving it along the top of the machine in the path of said band, revolving supports for the band, and means, substantially as described, for driving said band from the working parts of the machine, the said cleaning device being thereby caused to pass over the top of the frame upon one side of the central line of the roller-beam when moving in one direction and upon the other side of said line when moving in the opposite direction, cleaning the whole of the roller-beam, the back board, and other parts immediately adjoining the roller-beam, substantially as described.

2. The combination, with a ring-spinning frame, twisting-frame, speeder, or similar machine, of the cleaning device B, operating on both sides of the central line of the roller-beam, an endless belt or band, C, connected to said device for continuously moving it along the top of the machine, revolving supports for said belt, means, substantially as described, for driving said belt from the working parts of the machine, and one or more waste-retainers, substantially as described, located in the path of movement of the device B and adapted, as described, to remove therefrom the waste, &c., collected by the device, substantially as set forth.

3. The combination, with the roller-beam, back board, and guide-wire board of a ring-spinning frame, twisting-frame, speeder, or similar machine, of an endless belt or band, revolving supports for such band, located upon the roller-beam, a cleaning device directly attached to said band and having upon its bottom and projecting laterally from the sides thereof upon both sides of said band means, substantially as described, for cleaning the top of the frame, and means, substantially as described, for driving said band from the working parts of the machine, the said cleaning device being thereby caused to pass over the top of the frame upon one side of the central line of the roller-beam when moving in one direction and upon the other side of said line when moving in the opposite direction, cleaning the whole of the roller-beam, the back board, and other parts immediately adjoining the roller-beam, substantially as described.

4. The combination, in a ring-spinning frame, twisting-frame, speeder, or similar machine having hinged guide-wire blocks, of the cleaning device B, pointed or beveled at its forward end to turn down any of such guide-wire blocks that may have been left up after doffing, and having its bottom and two lateral sides provided with means, substantially as described, for cleaning the top of the frame, an endless band or belt, C, attached directly to said device for continuously moving it along the top of the machine, revolving supports for the band, located on the roller-beam of the machine, means, substantially as described, for driving said band from the working parts of the machine, and one or more waste-retainers, substantially as described, located in the path of movement of the cleaning device B, and adapted, as described, to remove the waste, &c., collected upon the bottom and sides of the cleaning device, said cleaning device being made to project upon both sides of the band C, so that by one round trip the whole of the roller-beam is cleaned, substantially as described.



5. The combination, with a ring-spinning frame, twisting-frame, speeder, or similar machine, of the cleaning device B and endless belt *c*, connected to said device for continuously moving it along the top of the machine, revolving support for said belt, means, substantially as described, for driving said belt from the working parts of the machine, one or more waste-retainers, substantially as described, located in the path of movement of the device B, and adapted, as described, to remove therefrom the waste, &c., collected by the device, and means, substantially as described, for cleaning the belt C, substantially as set forth.

6. The combination, with a ring-spinning frame, twisting-frame, speeder, or similar machine, of the cleaning device B, composed of a series of blocks flexibly jointed together and provided with brushes b^4, means, substantially as described, for giving said device a continuous movement along the top of the machine, one or more waste-retainers, F, located in the path of movement of the device B, and provided with flannels, as described, for removing the waste, &c., from the brushes b^4, and having the flannels on the inner side raised above the top of the machine, as described, and the plate H, located transversely between said flannels, substantially as set forth.

7. The cleaning device B, composed of a series of blocks flexibly connected together, with the foremost block beveled or pointed, and said blocks provided with flannels b^3 and brushes b^4, substantially as and for the purposes specified.

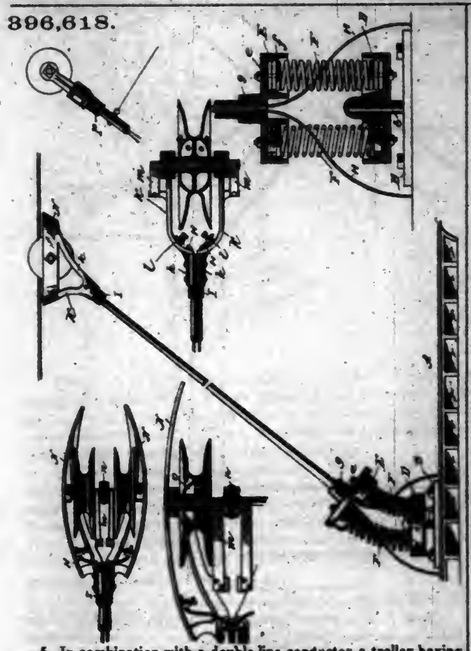
8. The waste-retainer F, having openings f' and f^3, flannels g g' g^2 g^3, extending from the openings f^3, the upper flannels being weighted, as described, the plate H, and the wire K, for supporting the outer end of the flannel g^3, substantially as and for the purposes specified.

396,617. DRAFT-EQUALIZER. FRANK SHERIDAN, Rockford, Minn. Filed May 23, 1888. Serial No. 274,797. (No model.)

Claim.—1. In a draft-equalizer, the combination, with the tongue, of the bar 3, adapted to be adjusted laterally upon the tongue, so as to have its longer end upon either side of the said tongue, the reversible lever 7, pivoted upon the tongue at the rear of said bar, and the cables or chains connecting the ends of the lever with the whiffletrees, substantially as described.

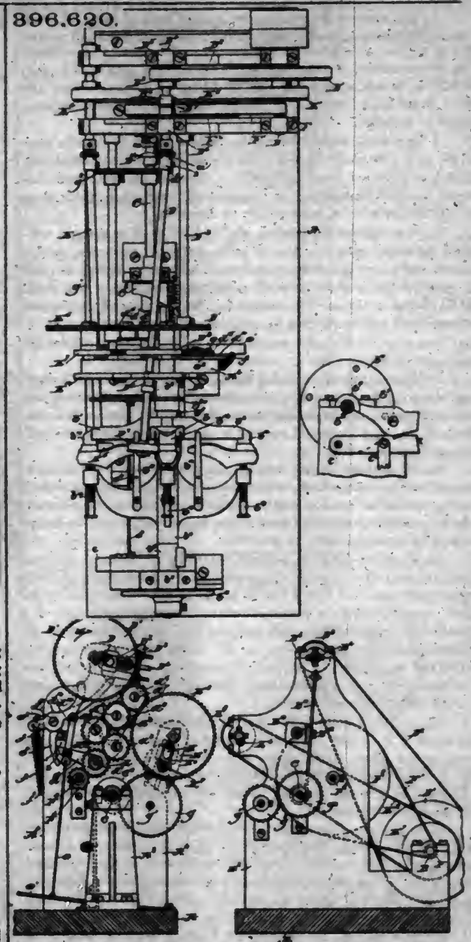
2. In a draft-equalizer, the combination, with the tongue, of a casting, 5, secured to said tongue, a lever, 7, pivoted upon said casting and capable of being reversed thereon, and the extensible bar 3, adjustably secured to the said casting and arranged to be extended to the right or left, substantially as described.

396,618. ELECTRIC-RAILWAY TROLLEY AND SUPPORT. SIDNEY H. SHORT, Columbus, Ohio. Filed Nov. 12, 1888. Serial No. 290,614. (No model.)



Claim.—1. The spring-support for the trolley-rod, consisting of a pair of springs attached to suitable caps and arranged one in front and the other in rear of the axis of the trolley-rod, whereby one is made to act under tension and the other under compression, substantially as described.

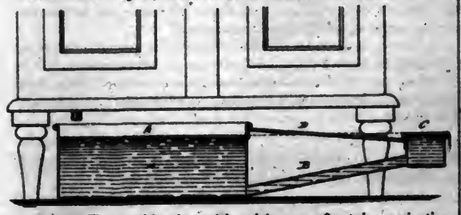
2. The lower cap formed with a socket, the upper cap carrying the trolley-rod, seats in said caps for the springs, and springs connected to said seats and arranged to act under tension or compression, and a stud, *b*, fitted to the central socket, substantially as described.



3. The insulating-sleeve on the upper end of the trolley-rod, the arms K, having shanks fixed to the sleeve, and the trolley-wheels, all substantially as described.

4. In combination with the shaft of the contact-wheel, the arms K, and the brush-connection extending directly between the wheel-axle and the arms K, substantially as described.

396,618.



396,620.

5. In combination with a double-line conductor, a trolley having a pair of wheels mounted on axles which revolve therewith, insulating material between the ends of the axles, said wheels being arranged each to bear upon one of the wires of the double line, and independent electrical connections between each axle and one terminal of the motor, substantially as described.

396,619. PAN FOR ICE-BOXES. CHARLES W. SMITH, Brooklyn, N. Y. Filed July 16, 1888. Serial No. 280,131. (No model.)

Claim.—The combination, with a drip-pan, of a tube projecting from one side of the same, and a cup on the end of said tube and connected with the drip-pan by said tube, the top of said cup being open and the top edge of the cup being some distance below the top edge of the drip-pan, substantially as set forth.

396,620. MACHINE FOR FINISHING HEELS OF BOOTS OR SHOES. JOHN P. SMITH, Exeter, N. H. Filed Feb. 7, 1888. Serial No. 263,305. (No model.)

Claim.—1. In the herein-described machine for treating the heels of boots or shoes, the rotating shaft b^3, capable of sliding longitudinally in bearings or boxes secured to the frame of the machine, and a plurality of jacks secured thereto, combined with a plurality of tools to act on the heels of the boots or shoes held by the said jacks, gearing, substantially as described, to operate said tools, and with lifting devices to move the rotating tools away from the said heels preparatory to moving the said shaft longitudinally, in order to enable the jack to be rotated, whereby a jack containing a shoe which has been acted upon by one tool may be brought into position to be acted upon by a second tool, substantially as described.

2. In the herein-described machine for treating the heels of boots or shoes, a shaft capable of sliding in its bearings, and a plurality of jacks secured thereto, combined with a plurality of tools to act on the heels of the boots or shoes held by the said jacks, gearing, substantially as described, to operate said tools, and with a stop mechanism to move the operating-tools away from the said boots or shoes to permit the said shaft to be moved longitudinally to remove the jacks out of the path of movement of the said tools, thereby enabling a jack containing a shoe which has been acted upon by one tool to be brought into position to be acted upon by a second tool, and provided with a guard or clamp for the toe of the boot or shoe, substantially as described.

3. In a machine for treating the heels of boots or shoes, a power-shaft and a driving-shaft, F^3, and two tool-carrying shafts, D E, rotated by the said power-shaft, guide arms or yokes D^6 E^{10} for the tool-shafts, gears D' E^9, connected to the said yokes, an intermediate gear, d^5, to mesh with the gears D' E^9, a second intermediate gear, d^3, in mesh with the gear d^4, a gear, F^4, on the driving-shaft, and a gear, d, in mesh therewith, combined with a driving-gear, d^2, and a reversing-gear, d^4, and with levers connected to and so as to operate the said driving and reversing gears, substantially as described.

4. In a machine for treating the heels of boots or shoes, a jack consisting of an arm, as *b*, provided with a seat having an opening, b^{16}, and a breasting-knife adapted to enter the said opening, substantially as described, combined with a second arm and a clamping device carried thereby, and by which the heel of a boot or shoe is held to its seat, substantially as described.

5. In a machine for treating the heels of boots or shoes, a jack consisting of an arm, as *b*, provided with a seat having an opening, as b^{16}, and a second arm and a clamping device carried thereby, and by which the heel of a boot or shoe is held to its seat, combined with a clamp consisting of spring-arms, as b^{18}, to engage the toe of a boot or shoe, as and for the purpose specified.

6. In a machine for treating the heels of boots or shoes, the combination, with a sliding shaft, of a jack mounted thereon and having an arm provided with a seat for the heel of a boot or shoe, and having an opening, as b^{16}, a breasting-knife adapted to enter the said opening and breast the heel, and a cam for moving the said breasting-knife, substantially as described.

7. In a machine for treating the heels of boots or shoes, the combination, with a shaft, of a jack mounted to slide thereon and consisting of an arm, as *b*, provided with a seat, and a second arm, a clamping device carried thereby, and by which the heel of a boot or shoe is held to its seat, a clamp to engage the toe of a boot or shoe, and a breasting-knife and cam for moving the same to operate substantially as described.

8. In a machine for treating the heels of boots or shoes, a cam-shaft, as **C**, provided with a cam and a breasting-knife, combined with a spring-controlled lever connected to the said breasting-knife and acted upon by the said cam to automatically produce reciprocations of the breasting-knife, substantially as described.

9. In a machine for treating the heels of boots or shoes, a tool-shaft provided with a sleeve or collar having lugs or ears, as *a'*, a second shaft having a sleeve or collar provided with lugs or ears, and a square block, as a^9, to unite the shafts, combined with a cam-shaft, as C, having a cam, as B^{14}, and with a lever connected to the said second shaft and acted upon by the said cam to produce a longitudinal movement of the said second shaft, substantially as and for the purpose specified.

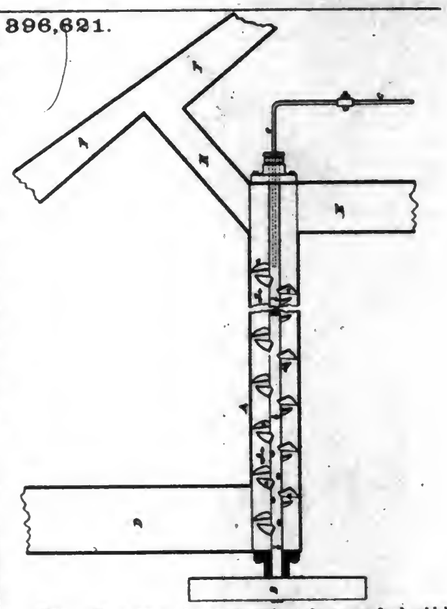
10. In a machine for treating the heels of boots or shoes, a former, and a tool-shaft adapted to travel over said former, combined with a conical sleeve mounted on said shaft and adjustable thereon to enable heels of the same shape, but varying in size, to be operated upon, substantially as described.

11. In a machine for treating the heels of boots or shoes, a former and a tool-shaft adapted to travel over said former, combined with a conical or tapering sleeve adjustably mounted on the said tool-shaft to enable heels of the same shape, but varying in size, to be operated upon, substantially as described.

12. In a machine for treating the heels of boots or shoes, a jack-carrying shaft capable of longitudinal movement and a tool-carrying shaft provided with a tool to act on a boot or shoe held by the jack, combined with a stop mechanism consisting, essentially, of a lever, as b^9, to engage the jack-carrying shaft and prevent its longitudinal movement, and a lever, as b^{20}, to engage the tool-carrying shaft and move it out of the path of movement of the jack, and connections, substantially as described, between said levers, substantially as and for the purpose specified.

13. In the herein-described machine for treating the heels of boots or shoes, a reversing mechanism consisting, essentially, of a loose gear, as *d*, a sleeve, as d^3, having gears d^3 d^5, and an arm, d^{12}, combined with a lever, as d^{14}, connected to the said arm, and with a second lever, as c^3, to be engaged by the arm d^{12}, substantially as and for the purpose specified.

14. In the herein-described machine for treating the heels of boots or shoes, a reversing mechanism consisting, essentially, of a loose gear, as *d*, a sleeve, as d^3, having gears d^3 d^5, and an arm provided with a toe or projection, combined with a lever, as d^{14}, connected to the said arm, and with a second lever, as c^3, provided with notches to be engaged by the said toe or projection, substantially as described.



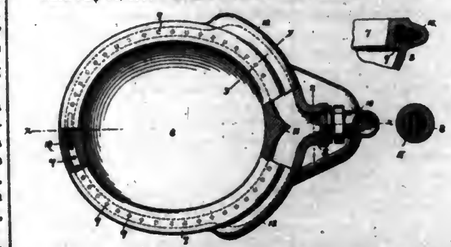
15. In a machine for treating the heels of boots or shoes, a reversing mechanism consisting, essentially, of a loose gear, as *d*, a sleeve, as d^3, having gears d^3 d^5 and an arm, a lever, as d^{14}, connected to said arm, and a second lever, combined with a support, as D^3, for a tool-shaft, and gearing, substantially as described, to produce rotation of the tool-shaft, the said support alternately acting on the levers d^{14} c^3 to alternately cause the gears d^5 d^4 to be engaged with the gearing rotating the tool-shaft, substantially as described.

16. In a machine for treating the heels of boots or shoes, a jack-carrying shaft capable of longitudinal movement, and a tool-carrying shaft having bearings in a movable support, combined with a stop mechanism consisting, essentially, of a lever, as b^9, to engage the jack-carrying shaft and prevent its longitudinal movement, and a lever, as b^{20}, to engage the tool-carrying shaft and move it out of the path of movement of the jack, and connections, substantially as described, between said levers, substantially as and for the purpose specified.

17. In a machine for treating the heels of boots or shoes, a jack-carrying shaft capable of longitudinal movement, and a tool-carrying shaft provided with a tool to act on a boot or shoe held by the jack, combined with a stop mechanism consisting, essentially, of a lever, as b^9, to engage the jack-carrying shaft and prevent its longitudinal movement, and a lever, as b^{20}, to engage the tool-carrying shaft and move it out of the path of movement of the jack, and means, substantially as described, to prevent rotation of the jack-carrying shaft when the lever b^9 is in engagement with the said jack-carrying shaft, substantially as described.

396,621. PREPARING WHEAT FOR FOOD. RICHARD SMITH, Stoke-on-Trent, County of Stafford, England. Filed Jan. 20, 1887. Serial No. 225,914. (Specimens.) Patented in England Oct. 6, 1886, No. 12,736; in France Nov. 2, 1886, No. 178,380, and in Germany Mar. 22, 1887, No. 42,457.

396,621.



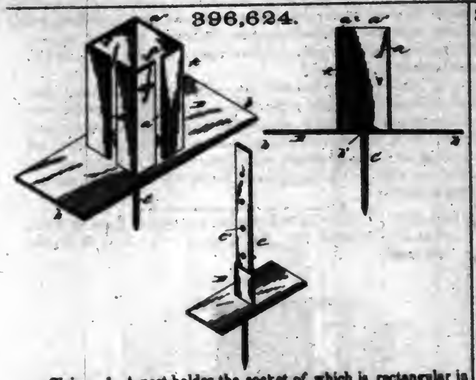
Claim.—The process of preparing wheat for use as food, which consists in subjecting wheat-germs to the action of superheated steam until the flavor of the germs is imparted to the steam, and then subjecting the broken wheat to the action of the same steam, substantially as described.

396,622. WATERPROOFING COMPOUND. CHARLES T. SNEDEKOR, New York, N. Y. Filed Oct. 6, 1888. Serial No. 287,411. (No specimens.) Patented in Canada Dec. 7, 1888, No. 43,500.

Claim.—1. A composition of matter for waterproofing purposes, consisting of asphalt, glue, cotton-seed oil, peroxide of manganese, talc, china-clay, isinglass, ammonia, linseed-oil, copal gum, pyrites, and coloring material, substantially as described.

2. A composition of matter for waterproofing purposes, consisting of liquid asphalt, glue, cotton-seed oil, peroxide of manganese, French talc, china-clay, Russian isinglass, ammonia, linseed-oil, West India copal gum, Zanzibar copal gum, pyrites, and lamp-black, substantially as described.

396,623. WATER-CLOSET. SAMUEL F. SHIPPEN, New York, N. Y. Filed July 31, 1888. Serial No. 281,567. (No model.)



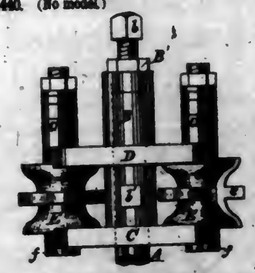
Claim.—1. A washout water-closet provided with an inlet-nozzle at the rear of the bowl, and having a perforated flushing-rim composed of contracted and enlarged portions, the latter being arranged adjacent to the inlet-nozzle, and the former extending from the enlarged portions to the front of the bowl and constructed thereat to provide the greatest discharge, substantially as set forth.

2. A washout water-closet provided with an inlet-nozzle at the rear of the bowl, a divider opposite said nozzle, and a perforated flushing-rim composed of contracted and enlarged portions, the latter being arranged adjacent to the inlet-nozzle, and the former extending from the enlarged portions to the front of the bowl and constructed thereat to provide the greatest discharge, as set forth.

396,624. POST-HOLDER. WILLIAM B. THOMAS, Green Camp, Ohio. Filed Sept. 28, 1888. Serial No. 286,668. (No model.)

396,624.

Claim.—1. A post-holder the socket of which is rectangular in shape and provided with two slots extending from the bottom to the top and dividing the said socket into two unequal parts, the larger of which acts as the post-holder and the smaller as a clamp to hold the post securely in position, substantially as described.

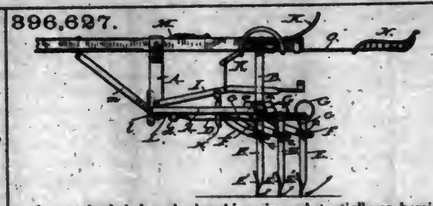


2. The combination, with a post-holder the socket of which is rectangular in shape and provided with two slots extending from the bottom to the top and dividing the said socket into two unequal parts, the larger of which acts as the post-holder and the smaller as a clamp, of a bar passing through the base of the socket and having a rounded head, on which the post rests, substantially as and for the purpose specified.

396,625. HOSE-CLAMP. OTTO TEUN, Grand Rapids, Mich. Filed Oct. 5, 1888. Serial No. 287,284. (No model.)

Claim.—A clamp consisting of a divided ring having a tapering underlap and an overlapping portion, parallel studs *d*, connected by means of a bolt, the stud of the overlap being set back from the end of the ring to form the strengthening-lug *e*, substantially as described.

396,626. CUTTER-HEAD. JAMES P. THURMAN, Atlanta, Ga., assignor of one-half to John T. Thurman, same place. Filed Feb. 17, 1888. Serial No. 264,440. (No model.)



Claim.—A cutter-head consisting of the mandrel A, sleeve B, and flanges C and D, in combination with the cutters *e*, secured to said flanges by means of bolts *f*, passing through the centers of said cutter and the flanges, and provided with washers G, substantially as shown and described.

396,627. CULTIVATOR. JOHN G. THUFF, Richville, Mich. Filed Oct. 31, 1888. Serial No. 289,800. (No model.)

Claim.—1. The main frame, the arched axle, the drag-bars, and the forked shovel-standards, in combination with the braces pivoted to said drag-bars and passed through the forked ends of the standards, breaking-pins securing said braces to the standards, and coiled springs having one end secured to the drag-bars and the opposite end secured to the standards below the breaking-pins, substantially as herein described.

396,627.

2. In a cultivator, the main frame having the arched front portion, the arched axle secured to said frame at its rear, and the drag-bars and attachments, in combination with the removably-secured plate, to which the central drag-bars are attached, a draft attachment extending above and below said plate, and a brace extending from the draft attachment to the pole or tongue, substantially as herein described.

3. In a cultivator, the combination, with the main frame, the main axle and bearing-wheels, and the drag-bars and attachments, of the pole or tongue and the seat having a spring-standard removably secured beneath the rear end of the pole or tongue, substantially as herein described.

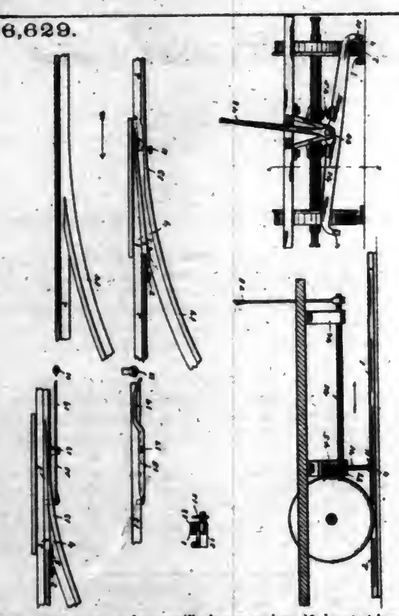
4. In a cultivator, the main frame, the main axle and bearing-wheels, and the drag-bars and attachments, in combination with the yoke H, consisting of the upper and lower longitudinal bars *g* and the vertical uniting-bars *h*, arranged in pairs and separated from each other to permit the passage of the drag-bars, substantially as and for the purpose specified.

396,628. LOCK. HENRY VAN HOEVENBERGH, New York, N. Y. Filed July 19, 1888. Serial No. 280,416. (No model.)

Claim.—1. In a pin-tumbler lock, the combination, with a revolving tumbler-carrier, of a stationary holder having two series of ducts, in line with either of which the line of tumblers in the carrier may be placed by the revolution of the carrier.

2. The combination of a tumbler-case and a key-cylinder revolving therein, the case containing two series of tumbler-recesses, and the cylinder having one series of tumbler-recesses, which latter may be made to coincide with either series of recesses in the case by the revolution of the carrier, and tumblers of varying lengths in said recesses.

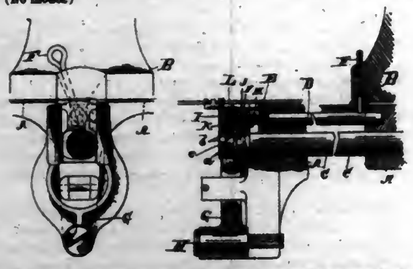
3. The combination of a tumbler-case having two series of tumbler-recesses, a tumbler-carrier or key-cylinder having one series of tumbler-recesses, which may be brought into line with either series in the tumbler-case by the revolution of the cylinder, and limiting-stops for arresting the cylinder in either position.



4. The combination of a tumbler-case having the series of tumbler-recesses, a tumbler-carrier or key-cylinder having one series of tumbler-recesses, which may be brought into line with either series in the tumbler-case by the revolution of the cylinder, limiting-stops for arresting the cylinder in either position, and tumblers of varying lengths in said recesses, whereby keys of different forms may be used to operate the lock.

396,629. RAILWAY-SWITCH. CHARLES W. WALKER, St. Paul, Minn. Filed July 17, 1888. Serial No. 280,174. (No model.)

Claim.—1. The combination, with the main track, of the pivoted switch-tongue 1, normally forming a part of the main rail and adapted to be thrown open to switch a car, a spring bearing at one end against the tail end of said tongue and at the other against the main stationary rail, a car adapted to run over the track and provided with a device to be depressed to move the tongue against the tension of said spring and adapted to be operated from the car-platform, and means between the device on the car and the tongue to transmit motion from the car to said tongue, said means comprising a lateral projection bearing against the tongue, and extending beyond the side of the rail and adapted to be moved for shifting the tongue, substantially as and for the purposes set forth.



2. The combination, with the main track, a pivoted switch-tongue, and means for automatically returning the tongue to its normal position, of a car provided, essentially, with a rock-shaft, 40, a lever for

396,629.

oscillating the same, and an oscillating cross-bar, 41, located beneath the car and operated from said lever to bring one of its ends against a part connecting with said tongue to move the latter, substantially as and for the purposes set forth.

396,630. FEEDING MECHANISM FOR SEWING-MACHINES. SIMON W. WARDWELL, Jr., Woonsocket, R. I., assignor to William P Earle, trustee, Brooklyn, N. Y. Filed Sept. 2, 1886. Serial No. 212,563. (No model.)

Claim.—1. In a sewing-machine feed, the combination of a feed-frame, a slide mounted therein and provided with cloth-engaging projections, mechanism for giving the said slide up and down movements, another slide also mounted in the frame, and mechanism for giving forward and back motions to the said second slide, and through it to impart lateral motions to the frame and the other slide carried thereby, substantially as described.

2. In a sewing-machine feed, the combination of a feed-frame, a slide mounted therein having cloth-engaging projections, a cam for giving said slide up and down movements, another slide mounted in the frame, a cam for moving the said second slide, and an adjusting deflecting-guide with which the second slide engages, whereby said second slide and through it the frame and other slide are given lateral movements, substantially as described.

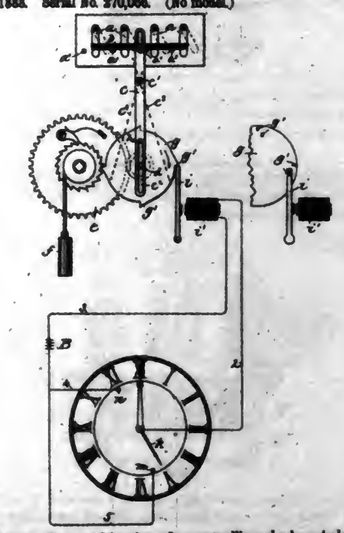
3. In a four-motioned feed for sewing-machines, the combination of a rocking frame having ways, two slides, one provided with cloth-engaging projections independently movable in said ways, cams for independently actuating said slides, and a deflecting-guide with which one of the slides engages, substantially as described.

4. In a sewing-machine feed, the combination of a rocking frame, two slides, one provided with cloth-engaging projections, movable independently of each other in said frame on lines radial to its pivot, cams for moving said slides independently, and means for imparting lateral motions to one of the slides to rock the frame, substantially as described.

5. In a sewing-machine feed, the combination of a rocking frame, two slides movable up and down therein independently of each other, one of the slides having feeding-teeth and the other a laterally-projecting stud, and a deflecting-guide with which said stud engages, whereby said slide is given a lateral motion and the frame rocked, substantially as described.

6. In a sewing-machine feed, the combination, with the main shaft and cams carried thereby, of two slides, one of which is provided with cloth-engaging projections, moved by said cams independently of each other, but in the same directions, a frame in which the slides are mounted, an adjustment-shaft, and a guide carried by said shaft, with which one of said slides engages and by which it is deflected, substantially as described.

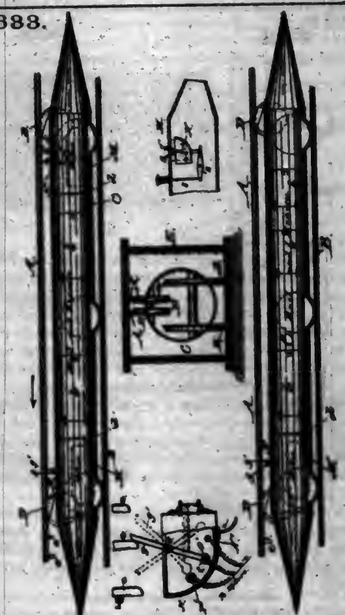
396,631. SHUTTLE FOR SEWING-MACHINES. SIMON W. WARDWELL, Jr., Providence, R. I. Filed June 11, 1887. Serial No. 241,043. (No model.)



Claim.—1. A shuttle-case having two inner shoulders extending entirely around the bobbin, substantially in line with the inner edges or faces of the bobbin-heads, substantially as described.

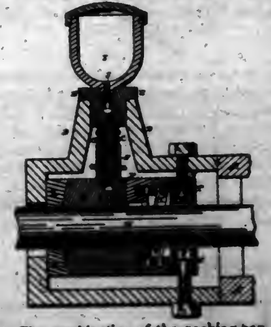
2. A shuttle-case having flanges A', to retain the bobbin, and two inner shoulders extending entirely around the bobbin, substantially in line with the inner faces of the bobbin-heads, the case being recessed between the shoulders to form an annular recess entirely around the bobbin to receive the uncoiled thread, substantially as described.

3. A shuttle having a recess for the reception of a bobbin, provided with a tension-lever pivoted near one end mounted on one side of the body and having its other end arranged to bear on the thread, and a spring mounted at the side of the body opposite the lever, its long end bearing against the short end of said lever, and an adjusting-screw engaging with and regulating said spring, whereby the said lever is made to bear with more or less pressure upon the thread, substantially as described.



396,632. TIME-SWITCH. BENJAMIN F. WATKINS, Brockton, assignor of one-half to Moses H. Hatch, New Bedford, Mass. Filed Apr. 9, 1888. Serial No. 270,066. (No model.)

Claim.—The combination of a controlling-clock and electric contacts, as m and n, operated thereby, with a motor having a number of stop projections, as g', which are double the number of said clock-controlled electric contacts, and a detent, as i, co-operating with the stops of the motor and governed by the clock-controlled electric contacts, substantially as described.



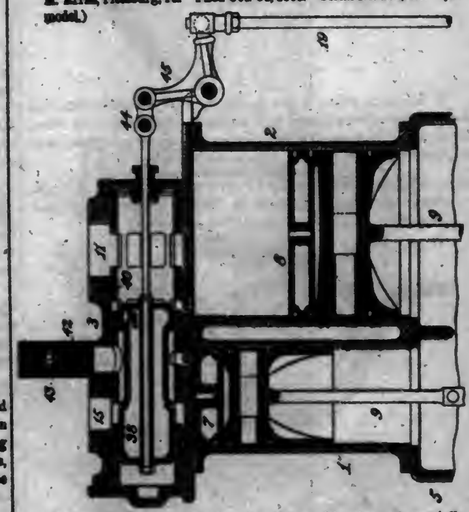
396,633. ELECTRIC-RAILWAY SYSTEM. DAVID G. WEEKS, Baltimore, Md., assignor to the Electro-Automatic Transit Company of Baltimore City, Maryland. Filed June 14, 1888. Serial No. 277,092. (No model.)

396,633.

Claim.—In an electric-railway system for transporting mail and packages, the combination, with upper and lower rails, and stops on the line of road, of an electrically-operated car, means for conveying the current thereto, and adjustable housings on the car having levers, which are actuated by the stops, substantially as and for the purpose described.

396,634. METALLIC PACKING. FRANK A. WESTBROOK, Port Jervis, and WINFIELD S. COOK, Middletown, N. Y.; said Cook assignor to said Westbrook. Filed Mar. 13, 1888. Serial No. 267,116. (No model.)

Claim.—1. The combination of the packing-box, the ring K, which forms a tight joint against the inner end thereof, the packing-ring H, which fits tightly against the piston-rod and forms a tight joint with the ring K, the ring P, which has a socket in its end to receive the conical end of the ring H, the spring Y, placed inside of the ring P, the collar T, and the screws which hold it in position, substantially as shown.

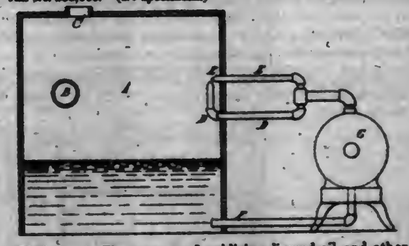


2. The combination of the packing-box, the ring K, which forms a tight joint against the inner side of its outer end, packing-ring H, provided with a shoulder or angular part, N, the ring P, having a socket in its end to fit over the conical part of the ring H, the recess O and the projections R, the ring Y, the collar T, provided with recesses S to receive the projections R, and the screws V, which pass through the side of the packing-box into the collar, substantially as described.

3. The combination of the packing-box, the packing-rings, the conducting-tube made in two parts, the spring C, placed between the two parts of the tube, the plug E, and the oil-cup provided with a valve, the packing-rings being held from turning upon the piston-rod W by suitable stops extending through the packing-box, substantially as set forth.

4. The combination of the packing-box, the packing-rings, which have a lateral movement with the piston-rod, and an adjustable oil-conducting tube having its inner end seated in or upon the packing-ring, the screw-plug, and the oil-cup, the packing-rings being prevented from turning upon the piston-rod W by stops which catch in the inner ring or collar, substantially as specified.

5. The combination of the packing-chamber, the ring K, the packing-ring H, the ring P, provided with the flange X, the collar T, and the screws V, the parts being arranged to operate substantially as shown and described.

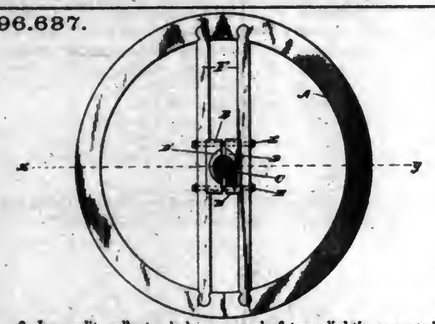


396,635. STEAM-ENGINE. HENRY H. WESTINGHOUSE and FRANCIS M. REYNS, Pittsburg, Pa. Filed Oct. 31, 1883. Serial No. 290,637. (No model.)

Claim.—1. In a compound engine, the combination, substantially as set forth, of a valve-chest, a high-pressure cylinder communicating by a continuously-open port therewith, and a clearance-chamber of variable capacity which communicates continuously with the valve-chest and high-pressure-cylinder port.

2. In a compound engine, the combination, substantially as set forth, of a valve-chest, a high-pressure cylinder communicating by a continuously-open port therewith, a clearance-chamber which communicates continuously with the valve-chest and high-pressure-cylinder port, and an adjustable head or plunger adapted to traverse within and be fixed in different positions in the clearance-chamber.

396,636. PROCESS OF OXIDIZING OILS OR OTHER LIQUIDS. GEORGE B. WIBER, South Newmarket, N. H. Filed Oct. 21, 1887. Serial No. 253,009. (No specimens.)



Claim.—1. The process of oxidizing linseed-oil and other oils and liquids by forcing the same alone in finely-divided particles into a body of air which is being constantly renewed, substantially as described.

2. The process of oxidizing linseed-oil and other oils and liquids by breaking the same into finely-divided particles by means of two currents of the oil or liquid striking against each other in a body of air which is being constantly renewed.

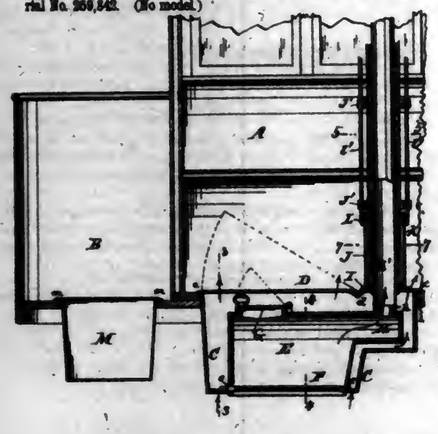
396,637. SPLIT PULLEY. WILLIAM A. WILLINGHAM, Chattanooga, Tenn. Filed Aug. 28, 1888. Serial No. 283,574. (No model.)

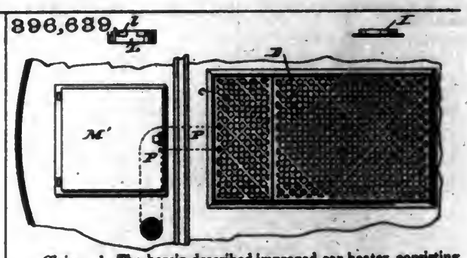
Claim.—1. In a split pulley, a bushing made up of two slightly separated parts, each having its external and its internal surface cylindrical, and each thinner in its middle than at either of its lateral edges, substantially as and for the purpose set forth.

396,687.

2. In a split pulley, a hub composed of two slightly-separated parts having in their adjacent faces registering bushing-grooves whose curved surfaces are portions of cylinders of a diameter greater than the greatest distance between those surfaces.

396,688. CABLE-RAILWAY STRUCTURE. WILLIAM H. YOUNG, Chicago, Ill., assignor of one-half to William J. Morden, same place. Filed May 23, 1888. Serial No. 274,846. (No model.)





Claim.—1. A railway-chair adapted to receive and support the rail, recessed in its base to receive the yoke, and having corrugations to engage similar corrugations on said yoke, and adapted to be secured thereto by a key, substantially as described.

2. A railway-chair having in a single casting a base portion adapted to receive the base of the rail, a transverse recess one wall of which is corrugated to adapt it to engage corresponding corrugations of the yoke and the other wall provided with a key-seat, and having, also, an upright shoulder or flange to support the web and tread of the rail, substantially as described.

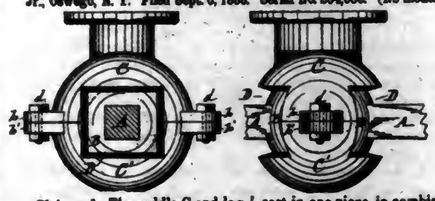
3. A railway-chair consisting of a casting, C, having groove *b*, shoulder D, having key-seat *d*, and a base portion having a recess to receive the yoke, one wall of which recess has the corrugations *e* and the other a key-seat, *f*, said walls converging downwardly, whereby to provide a dovetailed joint, substantially as described.

396,689. CAR-HEATER. JOHN ZIMMERMAN, Cincinnati, Ohio, assignor to the Zimmerman Machine Company. Filed Jan. 3, 1888. Serial No. 259,842. (No model.)

Claim.—1. The herein-described improved car-heater, consisting of a casing supported at its upper edge in the floor of the interior of the car, a perforated cover for said casing composed of sections hinged together, a furnace or fire-box having a cover, G, supported immediately beneath the perforated cover of the casing, a smoke-pipe, *N*, attached to the furnace or fire-box and passing directly upward through one of the sections of the perforated cover and also through the interior of the car, substantially as shown and set forth.

2. In a car-heater, the furnace or fire-box supported in the car, the smoke-pipe *N*, a perforated metal casing surrounding said smoke-pipe, and an open frame or guard composed of strips of wood or other non-conducting material surrounding the said perforated casing, with a space intervening between said casing and frame, substantially as shown and described.

3. In a car-heater, the furnace or fire-box supported in the car, the smoke-pipe *N* thereof provided with a surrounding perforated metal casing, and a frame or guard of wood or other non-conducting material surrounding the perforated casing, substantially as shown and described.

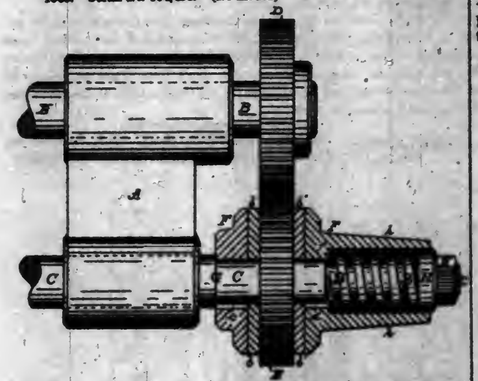


396,640. TWO-WHEELED VEHICLE. ARTHUR A. ABBOTT, Chicago, Ill. Filed June 14, 1887. Serial No. 241,291. (No model.)

Claim.—1. In a two-wheeled vehicle, the combination of shafts pivotally connected to the forward part of the body, springs for supporting said body connected at their rear ends to the axle, extended in line with the sides of the body and connected at their forward ends thereto, and springs connected at one end to the shafts, extended rearwardly in line therewith and connected at their rear ends to hangers depending from the body, substantially as described.

2. The combination of axle *a*, springs *c* and *d'*, frame *b b' c d'*, pivoted shafts *d* and *d'*, and springs *k* and *k'*, substantially as described and shown.

396,641. COUPLING FOR VEHICLE-AXLES. LEONARD ANES, Jr., Oswego, N. Y. Filed Sept. 6, 1888. Serial No. 284,668. (No model.)

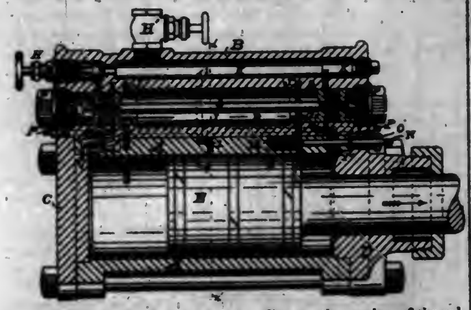


Claim.—1. The saddle C and leg *l*, cast in one piece, in combination with the axle A, ball B, rigidly secured to the axle, and the clip C', embracing the lower portion of the axle and connected to the saddle, substantially as described and shown.

2. In combination with the axle A, the ball B, formed with sockets *a a'*, respectively, in its top and bottom, the saddle C and leg *l*, cast in one piece, and the clip C' and lug *l'*, cast in one piece, substantially as described and shown.

3. In combination with the saddle C, clip C', and axle A, the dowel-pin *e*, secured to the axle, and the ball B, cast around the portion of the axle containing the dowel-pin, substantially as set forth.

4. The combination of the axle A, dowel-pin *e*, secured thereto, the ball B, cast around the axle and inclosing the dowel-pin, and formed with the elongated sockets *a a'*, respectively, in its top and bottom, and the saddle C and clip C', having integral with them, respectively, the lugs *l* and *l'*, projecting into the sockets *a a'*, substantially as described and shown.



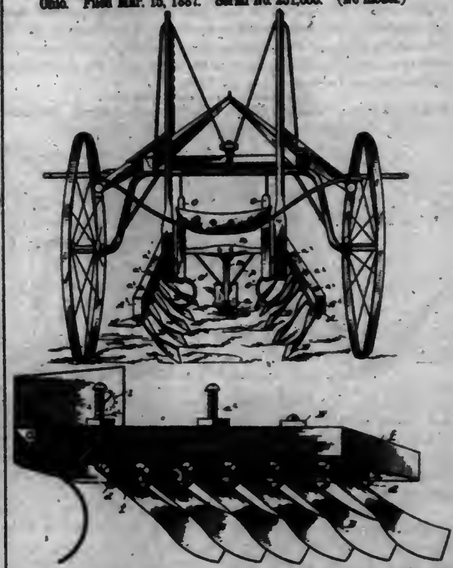
396,642. FRICTION-CLUTCH. ALBERT BALL, Claremont, N. H., assignor to the Sullivan Machine Company, same place. Filed Dec. 2, 1885. Serial No. 184,432. (No model.)

Claim.—1. The combination of a shaft, a gear loosely mounted thereon, a friction-plate on each side of said gear, a collar, F, securely fastened to said shaft and bearing against one of said plates, and a collar, F', formed with a chambered hub, A, thereon, inclosing the regulating-spring and bearing against the other plate, and a spring bearing against said collar F' and rendered adjustable by means of a nut, substantially as set forth.

2. The combination, with a suitable shaft and driving-gear on same, of a feed-shaft and loose gear mounted on same between two disks or plates, a fixed and a movable collar on the other sides of said disks or plates, a spiral spring arranged within said movable collar, and an adjusting-nut screwed on the said shaft, substantially as and for the purposes described and shown.

396,643. STEAM-ACTUATED VALVE. ALBERT BALL, Claremont, N. H., assignor to the Sullivan Machine Company, same place. Filed May 11, 1887. Serial No. 237,853. (No model.)

Claim.—1. The combination, in a direct acting engine, of the cylinder A, steam-chest B, piston E, double-balanced valves G G, steam-inlet ports I I', steam-exhaust ports J J', and hand-valves H H in said steam-inlet ports above said double balanced valves, so that the supply of steam to either end of said cylinder may be regulated before passing through said double-balanced valves, substantially as described.



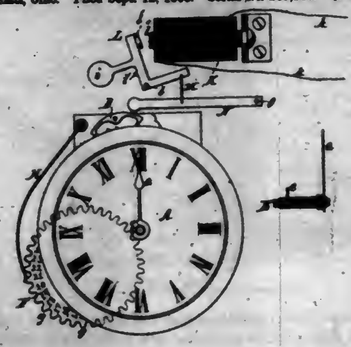
2. In a direct-acting engine, the combination of the piston provided with two inlet-pockets, 2 and 8, and the exhaust-pockets 4 and 9, the double-balanced steam-actuated valves to regulate the movements of said piston, and steam-passages 1, 3, 5, 6, and 7 to and from said pockets and valves and entirely separate and independent from the main steam-passage, substantially as described.

3. In a direct-acting engine, the combination of the piston provided with two inlet-pockets, 2 and 8, and with two exhaust-pockets, 4 and 9, the double-balanced steam-actuated valves to regulate the movements of said piston, steam-passages 1, 3, 5, 6, and 7 to and from said pockets and said valves and entirely separate and independent from the main steam-passage of the engine, and speed-regulators P, which control the quantity of steam passing through the passages 5 and 5 to and from said double-balanced valves, substantially as described.

4. The combination, in a direct-acting engine, of the cylinder A, double-balanced valves G G, piston E, steam-inlet ports I I', steam-exhaust ports J J', and the gate M in the exhaust-port J, substantially as and for the purpose set forth.

5. The combination, in a direct-acting engine, with the cylinder A and double-balanced valves G G, of the piston E, provided with pockets or concavities therein and entirely independent and separate from each other, for the purpose set forth, substantially as described.

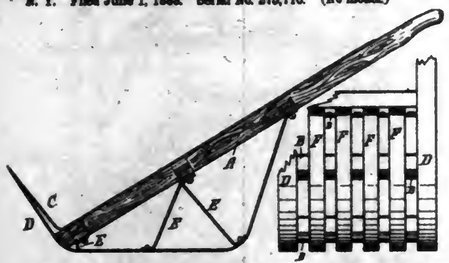
396,644. PULVERIZING-HARROW. MARTIN BRUNER, Rockland, Ohio. Filed Mar. 15, 1887. Serial No. 231,055. (No model.)



Claim.—1. In a harrow, the main beams having the double rows of bolts arranged thereon, and the harrow-teeth provided with perforations and slots engaging one of the rows of bolts, the other row of bolts connecting the edges of said teeth, and the cushioning-springs, in combination with the harrow-teeth, as shown and described, and for the purposes set forth.

2. In a harrow, the main beams having the double rows of bolts arranged thereon, and the harrow-teeth provided with perforations and slots engaging one of the rows of bolts, the other row of bolts connecting the edges of said teeth and their heads holding the teeth against displacement, in combination with the harrow-teeth, as shown and described, and for the purposes set forth.

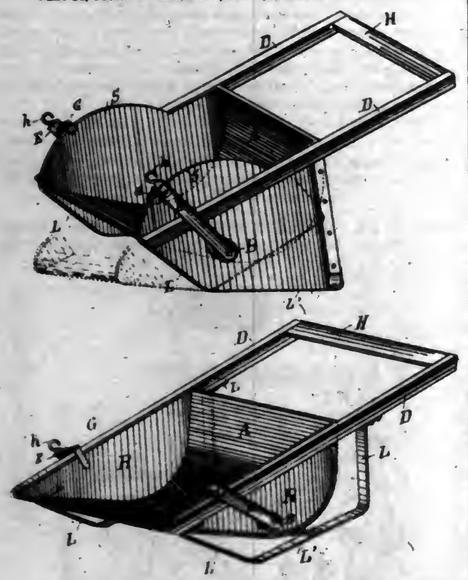
3. In a harrow, the combination, with the main beams having a double row of bolts for connecting the teeth to the beams, and coiled springs interposed between the teeth and beams, of the pivoted spring-tooth interposed between the front of the beams, as shown and described, and for the purposes set forth.



396,645. ELECTRIC TIME-METER. GEORGE F. CARD, Covington, Ky., assignor to the George F. Card Manufacturing Company, Cincinnati, Ohio. Filed Sept. 12, 1888. Serial No. 285,219. (No model.)

Claim.—1. In an electric meter, a clock mechanism the arbor of the hand-wheel of which is provided with a finger, *e*, a toothed and numbered dial, F, arranged to be engaged by the finger *e* and have imparted to it an intermittent rotary motion upon the rotation of said finger, combined with an electro-magnet and devices intermediate of the electro-magnet and clock mechanism for starting or stopping the operation of the clock upon the action of the electro-magnet, substantially as set forth.

2. In an electric meter, a clock mechanism the arbor of the hand-wheel of which is provided with a finger, *e*, a toothed and numbered dial, F, and a spring, H, engaging said wheel to hold it from accidental rotation, the said wheel being arranged to be engaged by the finger *e* and have imparted to it an intermittent rotary motion upon the rotation of said finger, combined with an electro-magnet and devices intermediate of the electro-magnet and clock mechanism for starting or stopping the operation of the clock upon the action of the electro-magnet, substantially as set forth.

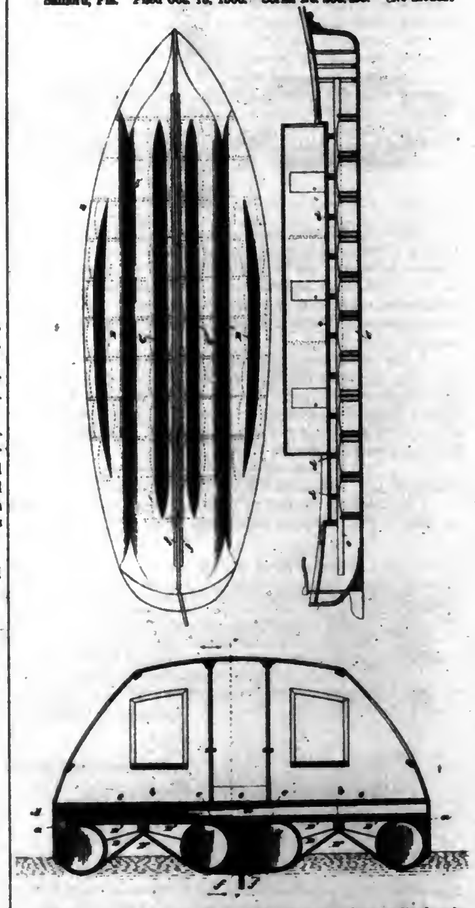


396,646. SLEIGH-TRUCK. LEONARD R. CARBART, Coeymans, N. Y. Filed June 1, 1888. Serial No. 275,710. (No model.)

Claim.—1. In a sleigh-truck, the combination of the side bars, A A, having attached to the upper portion thereof the metal bar C, said bar C being curved and extending above the side bars, A A, with the runners D D, attached to the side bars, A A, and to the metal bar C above the side bars, A A, substantially as described, and for the purpose set forth.

2. In a sleigh-truck, the combination of the side bars, A A, secured together by the cross-pieces B B, having attached to the upper portion of the said side bars the metal bar C, said bar being curved and extending above the side bars, A A, with the runners D D, attached to the side bars, A A, and to the metal bar C above the side bars, with the runners F F, attached to the cross-bars B B between the runners D D, substantially as described, and for the purpose set forth.

396,647. SCRAPER. LEONARD R. CARBART, Coeymans, N. Y. Filed June 11, 1888. Serial No. 276,689. (No model.)

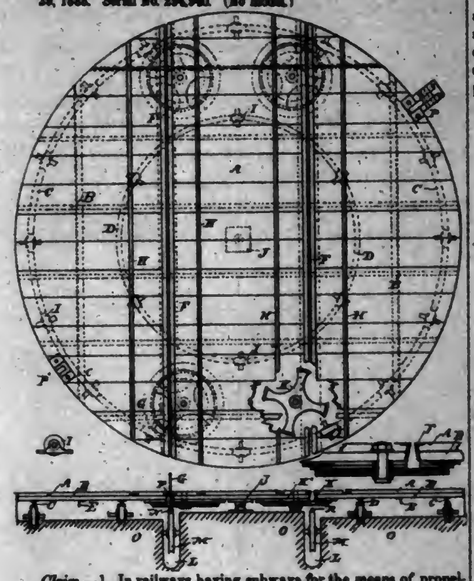


Claim.—1. In an ice-scraper, the combination of the runners L L', formed at an angle to each other, with the bars D D, attached to the side pieces, with the hook-bars E, movable about bolts B and provided with hooks *h*, all substantially as described, and for the purpose set forth.

2. In an ice-scraper, the combination of the runners L L', formed at an angle to each other, with the bars D D, attached to the side pieces, with the hook-bars E, movable about bolts B and provided with hooks *h*, and the guide-hooks G, all substantially as described, and for the purpose set forth.

3. In an ice-scraper, the combination of the runners L L', formed at an angle to each other, with the side pieces, S S, having their upper edges convex in form, with the bars D D, attached to the side pieces, S S, with the hook-bars E, movable about bolts B and provided with the hooks *h*, and the guide-hooks G, all substantially as described, and for the purpose set forth.

396,648. CONSTRUCTION OF VESSELS. JOHN D. CORNWALL, Sanford, Fla. Filed Oct. 18, 1888. Serial No. 288,495. (No model.)

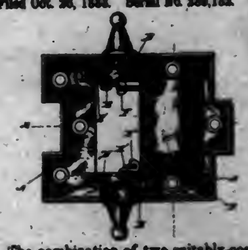


Claim.—1. In a vessel, the combination of a longitudinal series of barrels or casks, B B' and C C', braces D, having stay-pieces attached thereto abutting against the barrels, said braces being cut away centrally to provide a water-way, F, and exterior planking, substantially as shown.

2. The combination, in a vessel, of a series of braces, D, vertical planks *f f*, secured to the inner ends of said braces, longitudinal and transverse beams connected to said braces and supporting a superstructure, and a series of barrels held in place between the braces by stay-pieces, the exterior planking being attached to said braces so as to inclose either partially or wholly the barrels, substantially as shown, and for the purpose set forth.

3. The combination, in a vessel constructed substantially as described and provided with a series of longitudinal floats or barrels, of transverse braces forming compartments between said barrels, and an exterior planking having perforations formed therein to admit water flowing in and out between the braces, for the purpose set forth.

396,649. TURN-TABLE FOR CABLE OR ELECTRIC RAILWAYS. WARD DAVIDSON, Oakland, Cal. Filed May 27, 1887. Renewed Dec. 29, 1888. Serial No. 294,940. (No model.)

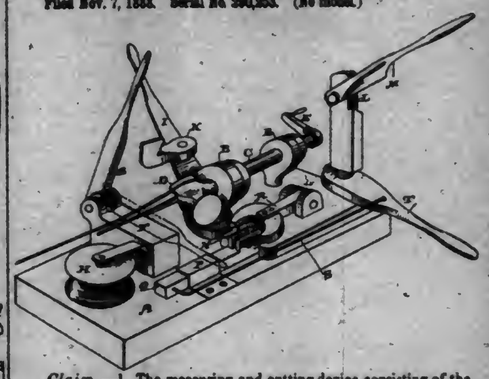


Claim.—1. In railways having subways for the means of propelling their cars, a turn-table consisting, essentially, of divided sections between which the device connecting between the car and the propelling medium may pass, and suitable means for connecting said sections together, so that the table they form may be revolved as one connected whole, said means of connection being arranged within the path of the said device connecting between the car and the propelling medium and adapted to be moved to permit said device to pass it as the car moves on or off the table, substantially as and for the purpose herein described.

2. A turn-table for cable, electric, or other railways having subways for the power appliances, consisting, essentially, of divided sections supported on rollers set below a circular track secured to the under side of the table and connected together at opposite ends by suitable locking devices adapted to be moved to permit the passage of the grip as the car moves on or off the table, substantially as and for the purpose set forth.

3. The lock for railway turn-tables having divided sections, consisting of the wheel K, having radiating arms with upturned ends, in combination with the plate K', having grooved surface to receive the upturned ends of the arms of the wheel, both wheel and plate being secured to the sections of the table, substantially as and for the purpose herein described.

4. As a means for operating to turn and move the cars at the termini of cable or electric railways, the combination of a turn-table divided by the grip-slot into practically separate sections, suitable means for connecting these sections together by or through which the grip may pass, and a cable or conductor supported under the table, so as to be accessible to be engaged with the gripper while the car is upon the table, substantially as and for the purpose described.

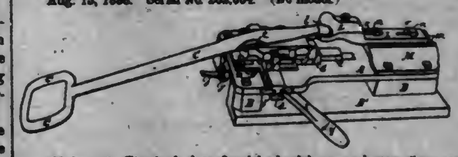


396,650. SPRING-HINGE. LEVI M. DEVORE and FREDERICK W. HOSTER, Freeport, Ill., assignors to the Stover Manufacturing Company, same place. Filed Oct. 26, 1888. Serial No. 289,182. (No model.)

Claim.—1. The combination of two suitably-connected hinge-leaves, one of which is provided at each end with a pivotal stud or pin, a spring-coil mounted parallel to the hinge-axis upon the other of said leaves, and links connecting, respectively, the ends of said spring with said pins, substantially as set forth.

2. The combination, with the leaf A', provided with the pins E E', and the leaf A, joined to the leaf A' by suitable pintles, of the spring-arbor D, mounted in suitable bearings upon the leaf A, the spring C, coiled about said arbor, and the links F F', connecting the ends of said spring with said pins, respectively, substantially as and for the purpose set forth.

396,651. BALE-TIE TWISTER. CHRIS FRANCO, Livermore, Cal. Filed Nov. 7, 1888. Serial No. 290,253. (No model.)



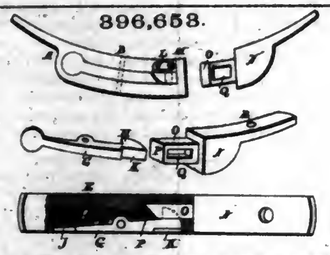
Claim.—1. The measuring and cutting device consisting of the head K, around which the loop is placed, the roller H, and a cutter, L N, substantially as herein described.

2. The semi-cylinder N, the slide O, with its jaws Q, and the holding-plate R, in combination with the lever T and the connecting-rod S, substantially as herein described.

3. The hook-forming device and gage consisting of the semi-cylinder N, the slide O, and the lever by which the slide is reciprocated to and from the open side of the cylinder, in combination with the pulley H, the loop-holder K, and the lever I, substantially as herein described.

4. A device for measuring, cutting, and forming loops in the ends of the wires for baling purposes, consisting of the rotary shaft with its twisting-head, anvil, and holding-lever, the reciprocating slide, and semi-cylindrical standard, the guide roller or pulley at the end of the table, the stretching hook and lever, and the knives or cutters, substantially as herein described.

396,652. MACHINE FOR TRIMMING SOFT-METAL LININGS OF CAR-AXLE BEARINGS. TIMOTHY W. OSTRAM, West Troy, N. Y. Filed Aug. 13, 1888. Serial No. 282,684. (No model.)

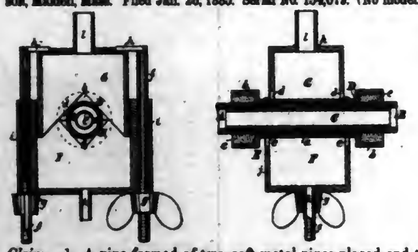


Claim.—1. The bed-plate furnished with an end stop for a car-axle bearing and having the lengthwise and transverse slotted ways, combined with the sliding clamps extending through and engaging with said slotted ways, and the operating-lever mounted under the bed-plate and having cams engaging with said clamps, substantially as described.

2. The bed-plate having the lengthwise and transverse slotted ways, the fixed end stop, D, and the vertical sockets *i*, adjacent to said stop, the movable end stop, D', fitting in said sockets, and the lever *j*, pivoted to the bed-plate and engaging with said movable stop, combined with the sliding clamps upon, extending through, and engaging with said slotted ways, and the lever mounted under the bed-plate and having cams engaging with said clamps, substantially as set forth.

3. The combination, with the bed-plate furnished with an end stop for a car-axle bearing and having the lengthwise and transverse slotted ways, the sliding clamps upon, extending through, and engaging with said slotted ways, and the lever mounted under the bed-plate and having cams engaging with said clamps, of the stock L, mounted upon and adjustable lengthwise along and above said bed-plate, and the hand-lever C, having the trimming-blade and connected to said stock by a ball-and-socket joint, as set forth.

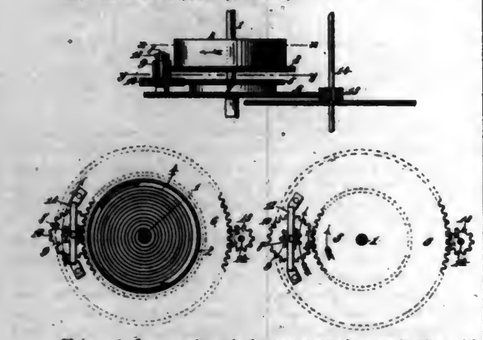
396,653. HAME-FASTENER. GEORGE W. HARBOR, Manhattan, Kans. Filed May 12, 1888. Serial No. 273,743. (No model.)



896,653.

Claim.—1. The within-described hame-fastening, consisting of the part A, enlarged at B and having the slot E, provided at its forward end with the opening C and flaring mouth D, and at its rear end terminating in the recess F, the hook-latch G, pivoted in the slot E, the spring J, acting on said latch, and the part N, having a central projecting scarfed and perforated bolt, O, the several parts made and all combined in the manner set forth.

2. In a hame-fastener, the combination of the part A, having a pivoted holding-finger, L, and slotted, as described, and having the hooked latch therein, said latch being cut away at K, combined with the part N, having stud O, perforated and scarfed, as described.

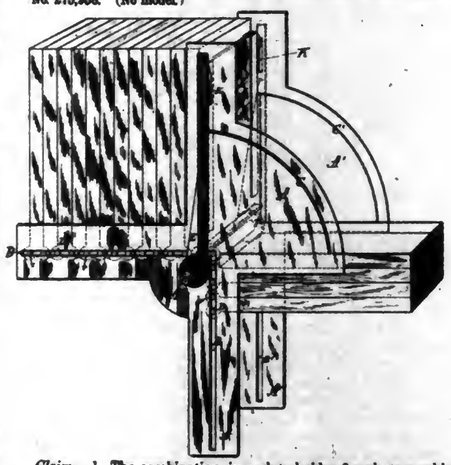


896,654. JOINT FOR SOFT-METAL PIPES. WILLIAM A. HENDERSON, Malden, Mass. Filed Jan. 26, 1885. Serial No. 154,072. (No model.)

Claim.—1. A pipe formed of two soft-metal pipes placed end to end and united simply by fusing the metal of the pipes at the place of juncture, the diameter of the pipe at the place of juncture being the same as the diameter of said ends, substantially as set forth.

2. A pipe formed of two soft-metal pipes placed end to end and united by fusing the metal of the pipe at the place of juncture, the diameter of the pipe at the place of juncture being the same as the diameter of said ends, and said pipe having within and covering said place of juncture a tube conforming to the interior of the pipe, substantially as set forth.

896,655. CLOCK. HERMANN HERWIG, Media, Pa. Filed Oct. 12, 1888. Serial No. 287,898. (No model.)

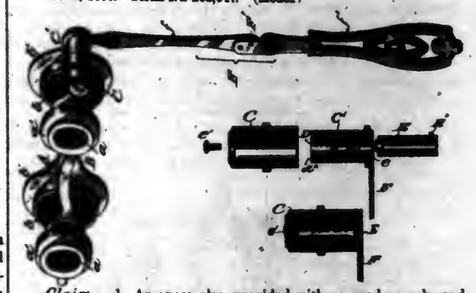


Claim.—1. In a watch or clock movement, the combination, with an arbor, of a barrel carrying a rigidly-attached gear loosely mounted on said shaft or arbor, a wheel consisting of the gears rigidly connected together and of unequal diameter loosely mounted on the same arbor, a pinion journaled on a stud, projecting from the flat face of the larger gear of said wheel, said pinion meshing with the gear carried by the barrel and carrying a pinion which meshes with the smaller gear of the wheel, substantially as described.

2. In a watch or clock movement, the combination, with an arbor, of a barrel and a gear rigidly mounted on said barrel, both loosely mounted on the shaft 1, a wheel composed of two unequal gears rigidly connected together, a pinion mounted on a stud projecting from the flat face of the longer gear, said pinion meshing with the gear carried by the barrel and having rigidly attached a pinion meshing with the smaller gear of the wheel, a shaft having a pinion meshing with one of the gears of the wheel, and a coiled spring connecting the barrel to the arbor, substantially as described.

3. In a watch or clock movement, the combination, with the arbor 1, of a barrel, 2, carrying a rigidly-attached gear, 3, loosely mounted on said arbor, a wheel composed of two rigidly-connected unequal gears, 5 and 6, the latter being provided with a stud, 8, a pinion, 9, having a rigidly-connected pinion, 10, journaled on said stud, the former meshing with the gear 3 and the latter with the gear 5, a shaft, 14, having a pinion, 13, and a spring, 4, connecting the barrel 2 and arbor 1, substantially as described.

896,656. MAGAZINE PLATE-HOLDER FOR PHOTOGRAPHIC PLATES. FREDERICK A. HETHERINGTON, Brooklyn, assignor of one-half to Henry A. W. Wood, New York, N. Y. Filed June 4, 1888. Serial No. 275,968. (No model.)



Claim.—1. The combination, in a plate-holder for photographic plates, of a series of leaves linked or hinged together and having flanged edges for protecting the photographic plates, with side plates having guide-slots, as described, substantially as and for the purposes set forth.

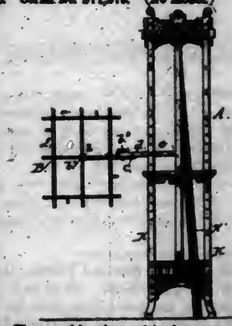
2. In a magazine plate-holder for photographic plates, the combination of a series of leaves hinged directly together, as shown, with side plates having guide-slots arranged so that by the act of turning a leaf through an arc of ninety degrees the next following leaf shall come into position for another exposure, substantially as set forth.

3. The combination, in a magazine plate-holder for photographic plates, of a series of hinged leaves having slotted side plates, as described, with operating levers, rods, and stops, substantially as and for the purposes set forth.

896,657. OPERA-GLASS. GUSTAV HOLLE, Philadelphia, Pa. Filed Feb. 1, 1888. Serial No. 262,647. (Model.)

Claim.—1. An opera-glass provided with an eye-lens yoke and an object-lens yoke, a telescopically-related extensible device the parts of which are secured to the extremities of the yokes for adjustably connecting said yokes, and capable of sufficient contraction to bring the lens-yokes into immediate proximity, and suitable mechanism for causing the extension or contraction of said extensible device, substantially as set forth.

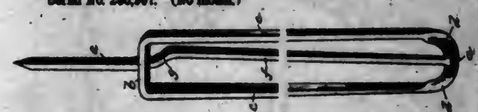
2. An opera-glass provided with an eye-lens yoke and an object-lens yoke adapted to approach and lie in immediate proximity to each other, connective devices for adjustably connecting said yokes, a stud mounted upon a connection of one of said yokes and working in a spiral slot formed in a rotatable cylinder mounted in connection with the other of said yokes, substantially as set forth.



3. An opera-glass provided with an eye-lens yoke and an object-lens yoke adapted to approach and lie in immediate proximity to each other, a telescopically-related extensible device for adjustably connecting said yokes, suitable mechanism for causing the extension or contraction of said connecting device, and a depending handle hingedly connected to a connection of one of said yokes, substantially as set forth.

4. An opera-glass provided with an eye-lens yoke and an object-lens yoke adapted to approach and lie in immediate proximity to each other, connective devices for adjustably connecting said yokes, a rotatable spirally-slotted cylinder mounted in connection with one of said yokes, a fixed stud mounted in connection with the other of said yokes, and a depending folding handle rigidly attached to said rotatable slotted cylinder, substantially as set forth.

5. An opera-glass provided with an eye-lens yoke and an object-lens yoke, a telescopically-related extensible connecting device, exterior to the space between said two yokes for adjustably connecting said yokes, a rotatable spirally-slotted cylinder mounted within said extensible device and in connection with one of said yokes, a fixed stud mounted within said extensible device in connection with the other of said yokes and engaged with the spiral slot of said cylinder, and a depending handle rigidly attached to said rotatable slotted cylinder, substantially as set forth.

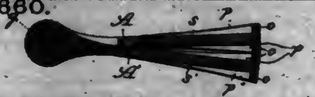


6. An opera-glass provided with an eye-lens yoke and an object-lens yoke, a telescopically related extensible connecting device exterior to the space between said two yokes for adjustably connecting said yokes, a rotatable spirally-slotted cylinder mounted within said extensible device and in connection with one of said yokes, a fixed stud mounted within said extensible device in connection with the other of said yokes and engaged with the spiral slot of said cylinder, and a sectional latch-provided handle attached to said rotatable slotted cylinder, substantially as set forth.

896,658. ARTIST'S EASEL AND ATTACHABLE REST. JOHN A. JOHNSON, Austin, Tex., assignor to John J. Tobin, same place. Filed Apr. 20, 1888. Serial No. 271,570. (No model.)

Claim.—The combination, with the rest, as described, of the bar c, pivoted to said holder by bolt b^3, the perforated bar d, pivoted to bar c by bolt b^4, and the easel A, united to the bar d by a suitable round bolt, substantially as and for the purpose set forth.

896,659. DITCHING-SPADE. JOHN R. KEUCHAN, JAMES H. KEUCHAN, and SQUIRE R. KEUCHAN, Anamosa, Iowa. Filed July 25, 1888. Serial No. 280,967. (No model.)



Claim.—A skeleton spade consisting of side bars, a a, formed of a single bar bent centrally to provide the cross-bar b, with its ends approximately parallel to form the sides a a, said sides being flattened and curved at their lower ends and united to form the cutting-edge, and the central bar, f, extending and inclining from said cutting-edge rearwardly, provided with a bend, g, at its top, substantially as described.

896,660. HINGE. DAVID S. LOUD, Chicago, Ill., assignor of one-half to Walter P. Conyers, same place. Filed Oct. 11, 1888. Serial No. 287,827. (No model.)

Claim.—1. A hinge comprising two butts with the usual knuckle-and-pin connection, the opposite surfaces of each butt forming divergent and substantially-radial planes, of which the axial line is the center, substantially as described.

896,660.

2. A hinge comprising two butts with the usual knuckle-and-pin connection, the opposite surfaces of the butts being provided with projections, as the flanges o p, whereby when the hinge is folded in either direction projections of the adjacent sides will meet, substantially as described.

3. A hinge comprising two butts with the usual knuckle-and-pin connection, the leaf of each butt extending in direct radial line from the axis of the hinge, and being provided along its opposite ends with curvilinearly divergent flanges p and on opposite sides of its outer edge with flanges o, whereby when the hinge is folded in either direction flanges of the adjacent sides will meet, substantially as described.

896,661. STUD OR OTHER JEWELRY. ADOLPH LUETY, New York, N. Y., assignor to A. Luthy & Co., same place. Filed Feb. 10, 1888. Serial No. 263,694. (No model.)

Claim.—1. The combination, with the base, a stem projecting therefrom, and two radial fastening-arms, the one rigid with said stem and the other mounted to turn on the axis of said stem and adapted to fold against the rigid arm or to be turned outwardly therefrom, of stops on the relatively-moving parts to hold the turning arm in coincidence with the rigid one, and inclines on the moving parts, respectively, to hold said turning arm frictionally in place when turned away from the rigid arm.

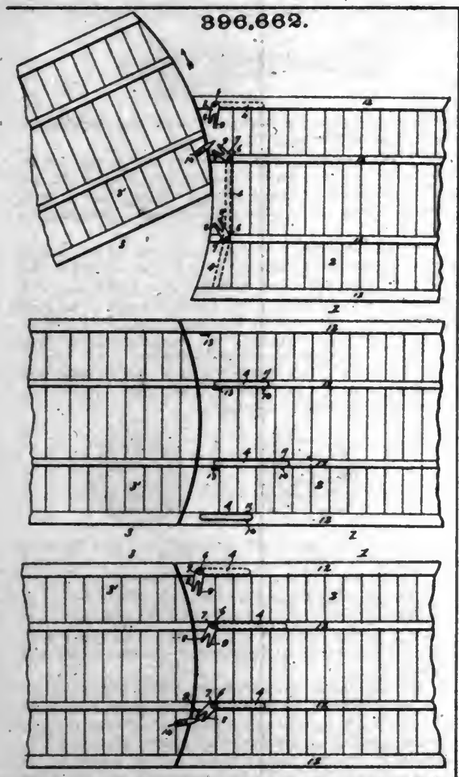
2. The combination, with the base and the stem projecting therefrom, of two radial fastening-arms, the one rigid with said stem and the other mounted to turn on the axis of said stem and adapted to fold against the rigid arm or to turn outwardly therefrom, and the said arms formed with stops to hold them in coincidence, and inclines on the moving parts, respectively, to hold the turning arm frictionally in place when turned away from the rigid arm.

3. The combination, with the base and a stem projecting therefrom, of two radial fastening-arms, the one rigid with said stem and the other mounted on a screw engaging said stem and adapted to fold against the rigid arm or be turned outwardly therefrom.

4. The combination, with the base, of the stem projecting therefrom and two fastening-arms projecting radially from said stem, the one rigid with said stem and the other mounted to turn relatively thereto, and both being half-round in cross-section and constructed to fit together, whereby when in coincidence they form a lateral continuation of such stem, and their insertion is facilitated.

5. The combination, with the base, of the stem projecting therefrom and two radial fastening-arms projecting from the rear of said stem at an obtuse angle, the one rigid with said stem and the other mounted to turn relatively thereto, and the two adapted to fold together, and constructed when thus coinciding to appear as a continuation of such stem.

6. The combination, with the base and a stem projecting therefrom, of two radial fastening-arms, the one rigid with said stem and the other mounted to turn relatively thereto, the one arm having its end extended beyond the other and thickened and formed with a shoulder abutting against the end of the other arm when the two arms are in coincidence.



7. The combination, with the base, of a tubular stem projecting therefrom and engaged therewith, a radial fastening-arm projecting rigidly from the rear end of such stem, a screw-shank screwing into said stem, and a radial fastening-arm fixed on said shank and adapted to turn therewith and to fold against the rigid arm.

8. The combination, with the base, of a stem projecting therefrom and screwing into the threaded socket therein, whereby it is adjustable relatively thereto, and two radial fastening-arms, the one rigid with said stem and the other mounted to turn on the axis thereof and to fold against the rigid arm.

896,662. DRAW-BRIDGE GATE. OLE MOEN, Manistee, Mich. Filed July 20, 1888. Serial No. 280,981. (No model.)

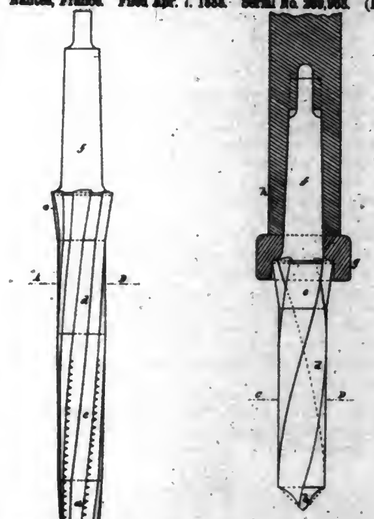
Claim.—1. The combination, with a pier or an abutment and a horizontally-swinging gate journaled thereon and provided with a lever or detent upon its vertical shaft, of a swinging draw span or bridge provided with a projecting finger or dog which is adapted to

396,662.

directly engage and turn said lever or detent and gate, substantially as described.

2. The combination, with a pier or an abutment and a horizontally-swinging gate having a vertical post journaled thereon and provided with a bifurcated lever or detent, of a swinging draw span or bridge provided with a finger or dog which projects therefrom and is adapted to directly engage and turn said bifurcated lever or detent and gate, substantially as described.

3. The combination, with a pier or an abutment and a swinging draw span or bridge, of a series of gates provided with vertical posts which are journaled upon said pier or abutment, bifurcated detents projecting from said vertical gate-posts, and a finger or dog which projects from the end of said swinging draw span or bridge and is adapted to directly and successively engage and turn said bifurcated detents and the gates with them, substantially as described.



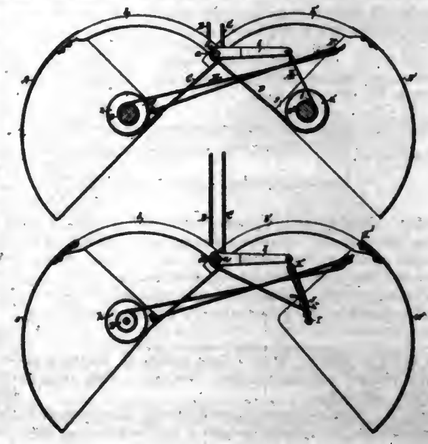
4. The combination, with a pier or an abutment and a swinging draw span or bridge, of a series of gates arranged in a segment of a circle having its center in the center of said draw span or bridge and provided with vertical posts which are journaled with their lower ends in said pier or abutment, bifurcated detents projecting from the lower ends of said vertical gate-posts, and a finger or dog which projects from the end of said swinging draw span or bridge and is adapted to successively engage and turn said bifurcated detents and gates, substantially as described.

5. The combination, with a pier or an abutment and a swinging draw span or bridge, of a gate provided with a vertically-journaled post, a bifurcated lever or detent secured to the lower end of said post and formed with a long finger or prong and a short finger or prong, and a finger or dog secured upon the end of said swinging draw span or bridge and adapted to engage and turn said bifurcated lever or detent and gate, substantially as described.

6. The combination of a swinging draw span or bridge, a pier or an abutment provided with a roadway and sidewalks, having beams or copings, a series of gates provided with vertical posts which are journaled with their lower ends in bearings secured in said beams or copings, bifurcated levers or detents projecting from the lower ends of said posts, a finger or dog secured upon the end of said swinging draw span or bridge and adapted to engage said bifurcated levers or detents, spring-latches secured upon said beams or copings, and stops arranged upon said abutment or pier at points at right angles to said spring-latches, substantially as and for the purpose described.

7. The combination of the swinging draw span or bridge 3, the pier or abutment 1, provided with the roadway and sidewalks, having the beams or copings 12, the series of gates 4, provided with vertical posts 5, which are journaled at their lower ends in the bearings 6 in said beams or copings, the bifurcated levers or detents 7, projecting from the lower ends of said posts and formed with short and long fingers or prongs 8 and 9, the spring-latches 10, secured upon said beams or copings, the stops 13, arranged upon said pier or abutment at points at right angles to said spring-latches, and a dog or finger, 14, secured upon the end of said swinging draw span or bridge at an angle to the central line of the same and adapted to successively engage said bifurcated levers or detents and turn the same and said gates, substantially as described.

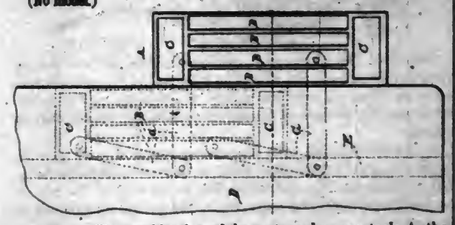
396,663. COUNTERSINK AND DRILL. AUGUSTE MORIMEAU, Nantes, France. Filed Apr. 7, 1888. Serial No. 269,963. (Model.)



Claim.—1. In combination with a drill or reamer having a conical upper end and the socket, a washer of any desired thickness fitting upon the upper end of said drill so as to overhang it, whereby the reamer may be allowed to descend to any given depth into the hole that is to be reamed, substantially as described.

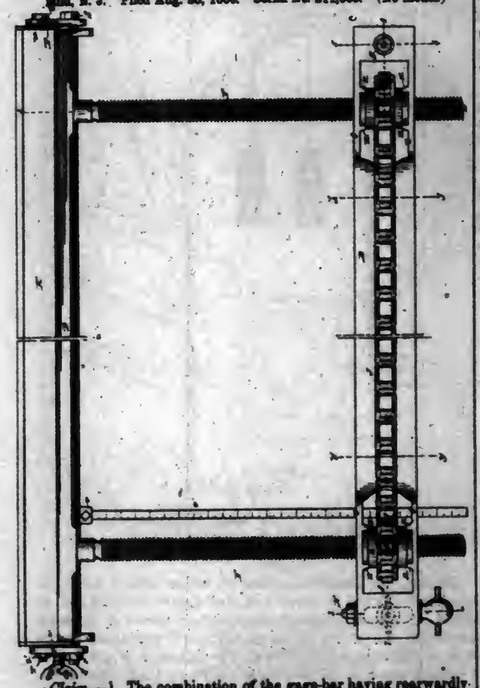
2. The within-described tool, having any desired twist, *c d*, and an enlarged conical upper end, *c*, combined with the washer *g* and the socket *A*, substantially in the manner and for the purposes set forth.

396,664. HOISTING-BUCKET. GEORGE B. NEWELL, Pawtucket, R. I. Filed Aug. 6, 1888. Serial No. 282,096. (No model.)



Claim.—In a hoisting-bucket, the combination, with the bucket-jaw and lever, of the opposite bucket-jaw pivoted to the said lever at a point intermediate of its ends, the guided rope or chain C, for closing the bucket, the guided rope or chain G, which is operatively connected with the outer end of the lever, and the power-multiplying movement for opening the bucket, substantially as described.

396,664.

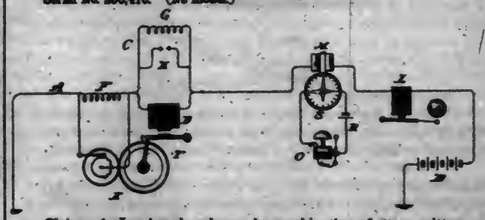


396,665. DESK ATTACHMENT. ARTHUR W. POTTER and THOMAS J. MCCORMICK, Wilkes-Barré, Pa. Filed Oct. 13, 1887. Serial No. 252,243. (No model.)

Claim.—The combination of the rectangular receptacle A, the cleat or strip B, having the same height as said receptacle and secured to the under surface of the desk-top parallel to the edge of said top and distant from said edge a space equal to the width of the receptacle, and the parallel arms G, of equal length, having their inner ends pivoted to the lower edge of the cleat and their outer ends pivoted to the bottom of the receptacle at points equally distant from the sides thereof, substantially as specified.

396,666. ADJUSTABLE SAW-GAGE. WILLIAM V. PRINCE, Vineland, N. J. Filed Aug. 25, 1886. Serial No. 211,869. (No model.)

Claim.—1. The combination of the gage-bar having rearwardly-projecting screw-stems, toothed nuts to which said stems are adapted, an endless chain adapted to said toothed nuts, and a single fixed bar or frame adapted to rest upon the saw bench or table and having bearings for both of the toothed nuts, the whole forming a single self-contained structure applicable to or removable from the saw bench or table as a unit, all substantially as specified.



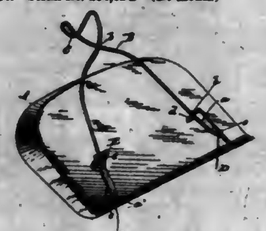
2. The combination of the work table or bed, the frame B, pivoted thereto at one end, but free to swing at the opposite end, means for securing said free end of the frame after adjustment, a gage-bar having projecting screws, nuts carried by the frame B and adapted to said screws, and means for simultaneously operating said nuts, all substantially as specified.

3. The combination of the work table or bed, the gage-bar, the pivoted frame B, a screw-connection between the same and the bar, a pin adapted to an opening in the work-table and having a nut, and a screw-stem carried by the frame B and adapted to said nut, all substantially as specified.

4. The combination of the gage-bar, the gage-block, the hanging-links, pivot-bolts for connecting one end of each link to the gage-bar and the other end to the gage-block, cheek-pieces interposed between the links and the ends of the gage-blocks, and a clamping-screw carried by one of the links and bearing against one of the cheek-pieces, all substantially as specified.

5. The combination of the gage-bar, the frame B, and the screw-connection between the two, with the work-table having a groove and a plate having a block adapted to said groove, and bolts for the reception of the opposite ends of the frame B, all substantially as specified.

396,667. BURGLAR-ALARM. ARTHUR C. ROBBINS, Brooklyn, assignor to William S. Andrews, New York, N. Y. Filed Sept. 22, 1887. Serial No. 250,410. (No model.)



Claim.—1. In a burglar-alarm, the combination of a transmitter, a closed circuit, a resistance in said circuit, and a normally-open short circuit around the said resistance, in which the transmitter is located, a magnet in said closed circuit controlling the transmitter, a closed shunt around the magnet, a resistance in the shunt, and signaling apparatus at the central station corresponding to the action of the said transmitter, and also to a change in the resistance of the circuit.

2. In a burglar-alarm, the combination of a transmitter, a magnet controlling the same, a closed shunt around the magnet leading to the spot to be protected, a resistance in the said shunt, a galvanometer in the circuit controlling an alarm at the central station, and a second alarm adapted to be operated by the said transmitter.

3. In a burglar-alarm, the combination of a transmitter, a magnet controlling the same, a shunt around the magnet containing a resistance, and distinctive sets of alarms at the central station corresponding one to the said transmitter and the other to a change in the line-resistance.

396,668. DUST-PAN. PRATT A. STICKER, Marshall, Mich. Filed Dec. 5, 1887. Serial No. 257,094. (No model.)

Claim.—1. In a dust-pan, a pan provided with ears, in combination with a detachable foot-rest, substantially as and for the purpose specified.

2. In a dust-pan, the pan having ears, in combination with an elastic detachable foot-rest, substantially as and for the purpose specified.

3. As a new article of manufacture, an elastic detachable foot-rest having fastening devices at its free ends to engage with a dust-pan, substantially as and for the purpose specified.

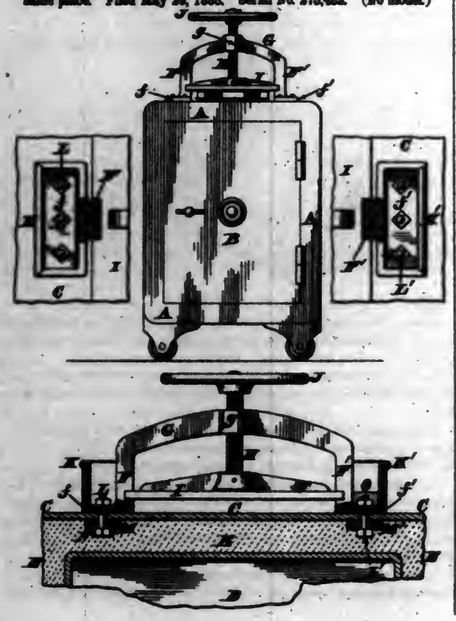
4. A dust-pan having sockets for the reception of the ends of a detachable foot-rest, one of said sockets having a slot and a lug to hold the end of the foot-rest against accidental displacement, in combination with a detachable foot-rest adapted to fit into said sockets and slot, substantially as described.

5. A dust-pan having sockets for the reception of the ends of a detachable foot-rest, one of said sockets having a slot and a lug to

hold the end of the foot-rest against accidental displacement, the other being provided with a perforated guard, in combination with a detachable foot-rest adapted to fit into said sockets and slot, substantially as described.

6. In a dust-pan, the pan having ears and an elastic detachable foot-rest, in combination with a guard having a perforation adapted to receive said foot-rest, and sockets for the reception and accommodation of the ends of said foot-rest, substantially as and for the purposes described.

396,669. DUST-PAN. PRATT A. SPICER, Marshall, Mich. Filed June 3, 1887. Renewed July 30, 1888. Serial No. 281,096. (No model.)



Claim.—1. A dust-pan having an elastic steadying and spreading piece secured to its bottom front edge and extending back to a point below and in alignment with the handle, substantially as described.

2. In a dust-pan, the combination, with the main pan, of a steadying and spreading piece secured to its under lower side at its front edge and extending back to a point below and in alignment with the handle forming a bearing for the said pan, substantially as described.

3. In a dust-pan, the combination, with the main pan, of a steadying and spreading piece consisting of an elastic wire bent at its middle portion in a loop to form a bearing for the pan, and having its ends secured to the front edge of the pan at opposite corners, substantially as described.

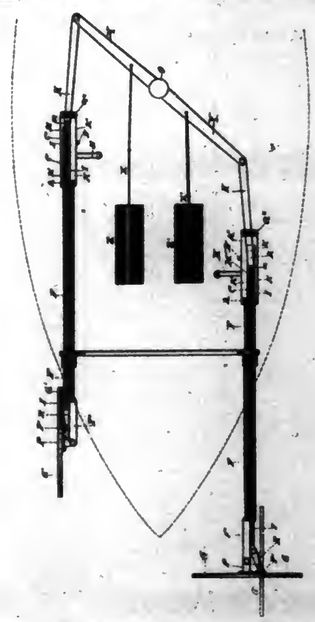
4. In a dust-pan, the combination, with the main pan, of a two-ended steadying and spreading piece consisting of an elastic wire bent in a loop and secured to the under side of the pan at its forward edge and at opposite corners, and extending back to a point below and in alignment with the handle, where it is bent up to form a projection against which the foot of the user is adapted to rest for the purpose, substantially as herein shown and described.

396,670. COMBINED SAFE AND COPYING-PRESS. THOMAS R. SPIVEY, Cincinnati, Ohio, assignor to the Victor Safe and Lock Company, same place. Filed May 29, 1888. Serial No. 275,482. (No model.)

Claim.—1. A safe having the standards of a copying-press attached to its top plate, whereby said plate serves as the base or bed of said press, substantially as herein described.

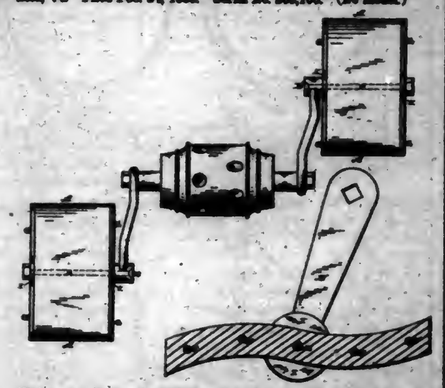
2. A safe having the standards of a copying-press attached to its top plate, said standards being provided with integral pockets or pits, for the purpose described.

396,671. VEHICLE-SPRING. ROBERT SPROUL, Pittsburg, Pa. Filed July 2, 1888. Serial No. 278,333. (No model.)



Claim.—1. The combination, with the running-gear and body of a vehicle, of a brace-rod attached at its lower end to the axle and provided at its upper end with two springs, whereby the vertical movement of the vehicle-body is controlled and limited, substantially as described.

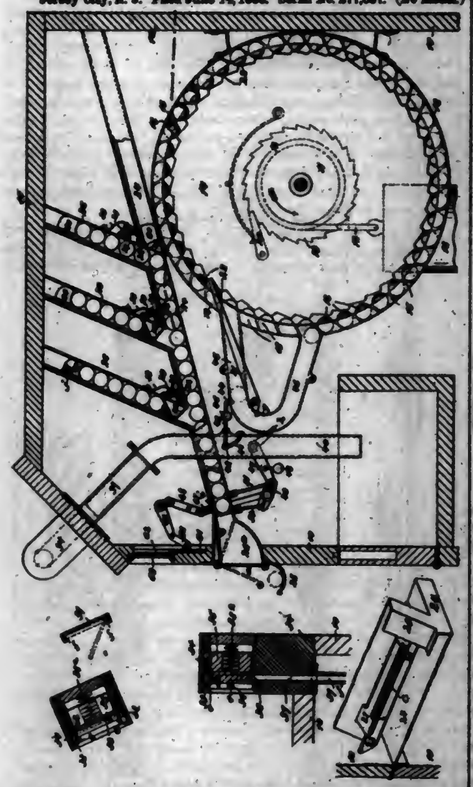
2. The combination, with the running-gear and body of a vehicle, of a vertical brace-rod provided at its lower end with a frame which embraces the axle and is attached to the body of the vehicle by means of a hollow casing containing buffer-springs, substantially as described.



3. The combination, with the running-gear and body of a vehicle, of rods E E', frame F, casing G, and springs *h h'*, all arranged and combined substantially as described.

396,672. MECHANISM FOR PROPELLING SHIPS. JOHN STEWARD, Sr., Troy, N. Y. Filed July 17, 1888. Serial No. 280,159. (No model.)

Claim.—The combination, with the tubular slides F, moving in guides within the hull of a ship and extending without said hull, as specified, a box or trough having collars A a^{x} and sides A' A", mounted upon the end of said slide, of the stops C and C' within said box or trough, the triple lever A H' H", pivoted to the bottom of said trough, the heads D and D' of the said levers H' H", working in the slots I and I' in the bottom of said trough and raising said stops C and C', substantially as specified, the sliding rods I, moving within said tubular slides F, the levers R, attached to the outer ends of said rods I, the projections F' upon the outer ends of the tubular slides F, the stems P, hinged to said projections, the paddles G, mounted upon said stems, the brackets P', fastened to said paddles beside the said stems, the short levers R, connecting the brackets P' and the rods I, the pinion K, connecting the rods I and the oscillating levers Y, the oscillating levers Y, pivoted at O and connected with the rods I, as specified, and means, substantially as specified, for oscillating said levers Y, all substantially as and for the purpose set forth.



396,673. PEDAL FOR VELOCIPEDES. ELMER E. TUPPS, Springfield, Vt. Filed Feb. 24, 1888. Serial No. 265,109. (No model.)

Claim.—1. A treadle which is curved upon both of its sides alike, so as to form a bearing both for the hollow and the toe of the foot, substantially as shown.

2. A treadle having its body formed of wood, and which is curved upon both of its sides alike, in combination with the metallic plates applied thereto, and the rivets which pass through the body and the plates, substantially as described.

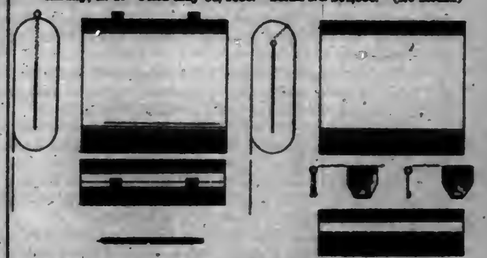
396,674. AUTOMATIC SELLING-MACHINE. JOHN W. VARNEY, Jersey City, N. J. Filed June 14, 1888. Serial No. 277,067. (No model.)

Claim.—1. In an automatic selling-machine, a coin-chute provided with one solid side, a top and a bottom, and flanges projecting from said top and bottom toward each other from the edges of said top and bottom opposite the edges connected with the solid side, thereby forming a longitudinally-slotted side of the chute opposite the solid side, said chute having its sides inclined to the vertical plane, substantially as herein shown and described.

2. In an automatic selling-machine, the combination, with a weightway, of a weight-releasing lever, an article-releasing mechanism, substantially as set forth, and a lever connected with the article-releasing mechanism and provided with a toe which enters the weightway, substantially as herein shown and described.

3. In an automatic selling-machine, the combination, with a coin-chute, of a weightway, a tripping-lever arranged in connection with the chute and way, an article-releasing mechanism, substantially as set forth, and a second tripping-lever arranged in connection with the releasing mechanism and the weightway, substantially as herein shown and described.

4. In an automatic selling-machine, the combination, with a weightway, of a weight-carrier, a weight-releasing lever, a tripping-lever arranged in connection with the weight-carrier, an article-releasing mechanism, substantially as set forth, and a lever connected with said releasing mechanism and provided with a toe which enters the weightway, substantially as herein shown and described.



5. The combination, with a drum, of a weight connected thereto by a cord, a weight-carrier formed with weight-receiving recesses in its peripheral face and mounted to turn forward with the drum, a ratchet rigidly connected to the weight-carrier, a jacket surrounding the weight-carrier, a way leading therefrom, a lever mounted to engage the ratchet and provided with a toe which enters the weightway, a tripping-lever formed with a projection which enters the weightway and provided with a pin which enters a coin-chute, said chute, a rocking frame, a lever connected thereto and formed with a toe which enters the weightway, a delivery-chute, and slides arranged in connection therewith and connected to the rocking frame, substantially as described.

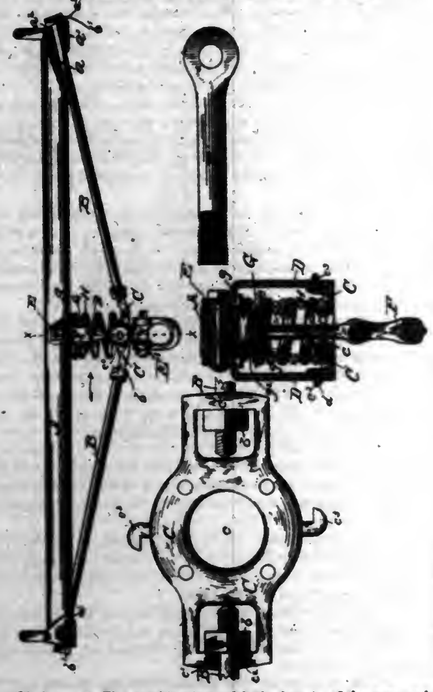
6. The combination, with a delivery-chute, of a trap or door formed of two leaves that are rigidly connected at an angle to each other, and hinged at the lower or delivery end of said chute, substantially as herein shown and described.

7. The combination, with a case or housing, of a spring-pressed plunger mounted therein, spring-tongues arranged in connection with the plunger, and a coin-chute leading from the case or housing, substantially as described.

8. The combination, with a case or housing, of a spring-pressed plunger mounted therein and formed with a groove in its peripheral face, spring-tongues formed with projections which normally rest within the plunger-groove and with inclined-faced projections which overlap the plunger's end, and a coin-chute leading from the case or housing, substantially as described.

396,675. TOILET OR WRAPPING PAPER ROLL. EDEN WEBSLER, Albany, N. Y. Filed May 11, 1886. Serial No. 201,906. (No model.)

Claim.—1. A toilet or wrapping paper roll having all of its lines of perforations or incisions in the same plane and provided with a stay applied thereto, substantially as described, to keep the perforations in said plane.



2. A toilet or wrapping paper roll having all of its lines of perforations or incisions in the same plane and provided with a stay passed through said perforations or incisions and secured therein, substantially as set forth.

3. A toilet or wrapping paper roll having all of its lines of perforations or incisions in the same plane, combined with a stay passed through said perforations or incisions and secured therein, the outer end of said stay having a hook or eye by which the roll may be suspended, substantially as described.

4. A toilet or wrapping paper roll having all of its lines of perforations or incisions in the same plane, combined with a stay passed through said perforations or incisions and having its inner end engaging the inner part of the roll, substantially as set forth.

5. A toilet or wrapping paper roll having all of its lines of perforations or incisions in the same plane, in combination with a spring-ball passed through the perforations or incisions and having its flaring inner ends spread apart to engage the inner part of the roll, substantially as described.

396,676. WHIFFLETREE. FREEMAN R. WILLSON, Sr., Columbus, Ohio. Filed June 16, 1888. Serial No. 277,493. (No model.)

Claim.—1. The combination, with the bar A, of the truss-rods extending, respectively, from the outer ends of the bar A to points near the central transverse line, and having their inner ends separately and adjustably fastened by means of nuts at their inner ends, adapted to rotate while the parts are joined, substantially as set forth.

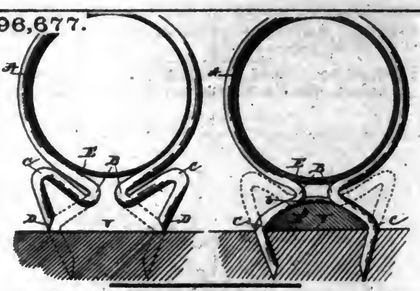
2. The combination, with the front bar of the whiffletree and the terminal clips *a'*, of the two truss-rods extending, respectively, in from the terminal clips to a connecting-plate at the center, and nuts engaging with said plate and adapted to rotate while in place for binding together the said central plate, the terminal clips, and the truss-rods, substantially as set forth.

3. The combination of the bar A, the truss-plate C, the truss-rods B B, the coiled spring bearing directly against the said truss-plate, and the draw-bar connected to the spring, substantially as set forth.

4. The combination of the bar A, the draw-bar E, the truss-plate C, extending around the draw-bar, the braces D, and the rods B B, adjustably connected to the plate C, substantially as set forth.

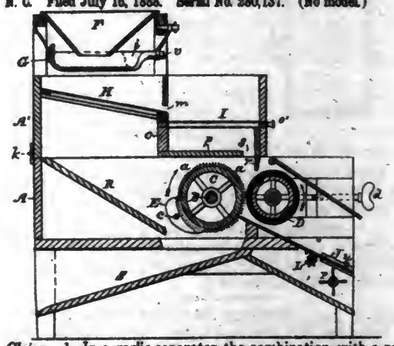
5. The plate or frame-piece C, having the aperture for the draw-bar and having the bars *c'*, with the apertures for the truss-rods, and having a seat for the spring, substantially as set forth.

6. The combination, with the bar A, of the truss-rods and the terminal clips having end walls covering the ends of the bar and engaged by the truss-rods, substantially as set forth.



7. The combination, with the whiffletree bar A and the spring, of the plate against which said spring bears directly, the strut or brace D, interposed between the bar A and said plate, and the draw-rods B, having their inner ends connected to the plate at the end of the spring independently of the bar A, substantially as set forth.

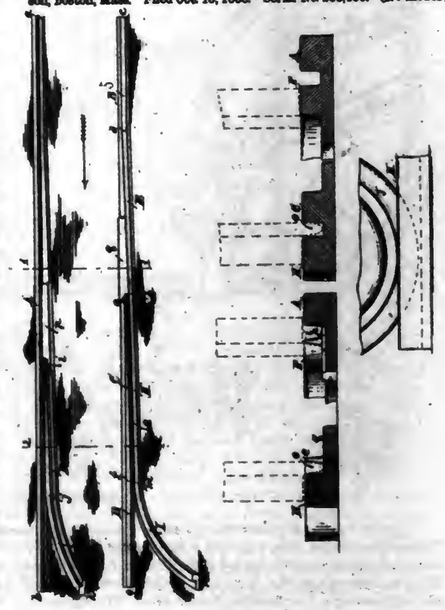
396,677. DEVICE FOR FASTENING CONDUCTORS. WILLIAM P. ZIMMERMAN, Freeport, Ill. Filed May 7, 1888. Serial No. 273,073. (No model.)



Claim.—1. As an improved article of manufacture, the herein-described device for holding and fastening conductors, &c., the same consisting of a section of wire bent into the shape shown in the drawings—that is to say, so as to form a loop adapted to fit closely around the conductor, the inner meeting ends of this loop being doubled to form shoulders B B, and then again doubled to form the outer shoulders, C C, terminating in pointed ends D D, substantially as and for the purpose shown and set forth.

2. The combination, with the device for holding and fastening conductors herein shown and described, of the grooved brace-block F, substantially as and for the purpose shown and set forth.

396,677.



396,678. GARLIC-SEPARATOR. WILLIAM C. AYERS, Plymouth, N. C. Filed July 16, 1888. Serial No. 280,137. (No model.)

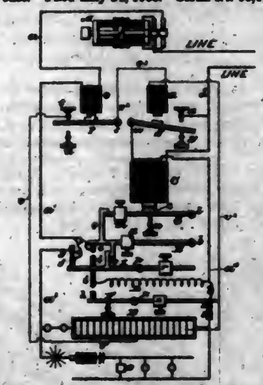
Claim.—1. In a garlic-separator, the combination, with a rotary cylinder provided with teeth on its periphery, which teeth are in rows extending around the cylinder, of an adjacent rubber roller in contact with said cylinder, a clearing-comb the teeth of which extend between the said rows of teeth to the surface of the cylinder, and an adjustable cut-off chute, substantially as and for the purposes described.

2. In a garlic-separator, the combination, with the rotary cylinder provided with teeth which are arranged in rows extending around the cylinder, of an adjacent rubber roller in contact therewith and a clearing-comb which is provided with teeth the inner edges of which are curved and conform to the periphery of the cylinder, substantially as set forth and described.

396,679. RAILWAY-SWITCH. WILLIAM H. BARWICK, Everett, assignor to himself, Calbee O. Benton, Cambridge, and Fred J. Hutchinson, Boston, Mass. Filed Oct. 13, 1888. Serial No. 288,039. (No model.)

Claim.—1. In a railway-switch, the combination of fixed rails of one track providing the tread A, and tread B, and tread C with fixed rails for a branch track, providing the tread E H, and the tread F, the tread B and tread C being parallel with tread A, the tread H being parallel with the tread F, and the tread E H being in one continuous line and extending each way beyond the end or point *e* of the tread C a distance equal to or about equal to the distance between the two wheels on one side of a car-truck, substantially as and for the purpose set forth.

2. The combination of fixed rails providing the tread A, tread B and tread C parallel with tread A, tread E and tread H about equal in length to each other, and tread F parallel with tread H, the distance between the tread H of the turn-out and the tread C of the main track being about equal to the thickness of the flange of a car-wheel, substantially as and for the purpose set forth.



3. The combination of fixed rails forming a railway-switch and providing a tread, A, on one side of the main track, a tread, B, and tread C on the other side of the main track, a tread, F, on one side of the turn-out, a tread, H, on the other side of the turn-out, opposite to and parallel with the tread F, a tread, E, between the tread B and tread C and forming part of each track, and the raised flanges *p* and *q*, the tread E and tread H forming a continuous line and equal in length to twice the distance between the two wheels on one side of a car-truck, substantially as described.

396,680. LINING FOR SAFES. WALTER W. BOOTH, Elmsford, assignor to himself, and Charles Francis Stone, New York, N. Y. Filed Dec. 27, 1888. Serial No. 191,902. (No model.)

Claim.—In a safe having inner and outer shells, the lining consisting of aluminous clay and feldspar fused together, substantially as described.

396,681. SECONDARY-BATTERY CHARGING. CHARLES F. BRUSH, Cleveland, Ohio. Filed May 21, 1888. Serial No. 95,608. (No model.)

Claim.—1. The combination, with an electric generator, a main or charging circuit, and a secondary battery, of switch mechanism constructed to connect and disconnect the opposite ends of the battery and the charging-circuit, and electro-magnets included in the charging-circuit and adapted to actuate the switch mechanism and automatically connect the opposite ends of the battery with the charging-circuit when the charging-current has approximately reached its normal strength, (and not until then,) substantially as set forth.

2. The combination, with an electric generator, a main or charging circuit, and a secondary battery, of switch mechanism constructed to connect and disconnect the opposite ends of the battery and the charging-circuit, a circuit around the battery adapted to be opened and closed, and electro-magnets included in the charging-circuit and circuit including the battery, and arranged to actuate the switch mechanism and automatically disconnect the opposite ends of the battery from the charging-circuit and simultaneously close the charging-circuit around the battery, substantially as set forth.

3. The combination, with an electrical generator, a main or charging circuit, and a secondary battery, of switch mechanism constructed to connect and disconnect the opposite ends of the battery and the charging-circuit, and electro-magnets included in the charging-circuit and circuit including the battery and arranged to be actuated by the rise of electrical potential of the secondary battery attending the completion of its charge and operate the switch mechanism and automatically disconnect the opposite ends of the battery from the charging-circuit and close the latter around the battery, substantially as set forth.

4. The combination, with an electrical generator, a main or charging circuit, a secondary battery, and translating devices included in the discharging-circuit of the secondary battery, and a circuit around the battery adapted to be opened and closed by a switch, of switch mechanism constructed to disconnect the opposite ends of the battery from the charging-circuit and closing the latter around the battery and electro-magnets included in the charging-circuit and circuit including the battery connected with and adapted to automatically actuate said switch mechanism, substantially as set forth.

5. The combination, with an electrical generator, a main or charging circuit, a secondary battery, and translating devices included in the discharging-circuit of the secondary battery, and a circuit around the battery adapted to be opened and closed by a switch, of switch mechanism included in the charging-circuit and circuit including the battery and arranged to disconnect the opposite ends of the battery from the charging-circuit and simultaneously close the latter around the battery, said switch mechanism being constructed to allow the working-circuit to be energized either by the generator or secondary battery, or both, and electro-magnets connected with and adapted to automatically actuate said switch mechanism, substantially as set forth.

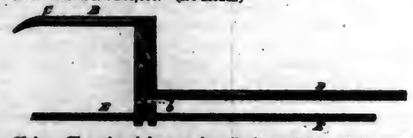
6. The combination, with an electrical generator, a main or charging circuit, and a secondary battery, of switch mechanism for connecting the opposite ends of the battery with the charging-circuit, and electro-magnets included in the charging-circuit and circuit including the battery and arranged to actuate the switch mechanism and automatically connect the opposite ends of the battery with the charging-circuit when the electrical potential of said battery shall have reached a predetermined minimum, substantially as set forth.

7. The combination, with an electrical generator, a main or charging circuit, and a secondary battery, of switch mechanism constructed and arranged to connect and disconnect the opposite ends of the battery and the charging-circuit and a circuit around the battery adapted to be opened and closed by a switch, and electro-magnets included in the charging circuit and circuit including the battery and arranged to actuate the switch mechanism and open the charging-circuit around the battery and to connect the opposite ends of the latter with the charging-circuit when the electrical potential of said battery shall have reached a predetermined minimum, substantially as set forth.

8. The combination, with an electrical generator, a main or charging circuit, a secondary battery, and translating devices included in the discharging or working circuit of the secondary battery, of switch mechanism constructed and adapted to connect the opposite ends of the battery and charging-circuit, and thereby switch the battery and its discharging or working circuit into the main or charging circuit, and electro-magnets included in the charging-circuit and circuit including the battery and arranged to actuate said switch when the electrical potential of the battery shall have reached a predetermined minimum and automatically switch the battery and its working-circuit into the main or charging circuit, substantially as set forth.

9. The combination, with an electrical generator, a main or charging circuit, a secondary battery, and a resistance included in a branch circuit adapted to be closed around the battery, of switch mechanism and electro-magnets for operating the same, the parts being constructed and arranged to automatically switch a part of the charging-current around the battery, and then divert the entire charging-current around the battery and disconnect the opposite ends of the battery from the main or charging circuit, substantially as set forth.

10. The combination, with an electrical generator, a main or charging circuit, a secondary battery, and an open resistance branch circuit around the battery, of switch mechanism and electro-magnets for actuating the same, the parts being constructed and arranged to be actuated by the fall of electrical potential of the battery for automatically connecting the opposite ends of the battery with the main or charging circuit and switching part of the charging-current through the battery and part around the battery, and then breaking the short circuit around the battery and diverting the entire charging-current through the battery, substantially as set forth.



11. A system embracing an electrical current-generator, a main or charging circuit, two or more secondary batteries or groups of secondary batteries, and switch mechanism and electro-magnets connected with each of said batteries or group of batteries, said switch mechanism and electro-magnets, the latter included in the charging-circuit and circuit including the battery and arranged to automati-

cally and independently connect the opposite ends of its battery or group of batteries with the charging-circuit when the charging-current has approximately reached its normal strength, substantially as set forth.

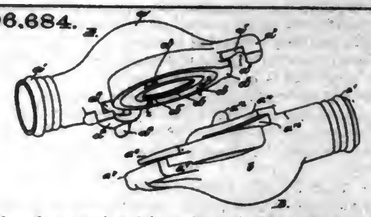
12. A system embracing an electrical current-generating apparatus, a main or charging circuit, two or more secondary batteries or group of secondary batteries, and switch mechanism and electro-magnets associated with each battery or group of batteries, said switch mechanism and electro-magnets being included in the charging-circuit and circuit including the battery and arranged to automatically and independently disconnect the opposite ends of each battery or group of batteries from the charging-circuit by the rise of electrical potential of said battery or group of batteries which attends the near completion of the charging process, substantially as set forth.

13. A system embracing an electrical current-generator, a main or charging circuit, two or more secondary batteries or groups of secondary batteries, and switch mechanism and electro-magnets associated with each battery or group of batteries, said switch mechanism and electro-magnet (the latter included in the charging-circuit and circuit including each battery or groups of batteries) being constructed and arranged to automatically and independently connect the opposite ends of each battery or group of batteries with the charging-circuit by the fall of electrical potential of said battery or group of batteries which attends the near exhaustion of its charge, substantially as set forth.

396,682. WIRE-TIGHTENER. CONSTANT B. BUTLER, Alliance, assignor of one-half to Pleasant W. Harrison, Paris, Tex. Filed Apr. 7, 1888. Serial No. 270,003. (No model.)

Claim.—The wire-tightener described, consisting of the metallic rectangle A, provided with the arm B, terminating in the claw C, the arm D, and the notches *a b*, substantially as shown and described.

396,683. TONGUE-TIP FOR VEHICLES. WRIGHT CHATTERSON, Portsmouth, assignor to Orrin W. Hawkins, same place, and John W. Hawkins, South Bay City, Mich. Filed June 28, 1888. Serial No. 278,419. (No model.)



Claim.—1. The combination, with a vehicle-tongue and a socket upon the end of the tongue having a forwardly-projecting portion, *e*, provided with an opening, *f*, of a hook, *j*, having a shank, *k*, passed through the opening *f*, and provided with a head, *m*, substantially as and for the purpose set forth.

2. The combination, with a vehicle-tongue, of a socket, *b*, provided with an upwardly-extending brace portion, *g*, and a forwardly-projecting portion, *e*, having an opening, *f*, and a curved hook, *j*, having a straight portion, *k*, passed through the said opening *f* and provided with a head, *m*, substantially as and for the purpose set forth.

3. The combination, with a vehicle-tongue and a socket, *b*, provided with a forwardly-projecting portion, *e*, having an opening, *f*, and with an upwardly-projecting brace portion, *g*, and the curved hook *j*, having a straight portion, *k*, passed through the said opening *f* and provided with the head *m*, of the supporting portions *g*, extending forwardly from the brace portion *g* upon each side of the said portion *k* of the hook, substantially as and for the purpose set forth.

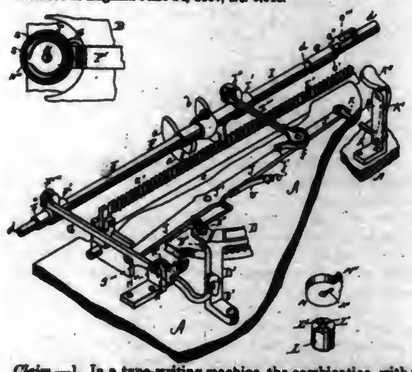
4. The combination, with a vehicle-tongue, a socket, *b*, provided with an upwardly-extending brace portion, *g*, and a forwardly-projecting portion, *e*, having a vertical opening, *f*, and a curved hook, *j*, having a straight portion, *k*, passed through the said opening *f*, and a head, *m*, of a pawl, *r*, pivoted to the curved portion of the said hook and with its inner free end resting upon the projecting portion *e*, substantially as and for the purpose set forth.

396,684. HOSE-COUPLING. JOHN COGHLAN, Boston, Mass., assignor to Charles W. Sherburne, same place. Filed July 30, 1888. Serial No. 281,266. (No model.)

Claim.—1. In a hose-coupling, two like halves or portions, each composed of the shell or case having the passage through it, the abutting face *c*⁶, arranged at right angles, as described, the ears *a*⁹ *a*⁷, the projection *a*¹⁰, and recess *a*¹², all substantially as described.

2. A hose-coupling composed of like halves or portions, each half consisting of a shell or case having an upturned end and an abutting face, ears or projections, as *a*⁹ *a*⁷, at the end of the shell or case opposite the upturned end, and the projection *a*⁶, formed upon the ear *a*⁷, and the projection *a*¹⁰, formed upon the shell or case between the abutting face and the upturned end, and the recess *a*¹², one wall or side of the projection *a*¹⁰ being in the arc of a circle eccentric to its opposite wall, and the recess formed between the projection *a*⁶ and the side wall of the shell or case corresponding in shape to the projection *a*¹⁰, all substantially as and for the purpose set forth.

3. In a hose-coupling, two like halves or portions, each composed of a shell or case having a passage through it, an abutting face, *a*⁶, arranged at right angles, as described, the ears *a*⁹ *a*⁷ and boss *a*⁸, forming a recess tapering from one end to the other, both in the direction of its length and its depth, and the projection *a*¹⁰ and recess *a*¹², substantially as and for the purpose set forth.



4. In a hose-coupling, the two like halves having abutting faces and provided with interlocking devices alike on each half, and consisting of the ears *a*⁹ *a*⁷ and boss *a*⁸ on each half, forming a tapering recess between them on one side of the face, and the projection *a*¹⁰ and its subjacent tapering recess *a*¹² on the other side of the face and constituting, essentially, sectional screw-threads to permit the screwing together of the two halves, substantially as and for the purpose set forth.

396,685. APPAREL-COLLAR. ESEK R. CROFUT, Newburyport, Mass., assignor to the Solid Fiber Company, Portland, Me. Filed Dec. 23, 1887. Serial No. 258,786. (Model.)

Claim.—A turn-over collar consisting of two portions, the outer portion composed of an impervious material of the character described and having a permanent roll, the inner portion or band lapping with said roll and cemented thereto, substantially as described.

396,686. TYPE-WRITING MACHINE. JAMES H. CURRIER and EUGENE I. BLODGET, Somerville, assignors to the Boston Type Writer Company, Boston, Mass. Filed Dec. 5, 1887. Serial No. 256,967. (No model.) Patented in England June 24, 1887, No. 9,013.

Claim.—1. In a type-writing machine, the combination, with the carriage provided with the feed-rack E' and the hinged frame C, of the disk-shaped pawls *a* and *b*, adapted to engage said feed-rack by turning on an axle or shaft common to said pawls and said frame, said pawls, by means of their disk shape, remaining in engagement with the feed-rack when the hinged frame is lifted and the pawls partially rotated, substantially as described.

2. In a type-writing machine, the combination of the carriage provided with the feed-rack E', the rod or axle *d*, sleeves F I, provided, respectively, with the pawls *a b*, adapted to be rotated simultaneously and engage the feed-rack alternately, the supplemental sleeve *e*, placed on said rod at a suitable distance to allow of a slight longitudinal play in the sleeve I, and a suitable stop, substantially as and for the purpose described.

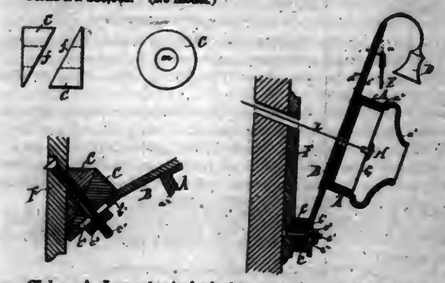
3. In a type-writing machine, the combination of the carriage provided with the feed-rack E', the rod or axle *d*, sleeves F I, provided, respectively, with the pawls *a b*, adapted to be rotated simultaneously and engage the feed-rack alternately, the supplemental sleeve *e*, placed on the said rod at a suitable distance to allow of a slight longitudinal play in the sleeve I, said supplemental sleeve being provided with a notch, *c'*, and the adjustable stop *c''*, substantially as and for the purpose set forth.

4. In a type-writing machine, the combination of the rod *d*, sleeve F, pawl *a*, hub F', rod G, elbow-lever H, standard H', spring H'', and pivoted frame C, substantially as and for the purpose described.

5. In a type-writing machine, the combination of the rod *d*, sleeve I, hub I', pawl *b*, lever I'', spring *f*, lever J, rod K, lever K' K'', and standard K''', substantially as and for the purpose set forth.

6. In a type-writing machine, the combination of the rod *d*, sleeves F I, hubs F' I', pawls *a b*, lever I'', spring *f*, lever J, spring U, rod G, provided with the catch *g*, elbow-lever H, spring H'', standard H', and type-frame C, substantially as and for the purpose described.

7. In a type-writing machine, the combination of the base B, post L, provided with the radial grooves L', disk N, provided with the hook N'' and projection N', sleeve P, provided with the lever P', spring S, having its opposite ends secured to said lever and said disk, link R, and carriage M, substantially as and for the purpose set forth.

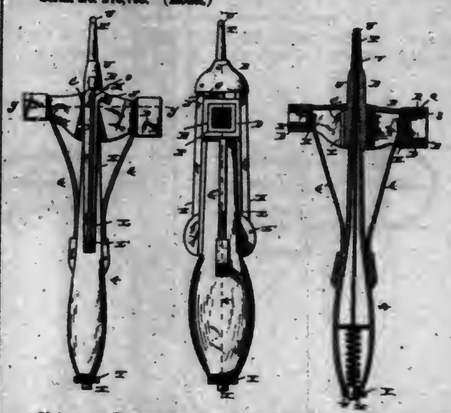


396,687. CAR-COUPLING. GEORGE CORNER, Hamilton, Ontario, Canada. Filed Feb. 4, 1888. Serial No. 263,010. (No model.) Patented in Canada Feb. 10, 1888, No. 26,508.

Claim.—1. A car-coupling in which the gripping-surfaces of the point-headed hooks A are formed, respectively, concave or a segment of a circle from the center of their operating-pins, substantially as and for the purpose specified.

2. The Miller car-coupling constructed with concave gripping-surfaces of the point-headed hooks, substantially as and for the purpose specified.

396,688. MECHANICAL TELEPHONE. THOMAS S. DAVIS, Cape Girardeau, Mo., and WILLIAM W. DAVIS, Lawrence, Kans., assignors of one-third to Thomas Johnson, Cape Girardeau, Mo. Filed July 14, 1888. Serial No. 280,002. (No model.)



Claim.—1. In mechanical telephones, steel spring B, having vertical shank *b'* and slot *c*⁴ said steel spring B being bent outward at its upper end and fastened to telephone-box A, in combination with the adjustable-eccentric-blocks C C, core *m*, bolt *c'*, and nut *c*², as and for the purpose set forth.

2. The adjustable eccentric-blocks C C, having diagonal faces *f f* and core *m*, said eccentric-blocks C C being adjustable on their diagonal faces *f f* in the manner of an eccentric, in combination with conducting-wire X of telephone-box A, bracket F, shank *b'* of steel spring B, bolt *c'*, and nut *c*², as and for the purpose set forth.

3. The combination of telephone-box A with ball D, depending from wire *d'*, and call or indicator E, having hinge *n* attached to wire *d'*, said ball D and call or indicator E being attached by said wires to said telephone-box A and placed immediately over same, as and for the purpose set forth.

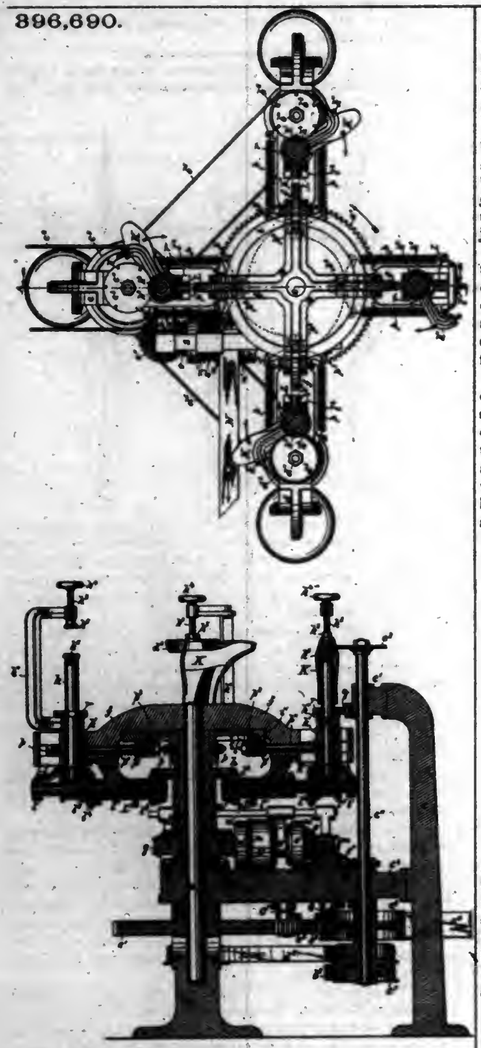
396,689. WRENCH. ALEXANDER L. DUNBAR, Roscoe, N. Y., assignor of one-half to Thomas L. Lindsay, same place. Filed Apr. 16, 1888. Serial No. 270,705. (Model.)

Claim.—1. The combination of the wrench handle or stem, the fixed jaws projecting at right angles from the same and provided with hollow boxes at their outer ends, the movable chucks sliding in said hollow boxes, and the springs pressing with their free ends against the back part of the movable chucks, substantially as and for the purpose herein shown and set forth.

2. The combination of the wrench handle or stem, the fixed jaws projecting at right angles from the same and provided with a hollow box at their outer ends, the movable chucks sliding in said hollow boxes, and the levers provided with right-angled projections adapted to engage the sliding chucks and to fix the same in their position within the jaws, substantially as and for the purpose shown and set forth.

3. The combination, in a wrench having recessed jaws, of the movable chucks and the spring-actuated levers adapted to lock the chucks in position within the recessed jaws, substantially as and for the purpose shown and set forth.

4. The improved wrench herein shown and described, consisting, essentially, of the following elements: a stem or handle, recessed jaws fixed upon and projecting from opposite sides of the same, the movable chucks, the springs bearing with their free ends against said chucks, the elbow-levers adapted to engage and lock the chucks in their position within the recessed jaws, and the springs engaging with their free ends the lower ends of said levers, the whole constructed and combined to operate substantially in the manner and for the purpose shown and set forth.



5. The improved wrench herein shown and set forth, consisting, essentially, of the following elements: a tubular stem or handle adapted to form an oil-receiver, recessed jaws fixed upon and projecting from opposite sides of the same, the movable chucks, the springs bearing with their free ends against said chucks, the elbow-levers adapted to engage and lock the chucks in their position within the recessed jaws, the springs engaging with their free ends the lower ends of said levers, the milled nut at the lower end of the handle, the rod extending through the handle and provided at its lower end with a button projecting through the milled nut, and the knob or button at the upper end of said rod adapted to close the nozzle which forms the outlet of the oil-receiver within the handle, all constructed and combined to operate substantially in the manner and for the purpose herein shown and set forth.

396,690. HEEL-FINISHING MACHINE. ALFRED B. FOWLER and GEORGE E. WARREN, Exeter, N. H., assignors to the Rockingham Machine Company, same place. Filed May 10, 1888. Serial No. 273,536. (No model.)

Claim.—1. The combination of an intermittently-rotating jack, a series of rotary tools located around the jack outside thereof, a series of radially-movable blocks carried by the jack, a series of circularly-oscillating work-holders on the radially-movable blocks, and means for rotating the tools, intermittently rotating the jack, oscillating the work-holders, and automatically moving the blocks and work-holders radially inward while the jack is rotating and outward when the jack ceases to rotate, substantially as described.

2. The combination of an intermittently-rotating jack, a series of rotary tools around the jack outside thereof, a series of radially-mov-

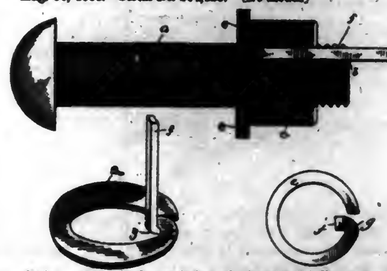
396,690.

ing blocks mounted on the jack, a series of circularly-oscillating work-holders carried by the radially-moving blocks, means for rotating the tools, intermittently rotating the jack and oscillating the work-holders, and a face-cam for moving said blocks radially inwardly while the jack is rotating and permitting their outward radial movement when the jack ceases to rotate, substantially as described.

3. In a heel-finishing machine, the mechanism for automatically moving the work-holders to and from the rotary tools, consisting of the intermittently-rotary jack *f f*, having blocks *k'*, arranged to slide out and in on said jack, and having spring-pressed spindles p^x secured to them, combined with the stationary cam *i* and pins, or pins and rolls p^2, mounted on said spindles p^x, substantially as and for the purpose set forth.

4. In a heel-finishing machine, the mechanism for automatically oscillating the work-holders, consisting of the intermittently-rotating gear *h*, the shafts L L, having pinions l^3 secured to their inner ends and geared to the said gear *h*, and having longitudinally-adjustable pinions l^4 geared to pinions k^2, secured to the work-holding spindles *k*, substantially as and for the purpose set forth.

5. In a heel-finishing machine, the intermittently-rotating jack *f f*, having mounted in its slotted arms the radially-movable and oscillating work-holding spindles *k k*, in combination with the intermittently-rotating gear *h*, positively geared, as described, to said spindles *k*, and the stationary cam *i*, substantially as and for the purpose set forth.



6. In a heel-finishing machine, the intermittently-rotating jack *f* and its radially-adjustable work-holding spindles *k*, and automatic mechanism for oscillating said spindles, combined with the heel-formers *r*, secured to said spindles, and rollers or projections *g*, arranged relative to the rotary tools of the machine, substantially as and for the purpose set forth.

7. In a heel-finishing machine, the mechanism for automatically imparting an intermittent rotary motion to the jack *f f* and to the gear *h*, consisting of the rotary pulley *n*, the friction-clutch *m'*, secured to shaft *m*, the worm *g'*, also secured to the latter, and worm-wheel *g*, secured to the gear *h*, and clutch-gear *o*, loosely journaled on said shaft *m* and geared in a suitable manner to the gear-wheel *c'* on the jack-shaft *c*, substantially as and for the purpose set forth.

8. In a heel-finishing machine, the intermittently-rotating gear *h*, the shafts L and their pinions l^3, geared to said gear *h*, for the purpose of imparting an oscillating motion to the work-holders, as described, combined with the shipper-lever *s*, having tooth or projection *s'*, and pins or projections L' L^x, secured to the shafts L, for automatically reversing the movement of said shipper-bar, substantially as and for the purpose set forth.

9. The combination of an intermittently-rotating jack, a series of rotating tools arranged around the jack and outside thereof, a series of radially-moving blocks on the jack, a series of circularly-oscillating work-holders carried by the blocks, means for intermittently rotating the jack, rotating the tools, and oscillating the tools, a cam acting to move the blocks and work-holders radially inward while the jack is rotating, and springs to move the blocks and work-holders radially outward when the jack ceases to rotate, substantially as described.

396,691. NUT-LOCK. GEORGE H. GRIFFIN, Abingdon, Va. Filed Aug. 30, 1888. Serial No. 284,126. (No model.)

Claim.—A nut-lock consisting of a longitudinally-grooved bolt, a nut, of a locking-washer provided with a washer portion embracing the bolt beneath the nut, and a locking-tongue resting in the groove and having its free end bent laterally to hold the nut, said lock consisting of an integral metal bar having a portion of its length bent to form the washer portion and the remainder of its length extending inwardly from one of the ends of the washer portion and then upwardly at right angles to the plane of the same, substantially as described.

396,692. PRINTING OF INDULINE DYE-STUFFS. GOTTFRIED GEIS, Elberfeld, Germany, assignor to the Farbenfabriken, vormals Fr. Bayer & Co., same place. Filed Feb. 21, 1888. Serial No. 264,857. (Specimens.)

Claim.—1. The process for producing a new printing-color of the induline dye stuffs herein described, which consists in mixing the induline paste with the formylethers of glycerine to form a dark-blue solution having the qualities for printing cotton clothe, and showing the same properties to chemical bodies as the induline dye-stuffs themselves, substantially as hereinbefore described.

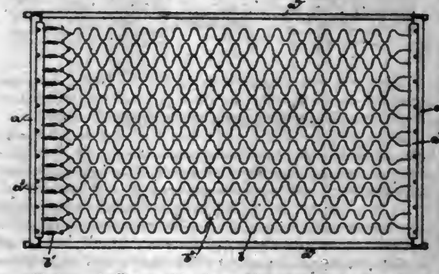
2. Printing the above-described induline paste by adding the formylethers of glycerine to the printing-paste, substantially as described.

396,693. PROCESS OF PRODUCING REFRACTORY COMPOUNDS. JAMES L. HASTINGS, Philadelphia, Pa., assignor, by mesne assignments, to the Welsbach Incandescent Gas Light Company, Gloucester City, N. J. Filed Mar. 20, 1886. Serial No. 195,994. (No specimens.)

Claim.—1. The process of producing a refractory crystalline compound, which consists in forming a base from two or more pulverized mineral substances—such as oxides, carbonates, or sulphates of metals—then adding a haloid salt, then moistening and molding the mixture, then subjecting the mixture to a low drying-heat, and finally exposing it to a high temperature, substantially as described.

2. The process of producing a refractory crystalline compound, which consists in forming a base from two or more pulverized mineral substances—such as oxides, carbonates, or sulphates of metals—then mixing said base with a flux composed of one or more haloid salts—such as chlorides, iodides, fluorides, or bromides of metals—then moistening the mixture with perchloric acid or its equivalent, then molding the mixture and subjecting it to a low drying-heat, and finally exposing the compound to a high temperature, substantially as described.

396,694. WAGON-SPRING. CHARLES A. HOWARD, Pontiac, Mich., assignor to Albert G. North, same place. Filed Sept. 1, 1888. Serial No. 284,329. (No model.)



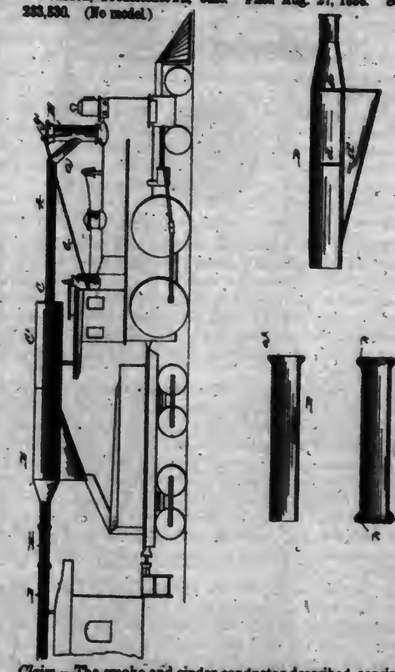
Claim.—1. In a vehicle-bolster-spring mechanism, the combination, with the bed plate or plates adapted to rest on the bolster, and the cross-bar adapted to receive the weight of the load, of spiral springs extending between said bed-plates and cross-bar at their extremities, and a semi-elliptic spring adapted to be swung either on or off the bolster at will, substantially as described.

2. In a vehicle-bolster-spring mechanism, the combination, with the bed-plates, the cross-bar, and a semi-elliptic spring pivoted to the said cross-bar and adapted to be swung either on or off the bolster, of spiral springs extending between the said bed-plates and the plates *c* on the cross-bar, and held in place by the bolts c^6, substantially as described.

3. In a vehicle-bolster-spring mechanism, the combination, with the bed-plates, the cross-bar, the spiral springs, and the semi-elliptic spring pivoted on the cross-bar and adapted to be swung either on or off the bolster, of means for locking the semi-elliptic spring in a position either on or off the bolster, substantially as described.

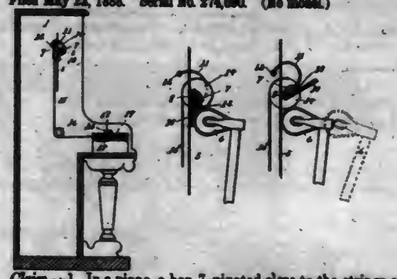
396,695. WIRE MATTRESS. ORIN HOWE, Cambridgeport, Mass. Filed Feb. 14, 1888. Serial No. 263,961. (No model.)

Claim.—1. The combination, with a mattress-frame, of a wire mattress consisting of vertically-bowed independent wires *b*, corrugated or made serpentine for the whole or a portion of their length at right angles to the plane of the bow, and connected to the head and foot rails of the mattress-frame to extend longitudinally the length of the bed, substantially as and for the purpose specified.



2. The combination, with a mattress-frame, of a wire-mattress consisting of independent bow-shaped wires *b*, corrugated or made serpentine for the whole or a portion of their length at right angles of the said bow, and connected to the head and foot rails of the mattress-frame to extend longitudinally the length of the bed, the said bow-shaped wires being elongated or made substantially flat by tension when secured to the mattress-frame, substantially as and for the purpose specified.

396,696. SPRING-TOOTH HARROW. CHARLES H. JEWELL, Auburn N. Y., assignor of one-half to Albert M. Nye, same place. Filed Mar 1, 1888. Serial No. 265,576. (No model.)

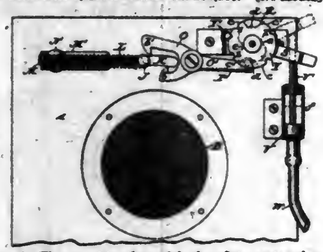


Claim.—A clip or clamp for fastening the teeth to the intersecting frame-bars of spring-tooth harrows, said clamp consisting of the seat portion *b*, having thereon a depending part, *j*, formed and arranged to enter the forward angles formed by the intersection of the said bars and to there bear upon the two bars forming said angles, respectively, and also having a horizontal extension or bar plate, *g*, all made in one and the same piece of cast metal, a detachable tooth-compressor, and fastenings for holding the said compressor against the teeth and for securing the said seat to the frame, substantially as specified.

396,697. SMOKE, SPARK, AND CINDER ARRESTER. WALTER R. JOHNSON, Fredericktown, Ohio. Filed Aug. 27, 1888. Serial No. 283,530. (No model.)

Claim.—The smoke and cinder conductor described, consisting of the section A, the shut-off located at the junction of said section and the smoke-stack, the section C, having the larger pipe, C', surrounding it, the section D, having the perforated screens *d* and the downwardly-projecting flaring portion under said screen and provided with the orifice *d'*, the flexible couplings H, and the section E, all substantially as described and set forth.

396,698. DEVICE FOR MUTING PIANOS. JOSEPH KELLER, Bridgeport, Conn., assignor to the Keller Piano Company, same place. Filed May 22, 1888. Serial No. 274,690. (No model.)



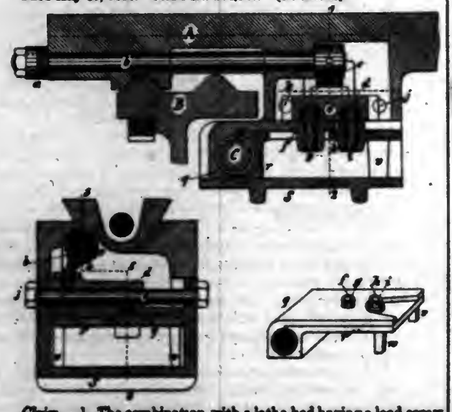
Claim.—1. In a piano, a bar, 7, pivoted close to the strings above the hammers and carrying a strip, 10, adapted to rest on the strings and be engaged by the hammers, in combination with a spring acting upon the bar to place the strip in operative position.

2. The combination, with the strings and hammers, of a pivoted bar and a strip of rubber carried by said bar and adapted to lie between the strings and hammers, and a spring acting to hold the strip in operative position.

3. The pivoted bar, strip 10, carried thereby, and a roller upon said bar, in combination with a cord attached to the roller and extending downward and outward, where it is attached to a slide, and a stud and set-screw, whereby the slide is locked in its retracted position to hold the strip out of engagement with the string.

4. Bar 7, carrying strip 10 and roller 14, in combination with a spring acting to hold the strip in operative position, and a cord extending from the roller and connected to a slide provided with a set-screw, whereby the bar may be partially rotated to place the strip out of operative position, and retained in that position.

396,699. PHOTOGRAPHIC SHUTTER. EDMOND KUHN, New York, N. Y. Filed Dec. 6, 1887. Serial No. 257,105. (No model.)

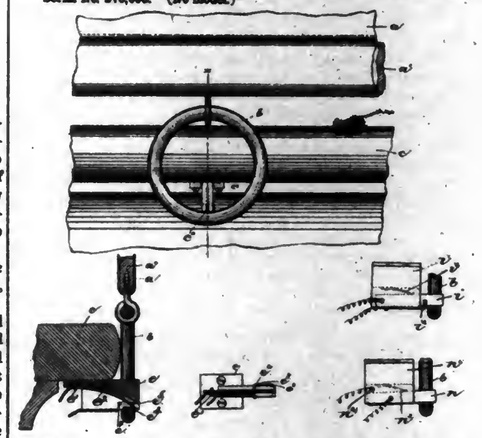


Claim.—1. The combination with the plate embracing the lens-opening in a photographic camera, a toothed ring revolving concentrically about the center of said opening as its axis, pinions geared to said ring, and shutters carried by said pinions to revolve therewith, of an arm projecting from said ring, a spring attached to said arm to draw it automatically in one direction, and stops adapted to limit the movement of the arm, all substantially in the manner and for the purpose herein set forth.

2. The combination, with the shutters pivoted to swing over the lens-opening in a photographic camera, pinions actuating said shutters, a toothed ring geared to said pinions, an arm extending from said ring and stops limiting the movement thereof, of a pin projecting from said arm, an escapement-plate pivoted in position to engage said pin and formed with two opposite hooks at different distances from its pivotal center wide enough apart to permit the pin on the arm to pass in a right line between them, a spring operating to draw the arm away from the escapement-plate, and mechanism, substantially as described, for moving said escapement-plate, all substantially in the manner and for the purpose herein set forth.

3. The combination, with the vibrating arm or lever E, the shutters C, controlling the lens-opening B, the intermediate mechanism, substantially as herein described, whereby the oscillation of the lever is made to open and close said shutters, a pin projecting from said lever, an escapement-plate pivoted in position to engage said pin and formed with two opposite hooks at different distances from its pivotal center wide enough apart to permit of the passage of the pin on the arm in a right line between them, a spring operating to draw the lever away from the escapement, and stops limiting the movement of the lever, of an arm projecting from said escapement-plate, a revolving disk having cams on its periphery to engage said arm and thereby determine the position of the escapement-hooks in relation to the lever-pin, and mechanism, substantially as described, for controlling and actuating said cam-disk, substantially in the manner and for the purpose herein set forth.

396,700. LATHE-CARRIAGE. WILLIAM LODGE, Cincinnati, Ohio. Filed May 18, 1888. Serial No. 274,340. (No model.)

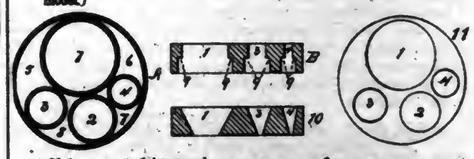


Claim.—1. The combination, with a lathe-bed having a lead-screw mounted inside of the same under the front shear, of a carriage having secured to the lower part of its cross-bridge the rectangular box B, provided on each side with the extension tubular journals for the lead-screw, substantially as set forth.

2. In a lathe, the combination, with the carriage thereof, having the box B, of the sliding cam *d* and the half-nuts *g* and *r*, having the wing of one superposed upon the other and provided with the roller-capped studs engaging the grooves of said cam, substantially as described.

3. The combination, in a lathe, of the carriage and its box B, the rod *b*, journaled in the carriage and having at one end an actuating-crank and at the other a lever, *e*, the sliding cam actuated by said lever, and the half-nuts with their studs in engagement with said cam, substantially as described.

396,701. BURGLAR-ALARM. GEOFFREY R. LENT, Medford, assignor of one-half to Bernice J. Noyes, Boston, Mass. Filed Apr. 14, 1888. Serial No. 270,698. (No model.)



Claim.—1. In a burglar-alarm, the circuit-changing lever receiving upon it and being held in its abnormal position by the pendant of a spring-actuated curtain or shade, substantially as described.

2. In a burglar-alarm, the spring-controlled circuit-changing lever, combined with the slitted guard within which it is placed, said lever receiving upon it and being held in its abnormal position by the pendant of a curtain or shade, substantially as described.

3. In a burglar-alarm, the spring-controlled circuit-changing lever, bent as at c^2, to receive the pendant of a curtain or shade, combined with the slitted block *c*, within which the said lever is made movable, and the contact against which the said lever normally bears, substantially as described.

4. In a burglar-alarm, the circuit-changing lever normally resting on a contact and receiving the pendant of a curtain or shade, by which it is moved into and held in its abnormal position, substantially as described.

396,702. FISHING-ROD CASE. HENRY LOFTIS, Syracuse, N. Y. Filed June 3, 1887. Renewed Dec. 26, 1888. Serial No. 294,698. (No model.)

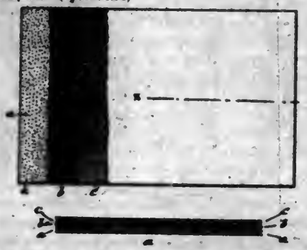
Claim.—1. A fishing-rod case consisting of an outer tube, a set of diametrically-graduated tubes placed within the outer tube, and end caps, substantially as described.

2. A fishing-rod case consisting of an outer tube, a set of diametrically-graduated tubes inclosed therein with suitable packing or filling, and end caps, substantially as described.

3. A fishing-rod case consisting of an outer tube, a set of diametrically-graduated tubes inclosed therein, and a holder, 10, for retaining the ends of the rod-sections, provided with tapering perforations and fitting upon the lower ends of the inner tubes, substantially as described.

4. A fishing-rod case consisting of an outer tube, a set of diametrically-graduated tubes inclosed therein, and metallic or flexible plates for steadying the upper ends of the rod-sections fitting on top of the inner tubes, and caps inclosing the ends of the outer tube, substantially as described.

5. A fishing-rod case consisting of an outer tube inclosing other tubes constituting a series of distinct diametrically-graduated compartments, substantially as described.



6. A fishing-rod case consisting of an outer tube, a set of diametrically-graduated tapering tubes to conform to the varying thickness of the several rod-sections inclosed therein, and end caps, substantially as described.

396,703. PROCESS OF MAKING BASIC LEAD SALTS. FARNHAM M. LYTE, Cotford, Oakhill Road, Putney, County of Surrey, England. Filed Aug. 30, 1887. Serial No. 248,273. (No specimens.) Patented in England Aug. 11, 1886, No. 10,206, and Sept. 18, 1886, No. 11,889; in France Aug. 9, 1887, No. 185,257; in Belgium Aug. 9, 1887, No. 73,822; in Germany Aug. 26, 1887, No. 44,008; in Italy Sept. 30, 1887, XXI, 22,192, XLIII, 479, and in Spain Apr. 20, 1888, No. 7,586.

Claim.—1. The herein-described process of rendering basic in a definite predetermined degree the insoluble or sparingly-soluble lead salts, which process consists in first precipitating the extra base out of a given volume of a solution of basic lead acetate, and then boiling the precipitate with such a volume of the same or a similar basic liquor as will impart the desired degree of basicity to the precipitate, as specified.

2. The process herein described of rendering insoluble or sparingly-soluble lead salts basic, consisting in first treating basic lead acetate with sulphuric acid to precipitate the extra base out of the same, then rendering the precipitate basic by the addition of basic lead acetate, and finally boiling the mixture, as set forth.

396,704. SIGN-PLATE. DAVID MACDONALD, Toronto, Ontario, Canada, assignor to William Stone, same place. Filed Apr. 11, 1888. Serial No. 270,261. (Specimens.)

Claim.—1. A sign-plate composed of a metal foundation plate or backing having a porous or roughened surface, an intermediate layer of cement, and a face layer of paper united with the foundation-plate by pressure, substantially as set forth.

2. A sign-plate composed of a metal foundation plate or backing having a porous or roughened surface, an intermediate layer of cement, and a face layer of sized and varnished paper united with the foundation-plate by pressure, substantially as set forth.

396,705. OBTAINING AMMONIA AND OXALIC ACID FROM SUGAR WASTE. EMIL MEYER, Berlin, assignor to Carl Uhl & Co., Brunswick, Germany. Filed Sept. 15, 1888. Serial No. 285,518. (No specimens.) Patented in Germany Aug. 22, 1887, No. 43,345; in Belgium Dec. 13, 1887, No. 79,896; in France Dec. 13, 1887, No. 187,573; in England Dec. 16, 1887, No. 17,347, and in Austria-Hungary May 2, 1888, No. 43,264 and No. 10,260.

Claim.—1. The novel process which consists in first heating a solution of a caustic alkali in a suitable receptacle, then gradually adding to the said solution at separate intervals a predetermined quantity of concentrated desaccharized lye or its equivalent in the form of molasses, in the proportions hereinbefore set forth, continuing the application of heat, and finally separating the oxalic salts from the resultant mass, substantially as described.

2. The novel process which consists in first heating a solution of a caustic alkali in a suitable receptacle, then adding concentrated desaccharized lye or its equivalent in the form of molasses, continuing the application of heat to liberate all the ammonia, then separating the oxalic salts from the resultant mass, and finally rendering the alkaline residue caustic, whereby it may be used over again, all substantially as and for the purpose set forth.

396,706. SAW-GIN. ROBERT S. MUNGER, Dallas, Tex. Filed June 16, 1888. Serial No. 277,263. (No model.)

Claim.—1. The combination, with a gin-frame, of the saw-carrying shaft having a pulley, 38, an idle-pulley, 39, pivoted swinging arms 41, connected and carrying the idle-pulley, a pendent arm, 44, connected to one of the pivoted arms, a bar, 45, connected to the lower end of the pendent arm, and having a handle, 48, for swinging the pivoted arms, a detent for said bar, a power-pulley, a brush-shaft pulley, 37, located between the saw-shaft and the idle-pulley, and a single belt passing from the power-pulley over the idle and brush-shaft pulleys and about the saw-shaft pulley, substantially as described.

2. The combination, with a gin-frame and a lengthwise-adjustable breast hinged thereto, of a hinge composed of two plates, one movably secured to the gin-frame and the other fixed to the breast, and a set-screw mounted on the gin-frame and engaging the movable plate of said hinge to adjust the breast lengthwise, substantially as described.

3. The combination, with a gin-frame and a lengthwise-adjustable breast, of hinges each composed of two parts, one movable laterally with respect to the other and secured, respectively, to the gin-frame and breast, a hinge composed of two plates, one movably secured to the gin-frame and the other fixed to the breast, a lug on the gin-frame, and a set-screw carried by the lug and engaging a part of the said movable plate of the hinge, substantially as described.

4. The combination, with a gin-frame and a lengthwise-movable breast hinged thereto, of a hinge composed of two plates, one slotted and movably secured to the gin-frame and having a vertical lug and a lug fixed to the gin-frame, a set-screw swiveled to the lug on the gin-frame and screw-threaded into the lug on the movable plate of the hinge, substantially as described.

5. In a cotton-gin, the saw-cylinder consisting of a shaft having both ends screw-threaded, saws on the shafts, spacing-blocks between the saws, one of which is rigidly secured to the shaft at or adjacent to the middle of its length, and a nut at each end of the shaft, substantially as described.

6. In a cotton-gin, the combination, with a shaft, of a space-block rigidly connected thereto at or near its center, alternating saws and space-blocks arranged in a series upon each side of the rigid block, collars placed upon the ends of the shaft, and nuts turned upon said ends and resting against the collars, substantially as described.

7. In a cotton-gin, the combination, with the gin-frame, of a breast having a hinge-connection with the gin-frame, pins projecting through the gin-frame and supporting the hinged breast, said pins having beveled heads, a rod carrying oppositely-beveled blocks engaging the beveled heads of said pins, and means for giving longitudinal adjustment to said rod to project the supporting-pins outward, substantially as described.

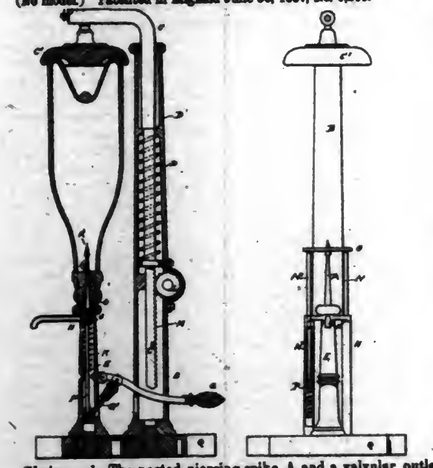
8. In a cotton-gin, the combination, with a gin-frame and a breast having hinge-connections with the gin-frame, of pins projecting through the gin-frame and supporting the breast upon their ends, a rod arranged in parallelism with the breast and carrying beveled blocks engaging oppositely-beveled heads upon the supporting-pins, a set-nut turned upon the threaded end of said rod, and a housing inclosing one of the supporting-pins, substantially as described.

9. In a cotton-gin, the combination, with the gin-frame, of a breast hinged to the gin-frame, a longitudinally-movable rod arranged behind said breast and carrying cam-blocks engaging with adjustable supports for said breast, and means for giving longitudinal movement to said rod, substantially as described.

396,707. LINE-GUIDE FOR FISHING-RODS. JOEL C. PARKER, Grand Rapids, Mich. Filed July 9, 1888. Serial No. 279,454. (No model.)

Claim.—1. A line-guide for fishing-rods, having an opening substantially parallel to the axis of the rod, and a passage through the side of said guide not in contact with the rod, through which the line may be brought within the said opening, the sides of said passage being substantially parallel and arranged at an angle to or spirally around the axis of said opening, substantially as described.

2. A line-guide for fishing-rods, consisting of two or more spiral coils attached to said rod, arranged with the axis of said coils substantially parallel to the axis of said rod, and with space between the turns of said coils for insertion of the line, substantially as described.



3. A line-guide for fishing-rods, consisting of a number of turns

of a spiral coil, one end of which is prolonged substantially parallel to the axis of said coil and secured to the rod by a seizing or other suitable fastening, substantially as described.

4. A line-guide for fishing-rods, consisting of one or more turns of a spiral coil attached at one end to the end of the rod, and having the free end extended outside of said coil substantially parallel with the axis of the same and terminating opposite the end of said rod, and adapted to permit the insertion of the line by passing the same between the respective turns of the coil, substantially as described.

5. A line guide for fishing-rods, consisting of substantially one and one-half turn of a spiral coil having substantially a triangular form, one angle thereof being near the middle of the overlapping part of said coil and secured to the rod by a strap or other suitable fastening engaging with the side of the triangle opposite said angle, substantially as described.

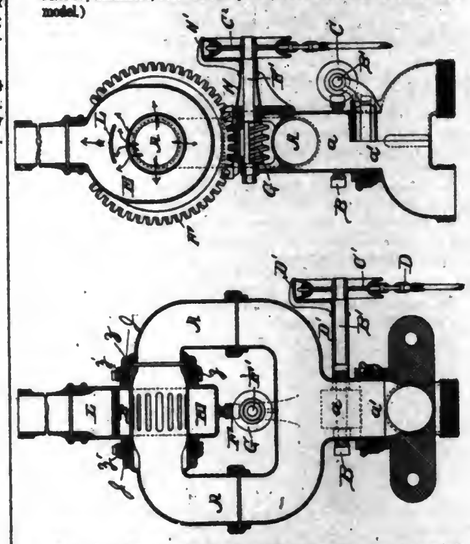
396,708. APPARATUS FOR WITHDRAWING EFFERVESCING OR GASEOUS LIQUIDS FROM CORKED RECEPTACLES. WILLIAM J. PAYNE, London, assignor to John Edward Bingham and Charles Henry Bingham, Sheffield, England. Filed Apr. 26, 1888. Serial No. 272,163. (No model.) Patented in England June 30, 1887, No. 9,289.

Claim.—1. The ported piercing-spike A and a valvular outlet therefor, combined with the hollow column B, the vertically-sliding rod C in said column, the block C' on said rod, the spiral spring D, acting on the rod to depress it, and the gearing for controlling the movement of the rod, all constructed and arranged substantially as described.

2. In apparatus for permitting the discharge of gaseous liquids from bottles, the tapered cork-piercing tube A, having ports A^2, the column E, having a chamber into which the tube opens, an outlet-spout, H, for said chamber, the valve J, arranged in said chamber beneath the tube to open and close it, and suitable means for raising and lowering said valve, in combination with a vertically-sliding rod provided with a cap to engage the bottom of the bottle, a column to support the said rod, and suitable means—such as a spring—to draw down the rod and force the cork-piercing tube through the cork, substantially as described.

3. In apparatus for the purpose herein specified, the combination, with a tapered tube, A, having an enlarged point, A', and entrance-ports A^2, and a support for the tube, of the columns N, with the rods and plate O, and springs P, substantially as described and shown.

396,709. SASH-HOLDER. LOUIS FRIBERT, Pullman, assignor to George M. Pullman, Chicago, Ill. Filed Feb. 6, 1886. Serial No. 191,070. (No model.)



Claim.—1. The combination of a casing provided with a groove, a sash sliding in the said groove, and a two-armed spring pivoted to the sash, one arm of said spring bearing against one face of the groove and the other arm of the spring resting upon the sash, substantially as described and shown.

2. The combination of a casing provided with a groove, a sash sliding in the said groove, and a two-armed plate-spring attached to the sash, the two arms being connected to each other by a tubular portion, one of said arms bearing against one of the interior faces of the groove, substantially as and for the purpose set forth.

3. As a means for holding a sash in place, a bent metal plate, A, in combination with hubs C, by means of which it is pivoted to the sash and spring G, for increasing the tension of the plate, one arm of said plate resting upon the sash, and the other arm being pressed against the surface of the sash-casing, substantially as described and shown.

396,710. FIRE-EXTINGUISHING APPARATUS, &c. JOHN R. PROUTY, Baltimore, Md. Filed Apr. 30, 1888. Serial No. 272,333. (No model.)

Claim.—1. The combination, with an adjustable pipe or conduit, of an annular or auxiliary chamber provided with a radially-extending discharge-nozzle, said chamber tightly embracing a portion of the pipe or conduit and capable of turning upon the same to direct and hold the nozzle pointing in any direction, and a baffle-plate extending across the interior of the auxiliary chamber between the periphery of the pipe or conduit and the inner end of the discharge-nozzle.

2. The combination, with a continuous horizontally-adjustable pipe or conduit provided with a series of discharge-ports around its upper horizontal portion, of an auxiliary chamber embracing the horizontal portion of said conduit and forming an annular chamber around the discharge-ports in the same, a discharge-nozzle extending radially from said chamber, the same being adjustable around the pipe to direct and hold the nozzle in any direction, and a baffle-plate within the chamber between the inner end of the discharge-nozzle and the ports in the pipe or conduit, whereby the pressure is equalized and the retroactive force of the water overcome.

3. A pipe and a nozzle adjustably mounted on the same and provided with an annular or auxiliary chamber at its rear end, into which the water is centrally and radially discharged, in combination with the herein described baffle-plate located in said chamber at the inner or induction end of the nozzle, for the purpose set forth.

4. The combination of a vertical approximately annular conduit provided with a central rigid hollow neck at its lower portion, through which the water is received and by which the conduit is swiveled to turn horizontally, said conduit being provided with a series of discharge-ports around its upper horizontal portion, an auxiliary chamber embracing and adjustable around the horizontal part of the conduit and forming an annular chamber around said discharge-ports, a discharge-nozzle extending radially from said chamber, whereby the nozzle can be directed in any direction, gearing for horizontally adjusting the apparatus upon said central hollow neck as a pivot, and separate and independent gearing for vertically adjusting the nozzle around the upper horizontal portion of said conduit.

5. The combination of a vertical approximately annular conduit provided with a central neck extending downwardly from its lower portion, and through which the water is received and by which the conduit is swiveled to turn horizontally, horizontal gearing encircling the periphery of said neck, a shaft provided with a screw or worm meshing with said gearing, and by which the device is rotated horizontally, an auxiliary chamber in communication with, embracing, and forming an annular chamber around the upper horizontal portion of said conduit, a discharge-nozzle extending from said chamber, said chamber, and hence the nozzle, being adjustable in a vertical plane, gearing around the outer periphery of the chamber, and a shaft located in the open center of said conduit and provided with a screw meshing with said gearing and by which said nozzle is vertically adjusted.

6. The combination of a vertical approximately annular conduit provided with a series of eduction-ports around its upper horizontal portion, a central hollow neck rigidly secured to or cast with the lower horizontal portion of said conduit and extending downwardly from the same and journaled in a suitable base to allow the conduit to be horizontally adjusted, an auxiliary chamber embracing the upper horizontal portion of said conduit and forming an annular chamber around the eduction-ports in the same, whereby the water is radially discharged from the conduit into the annular chamber, and a discharge-nozzle extending from said chamber, said auxiliary chamber being capable of rotation upon the conduit, whereby the nozzle can be vertically adjusted.

7. In combination, the hollow base, the vertical continuous conduit capable of rotatory adjustment in a horizontal plane, the central downwardly-extending neck provided with peripheral gearing, a suitably-journaled shaft connected with said gearing, a chain extending to or near the ground and operating said shaft, a nozzle having an auxiliary chamber mounted upon the upper horizontal portion of said conduit, vertical gearing on the periphery of said chamber, a shaft connected with the same, and a chain extending to or near the ground and operating said shaft.

8. In a portable fire-extinguishing apparatus, the combination of a hollow base to which the water-pipes are secured, a vertical approximately annular conduit journaled on said base to render the conduit capable of rotatory adjustment in a horizontal plane, a nozzle rotatable in a vertical plane and provided with a chamber embracing and mounted upon the upper horizontal portion of said conduit, and the herein described and shown folding and jointed standard pivoted to said base and supporting the device.

9. The combination of a supply pipe or conduit, the auxiliary chamber embracing and rotating upon the same, packing and retaining rings at the junction of pipe and chamber to make a water-tight joint, and a ring embracing the pipe and adjustable to and away from said chamber to prevent lateral play or motion of the same.

10. In a fire-extinguishing apparatus, the combination of a hollow base, a vertical approximately annular conduit journaled in said base to render the conduit rotatable in a horizontal plane, and a nozzle rotatable in a vertical plane and provided with an auxiliary chamber journaled upon and embracing the upper horizontal portion of said conduit and into which the water from the conduit is radially discharged.

11. The combination, with the hollow base, of the vertical approximately annular conduit, a central hollow neck journaled in said base and extending from the lower horizontal portion of the conduit, and rendering the same capable of rotatory adjustment in a horizontal plane, gearing around the periphery of said neck, a suitably-journaled shaft provided with a worm meshing with said gearing, and by which the conduit is rotated, and the nozzle journaled upon the upper horizontal portion of said conduit and rotatable thereon in a vertical plane.

396,711. GUM-BOX FOR ENVELOPE-MACHINES. FRANCIS H. RICHARDS, Springfield, Mass., assignor of one-half to the Pratt & Whitney Company, Hartford, Conn. Filed Nov. 15, 1886. Serial No. 218,878. (No model.)

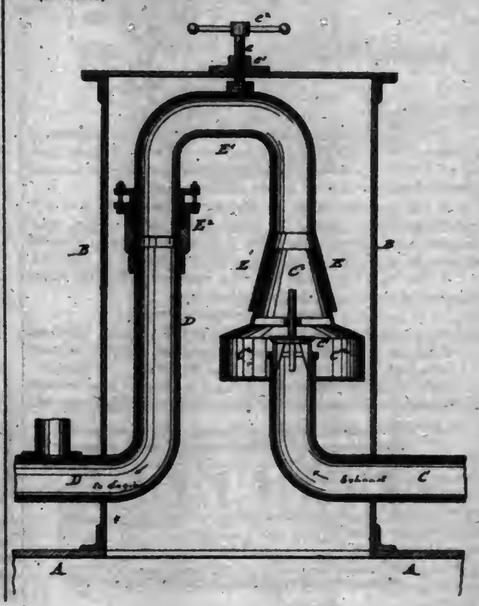
Claim.—1. The combination and arrangement, in a gum-box and with the roll R thereof, of the movable scraper-carrying frame having a fixed stroke toward and from the roll, the scraper adjustably mounted rigidly on said frame and free of said roll, the actuating-handle having a forward and backward movement, and connecting mechanism, substantially as described, operating said frame from said handle, all substantially as shown and set forth.

2. The combination, in a gum-box, of the box and its roll, the laterally-movable frame carrying the adjustably-mounted scraper and having slot 7, and shaft 6, journaled in said box and having a crank-pin working in said slot, substantially as set forth.

3. The combination of a frame having a concave groove, the scraper C, having rib 14 fitting said groove and bored to receive screws 15, and the spherical-headed screws 15, all substantially as set forth.

396,712. CULTIVATOR. JOSEPH B. ROSIER, Germantown, Nebr. Filed Oct. 24, 1888. Serial No. 288,094. (No model.)

Claim.—1. In a cultivator, the runners and the transverse beams or plates having the projecting side portions with the adjusting-holes therein, in combination with the cylindrical beams, the standards secured in said holes and having sockets in which the beams are adjusted, set-screws for holding the beams in their adjusted positions, and adjustable slotted shovels or plows on the rear ends of the beams, substantially as herein described.



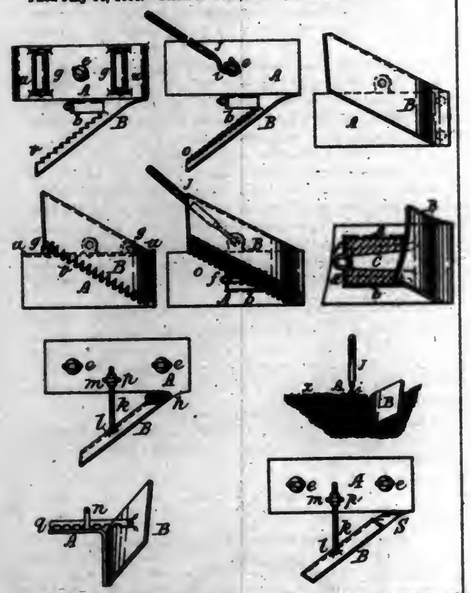
2. In a cultivator, the runners and the transverse plates or beams B B' B'', having arched central portions and projecting side portions, standards carried by said side portions and adjustable in holes therein, cylindrical beams journaled in said standards, and adjustable slotted shovels or plows on the rear ends of the beams, substantially as herein described.

3. In a cultivator, the combination of the runners, the transverse beams or plates, the shovels with their beams and suitable vertically-adjustable floats or plates near the front of the machine and adapted to rest upon the ground, whereby clods are crushed and rocking motion of the machine prevented, substantially as herein described.

4. In a cultivator, the runners, the transverse plates B B' B'', the adjustably-secured standards, the beams C D, journaled therein, and the shovels or plows carried by said beams, in combination with T-shaped standards carried by each projecting side portion of the front plate, B, horizontally-placed plates or floats beneath said projecting side portions, hinged pins attached to said plates and passing through the T-standards, and set-screws for adjustably securing said pins, whereby the floats or plates may be raised or lowered, substantially as herein described.

5. In a cultivator, the runners, the shovels and beams, and the transverse beams B' B'', having tubular sockets in their outer ends, in combination with bent rods I, journaled in the tubular sockets and provided with inwardly-turned front portions, and having the rear portions adapted to enter the ground and serve as rudders for the machine, substantially as described.

396,713. REGENERATING-EXHAUST. ALBERT SAUER, Pittsburg, Pa. Filed Mar. 19, 1888. Renewed Dec. 20, 1888. Serial No. 294,346. (No model.)



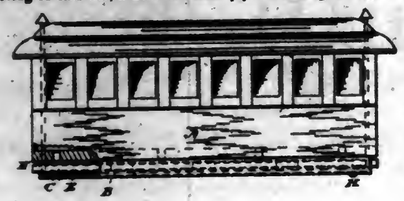
Claim.—1. The combination, with the dome of a steam-generator, of an injector located in said dome, a live-steam pipe connecting the discharge end of the injector with the motor-engine, and an exhaust-pipe connected to the suction end of the injector and provided with a check-valve, substantially as set forth.

2. The combination, with the dome of a steam-generator, of an exhaust-pipe terminating at the outside of said dome, a check-valve at the end of the exhaust-pipe, a casing surrounding the valved end of the exhaust-pipe, the casing being provided with a conical exhaust-nozzle, a second nozzle surrounding the exhaust-nozzle, and a live-steam pipe connecting the exterior nozzle with the motor-engine, substantially as set forth.

3. The combination, with the dome of a steam-generator, of an exhaust-pipe terminating inside of said dome, a check-valve at the end of said exhaust-pipe, a casing surrounding the valved end of the exhaust-pipe, said casing being provided with a conical exhaust-nozzle, a second nozzle surrounding the exhaust-nozzle, a bent pipe applied to the nozzle, a live-steam pipe having a stuffing-box for the end of the bent pipe, and means for adjusting the bent pipe and exterior nozzle, so as to increase or decrease the supply of live steam to the same, substantially as set forth.

396,714. EDGING-PLOW. JOHN S. STEVENS, London, England.

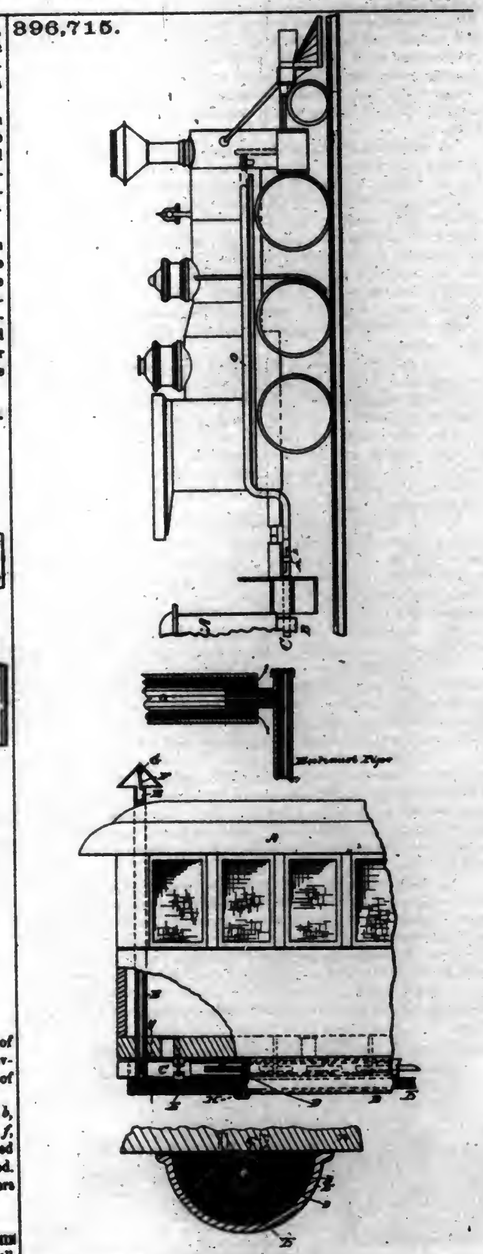
Filed July 30, 1888. Serial No. 281,269. (No model.)



Claim.—1. An edging-plow for gardening purposes, consisting of a plate bent at a right angle for fitting upon the edge of border, having a turn-furrow attached thereto, said plow operating by means of a handle fitted with a hook, for the purposes described.

2. The combination of the edging-plow, having the socket *b*, with the turn-furrow having the tongue C, screwed pin *d*, and nut *f*, for purpose of fastening the parts A B, and the eye *e*, mounted thereon, for operating the plow by means of handle J, as described.

3. The right-angle plate A, having cambered ends *a* and rollers *g g* mounted thereon, for the purposes set forth.

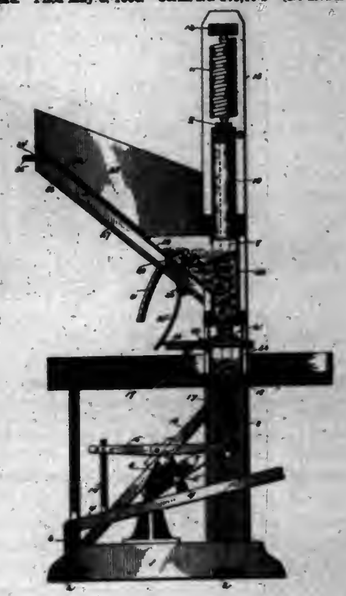


396,715. MEANS FOR HEATING RAILWAY-CARS. BENJAMIN F. TAYLOR, Newark, N. J., assignor to himself and Andrew D. Campbell, same place. Filed Feb. 28, 1887. Serial No. 229,157. (No model.)

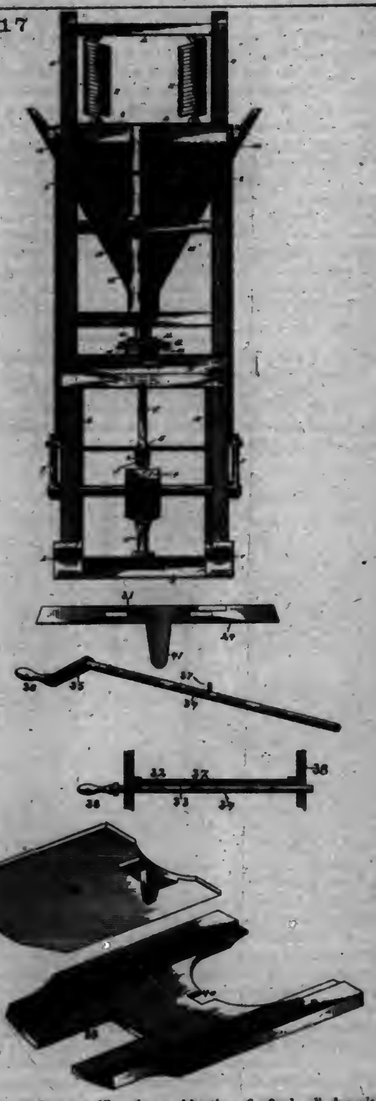
Claim.—In combination with a car, A, a casing secured beneath the flooring of said car, a heat or steam pipe extending through the

chamber formed by said casing, a perforated outer air-pipe extending through said chamber, and a heat-absorbent receptacle arranged within said steam-pipe and open to said chamber formed by said casing, all said parts being arranged and adapted to co-operate substantially as and for the purposes set forth.

396,715.



396,716. CHANGEABLE BILL OF FARE. DELANCY E. TERRILL, Copenhagen, N. Y. Filed Nov. 6, 1888. Serial No. 290,078. (No model.)



Claim.—As an improved article of manufacture, the herein-described changeable bill of fare, comprising, in combination, a series of trays, each having its ends and one of its sides turned up, as described, and a spring secured at one of its ends to the side of the tray, removable indicating-strips held within the tray, and a series of cases having hinged connection at their adjacent edges, and each having the upper edges of its turned-up sides and end turned inwardly, so as to retain and form a frame for the tray containing the indicating-strips, substantially as shown and described.

396,717. CAN-FILLING MACHINE. BENONI P. THOMAS, North East, Md. Filed May 8, 1888. Serial No. 273,190. (No model.)

396,717

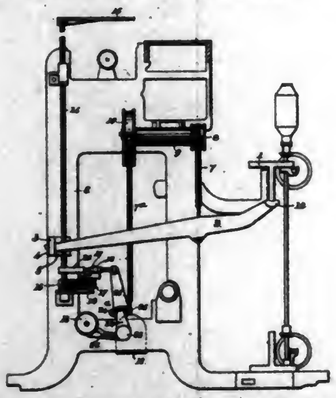
Claim.—1. In a can-filler, the combination of a feed-cylinder with a hopper communicating with said cylinder, said hopper being provided with a perforate bottom and means for opening and closing the perforations, whereby the consistency of the canning material can be kept uniform.

2. In a can-filler, the combination, with a feed-cylinder, of a hopper communicating with said cylinder, said hopper being provided with a perforate bottom and an auxiliary perforated bottom sliding on the main bottom, and an exterior handle to throw the two sets of perforations into or out of register.

3. In a can-filler, the combination of a feed-cylinder with a hopper having perforate bottoms 32 33, means to throw the perforations into and out of register, a drip-chamber below the bottoms, and a discharge-pipe to the drip-chamber.

4. In a can-filler, the combination of a feed-cylinder, a vertically-reciprocating can-support, a plunger, means for bringing the plunger and can-support simultaneously toward the discharge-opening of the feed-cylinder, a spring-actuated can-ejector, and a cover for the discharge-opening controlled thereby, whereby when the plunger is lifted the can is automatically ejected and the discharge-opening sealed.

5. In a can-filler, the combination of a feed-cylinder having a contracted end provided with a flange, with a reciprocating can-support, an automatic cut-off to seal the discharge-orifice of the cylinder when



the can is removed, and a flexible washer on the lower face of the flange, said washer overlapping the cut-off when the mouth of the feed-cylinder is open.

6. In a can-filler, the combination of a feed-cylinder with a sliding plate, 23, adapted to seal the mouth of the cylinder when pushed forward, a lug on said plate to engage the can, and a spring to push the plate, simultaneously eject the can, and seal the cylinder, and an elastic washer around the mouth of the cylinder, said washer overlapping the plate when the mouth of the feed-cylinder is open.

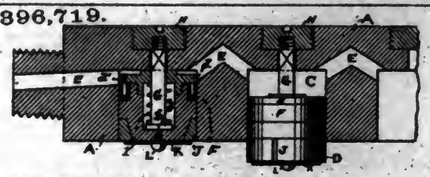
7. In a can-filler, the combination of a feed-cylinder with a supply-hopper in communication therewith, said hopper being provided with a perforate bottom and means for opening and closing the perforations, whereby the consistency of the canning material can be kept uniform, a plunger, a can-support, a foot-lever, and connecting devices for simultaneously bringing the plunger and can-support toward the discharge-opening of the cylinder, and an automatic ejector and cylinder-seal for discharging a filled can and preventing waste of the filling material.

396,718. ROVING-FRAME, &c. SAMUEL TWEEDALE, Accrington, County of Lancaster, England. Filed July 12, 1887. Serial No. 244,106. (No model.) Patented in England Jan. 12, 1885, No. 395.

Brief.—The object of the invention is to provide improved means for balancing the lifting-rail and for raising and lowering the bottom cone, so as to facilitate the transfer of the cone-strap.

Claim.—1. In combination, the rail 1, a pivoted lever supporting said rail directly beneath its center, a supplemental shaft, pulleys thereon, a strap directly connected to the pivoted lever, and a counterbalance-weight, substantially as described.

2. In combination, the cone 13, the rock-shaft 23, having arms 26 for supporting the cone, the hand operating-shaft 14, provided with the handle 15, and connections between the hand operating-shaft 14 and the shaft 23, for transmitting the motion from the former to the latter for moving the cone, said connections consisting of a lever, 20, a gear and crank-pin connection for operating said lever, and connections between the lever 20 and the shaft 23.



3. In combination, the cone 13, the rock-shaft 23, having arms 26 for supporting the cone, the operating-shaft 14, a segment, 16, on the end of the shaft 14, a gear, 17, meshing therewith, a lever, 20, a gear, 17, and crank-pin for operating said shaft, and connections between the lever 20 and the shaft 23, substantially as described.

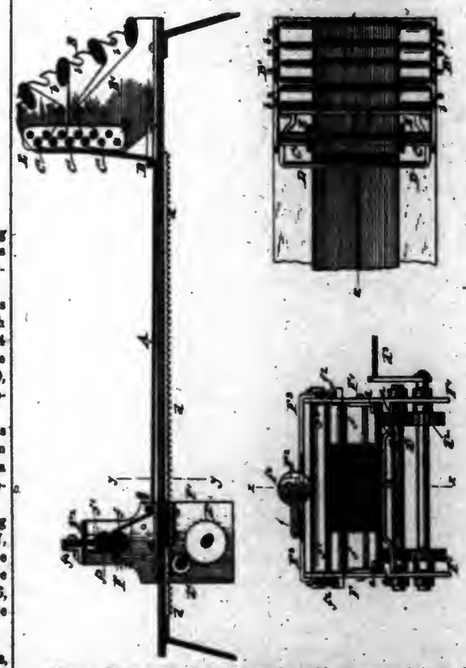
4. The combination, with the bottom cone, of devices for raising and lowering it, consisting of the shaft 14, segment 16, pinion, 17, crank-pin 18, and slotted lever 20, the slotted arm 21, operated by the said lever 20, the shaft 23, and the arm 24, adapted to operate the said shaft 23 through the turning of the arm 21, and arms 26 26, adapted to lift and lock the cone 13, all substantially as and for the purpose set forth:

396,719. MINING-MACHINE. ALFRED R. WATKINS, South Orange, N. J., assignor of one-half to Rufus R. Rockwell, Boston, Mass. Filed June 17, 1887. Serial No. 241,597. (No model.)

Claim.—1. In a mining-machine, a frame provided with a series of two or more ram-chambers and with ports or passages leading to said chambers from a pressure-supplying device, in combination with

396,719.

a corresponding series of rams each of which is held movably within its chamber by a retaining-bolt, substantially as shown and described.



2. In a mining-machine, the combination of a frame, a ram supported therein, a port or passage leading to said ram from a pressure-supplying device, and a sectional ring mounted to slide upon the outer end of said ram and adapted to be contracted diametrically when the body of the ram is partially drawn out of said ring, substantially as and for the purposes shown and described.

3. In a mining-machine, the combination of a frame provided with a ram-chamber which is in communication with a pressure-supplying device, a ram within said chamber, a stop to prevent the ram from being forced entirely out of said chamber, and a spring adapted to draw said ram back into said chamber when the ram is relieved from pressure, substantially as shown and described.

4. In a mining-machine, the combination of the frame A, the ram D, the passages E, communicating with a pressure-supplying device, the stop G, the spring I, and the relief-passage M, substantially as shown and described.

5. In a mining-machine, the combination of the frame A, ram D, passages E, communicating with a pressure-supplying device, and bolts G, held in position by the removable plugs H, substantially as shown and described.

396,720. MACHINE FOR FILING TEXTILE FABRICS. OTTO WOLFSOHN, New York, N. Y., assignor of one-half to Michael Wolbach, same place. Filed June 13, 1888. Serial No. 276,978. (No model.)

Claim.—The combination of a cutting-table, a supporting-stand at one end for the fabrics, and a traversing-carriage provided with a stretcher-bar, a fixed clamping-jaw, a vertically-movable clamping-jaw, springs for forcing said jaws apart, and an eccentric for pressing them together.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

MCCORMICK *et al. v.* WHITMER.

Decided January 7, 1889.

1. GRAHAM—HARVESTERS.

Letters Patent No. 74,342, granted to Alvaro B. Graham February 11, 1868, for an improvement in harvesters, construed, and claims 1 and 2 *Held*, in view of the state of the art and of the special limitations put upon them on the requirement of the Patent Office, to be limited to the special construction and arrangement set forth in the claims.

2. INFRINGEMENT.

Under this construction of claims 1 and 2 of the plaintiff's patent the defendants have not infringed.

APPEAL from the Circuit Court of the United States for the Northern District of Illinois.

Mr. R. H. Parkinson for the appellants.

Messrs. E. & T. A. Banning for the appellee.

Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity, brought in the Circuit Court of the United States for the Northern District of Illinois, by Hugh Graham against Cyrus H. McCormick, Leander J. McCormick, and Robert H. McCormick, on the 8th of June, 1877, founded on the alleged infringement of Letters Patent No. 74,342, granted to Alvaro B. Graham, February 11, 1868, for an "improvement in harvesters." In the course of the suit the defendant Cyrus H. McCormick having died, his executor, Cyrus H. McCormick, and his executrix, Nettie Fowler McCormick, were substituted as defendants in his stead.

The defenses set up in the answer were want of novelty and non-infringement. After issue joined, proofs were taken on both sides, and on the 24th of April, 1882, the court made an interlocutory decree, holding the patent to be valid as regarded its first and second claims, decreeing that the defendants had infringed those claims, awarding a recovery of profits to the plaintiff from the 12th of August, 1870, the date of the assignment of the entire patent by the patentee to the plaintiff, and referring it to a master to take an account of profits and damages. On the 21st of July, 1884, the master made a report awarding a sum of money in favor of the plaintiff, to which both parties filed exceptions. On a hearing, the court sustained some of the defendants' exceptions and overruled all others, and rendered a money decree in favor of the plaintiff. Both parties prayed appeals to this Court, but the plaintiff did not perfect his appeal. Since the record was filed in this Court, the plaintiff has died, and his administrator, Peter Whitmer, has been substituted in his place as appellee.

Only claims 1 and 2 of the patent are involved. The specification states, among other things, that one object of the improvements which constitute the invention set forth in the patent, is to obtain a greater capacity of movement in a floating finger-beam, while retaining its connection with a gearing-carriage that is drawn forward by a stiff tongue; that, to that end, the first of the improvements of the patentee—

consists of the combination of the finger-beam with the gearing-carriage by means of a vibratable link extending crosswise to the line of draft, a draft-rod extending parallel with the line of draft, and two swivel-joints, the one for the vibratable link, and the other for the draft-rod, so that the finger-beam can rise and fall at either end, and rock forward or backward independently of the gearing-carriage, while maintaining its connection with it—

and that his—

next improvement consists of the combination of the finger-beam, gearing-carriage, vibratable link, draft-rod, and swivel-joints, with an arm connected with the finger-beam, to enable it to be rocked for the purpose of setting its guard-fingers at any desirable inclination to a horizontal line.

The specification further says:

My improvements may be embodied in a machine having the finger-beam arranged in advance of the axial line of the shaft or arbor of the driving-wheel, or arranged in the rear of that axial line. In the former case the vibratable link that connects the finger-beam with the gearing-carriage will be arranged in advance of the driving-wheel, and in the latter case in the rear of the driving-wheel. In the former case also the rod hereinbefore called a "draft-rod," (because the strain to which it is subjected is a pulling-strain,) becomes a pushing or thrust rod, and connects the inner end of the finger-beam with the rear of the gearing-carriage. In the former case the radius-bar for the reel and raking-platform connects with the rear end of the gearing-carriage, and in the latter case with its front end.

I prefer to construct a harvesting-machine with the finger-beam in the rear of the line of the axle of the driving-wheel, and as a description of such a machine, perfected by my improvements, will enable them to be fully understood, all of my improvements are embodied in the harvesting-machine of that description, which is represented in the accompanying drawings, and which is an illustration of the best mode which I have thus far devised of embodying them in a working-machine.

There are twelve figures of drawings. The specification states that the machine is what is commonly called a "combined machine," and is adapted to reaping and mowing; that, when used for the former purpose, it is arranged as represented in Figures 1 to 6; that, when used for the latter purpose, certain of its parts are removed, as thereinafter stated, and a grass-divider is substituted for the grain-divider, at the outer end of the finger-beam; and that the gearing which imparts motion to the sickle and reel is mounted upon a carriage, A, which is supported by two running or ground wheels, and is provided with a tongue to which the horses are hitched.

The parts of the specification which relate particularly to the subject-matter of claims 1 and 2 are as follows:

The finger-beam G of the machine projects at one side of the rear end of the gearing-carriage A, and is fitted with guard-fingers H, through the slots of which a scalloped cutter, I, is arranged to reciprocate endwise. The end of this cutter that is nearest the gearing-carriage is connected with the crank-wrist *g* of the crank-shaft D^2 by means of a connecting-rod, J. The fin-

ger-beam is connected with the rear end of the gearing-carriage in the following manner: The end of the beam nearer the carriage is provided with a shoe, K, from which lugs *a a* project upward. These lugs are perforated to admit a joint-bolt, a^1, which connects the shoe with one end of a vibratable forked link, L, whose other end is connected by a swivel-joint, M, with a bracket, N, secured to the rear of the gearing-carriage. This swivel-joint is formed by a cross-head, (m, Fig. 1^a,) the center of which is bored transversely to permit a journal formed on the end of the forked link L to turn in it. The ends of the cross-head *m* are formed into journals, which turn in bearings upon the bracket N. Hence the finger-beam can both rise and fall freely at either end, and rock forward and backward without twisting the link that forms its connection with the gearing-carriage. Moreover, the axis of the cross-head *m* of the swivel-joint is arranged in line, or thereabout, with the axis of the crank-shaft D^2, that imparts motion to the cutter, so that such rising and falling, or rocking, does not materially change the distance between the crank-shaft and the cutter. The shoe K of the finger-beam is connected also with the front end of the gearing-carriage by a draft-rod, O, and the connection between the rear end of this draft-rod and the said shoe is a swivel-joint, M', of which the joint-pin a^1 of the vibratable link L is the longitudinal axis, and its T-head m^1 the horizontal axis. This swivel-joint, therefore, while maintaining a firm connection with the draft-rod, gives free play for both the longitudinal and rocking movements of the finger-beam. Hence, when the machine is used for cutting grass the said finger-beam may be left free, not only to rise and fall at either end, but also to rock or to be rocked forward and backward, so that the points of its guard-fingers incline toward or from a horizontal plane.

In order that the finger-beam may be rocked by the conductor of the machine, the vibratable link L is fitted with an arm, *l*, whose upper end is connected by a rod with the lower end of a lever, P, that is pivoted to the gearing-carriage near its forward end. The upper end of this lever P extends within the reach of the driver, who sits upon the driver's seat Q, so that he may rock the finger-beam by moving the said lever to and fro. This rocking lever P is fitted with a spring-bolt, whose end can engage in any one of a number of notches formed in a segment, R, which is attached to the gearing-carriage concentrically with the pivot of the rocking lever, so that the finger-beam may be fastened in the desired position by the engagement of the spring-bolt in the appropriate notch. The rocking lever is fitted with a lever-handle, *p*, and rod connecting with the spring-bolt, by which the spring-bolt may be withdrawn from the notched segment and held disengaged therefrom during the movement of the lever. In order that the connection between the cutter on the finger-beam and the crank-shaft on the gearing-carriage may not obstruct the free rocking of the finger-beam, the connecting-rod J is connected with the cutter I by means of a swivel-joint, S, consisting (see Fig. 1^b) of a head, *s*, that is pivoted to the cutter-stock (by a shank that extends lengthwise therewith, and turns in an ear, s^1, secured to the end of the cutter-stock,) and of a cross-pivot, s^2, that passes through the said head and through two ears formed upon the connecting-rod J.

There are ten claims in the patent, claims 1 and 2 being as follows:

1. The combination, as set forth, in a harvester, of the finger-beam with the gearing-carriage by means of the vibratable link, the draft-rod, and the two swivel-joints M and M', so that the finger-beam may both rise and fall at either end, and rock forward and backward.

2. The combination, as set forth, in a harvester, of the finger-beam, gearing-carriage, vibratable link, draft-rod, swivel-joints, and arm, by which the rocking of the finger-beam is controlled.

It will conduce to a solution of the questions involved in the case, to give a history of the progress of the application for the patent through the Patent Office, as gathered from certified copies of those proceedings found in the record. On the 4th of December, 1865, the patentee, Alvaro B. Graham, as assignor to himself, William B. Werden, and Cyrus A. Werden, filed in the Patent Office an application for a patent, which was sworn to by him on the 25th of February, 1864. The specification of this application stated that one object of the invention was the free passage of the finger-bar over the ground, and the perfect moving of it to adjust itself to the inequalities of surface over which it might pass; and that another object of the invention was the cutting in a proper manner of lodged grass or grain. It also stated that the machine had a finger-bar, I, the inner end of which was attached, by a joint, *h*, to a bar, J, which was at the rear of the main frame A, and was connected thereto, at its left-hand side, by a swivel or universal joint, K, such joint being composed of a rod, *i*, which was allowed to turn in a bearing, *j*, attached to the main frame, the end of the bar J being cylindrical and allowed to turn in the rod *i*; that the joint K admitted of the bar J and finger-bar I being raised vertically, and also admitted of those bars being turned in a more or less inclined position, in their transverse section, to admit of the fingers and sickle being turned more or less down toward the ground, as might be required; that this adjustment of the fingers and sickle was effected through the medium of a lever, M, which was connected by a rod, *l*, with an upright, *m*, on the bar J; that this lever M might be retained in any desired position, within the scope of its movement, by means of a perforated bar, *n*, into the holes of which a pin on the lever caught; that the finger-bar I might be raised separately from the joint *h*, as a center, through the medium of a lever, N, which, like the lever M, was attached to the main frame A, and had a chain or cord attached to its lower end, said chain or cord passing around a pulley, *q*, on the bar J, and being attached to the upper end of an upright, *r*, attached to the finger-bar at the joint *h*; that both bars I and J might be elevated simultaneously by a lever, O, which was also attached to the main frame A, and bore at its lower end on another lever, P, the outer end of which was connected by a chain, *s*, with the bar J; that the lever O might be retained at any desired point, within the scope of its movement, by means of a rack-bar, P'; that, in case an obstruction presented itself to the inner end of the finger-bar I, the lever O was actuated in order to raise such end of the finger-bar, and, if an obstruction presented itself to the outer end of the finger-bar, the lever N was actuated; and that the applicant did not claim the connecting of the finger-bar I to the bar J, by a joint, *h*, for that had been previously done.

There were five claims in the specification, the first two of which were as follows:

1. The attaching of the bar J to the main frame A by means of the swivel or universal joint K, when used in combination with the finger-bar I, attached to it by a joint, *h*, and this I claim irrespective of any peculiar position of the parts or particular application of the same to the frame of the machine, so long as the desired result is obtained.

2. The arrangement of the lever N, chain or cord *p*, and upright *r*, substantially as shown, for raising the outer end of the finger-bar I, as set forth.

On the 30th of December, 1865, the Patent Office rejected claims 1 and 2 on a reference to prior patents. On the 24th of March, 1866, the applicant erased claims 1, 2, and 3, and substituted for claim 1 the following:

1. The combination of the finger-bar I and bar J, attached to the frame A by means of the universal joint or swivel K, in the manner and for the purpose herein specified.

On the 4th of April, 1866, the Patent Office rejected this substituted claim 1, by a reference to a prior rejected application and to a prior patent. On the 1st of October, 1866, it allowed the two remaining claims applied for, which had been numbered 4 and 5 originally. On the 18th of June, 1867, the applicant filed a withdrawal of the amendments filed March 24, 1866, the effect being to limit the invention claimed under the patent to the two claims allowed October 1, 1866, and the patent was granted July 23, 1867, as No. 67,041, with those two claims, which in no manner relate to any question involved in the present suit. Prior to such withdrawal of June 18, 1867, and on the 11th of February, 1867, Mr. Graham filed an application which resulted in the patent in suit, No. 74,342, issued February 11, 1868. Claims 1 and 2 of the specification of that application originally read as follows:

1. The combination, in a harvester, of the finger-beam with the gearing-carriage, by means of a vibratable link, draught-rod, and two swivel-joints, so that the finger-beam may both rise and fall at either end, and rock forward and backward, substantially as set forth.

2. The combination, in a harvester, of the finger-beam, gearing-carriage, link, draught-rod, swivel-joints, and arm, by which the rocking of the finger-beam is controlled, substantially as set forth.

There were 15 claims in all made in the specification. On the 29th of July, 1867, the Patent Office rejected claims 1 and 2, by a reference to prior patents. On the 31st of December, 1867, the applicant amended claims 1 and 2 so as to read as they are in the patent as granted. The changes thus made in those two claims, and which, under the circumstances, were made to secure the issuing of the patent, the claims having been rejected in the shape in which they were first proposed, were these: In claim 1, "the combination as set forth," was substituted for "the combination;" "the vibratable link," for "a vibratable link;" "the draught-road," for "draught-rod;" "the two swivel-joints M and M'," for "two swivel-joints;" and the words "substantially as set forth" were erased. In claim 2, "the combination as set forth," was substituted for "the combination;" "vibratable link," for "link;" and the words "substantially as set forth" were erased. In the second claim the word "the" was always prefixed to the enumerated elements composing the combination claimed.

The principal question for determination, in the view we take of the case, is that of infringement. The circuit court, in its opinion, delivered on the making of the interlocutory decree, (10 Biss., 39, and 11 Fed. Rep., 859,) considered especially two prior patents, one granted to David Zug, October 4, 1859, No. 25,697, and the other granted to F. Ball, October 18, 1859, No. 25,797. In considering those patents, on the question of infringement as well as on the question of novelty, the circuit court said:

> The two claims of the Graham patent, which are alone in controversy here, are the first and second. The first claim is for a combination of the finger-beam with the gearing-carriage by means of the vibratable link, the draft-rod, and the two swivel-joints, M and M', so that the finger-beam may both rise and fall at either end and rock backward and forward; and the second claim is the same as the first with this only added, that an arm is attached to the vibratable link by which the rocking of the finger-beam is controlled by the driver. The object of this invention, as set forth in these two claims, seems to be mainly to produce the rocking motion of the finger-beam as described and by the method described. In the Ball patent, while there may be said to be something equivalent to the swivel-joint M of the plaintiff's machine, where it is attached to the frame, and also something similar to the draft-rod and the arm, there is nothing to produce the rocking motion, which is the essential object in the first two claims of the plaintiff's machine; and consequently there is no swivel-joint M', as in the plaintiff's machine; so that there is nothing in the Ball machine to prevent the validity of the combination in the first two claims of the plaintiff's patent. The Zug machine has, if not a swivel-joint like that of the plaintiff's at M, where connected with the frame, something which seems substantially similar. It has a vibratable link and it has something which is equivalent to the draft rod, the main difference being that it is attached beneath the shoe instead of above, but there is no swivel-joint M'. There is an arm which is attached to the draft-rod and shoe by which it can be raised and lowered, but Zug claims in his patent that when the machine is in progress over the field, and when the finger-bar strikes any obstacle, there is a device in a box in which the forward part of the draft-rod is fastened, by which the finger-bar yields to the obstacle; and that there is also a mode by which the vibratable rod is attached to the frame, called "joint 16," in his patent, and what has been termed an open clevis where the vibratable link is connected with the draft-rod, by which a motion is given to the finger-bar, and thus the finger-bar is relieved from the obstacle. Zug does not claim that the finger-bar in his machine has a rocking motion, but only that the mode by which the draft-rod is fastened and the motion given to the finger-bar, prevents the obstacle which the machine may meet from doing damage to it. These seem to be the main differences between the two machines, and the question is, whether there is anything in the Zug machine to prevent the combination named in the first two claims of the plaintiff's patent from being valid. The defendants' machine has the swivel-joint attached to the frame, the vibratable link in the same form as the plaintiff's, and the draft-rod attached forward in substantially the same way as the plaintiff's, but instead of having a swivel-joint at M', as stated in plaintiff's machine, forward of the shoe, the draft-rod has a swivel-joint at the rear end of the shoe; and there is an arm attached to a part of the vibratable link substantially like that of the plaintiff's; and the substantial difference, as it seems, between the plaintiff's device as described in the first and second claims, and that of the defendants', is, that the draft-rod is attached to the rear part of the shoe, and not to the forward part, as in the plaintiff's patent. There are also other devices in defendants' machine which may make it different from the plaintiff's. But as to the swivel-joint, the vibratable link, and the mode in which the motion is produced in the finger-bar, there does not seem to be much difference in substance; and in both machines, and by substantially the same means, there is produced a rocking motion. In this connection it is noticeable that the defendants, in the claim set forth in the specification of their patent, make a rocking motion of the shoe and cutter a feature of their combination. In their second claim they say that they claim the combination of the "shoe, and the drag-bar extending over and in the rear of the shoe, and its swiveled pin connecting it with the rear end of the shoe, whereby the drag-bar sustains the thrust of the shoe while leaving it free to rock on its hinges." Again, in their fifth claim, they say that they claim the combination "of the shoe, the forked coupling-arm, the drag-bar extending over and in rear of the shoe, the swivel-pin connecting the two, the rocking lever and the detent mounted on the drag-bar, and the adjustable link-connection between the lever and coupling-arm, whereby the shoe readily may be rocked or adjusted." And again, the motion which seems to be produced in the operation of plaintiff's machine is more distinctly described in the seventh claim made by the defendants in their patent, as follows: The combination "of the shoe, the drag-bar, the forked coupling-arm," and the other elements of mechanism before mentioned, "whereby the shoe is first rocked, and then lifted by one continuous movement of the lever." It must be confessed that the difference between the Zug machine and the first two claims of plaintiff's patent is not very marked. But in view of the description contained in the specifications of Zug's patent and in those of the plaintiff's patent, we are inclined to think that the plaintiff's patent may be sustained on the ground that there is a difference in the manner in which the draft-rod is attached to the shoe, and the finger-bar to the shoe and to the vibrating link; and that there is also a difference in the manner in which the combination of the various parts are adjusted; and that there is an effect produced in the plaintiff's machine which does not exist in the Zug machine. In the plaintiff's machine there is a rocking motion, and not a mere vibratory motion, such as exists in the Zug machine in consequence of the open clevis; neither is there in the plaintiff's machine the yielding of the draft-rod, as described in the Zug patent; and it is obvious, too, from the manner in which the parts are constructed in the Zug machine, that there is only a small vibratory action of the finger-bar; so that, on the whole, we think that the combination as described in plaintiff's patent may be sustained. Then, from what we have said, we do not see that there can be any substantial difference between the combination, as described, in the plaintiff's machine, of the swivel-joints, draft-rod, and vibratable link, with the frame and shoe and finger-bar, and that of the defendants' machine. The differences which have been stated between the two machines in this respect do not constitute any difference in principle. The one is substantially the same as the other. The additions which have been made to defendants' machine, such as the device by which the pressure of the cutting apparatus upon the ground is regulated, and other devices which have been made, do not affect the combination as claimed in the plaintiff's machine. The attachment of the draft-rod to the rear part of the shoe instead of to the front part, which is substantially the only difference that there seems to be in the mode of construction, cannot constitute a difference in principle, and cannot prevent the defendants' machine from being an infringement of the plaintiff's patent. It may be said that there are differences also between the defendants' machine and that of the plaintiff, in the manner in which the arm is attached to the vibratable link, and also as to the mode in which the force applied to the arm may operate upon the finger-bar; but these are differences of form and not of substance.

The specification referred to in that opinion as the specification of the defendants, and quotations from claims 2, 5, and 7 in which are made, is a patent under which the defendants' machines were constructed, No. 193,770, granted July 31, 1877, to Leander J. McCormick, William R. Baker, and Lambert Erpelding, assignors to C. H. and L. J. McCormick.

The invention of the patentee is carried back to November or December, 1863, at which time he made a model containing his perfected invention, which he shortly afterward sent to his patent solicitors, and which was sent to the Patent Office with the application sworn to February 25, 1864, and filed December 4, 1865. The delay seems not to have been attributable to the applicant.

The patents introduced in this case as affecting the questions of novelty and infringement, and which were prior to the invention of Graham, and which seem to be relied on by the appellee, were as follows:

To George C. Dolph, No. 18,141, issued September 8, 1857; to W. S. Stetson and R. F. Maynard, No. 24,063, issued May 17, 1859; the Zug patent; the Ball patent; and one to Stephen S. Bartlett, No. 34,545, issued February 25, 1862.

We are of opinion that the circuit court took an erroneous view of the question of infringement. The capacity of the finger-beam to "rise and fall freely at either end," spoken of in the specification of the plaintiff's patent, was not a new thing with him, but had been used for many years in mowing and reaping machines, the finger-beam moving on a pivot at its inner end; and the plaintiff, in the specification of his patent of July 23, 1867, stated that he did not claim the connecting of the finger-bar I to the bar J by the joint *h*, because that had been previously done. It was also old to have a lever connected by a loose connection, by which the driver could tip up the front edge of the finger-bar arbitrarily, and secure it so that it could not fall below the inclination at which he had set it, although it was left free to tip up further automatically.

The arrangement spoken of in the plaintiff's specification, whereby the finger-beam can "rock forward and backward without twisting the link that forms its connection with the gearing-carriage," was secured by making the pivot on which the crosswise tilt takes place, at a point in front of the beam, so that the pivot rises and falls with the guard-fingers, and an arm is provided by which the movement of the finger-beam in both directions is controlled by the driver, instead of its being independent of his control in its downward movement, as was the case in prior machines. It is apparent, from the proceedings in the Patent Office on his application, and from the terms of his specification and of claims 1 and 2 as granted, that the intention was to limit the modification which he made, to the particular location of the swivel-joint M', on which the crosswise rocking movement takes place, and to the rigid arm by which the positive rocking of the finger-beam in both directions is effected and controlled.

In a mowing-machine for cutting grass, where it is desirable to cut near to the ground in order to cut and use as much of the grass as possible, the front edge of the finger-beam must bear closely on the surface of the ground, with a yielding pressure, so that it will rise freely in order to pass over such irregularities in the surface of the ground as do not require that the finger-beam should be bodily lifted. This yielding pressure is secured by a capacity in it to swing upward on its heel as a pivot, because, if its front edge were held rigidly down upon the ground, the guard-fingers would be driven into every obstruction. This necessity does not exist in machines for harvesting grain, because in them the finger-beam is set several inches above the ground, the grain being the desirable object, rather than the straw, and the carrying of the finger-beam at an elevation prevents its meeting with obstructions; and hence there is no such occasion, as in mowing-machines, for its front edge being left free to swing upward.

The capacity, if any, which Graham added to the machines in general use, was one for raising and lowering the pivot of oscillation, which had before been stationary, and a further capacity for a positive downward tilt or forward rocking, which enabled the driver to tip up the heel of the finger-beam and force the fingers under lodged grain or grass. The rocking forward and backward, spoken of in the plaintiff's specification, is applied to a tilting backward which rocks the front of the finger-beam upward, and to a tilting forward which rocks the heel of that beam upward and its front downward. In the defendants' machine, there is no such rocking backward and forward, but there is a swinging motion, the same as in the prior Ball patent, the pivot on which the tilting takes place being in the rear of the finger-beam, and there being no means of positively tipping the front of the beam downward or of raising its heel to force its front edge and the finger-guards downward. In the Ball patent, the draft-rod passes under the finger-beam, and in the defendants' machine the draft-rod passes over the finger-beam, to reach the pivotal point, which is in both cases the same. In both of them, the weight of the finger-beam being in front of the pivot tends to hold its front edge down upon the ground, but, when the finger-guards strike any elevation, the front edge of the beam swings up freely on its rear pivot, the tendency being for its weight to carry it back to its original position as soon as the elevation is passed. In the Ball patent, there is a lever connected with a chain which can raise the finger-beam or hold it up, but cannot affirmatively depress it, its downward movement being dependent solely upon the fact that its weight is in front of the pivot on which it turns. In the defendant's machine, there is a substitute for the Ball chain, namely, a loose sliding link, which permits of the same upward movement that the chain does, and which cannot force or hold the beam down. In both the Ball machine and the defendant's machine, the propelling force from the draft-rod is exerted from the pivot in the rear, and in both the front edge of the finger-beam, where the guards are situated, is left free for the swinging movement above mentioned. In contradistinction to this, the pivotal connection between the finger-beam and the draft-rod in the plaintiff's machine, instead of being at the heel of the finger-beam, is placed in front of it, at the swivel-joint M', and a rigid arm, *l*, is mounted on the vibratable link, so that the beam can thereby be rocked backward and forward by the driver, to tip the heel of the shoe up and the front down, or the front up and the heel down, the heel of the finger-beam being lifted by the forward rocking of the arm *l*, and its front being lifted by the backward rocking of such arm. By the locking of the lever which works the arm, the finger-beam can be set at any desired inclination. The movement of the finger-beam in each direction is positive. In the defendants' machine, it swings on a pivot at its rear, which is not raised or lowered by the upward or downward tilt of the guard-fingers, while in the plaintiff's machine, as the finger-beam rocks on the swivel-joint M', the heel of the finger-beam is lifted from the ground as the finger-guards are turned downward.

In the Zug patent, of October, 1859, there is a finger-beam attached to the rear end of the machine by a vibratable link, which is itself attached at its rear end loosely to the machine, and is also fitted loosely within the draft-rod, so that there is a considerable rising and falling motion to the front end of the shoe, whereby the guard-fingers can be elevated and depressed to a considerable extent, and in substantially the same manner as in the defendants' machine, the raising and lowering of them being accomplished at a similar point as in the defendants' machine, the difference in the rising and falling motion of the finger-beam in the Zug and in the defendants' machine being a difference only in degree.

In the Ball patent of October, 1859, there is a finger-beam attached by a hinged, vibratable link, and there is a draft-rod, which is hinged at its front end. A shoe is attached to the rear end of the draft-rod, with a free up-and-down hinged joint. The finger-beam of the machine is attached in front of this hinge, and such hinged connection admits of the rising and falling of the front of the shoe and of the finger-beam. This motion is not a rocking motion, as in the plaintiff's patent, but is substantially the same rising and falling motion that is found in the defendants' machine, the only material difference being that, in the Ball patent, the draft-rod extends under the shoe and the finger-beam, and prevents them from falling down lower than a horizontal position; whereas, in the defendants' machine, the draft-rod extends over the shoe and finger-beam to the same point of attachment as in the Ball patent, and thus the finger-beam can fall lower than in the Ball patent, and even to below a horizontal position; but the finger-beam in the Ball patent can rise and fall as freely at either end as in the defendants' or the plaintiff's machine, and the crosswise rising and falling motion in the Ball patent is of the same character as in the defendants' machine, but wholly unlike the rocking motion, or the forward and backward motion, of the finger-beam in the plaintiff's patent.

In the Bartlett patent, of February, 1862, there is a finger-beam attached at its rear by a vibratable link, which has a swivel-joint at its outer end and a free joint at its inner end, in connection with a shoe and with a draft-rod which extends from the front end of the machine to the rear end of the shoe; and the finger-beam is attached to the shoe in front of the vibratable link. There is also a lever which rocks forward and backward, and is so arranged that the finger-beam and the draft-rod rise and fall, and the finger-beam rocks forward and backward, substantially in the same manner as in the plaintiff's patent, though with a less perfect motion. But there is considerable forward and backward rocking motion, and the rocking takes place with substantially rigid lever devices, and there is substantially the same rising and falling motion of the finger-beam at either end as in the plaintiff's patent.

In view of this prior state of the art, the question of infringement stands in this way: In the defendants' machine, there is, in combination with the gearing-frame, a vibratable link-connection with the finger-beam, not very materially different from the vibratable link connection in the plaintiff's patent; but the draft-rod in the defendants' machine is different from that of the plaintiff's patent, in that its forward connection is not substantially a swivel-joint, but is so hinged as to afford no torsional action, and the draft-rod is connected with the shoe at nearly the extreme rear end of the shoe, while the draft-rod in the plaintiff's patent has swivel-joints at both its forward and rear ends, and such joints have substantially a free torsional capacity. So, too, the draft-rod in the plaintiff's patent is attached to the shoe in front of the finger-beam, instead of at the extreme rear end of the shoe, as in the defendants' machine. As a consequence of these several arrangements, the finger-beam in the plaintiff's patent rocks freely both forward and backward, in such manner that the rear of the finger-beam may be elevated and the guards be thrown down, or the front of it may be elevated and the guards be thrown up, with an equal rocking motion in either direction; whereas, in the defendants' machine, when the finger-beam is operated upon by the lever, the front part of it merely rises and falls with a swinging motion from its pivoted point in the rear. The defendants' machine differs from the plaintiff's patent in that its finger-beam cannot be raised at all at its rear by the lifting-lever, and cannot be positively moved downward by that lever. Therefore, as the finger-beam in the defendants' machine does not have the motion which results from the combination of the elements specified in the first claim of the plaintiff's patent, and does not "rock forward and backward" in the sense of that claim, or in the sense described in the specification of the plaintiff's patent, it does not infringe such first claim. Nor does it contain the swivel-joint M', specified in the first claim, located and operating as in the plaintiff's patent. The first claim of that patent must, in view of the state of the art, and of the special limitations put upon it on the requirement of the Patent Office, be limited to the special construction and arrangement set forth in that claim. The same views apply to the second claim of the patent, which contains combined all the elements set forth in the first claim, with the addition of the rigid arm *l*. That arm, in the plaintiff's patent, has a rigid connection with the vibratable link to which it is attached, and through such arm the finger-beam is made to rock backward or forward by positive action, in either direction; while in the defendants' machine there is no such rigid arm, but only a connection by which the front of the finger-beam can be lifted, while it falls by its own weight when released, instead of being positively forced down, as in the plaintiff's patent. This species of lifting device was old.

In regard to the extracts set forth in the opinion of the circuit court from the defendants' patent of July, 1877, we are of opinion that the second, fifth, and seventh claims of that patent, in speaking of the shoe as "rocking," can only refer to its swinging on a hinge at its rear end; and that the term "rocking" is not used in the sense in which it is used in the plaintiff's patent, because, neither in the defendants' patent nor in their machine has their shoe or their finger-beam any such rockin ; motion as is describ d in the plaintiff's patent.

It results from these views that, on a proper construction of claims 1 and 2 of the plaintiff's patent, the defendants have not infringed it, and that the decree of the circuit court must be reversed, and the cause be remanded with a direction to dismiss the bill of complaint, with costs.

Supreme Court of the United States.

ANDERSON *v.* MILLER *et al.*

Decided January 14, 1889.

ANDERSON—DRAWERS.

Letters Patent No. 265,733, granted October 10, 1882, to Robert H. Anderson, for an improvement in drawers, not infringed by an article manufactured by the appellees for more than two years prior to the appellant's application for a patent.

APPEAL from the Circuit Court of the United States for the Eastern District of Virginia.

Mr. C. S. Whitman for the appellant.
Mr. John S. Wise for the appellees.

Mr. Justice LAMAR delivered the opinion of the Court.

This is a suit in equity, brought in the Circuit Court of the United States for the Eastern District of Virginia, by the appellant against the appellees, founded on an alleged infringement by them of Letters Patent No. 265,733, granted to appellant, October 10, 1882, upon an application filed June 24, 1882, for an improvement in drawers.

The alleged infringement consisted in appellees placing on drawers manufactured by them a patch extending down the front and lapping the seam of the crotch by at least half an inch, which process of re-enforcing the garment, it was alleged, was the invention of the appellant.

The bill avers that—

the defendants, Henry T. Miller and William Mitchell, both of the city of Richmond, in the county of Henrico and State of Virginia, and citizens of the said State of Virginia, constituting the firm of Henry T. Miller & Co., doing business at Richmond, in the county, State, and district aforesaid, * * * are now using said patented improvements, or improvements in some parts thereof substantially the same in construction and operation as in the Letters Patent mentioned, and, in violation of his rights, have made, used, and vended within the eastern district of Virginia * * * large quantities of drawers described and claimed in the Letters Patent aforesaid, &c.

The answer of the defendants, in their own separate names, with the firm-name, precisely as they are stated by the bill, in response to complainant's interrogatories, admits that they are residents of Richmond, Va., and engaged in the business of the manufacture and vending of drawers for the clothing trade in that city.

The averments of the answer, material to this inquiry, are—

that drawers, as re-enforced as described in Letters Patent of plaintiff, had been made and in public use and on sale by sundry and divers persons for many years prior to plaintiff's application—

that they, the defendants—

have been manufacturing one particular kind, and only one particular kind, of re-enforced drawers for more than five years hitherto continuously, a specimen of which drawers, manufactured by them, is filed as "Exhibit A," &c., and that these are the only kind of re-enforced drawers that have been manufactured by them, or either of them, during the last five years—

and that—

even if the drawers manufactured by them are either identically or substantially the same as those manufactured by the complainant, he is entitled to no relief whatever against them, because these respondents are prepared to prove that Henry T. Miller & Co. and Henry T. Miller have hitherto continuously for over five years manufactured the identical re-enforced drawers filed as "Exhibit A," and that for over four years prior to the application for said patent they used and sold re-enforced drawers of the pattern and design of those now filed as "Exhibit A," and none other.

The circuit court dismissed the bill, and an appeal from that decree of dismissal brings the case here.

It is contended by the appellant that the answer of the defendants below did not contain a sufficient notice, under the statute, of the defense of want of novelty and two years' public use, in that it did not state the names and places of residence of the persons by whom and where it was used. The object of this statutory requirement is to apprise the plaintiff of the nature of the evidence which he must be ready to meet at the trial. This object is substantially and fully accomplished by the pleadings in this case, and we decline to disturb the action of the court below overruling the motion made at the hearing to strike out the testimony of the witnesses for the defense, who testified to the prior use of the patented article.

We do not deem it necessary to consider the question whether the patent of the appellant is for a new and useful invention within the meaning of section 4886 *et seq.*, Revised Statutes, inasmuch as it is the opinion of this Court that there has been no infringement of it in this case by the appellees. It is satisfactorily shown by the evidence in the record that for more than two years prior to the application for the patent in question the appellees had been manufacturing, at their place of business at Richmond, Va., garments identical in pattern with those that are now alleged to infringe appellant's patent.

The decree of the circuit court is affirmed.

DECISIONS OF STATE COURTS.

Supreme Court—State of New York.

MUNRO *v.* BEADLE *et al.*

Decided October 11, 1888.

TRADE-MARK.

The word "Sleuth," being a word having a place and meaning in the language, cannot be appropriated as a Trade-Mark for a book or periodical.

Mr. Roger Foster for the complainant.
Mr. Rowland Cox for the defendants.

INGRAHAM, *J.*:

The only act of the defendants complained of by the plaintiff is the introduction of the word "Sleuth" in the title of certain stories published by the defendants. There was no attempt on the trial to show that the defendants had used any symbol or design invented by the plaintiff to designate his series, and unless the plaintiff can establish that he has in some way acquired the exclusive right to use the word "Sleuth" in connection with stories of detectives no right of plaintiff's has been infringed.

The word "Sleuth" has a well-defined meaning, and is defined by Webster to mean "the track of man or beast as followed by the scent." It is used in connection with a hound to indicate that a hound follows the track of a human being or animal, and as applied to man would have the same meaning.

The adoption by the plaintiff of the name of "Old Sleuth" to designate the series of books published by him could hardly be said to give to the plaintiff the exclusive right to use the word "Sleuth" in all future publications of every character, so that the rest of the world must invent a new word to express that meaning. That would be the logical effect of sustaining the position taken by the plaintiff in this case.

The titles adopted by the defendants in the publication of their books would be perfectly intelligible to any one having no knowledge of the use to which the word had been applied by the plaintiff, and, assuming that the plaintiff had acquired a Trade-Mark in the words used by him to designate his publications, nothing proved in this case would show that the defendants have violated any rights that they have acquired. The plaintiff has therefore failed to show any cause of action against the defendants, and the complaint must be dismissed, with costs.

Transfer of Classes.

(ORDER No. 522.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., January 23, 1889.

It is hereby directed that Class 125, Stone-Working, and Class 166, Artesian and Oil Wells, be transferred from Division XV to Division XXV.

BENTON J. HALL,
Commissioner.

Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., January 22, 1889.

SIR: The Secretary of the Interior has ordered that John Lee Taylor, of Chicago, Ill., be not recognized after this date as attorney or agent in the prosecution of any claim or other matter before this Department or any bureau thereof.

Very respectfully,

GEO. A. HOWARD,
Chief Clerk.

The Commissioner of Patents.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and subclassified in the Scientific Library for convenient and ready reference.

Issue of January 29, 1889.

DESIGNS.

18,880.—BUTTON-HOLE DECORATION.—*William W. Burns*, Governor's Island, N. Y., assignor to *Bailey, Banks & Biddle*, Philadelphia, Pa. Application filed November 30, 1888. Serial No. 292,332. Term of patent 14 years.

18,881.—AX-HANDLE.—*James W. Carver*, Pawlet, Vt., assignor to himself and *Gibbons L. Kelty*, Brooklyn, N. Y. Application filed October 5, 1888. Serial No. 287,321. Term of patent 7 years.

18,882.—NEWEL-POST.—*William C. Hanna, Jr.*, New York, N. Y., assignor to *J. W. Fiske*, same place. Application filed September 26, 1888. Serial No. 286,467. Term of patent 7 years.

18,883.—CURTAIN.—*William F. Riley Hartley*, Philadelphia, Pa., assignor to *Barnes & Beyer*, same place. Application filed January 3, 1889. Serial No. 295,340. Term of patent 3½ years.

18,884.—FONT OF COMBINATION TYPE ORNAMENTS.—*Herman Ihlenburg*, Philadelphia, Pa., assignor to *The MacKellar, Smiths & Jordan Company*, same place. Application filed November 30, 1888. Serial No. 292,335. Term of patent 7 years.

18,885.—FONT OF COMBINATION TYPE ORNAMENTS.—*Herman Ihlenburg*, Philadelphia, Pa., assignor to *The MacKellar, Smiths & Jordan Company*, same place. Application filed November 30, 1888. Serial No. 292,336. Term of patent 14 years.

18,886.—CANE-HANDLE.—*Frederick R. Kaldenberg*, New York, N. Y. Application filed November 8, 1888. Serial No. 290,333. Term of patent 7 years.

18,887.—CURTAIN-POLE END.—*Charles W. Lawrence*, New York, N. Y. Application filed May 23, 1888. Serial No. 274,842. Term of patent 7 years.

18,888.—NUT-CRACKER.—*Henry Marcus Quackenbush*, Herkimer, N. Y. Application filed November 19, 1888. Serial No. 291,287. Term of patent 14 years.

18,889.—BRAID.—*Valentine G. Schuck*, New York, N. Y., assignor to *The Sutro Brothers Braid Company*, New York. Application filed November 23, 1888. Serial No. 291,685. Term of patent 14 years.

18,890.—UPHOLSTERY PLUSH.—*Edward W. Tingue*, New York, N. Y., assignor to *The Tingue Manufacturing Company*, Seymour, Conn. Application filed December 28, 1888. Serial No. 294,871. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,220.—SAFES AND LOCKS.—*Thomas Barnes*, Pittsburg, Pa. Application filed November 18, 1887. Used since 1845.

"The words 'BARNES SAFE AND LOCK CO.' arranged within a border."

16,221.—LUBRICATING COMPOUND.—*Edwin Hendry Benners*, Elizabeth, N. J. Application filed November 5, 1888. Used since July 15, 1888.

"An indented oval figure formed by describing a portion of three circles—a larger one in the center and a smaller one on each side—with the word 'LUBRICATING' crossing it at its greatest diameter, with the word 'BENNERS'' in a curve over it and the word 'COMPOUND' in a curve below it."

16,222.—HAIR-WASH MADE OF EXTRACT OF HERBS, ROOTS, AND FLOWERS.—*Richard Binder*, Philadelphia, Pa. Application filed January 8, 1889. Used since January 1, 1888.

"The word 'PHYTALIA.'"

16,223.—RED HEMATITE, A COLORING MATERIAL FOR MORTAR, BRICK, TILES, AND ALL CLAY PRODUCTS.—*Clinton Metallic Paint Company*, Kirkland and New York, N. Y. Application filed September 29, 1888. Used since July 1, 1887.

"A perspective view showing the head and a portion of the body of a barrel, the head having on it the words 'CLINTON HEMATITE RED.'"

16,224.—SOAP.—*Michael H. Duffy*, Paterson, N. J. Application filed November 21, 1888. Used since November 14, 1888.

"The words 'DUFFY'S SECRET' and the representation of a woman holding a towel, on which are the words 'WHITE AS SNOW.'"

16,225.—BLUING-CAPSULES.—*The Electric Chemical Co.*, New Haven, Conn. Application filed December 26, 1888. Used since December 15, 1888.

"The words 'ELECTRIC LAUNDRY BLUE.'"

16,226.—PRESERVED FRUITS, VEGETABLES, MEATS, AND POULTRY.—*Erie Preserving Company*, Brant, N. Y. Application filed May 28, 1886. Used since August, 1885.

"The words 'HONEY DEW' and the pictorial representation of a bear in an upright position resting against a tree and biting into a cake of honey."

16,227.—RAZORS AND RAZOR-STROPS.—*Philip Hahn*, New York, N. Y. Application filed November 28, 1888. Used since August 1, 1884.

"The representation of a rooster."

16,228.—TWINES, ROPES, CORDAGE, NETS, LINES, YARNS, AND THE LIKE.—*Frank B. Hooper*, New York, N. Y. Application filed September 28, 1888. Used since 1886.

"The word 'HOOPER' printed upon the face of a seal associated with the representation of a ball of cord, a strand of the cord being shown as unwound from the ball and fashioned into a letter."

16,229.—WHISKY.—*Fred. J. Kiesel & Company*, Ogden, Utah Ter. Application filed November 23, 1888. Used since July 15, 1881.

"The words 'IMPERIAL CROWN' and the representation of a crown beneath said words and in connection with them."

16,230.—PREPARATION FOR PILES.—*Reuben C. Mooney*, Jasper, Tenn. Application filed October 2, 1888. Used since April 22, 1887.

"A square cut surrounded by an ornamental border and containing a picture of a lamb bearing a long Latin cross with scroll."

16,231.—FLOUR.—*The Muscatine Oat Meal Company*, Muscatine, Iowa. Application filed November 30, 1888. Used since June 1, 1887.

"The word 'HAWKEYE.'"

16,232.—BAKING-POWDER.—*The New York Phosphate Company*, Jersey City, N. J., and New York, N. Y. Application filed December 14, 1888. Used since September 10, 1888.

"The representation of a white Swiss cross and the words 'PHOSPHATE HEALTH BAKING POWDER,' in white letters on a red background."

16,233.—LINIMENT.—*Charles Sands*, Norristown, Pa. Application filed November 17, 1888. Used since July 3, 1876.

"The representation of a soldiers' camp, a soldier lying upon the ground, a surgeon kneeling beside him, and the words 'WONDERFUL PAIN KILLER' arranged around the picture"

16,234.—STOVES, RANGES, AND FURNACES.—*Syracuse Stove Works*, Syracuse, N. Y. Application filed December 5, 1888. Used since January 1, 1880.

"The word 'WELCOME.'"

16,235.—LINIMENT.—*William J. Thompson*, Pittsburg, Pa. Application filed December 6, 1888. Used since November 1, 1886.

"The words 'SEVEN SEALS.'"

LABELS.

5,808.—Title: "THE CELEBRATED LINCOLNSHIRE CHUTNEY."—*Godley Brothers*, Madison, Wis. Application filed December 19, 1888.

5,809.—Title: "BALSAM OF TULU AND WHITE PINE."—*Green & Bentley*, Oskaloosa, Iowa. Application filed January 3, 1889.

5,810.—Title: "BRAND A" (FOR SHEATHING PAPER.)—*Margaret E. Manahan*, New York, N. Y. Application filed January 5, 1889.

5,811.—Title: "P. JAMIESON, ABERDEEN." (FOR HARNESS COMPOSITION.)—*Peter Jamieson*, Aberdeen, Scotland. Application filed December 3, 1888.

5,812.—Title: "P. JAMIESON'S NOTED HARNESS COMPOSITION."—*Peter Jamieson*, Aberdeen, Scotland. Application filed December 3, 1888.

5,813.—Title: "P. JAMIESON'S HARNESS COMPOSITION."—*Peter Jamieson*, Aberdeen, Scotland. Application filed December 3, 1888.

5,814.—Title: "PRACTICALLY INDESTRUCTIBLE" (FOR PIANOS.)—*Albert Riley*, New York, N. Y. Application filed December 29, 1888.

5,815.—Title: "DR. HAMILTON'S LINIMENT."—*John H. Shade* Wellington, Kans. Application filed November 20, 1888.

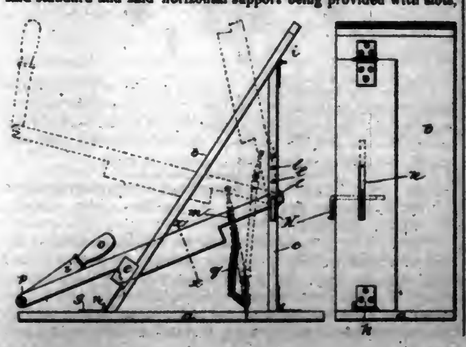
PATENTS

GRANTED JAN. 29, 1889.

396,721. CAR-WHEEL. RICHARD H. ALLEN, Cleveland, Ohio. Filed June 14, 1888. Serial No. 277,113. (No model.)

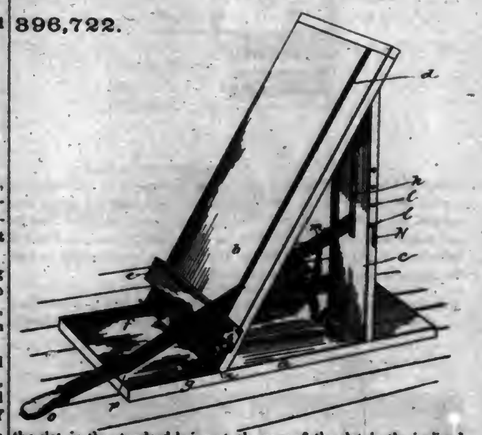
Claim.—1. A hollow car-wheel center adapted to receive a tire, consisting of a hub, rim, side plates, and cross-ribs or stays, and composed of two separable main or principal parts or pieces united together by bolts or rivets, substantially as and for the purpose set forth.

2. A hollow car-wheel center adapted to receive a tire, consisting of a hub, rim, side plates, and cross-ribs or stays, and composed of two separable principal parts or pieces secured together by bolts or rivets, one of which parts is of cast metal, while the other is of wrought iron or steel, substantially as and for the purpose set forth.



3. A hollow car-wheel center adapted to receive a tire, composed of two separable principal parts secured together by bolts or rivets, one of said parts being of cast metal, and forming the hub, rim, and one side plate with cross-ribs or stays, while the other part is of wrought iron or steel and constitutes the opposite side plate, substantially as and for the purpose set forth.

4. A car-wheel composed of a tire and a substantially hollow center formed in separate parts and united together, the center containing a hub, rim, side plates, and cross-ribs or stays, being composed of two principal parts or pieces secured together by bolts or rivets, substantially as and for the purpose described.



5. A car-wheel composed of a tire and a substantially hollow center formed separately and united together, the center containing a hub, rim, side plates, and cross-ribs or stays, being composed of two principal parts or pieces secured together by bolts or rivets, one of which parts is of cast metal and the other of wrought iron or steel, substantially as and for the purpose set forth.

6. A car-wheel composed of a tire and a substantially hollow center formed separately and united together, the center being composed of two principal parts or pieces secured together by bolts or rivets, one of which parts is of cast metal and contains a hub, rim, and one side plate, and the other part is of wrought iron or steel and is the other side plate, substantially as and for the purpose set forth.

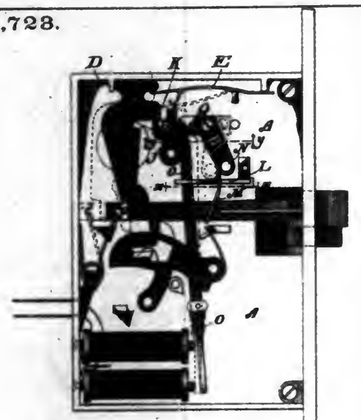
396,722. WOOD-SPLITTING MACHINE. CHARLES BARR, Chicago, Ill. Filed Aug. 24, 1888. Serial No. 284,008. (No model.)

Claim.—1. The combination, with the inclined support provided with a transverse block near its lower end, of the brace or standard, said standard and said horizontal support being provided with slots,

the slot in the standard being at the rear of the slot in the inclined support, and a knife pivoted upon a pin passing through the slot in the standard, said knife extending through the slot in the inclined support and being provided with a weighted pivoted handle and a retractile spring, against the tension of which the knife is lifted when raised, substantially as and for the purpose specified.

2. The combination, with the base *a*, of the upright standard *c*, the inclined support *b*, said support *b* being provided with a transverse block, *e*, and a knife pivoted to the standard and extending through a slot provided in the inclined support, said knife being provided with a pivoted handle, substantially as and for the purpose specified.

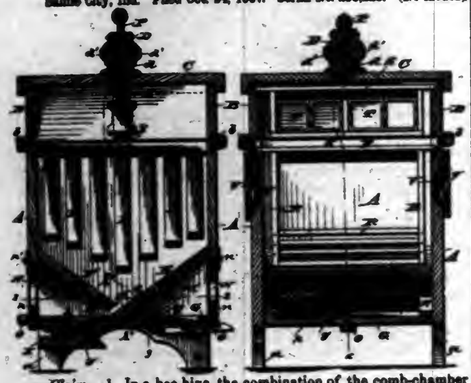
3. The combination, with the base *a*, of the inclined support *b* and the back or standard *c*, said pieces *a b c* being rigidly secured together by hinges provided with removable pins, a knife secured to the standard *c* by a pivotal attachment, said knife extending through a slot, *d*, provided in the inclined support, and a retractile spring between the knife and the base, substantially as and for the purpose specified.



4. In a machine for splitting wood, the combination, with the base, of an inclined slotted support braced or secured in position by a standard extending from the base to the under side of the inclined support near the top of said support, said standard being provided with a slot at the rear of the slot in the inclined support, several pin-holes being provided in the standard, passing through the edge of the standard and through the slot, as described, and a knife extending through the slot in the inclined support and pivoted upon a pin passing through the eye in the end of the knife and one of the pin-holes, said knife being adapted to be adjusted to any desired height by changing the pin or pivot from one pin-hole to another, substantially as and for the purpose specified.

396,723. ELECTRICALLY-OPERATED DOOR-LOCK. CHARLES B. BURNS, Bridgeport, Conn. Filed Mar. 19, 1888. Serial No. 267,663. (No model.)

Claim.—1. The combination of the electro-magnet, the lever O, pivoted to the casing and having at one end an armature within the field of said magnet and at the other end a tongue, P, the sliding bolt I, having a shoulder, Q, and the latch-operating tumbler having a shoulder, K, substantially as shown and set forth.



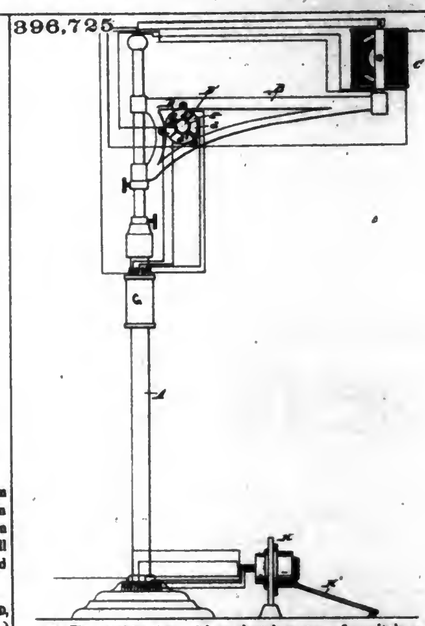
2. In a door-latch, the combination of the latch-operating tumbler, the latch having a shoulder against which said tumbler abuts, a bolt adapted to lock said tumbler as against operation, a pivoted rock-lever carrying said bolt and having upwardly-projecting pin, a vertical

396,723.

fin secured to the latch-casing and having its upper edge inclined from a point above said pin to a point below the same, and the spring-arm secured to the latch and extended in normal position across said fin and above said pin, whereby when the latch is retracted said arm will ride down the fin to a position behind said pin, substantially as and for the purposes hereinbefore set forth.

396,724. BEE-HIVE. JONATHAN BENSON and JOHN H. HIRSCHFELD, Saline City, Ind. Filed Oct. 24, 1887. Serial No. 253,226. (No model.)

Claim.—1. In a bee-hive, the combination, with the comb-chamber provided with a hopper-shaped bottom formed of the inclined boards E F, having the space *f* between them, and the board E, having the aperture *e*, a closed bottom below the hopper-shaped bottom and formed of the section G and the reversible section H I, and the screen-doors N, for closing the chambers formed by and between the said bottoms, substantially as herein shown and described.



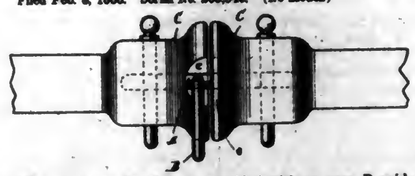
2. A bee-hive made with a reversible floor-section, H I, spaced apart by strips J to form a moth-receiving pocket, K, and said part H provided with a recess, *h*, forming a feed-trough, and the part I serving as an alighting-board, substantially as herein set forth.

3. The combination, with a bee-hive having a hopper-shaped bottom with a space between the boards thereof and provided with cleats secured to the sides below the said bottom, of the recessed board H, the plain board I, and the strips J, arranged between the said boards and forming a central moth-pocket, K, and end grooves to receive the said cleats, the boards H I and strips J forming a removable and reversible box-like structure, substantially as and for the purpose set forth.

396,725. DEVICE FOR CONTROLLING ELECTRIC MOTORS. HARRY H. BLADEN, Detroit, Mich. Filed Mar. 23, 1886. Serial No. 202,223. (No model.)

Claim.—1. The combination, with an electric motor, of a switch mechanism governing a current-regulator and another switch mechanism whereby the current may be short-circuited around the field magnets or armature, turned on through both, or reversed, one of said switches adapted to be operated by the hand and the other by the foot, substantially as and for the purposes described.

396,725.

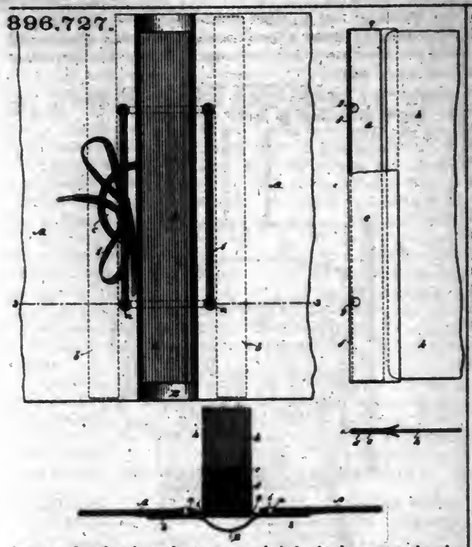


2. The combination, with an electric motor, of a switch connected with a resistance-regulator for governing the amount of current admitted through the motor and another switch constructed to short-circuit the current from the field magnets or armature, turn on or reverse the current, one of said switches adapted for operation by hand and the other by the foot, substantially as and for the purposes described.

3. The combination, with an electric dental motor, of one switch located upon the stand and adapted for operation by hand and another switch located adjacent thereto at the floor and adapted for operation by the foot, one of said switches governing the short-circuiting, the turning on, and direction of the current, and the other governing the resistance-regulator, which determines the amount of current admitted through the motor, substantially as and for the purposes described.

4. The combination, with an electric dental motor, of a switch located upon the stand adjacent to the hands of the operator, said switch adapted to govern the resistance-regulator, whereby is regulated the amount of current admitted through the motor, the same adapted for operation by hand, and in connection therewith another switch located at the floor adjacent to the foot of the operator for short-circuiting and regulating the direction of the current and adapted to be operated by the foot of the operator, substantially as and for the purposes described.

396,726. CAR COUPLING-LINK. FRANK P. BOYCE, Rye, N. H. Filed Feb. 8, 1888. Serial No. 263,346. (No model.)



Claim.—A coupling-link, A, provided with an arm, B, said arm being attached to the side of the link at either side of its center, in combination with the ordinary coupling-pin and a draw-head or buffer provided on one side with a recess, *c*, of sufficient depth to receive the arm B, substantially as and for the purposes set forth.

396,727. TEMPORARY BINDER FOR PHOTOGRAPHIC CARDS. IRVING H. BROWN, New York, N. Y. Filed Nov. 4, 1887. Serial No. 254,250. (No model.)

Claim.—1. A holding device for use in binders, consisting of a strip of suitable material, a covering inclosing said strip at its back edge, sides, and front edge, and extending outwardly from the front edge of the strip for uniting to the holding device the article to be bound, and a wire beading along the back edge of the strip between the strip and the inclosing-covering, the said strip and covering having a perforation through them near their back edge next to the wire beading, all substantially as shown and described.

396,727.

2. A binder consisting of a pair of covers having perforations at their inner edges, a back-piece uniting the covers and attached to them beyond the perforations, a binding-cord, a recess in the inner end of one cover to receive the knot of the cord, a holding device consisting of a strip of suitable material, a covering inclosing said strip at its back edge, sides, and front edge, and extending outwardly from the front edge of the strip for uniting to the holding device the article to be bound, and a wire beading along the back edge of the strip between the strip and the inclosing-covering, the said strip and covering having a perforation through them near their back edge next to the wire beading, all combined substantially as shown and described.

3. A binder, substantially as shown and described, consisting of a pair of covers having perforations at their inner edges, a back-piece uniting the covers and attached to them beyond the perforations, a binding-cord, a holding device consisting of a strip of suitable material, and a covering inclosing said strip and extending outwardly from its front edge for uniting to the holding device the article to be bound, the said strip and covering having perforations through them at the inner edge of the strip, whereby a double joint is secured between the binding-cord and the article held in the binder.

396,728. FLOW-POINT. MARVIN S. CADWELL and EDWARD L. CADWELL, Lansing, Mich. Filed Sept. 1, 1887. Serial No. 248,500. (No model.)

Claim.—1. The combination, with point B, provided with longitudinal ledge or shoulder *b'*, of an adjustable self-sharpening supplemental point, D, consisting of a long thin narrow piece of plate or spring steel of even width and thickness, adjustably secured and lying flat upon the upper face of said point B, and bolt *d*, substantially as specified.

2. The combination, with point B, provided with longitudinal ledge or shoulder *b'*, of an adjustable self-sharpening supplemental point, D, consisting of a long thin narrow piece of plate or spring steel of even width and thickness, adjustably secured and lying flat upon the upper face of said point B, and bolt *d*, said point B or supplemental point D, one or both, being furnished with a longitudinal slot through which said bolt *d* passes, substantially as specified.

3. The combination, with point B, furnished with bed *b* and longitudinal ledge *b'*, of supplemental self-sharpening point D, adjustably secured thereon, and consisting of a long thin narrow piece of plate or spring steel, said ledge *b'* extending back about two-thirds the length of said supplemental point D, substantially as specified.

4. The combination, with cast-iron point and share B C, cast integrally together and furnished with thickened bed *b*, and longitudinal ledge *b'*, of self-sharpening, reversible, and adjustable supplemental point D, consisting of a long narrow thin piece of plate or spring steel, said point B being furnished with a recess, B', on its under face, and an inclined slotted shank portion, B^2, and the bolt *d* for securing said supplemental point D to said point B, substantially as specified.

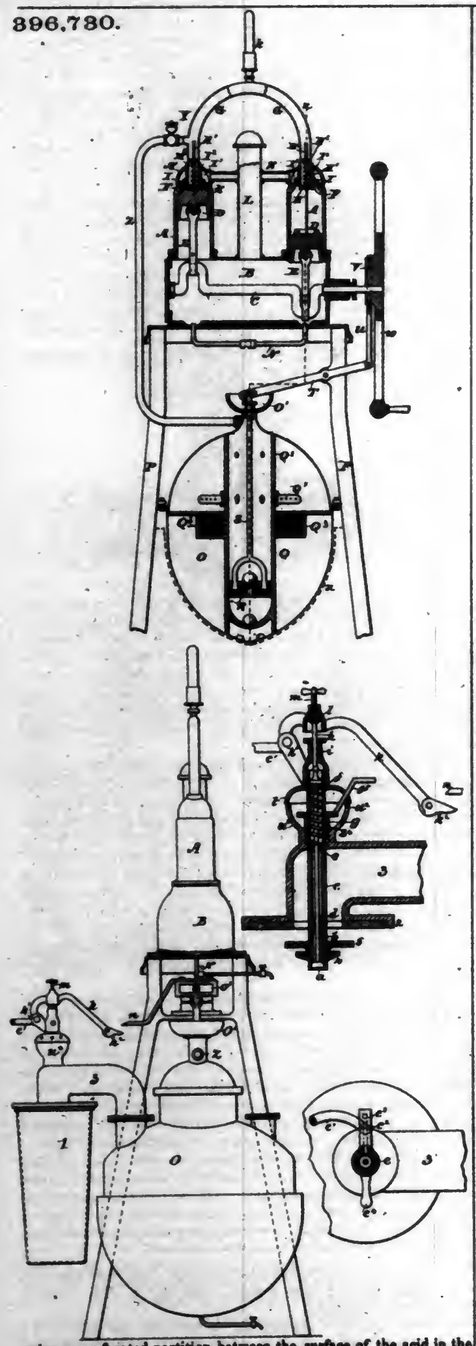
5. The combination, in a mold-board plow, of its cast point, share, and landside, with a thin supplemental self-sharpening plate-steel point secured on top of said cast point, with its cutting-edge projecting beyond said cast point and below the horizontal line or lower surface of said cast point and landside, whereby the forward end of the cast point is protected by the overhanging or projecting end of the supplemental point and the cast point is prevented from offering obstruction to the forward movement of the plow, substantially as specified.

396,729. WATER-MOTOR. JOHN COATES, Erie, Pa. Filed Nov. 11, 1887. Serial No. 254,907. (No model.)

Claim.—1. In a water-motor, the combination of a main cylinder, A, having passage-chambers A' A' extending from its ends to its middle point, and then connecting with a breast and an exhaust-passage, a secondary-valve chamber formed within said breast, which is parallel with the cylinder-chamber, and a steam-chest having a main-valve chamber at right angles to said cylinder-chamber fixed on said breast, thereby placing the secondary-valve chamber between the main-valve chamber and the cylinder and at right angles to said main-valve chamber.

2. In a water-motor, the combination of a main cylinder, A, having passage-chambers A' A' extending from its ends to its middle point, a circumferential exhaust-passage, C, located at said middle point, a breast at said middle point, in which said passages terminate, a valve-chest fixed upon said breast, and having therein a main-valve chamber lying at right angles to the main cylinder and a secondary-valve chamber lying parallel with said cylinder and between said main valve and said cylinder, said valve-chambers containing proper valves and having proper ports and passages, as set forth and shown, a mechanical valve-gear for moving said secondary valve from the main piston, and a mechanical valve-gear for giving the main valve an initial impetus in the direction of the fluid-pressure admitted against it by said secondary valve.

3. In a water-motor, the combination of a main cylinder, A, having passage-chambers A' extending from its end to its middle, a breast, A^3, at its middle, an exhaust-passage extending from said breast around to an exhaust-nozzle back of said cylinder, a valve-chest attached to said breast containing a main valve which lies at right angles to the cylinder, and a secondary valve which lies parallel with the cylinder, and between it and the main valve, said secondary valve admitting fluid under pressure to the main valve, and the main valve admitting fluid under pressure to the said cylinder, substantially as set forth.

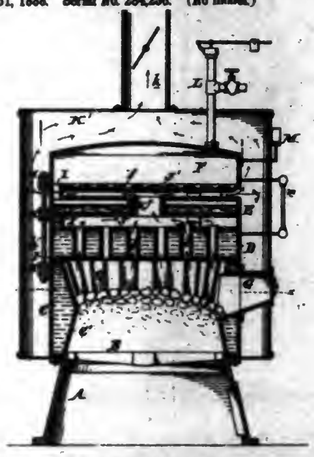


4. In a water-motor, the combination of a main-piston chamber, a main-valve chamber at right angles to said piston-chamber, a secondary valve between the main-valve and the piston chamber, which is at right angles to the main valve, and a lever for communicating motion from said secondary-valve stem to the stem of said main valve.

396,730. REFRIGERATING-MACHINE. ALEXANDER COLACHER, Windsor, County of Berks, England. Filed May 10, 1888. Serial No. 273,494. (No model.)

Claim.—1. In a refrigerating-machine, the combination of a vacuum-pump, a pipe leading from said pump to an absorbing-vessel containing sulphuric acid, a liquid stirrer and elevator within said absorber, a perforated partition between the surface of the acid in the absorber and the air-pipe leading therefrom to the pump, and a porous or liquid-diffusing substance, as described, upon said perforated partition, with an air-sealed vessel having a pipe-connection with the absorber, substantially as and for the purpose described.

2. In a refrigerating-machine, the combination of a vacuum-pump, a pipe leading from said pump to an absorbing-vessel named an "absorber," containing sulphuric acid, a liquid-elevator within said ab-



396,730.

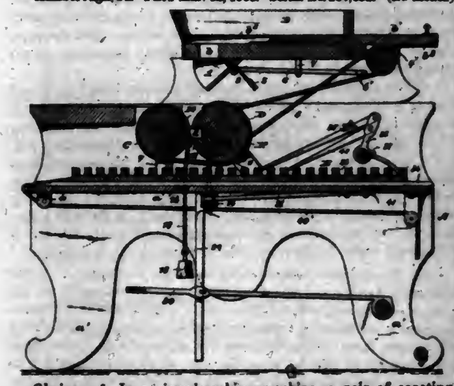
sorber, a perforated partition between the surface of the acid in the absorber and the air-pipe leading therefrom to the pump, and vapor and a porous or liquid-diffusing material, substantially as described, upon said perforated partition, with an air-sealed vessel having a pipe-connection with the absorber, and means, substantially as described, for automatically admitting intermittently at regular intervals of time conical jets of water projected downward into said air-sealed vessel, substantially as set forth.

3. The combination, with the freezing-vessel, the supply-pipe, and its spring-seated valve, of the hammer above the valve-stem and the trip, constructed and arranged as described, to be actuated by the pump-operating means, whereby the water to be frozen is automatically and intermittently injected in small quantities into the freezing-vessel.

396,731. BOILER. JOHN B. DE BARTHE, North Wales, Pa. Filed Aug. 31, 1888. Serial No. 284,236. (No model.)

Claim.—1. The combination, in a steam-boiler, of a fire-box section having its interior formed with walls inclining inwardly at the top and outwardly at the bottom on descending, and forming a water-back, the upper part of said section having its walls formed with corrugations, steam and water sections above said fire-box section, provided with flues or passage-ways for the passage of water and steam from said water-back into said steam and water sections, flues through said steam and water sections opening into said fire-box section, a superheating-section surmounting said steam and water sections and provided with openings into the topmost of them, and means, substantially as described, to clamp said sections together.

2. The combination, in a steam-boiler, of a fire-box section having its interior formed with walls inclining inwardly at the top and outwardly at the bottom on descending, and forming a water-back, the upper part of said section having its walls formed with corrugations, steam and water sections above said fire-box section provided with flues or passage-ways for the passage of water and steam from said water-back into said steam and water sections, flues through said steam and water sections opening into said fire-box section, a superheating-section having a corrugated lower surface surmounting said steam and water sections and provided with openings into the topmost of them, and means, substantially as described, to clamp said sections together.



3. In a steam-boiler, the combination of a fire-box section having its interior formed with walls inclining inwardly at the top and outwardly at the bottom on descending and forming a water-back, a water-section opening into said water-back, located above said fire-box, and provided with a series of tubes passing through it opening from said fire-box, a second water-section located above said tube-section and opening into it provided with a central flue for the passage of the products of combustion, said sections having a closed compartment between them, whereby the products of combustion which are divided in passing through said tubes are again collected together in passing through the central flue, and a superheating-section opening into said water or steam sections located above said sections and having a space or compartment between it and the upper of said sections provided with lateral outlets for the products of combustion, and means, substantially as described, to clamp said sections together.

4. The combination, in a steam-boiler, of a fire-box section having a water-back, a water-section opening into said water-back, located above said fire-box section, and provided with a series of tubes passing through it opening from said fire-box and having necks upon its upper surface, a second water-section having a single central flue and provided with necks upon its upper and lower surfaces, and a downwardly-extending flange adapted to rest upon said first section, so that the necks upon its lower edge will rest upon the necks of the first section, forming passage-ways for water and steam from one section to another, but forming by said flange a closed compartment between said sections, and a steam-dome or superheating-section provided with necks upon its lower surface adapted to rest upon the necks on the upper surface of said second section for the passage of steam therefrom into said steam-dome, but having an open space between said steam-dome and second section for the escape of the products of combustion.

5. The combination, in a steam-boiler, of a fire-box section having a water-back, a water-section opening into said water-back, located above said fire-box section, and provided with a series of tubes passing through it opening from said fire-box and having necks upon its upper surface, a second water-section having a single central flue and provided with necks upon its upper and lower surfaces, and a downwardly-extending flange adapted to rest upon said first section, so that the necks upon its lower edge will rest upon the necks of the first section, forming passage-ways for water and steam from one section to another, but forming by said flange a closed compartment between said sections, a steam-dome or superheating-section provided with necks upon its lower surface adapted to rest upon the necks on the upper surface of said second section for the passage of steam therefrom into said steam-dome, but leaving an open space between said steam-dome and second section for the escape of the products of combustion, and means, substantially as described, to clamp said sections together.

6. In a steam-boiler, the combination of a fire-box section having its interior formed with walls inclining inwardly at the top and outwardly at the bottom on descending, forming a water-back, and in which both of the said walls are formed with corrugated or fluted surfaces, steam and water sections above said fire-box section, and means, substantially as described, to clamp said sections together.

396,732. CIGAR-BUNCHING MACHINE. ALEXANDER K. DUNCAN, Millsborough, Pa. Filed Mar. 12, 1888. Serial No. 267,093. (No model.)

Claim.—1. In a cigar-bunching machine, a pair of coacting presser-rolls, one having a longitudinal recess, in combination with an apron passing around both rolls and connected at its ends to the roll having said recess and upon opposite sides thereof and adapted to form a bight between the rolls, and a grasping device, substantially as described, housed within said recess to grasp and retain the bunch therein during the rotation in one direction of said roll, substantially as described.

2. In a cigar-bunching machine, the combination of a pair of coacting presser-rolls, one having a longitudinal recess in its periphery, an apron passing around both rolls and having its ends connected to the recessed roll on opposite sides of the recess therein and adapted to form a bight between the two rolls, and an expelling device, substantially as described, carried by the roll having the recess and located within the latter, to expel the bunch from said recess at the completion of the revolution in one direction of said recessed roll, substantially as and for the purpose set forth.

3. In a cigar-bunching machine, the combination of a pair of coacting presser-rolls, one having a longitudinal recess, an apron passing around both rolls and having its ends secured to the recessed roll on opposite sides of the recess therein and adapted to form a bight between said rolls, a grasping device housed within the recess for holding the bunch therein during the rotation of the roll in one direction, and an expelling device, substantially as described, normally located in the bottom of the recess and at one side of the grasping device, said expelling device being adapted to move laterally to one side of the grasping device for positively expelling the bunch from said recess at the completion of the rotation of the roll in one direction, substantially as and for the purpose described.

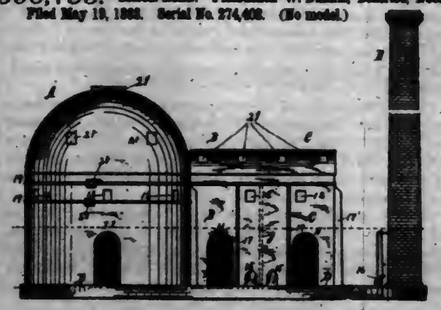
4. In a cigar-bunching machine, the combination of a pair of coacting presser-rolls, one having a longitudinal recess in its periphery adapted to receive a cigar-bunch, an apron passing around both rolls and connected at its ends to the recessed roll on opposite sides of the recess therein and adapted to form a bight between the rolls, an expelling-bar arranged longitudinally within the recess, and devices connected to a treadle for moving said expelling-bar laterally in the recess at the termination of rotation of the recessed roll in one direction, substantially as and for the purpose described.

5. In a cigar-bunching machine, the combination, with a pair of coacting presser-rolls, one having a longitudinal recess and annular grooves at the ends of the recess, and an apron passing around both rolls and connected at its ends to the recessed roll on opposite sides of said recess and adapted to form a bight between the two rolls, of an expelling-bar housed within the recess and having its ends extended into the annular grooves, vertical rods normally fitting in the annular grooves and adapted to engage the ends of the expelling-bar, and a treadle to which said rods are connected, substantially as described.

6. In a cigar-bunching machine, the combination, with a pair of coacting presser-rolls, one having a longitudinal recess, and an apron passing around both rolls and connected at its ends to the recessed roll on opposite sides of the recess therein and adapted to form a bight between said rolls, of an expelling-bar housed within the recess, springs fixed to the roller and arranged in the path of the expelling-bar for limiting the play thereof, vertical rods adapted to engage the expelling-bar to move the latter toward the springs, and a treadle to which the rods are connected, substantially as described.

7. In a cigar-bunching machine, the combination of the presser-rolls, one having a recess therein, an apron passing around both rolls and connected at its ends to the recessed roll on opposite sides of the recess therein and adapted to form a bight between said rolls, a spring-controlled grasping-bar arranged lengthwise of the recess and having its ends extended beyond the same, and stops arranged in the path of the ends of said bar, substantially as described.

8. In a cigar-bunching machine, the combination of the presser-rolls, one having a recess therein, an apron passing around both rolls and connected at its ends to the recessed roll on opposite sides of the recess therein, a spring-controlled presser-bar housed within the recess and having its ends extended beyond the same, stops for limiting the play of said bar in the recess, and fixed stops depending between the rollers and arranged in the path of the ends of the presser-bar, substantially as described.

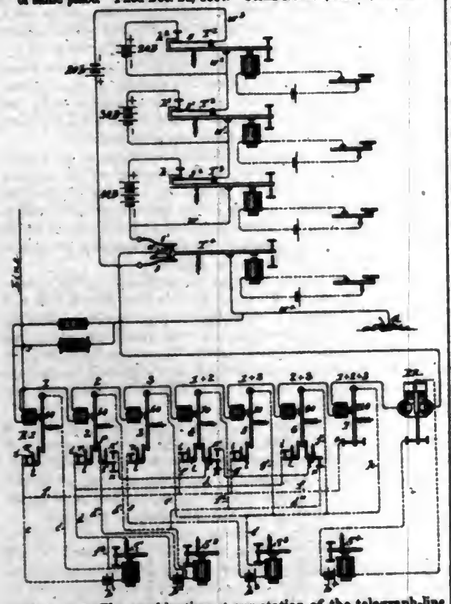


9. In a cigar-bunching machine, the combination of a pair of presser-rolls, one having a longitudinal recess therein, an apron passing around both rolls and connected at its ends to the recessed roll on opposite sides of the recess therein, a traveling mold arranged beneath the rolls to receive the bunches therefrom, and devices for feeding the mold with a step-by-step movement, substantially as described.

10. In a cigar-bunching machine, the combination of a pair of presser-rolls, one having a recess, an apron passing around the rolls and connected at its ends to the recessed roll on opposite sides of the recess therein, a grasping device housed in the recess, an expelling device, a traveling mold arranged beneath the rolls and having a series of transverse pockets, and a feeding-pawl for moving the mold with a step-by-step movement, substantially as described.

11. In a cigar-bunching machine, the combination of a pair of presser-rolls, one having a recess, an apron passing around both rolls and connected at its ends to the recessed roll on opposite sides of the recess therein, a traveling mold guided in a direct line beneath the rolls and having a series of transverse pockets, a feeding-pawl carried by a rock-shaft, a pitman intermediate the rock-shaft and one of the presser-rolls, a weighted cord connected with one end of the mold, and a slip-pawl engaging the mold, substantially as described.

12. In a cigar-bunching machine, the combination of a pair of coacting presser-rolls, an apron passing over the rolls, an elevated hopper having an opening in its bottom and an inclined fixed chute arranged to deliver the tobacco between the rolls, a pivoted valve having a depending weighted lip adapted to normally close said opening, a roller belted to one of the presser-rolls, and a pitman connected to the valve and adapted to be moved endwise to open the valve by a pin fixed on the periphery of the roller, substantially as and for the purpose described.



396,733. BRICK-KILN. FREDERICK W. DIETZE, Beatrice, Nebr. Filed May 19, 1888. Serial No. 274,402. (No model.)

Claim.—1. In a kiln, substantially as shown and described, the heavy iron bars 18, built in the cross-wall 23, iron bands 19, their tongue hooking into the eyes of said bars, doubling back on said bands, and secured by bolts and nuts 22, and buckle-nuts 20, all substantially as shown and described, and for the purposes set forth.

2. In combination with the round part A, substantially as described, and having the main flue 6, opening *f'*, and cap *f*, the oblong kiln B C, substantially as described, having the flame-wall *c*, and slanting cap 13, substantially as shown and described, and for the purposes set forth.

396,734. OCTUPLEX TELEGRAPH. MARK W. DEWEY, Syracuse, N. Y., assignor of two-thirds to Emil Lasar and Charles H. Duell, both of same place. Filed Dec. 21, 1887. Serial No. 258,548. (No model.)

Claim.—1. The combination at one station of the telegraph-line with its weak battery in constant circuit of four transmitters, four batteries of different strengths, each of the latter being controlled separately by one of said transmitters, and eight relays at another station controlling four registers or sounders, substantially as specified.

2. The combination at one station of three single-current transmitters, several batteries of different strengths, each of the latter being controlled separately by one of said transmitters, and seven relays at another station controlling three sounders or registers, as set forth.

3. The combination at a receiving-station of seven relays adapted to be operated by currents of different strengths sent from another station through a single line-wire, the levers *l*, and contact-stops *i*, controlling three sounders, and a polarized relay controlling a separate sounder, substantially as specified.

4. In a system of multiplex telegraphy having a single line-wire, the combination at the receiving-station of seven relays differently adjusted and actuated by currents of different strengths, their contact-levers *l*, stops *i*, contact-levers *l'*, stops *n* and *n'*, and their respective local circuits, batteries, and sounders, substantially as specified.

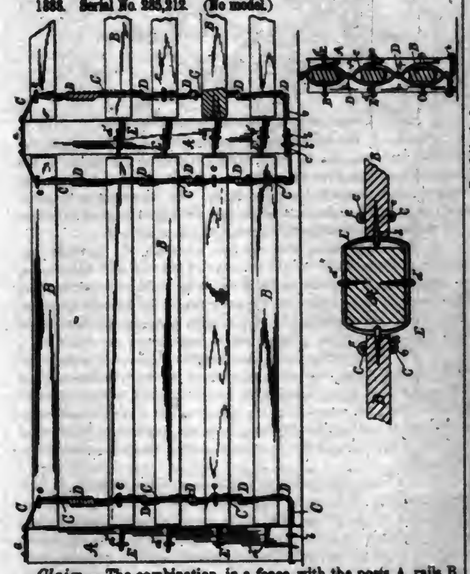
5. In a system of multiplex telegraphy having a single line-wire, the combination at the receiving end of seven relays differently adjusted and actuated by currents of different strengths sent from a distant station, their contact-levers *l*, stops *i*, contact-levers *l'*, stops *n* and *n'*, their respective batteries and sounders, and the polarized relay controlling a separate sounder or register by a separate local circuit, substantially as specified.

6. The combination of three single transmitters at one station, a portion of main line containing on its circuit a section of a battery that forms part of the main line only when two or more of said transmitters are closed simultaneously, the batteries of different strengths, and the neutral relays controlling the sounders at the receiving-station, substantially as set forth.

7. In a multiplex telegraph, a single main line in combination with a series of batteries of different strengths at the transmitting end of the line, a series of transmitting-keys corresponding to said batteries and each of which is adapted to couple its battery in the line-circuit, a series of sounders or registers at the receiving end of the line corresponding to said transmitters, a series of relays in circuit with the main line and corresponding in number to the possible combinations of the transmitting-keys, springs to hold the armatures of the relays back and corresponding in strength to the strength of the possible combinations of the batteries, local batteries for the sounders or registers, and local circuits for said sounders or registers controlled by said relays, whereby the proper sounders or registers will respond for given keys.

8. In a multiplex telegraph, the combination of a main line, a line-battery of low tension always in line, a series of batteries of different strengths at the transmitting end of the line, a series of continuity-preserving single-current transmitters or keys corresponding to the said last-mentioned batteries and adapted to put one or more of said batteries to line, according as to the number of said transmitters or keys put into action at one time, a continuity-preserving double transmitter or key, also at said transmitting end of the line and adapted to reverse the current in the line, a series of sounders or registers at the receiving end of the line and corresponding in numbers to the transmitters or keys, a series of relays arranged in the main-line circuit and corresponding in numbers to the possible combinations of the continuity-preserving single-current transmitters and adapted to respond to currents of different strengths but greater strength than the current which always traverses the main line from the low-tension battery, a polarized relay in series with the relays above mentioned and adapted to respond to the reversals of the low-tension current which normally traverses the main line and which is controlled by the continuity-preserving double transmitter, and a series of local circuits between said sounders or registers and all of the relays and controlled by said relays, whereby the sounder or register corresponding to each transmitter or key shall sound or register upon the operation of said transmitter and irrespective of the operations of the other transmitters.

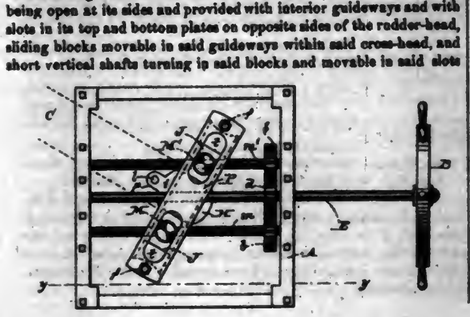
9. In a multiplex telegraph, the main line, over which a current is normally flowing and which current is varied in strength and polarity, in combination with suitable receiving-instruments at the receiving end and the following transmitting-instruments at the transmitting end, to wit: three continuity-preserving single-current transmitters, three batteries of different strengths, each of which is adapted to be put into the line-circuit by its corresponding transmitter, a continuity-preserving double transmitter for reversing the current passing to line, and a line-battery of less strength than the other batteries always in circuit with the line and controlled as to its polarity by the double transmitter.



10. In a multiplex telegraph, the main line, over which a current is normally flowing and which current is varied in strength and polarity, in combination with suitable receiving-instruments at the receiving end and the following transmitting-instruments at the transmitting end, to wit: three continuity-preserving single-current transmitters, three batteries of different strengths, each of which is adapted to be put into the line-circuit by its corresponding transmitter, a continuity-preserving double transmitter for reversing the current passing to line, and a line-battery of less strength than the other batteries always in circuit with the line and controlled as to its polarity by the double transmitter, and a fifth battery equal to, or substantially equal to, the strength of the weakest battery controlled by the single transmitters and adapted to be put into line-circuit only when the single transmitters controlling the weakest and one or more of the stronger batteries are simultaneously closed to cause the variations in strength of the current flowing in the line to vary uniformly.

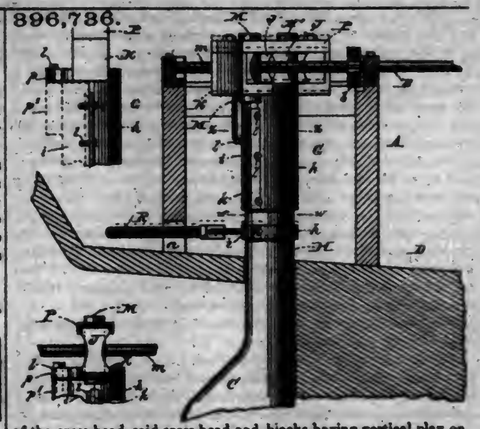
11. In a multiplex telegraph, the main line, over which a current is normally flowing, and transmitting-instruments at the transmitting end of the line, consisting of three single-current transmitters and three batteries of differing strength, each battery adapted to be put into line-circuit by its corresponding transmitter for varying the strength of the current in the line in a predetermined manner, in combination with a series of sounders or registers at the receiving end of the line, a series of relays, also at said end of the line in the line-circuit and equal in number to the possible combinations of the sounders or registers and adapted to respond to currents of different strengths, local batteries, and connecting local circuits including said sounders or registers and batteries and controlled by the relays.

12. In a multiplex telegraph, the main line, over which a current is normally flowing, and transmitting-instruments at the transmitting end of the line, consisting of three single-current transmitters and three batteries of differing strength, each battery adapted to be put into line-circuit by its corresponding transmitter for varying the strength of the current in the line in a predetermined manner, and a double-current transmitter for reversing the current in the line when desired, in combination with a series of sounders or registers at the receiving end of the line, a series of relays, also at said end of the line in the line-circuit and equal in number to the possible combinations of the sounders or registers and adapted to respond to currents of different strengths, local batteries, and connecting local circuits including said sounders or registers and batteries and controlled by the relays, a polarized relay in circuit with the above-mentioned relays and line, a sounder or register for said polarized relay, a local battery, and a local circuit including said sounder or register and battery and controlled by said polarized relay.



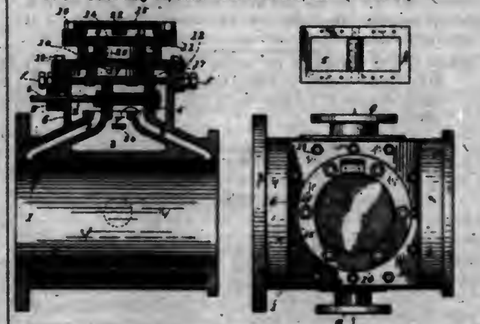
13. The combination at the receiving-station of the line-circuit conveying currents of different strengths with seven relays adapted to be operated by currents of different strengths sent from another station through the line, three sounders or registers having double windings, local batteries, seven local circuits including said batteries and sounders or registers and respectively controlled by said seven relays, levers *l* of said relays adapted to offer different resistances to movement, and stops *i*, connecting, respectively, with one end of the local circuits, the other ends of which circuits connecting with the relay-armature, whereby said seven relays control the three sounders or registers for seven variations in the line-current.

396,735. FENCE. BRENNUS DOUD, Peru, Ind. Filed Sept. 12, 1888. Serial No. 285,212. (No model.)



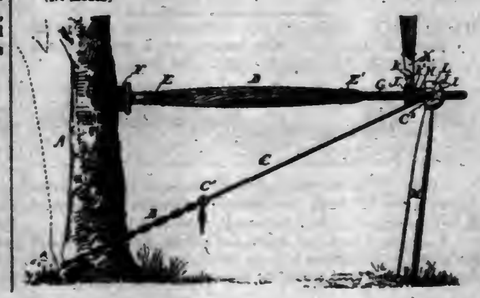
Claim.—The combination, in a fence, with the posts A, rails B, and vertical wires C, said wires C being secured around the foot of the post, then crossed back and forth around the end of each rail and over the top of the post, and secured by staples *c* at each side of the rail, of the short wires E, secured at the ends of the rails by staples *d*, passed around the posts A, and secured thereto by staples *d'*, as described, for the purposes specified.

396,736. STEERING APPARATUS FOR VESSELS. JOAQUIN J. DUARTE, Boston, Mass. Filed Aug. 15, 1887. Serial No. 247,008. (No model.)



Claim.—In a steering apparatus, the combination of a frame, a central shaft journaled in said frame and provided with a steering-wheel at one end, a screw-shaft at one side of the central shaft provided with a right-hand screw-thread, a screw-shaft at the other side of the central shaft provided with a left-hand screw-thread, intermeshing gears on said shafts, a rudder-head at right angles to said shafts, an oscillating cross-head attached to said rudder-head, said cross-head being open at its sides and provided with interior guideways and with slots in its top and bottom plates on opposite sides of the rudder-head, sliding blocks movable in said guideways within said cross-head, and short vertical shafts turning in said blocks and movable in said slots

of the cross-head, said cross-head and blocks having vertical play on the vertical shafts, and the vertical shafts being provided with horizontal screw-threaded holes, and said screw-shafts passing through said holes of the vertical shafts and through the open cross-head, substantially as described.

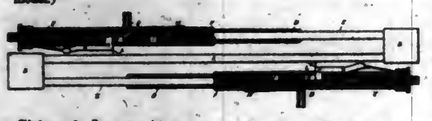


396,737. BALANCED VALVE. CHILION M. FARRAR, Buffalo, N. Y. Filed July 21, 1888. Serial No. 280,848. (No model.)

Claim.—1. In a balanced steam-valve, the combination of a steam-chest having an upper and lower steam-chamber divided by a sheet-metal diaphragm, a valve located in the lower chamber, the usual mechanism for operating it, a plate seated on the top of the valve having an upward portion provided with a top piece adapted to screw up or down on the same, so as to adjust the two parts between the valve and the diaphragm, and a steam-passage connecting the upper and lower chambers, substantially as and for the purposes described.

2. In a balanced steam-valve, the combination, with the steam-chest, of a sheet-metal diaphragm secured steam-tight to the upper portion of the same, a valve having a plate seated thereon and provided with a cylindrical portion projecting upward, and a top piece adapted to screw on said portion, so that the two parts may be adjusted between the top of the valve and the under side of the diaphragm, for the purposes described.

396,738. MACHINE FOR OVERTHROWING TREES. JOHN F. FOULKE, Philadelphia, Pa. Filed Sept. 22, 1887. Serial No. 250,400. (No model.)



Claim.—1. As a device for overthrowing trees, a triangular truss or frame adapted to rest against or incorporate a tree-trunk on one of its sides, and having its other sides extending away from the tree, the upper one constituting a strut and the lower one a tie, in combination with an unyielding brace or support to prevent downward movement of the strut, a coupling for uniting the ends of the strut and truss, and mechanism whereby the said strut can be lengthened relatively to the tie, all substantially as and for the purpose specified.

2. As a device for overthrowing trees, a triangular truss or frame adapted to rest against or incorporate a tree-trunk on one of its sides, and having its other sides extending away from the tree, the upper one constituting a strut and the lower one a tie, in combination with a screw forming the end of one of the outwardly-extending sides of the truss, a perforated stirrup uniting the ends of said strut and tie, a threaded sleeve secured upon the threaded end of one side of the frame and abutting against the perforated stirrup, by means of which the strut may be lengthened proportionately to the tie, and an unyielding brace supporting the outer end of the truss, all substantially as and for the purpose specified.

3. In a device for overthrowing trees, a strut, D, tie C, and support M, said strut and tie being adapted to be secured to a tree-trunk, substantially as shown and described, in combination with a perforated stirrup, L, a threaded sleeve, H, engaged on a threaded end of one side of the frame and abutting against the socket-piece, and a lever, K, whereby the sleeve can be turned and the form of the truss or frame changed, so as to proportionately lengthen the strut relatively to the tie.

4. In a tree-overthrowing device, substantially as specified, the perforated socket-piece L, having a rounded socket, I, in combination with a threaded sleeve, H, having one rounded end adapted to fit in socket I and the other end provided with a ratchet, J, and a lever, K, secured upon the sleeve by a loose collar, *k'*, and having a pawl, *k*, all substantially as and for the purpose specified.

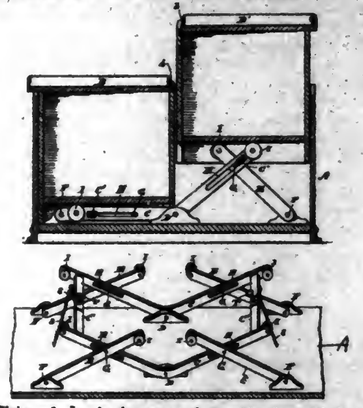
396,739. MACHINE OR ENGINE FOR THE APPLICATION OF EXPLOSIVE ENERGY TO MECHANICAL POWER. GEORGE C. GILLMER, Brooklyn, N. Y. Filed Oct. 21, 1887. Serial No. 252,967. (No model.)

Claim.—1. In a machine or engine for the application of explosive energy to mechanical power, the combination of a movable explosion-cylinder acting against an abutment-spring and working in an outer cylinder provided with a trigger for holding the working-cylinder at any desired point or points of the stroke, substantially as and for the purpose described.

2. In a machine or engine for the application of explosive energy to mechanical power, the combination of an explosion-cylinder unattached to the working-rod of the engine and working in an outer cylinder provided with a charging-tube for the introduction of explosive material, substantially as described.

3. In a machine or engine for the application of explosive energy to mechanical power, the combination of an explosion-cylinder working in an outer cylinder provided with a charging-tube, as aforesaid, such working-cylinder carrying an imperforated projecting lip or blade traveling through slots in the outer cylinder and charging-tube for the purpose of cutting off and feeding inward a charge of explosive material at each inward stroke of the working-cylinder, substantially as described.

4. The combination of the working-shaft A, cross-heads B, plungers C, reacting explosion-cylinders D, spiral springs E, outer cylinders, F, charging-tubes G, slots H and I, with charging mechanism M, and firing mechanism K and L, substantially as and for the purposes described.



396,740. STRINGING AND TUNING DEVICE FOR PIANOS. GEORGE H. GUILD, Boston, Mass., assignor to H. H. Guild, same place. Filed May 22, 1888. Serial No. 274,674. (No model.)

Claim.—1. The bearers F, having the bearings C D, and the screws H, passing loosely through the bearers, in combination with the bridge E, having the groove and the strings G, as set forth.

2. The pin E, formed as shown, and with the pin A, provided with the spring *i*, in combination with the socket *f*, said pin being arranged therein and to operate therewith, essentially as shown and set forth.

396,741. BOOK-SUPPORT. FRANK H. HEALEY, Morrisville, Vt. Filed Apr. 5, 1888. Serial No. 269,747. (No model.)

Claim.—1. In a book-support, the combination, with the base, the movable supports, and the bent levers pivoted at the center to the base and supporting one side of the movable supports, of co-operating arms or levers pivoted at one end on the base, supported at an intermediate point upon the bent levers, and serving to support the other side of the movable supports, substantially as described.

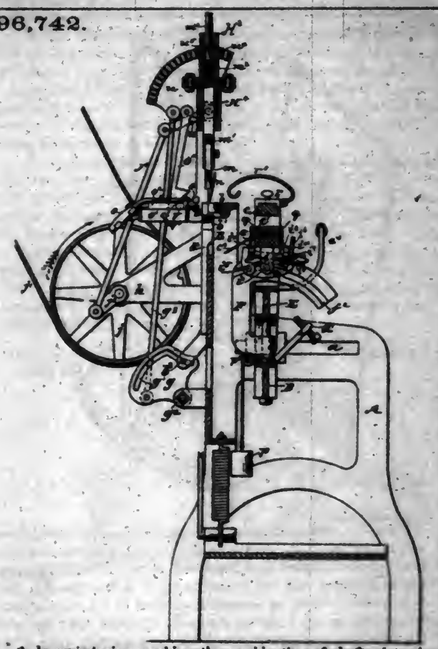
2. The combination, with the box or casing, the movable supports, and the centrally-pivoted levers provided with slots and serving to support one side of the movable supports, of the co-operating pivoted levers or arms supporting the other side of the movable supports, being themselves supported by pins or studs entering said slots in the centrally-pivoted levers, substantially as described.

3. The combination, with the movable supports and the centrally-pivoted levers supporting one side of the movable supports, of the co-operating pivoted levers or arms supported by the centrally-pivoted levers for supporting the opposite side of the movable supports, and the springs for returning both the centrally-pivoted levers and the co-operating levers or arms to normal position, substantially as described.

4. In a book-support, the combination, with the centrally-pivoted levers carrying the movable supports free to be moved in either direction by the weight of the book, of the co-operating pivoted levers or arms supported by the centrally-pivoted levers, and the adjustable stops for limiting the extent of movement in either direction, substantially as described.

5. In a book-support, the combination, with the levers pivoted at the center and a support carried by each end of the levers, each adapted to be moved down by the weight of the book and cause a corresponding elevation of the opposite support, of adjustable stops for limiting the extent of movement in either direction, whereby the support may be adjusted to accommodate books of different thicknesses, substantially as described.

6. The combination, with the movable supports, the centrally-pivoted levers supporting one side thereof, and the pivoted levers or arms supported by the centrally-pivoted levers supporting the other side, of the springs for returning the parts to normal position when moved in either direction, and adjustable stops for limiting the extent of such movement, substantially as described.



7. The combination, with two supports free to move in either direction and connecting mechanism by which one support is raised when the other is depressed, of springs for bringing said supports to equilibrium when the moving force is removed, and adjustable stops for limiting the downward movement of said supports, substantially as described.

8. In a book-support, the combination, with the casing, the movable supports in the same, and connecting mechanism by which one is raised when the other is depressed, of a lock for rigidly connecting the casing and one of the supports at any desired point of adjustment, but allowing the supports free movement when disengaged, substantially as described.

396,742. INDEXING-MACHINE. FLETCHER W. HEWES, Bloomfield, N. J. Filed Aug. 1, 1887. Serial No. 245,805. (No model.)

Claim.—1. In an indexing-machine, the combination of a cylindrical knife having a screw-thread on its shaft with a supporting-frame, such frame carrying another screw-thread with which the screw upon the knife-shaft gears, by which the same source of power gives both rotation and longitudinal movement to the knife, substantially as described.

396,742.

2. In an indexing-machine, the combination of shaft m', having the screw m^2 and feather-way m^3, and carrying a cylindrical knife, the gear-wheel n^4, carrying the feather n^5, and the frame H, provided with an interior thread with which the screw m^2 gears, by which combination the combined rotary and descending motion is given to the knife.

3. In an indexing-machine, the combination of the book-carriage made in two parts hinged together horizontally, and the table or way upon which it rests, also made in two parts hinged together horizontally to allow of adjustment at various inclinations.

4. In an indexing-machine, the combination of the stationary part F, containing cam-groove f^2, with the rocking bar i^2, attached to the oscillating table which supports the book-carriage, and racks attached to the book-carriage, each rocking bar having pin i^3 to traverse the cam-groove f^2, and catches i^4 to engage alternately with the racks upon the book-carriage.

5. In an indexing-machine, a shaping-stop affixed to the cutting-table near the knife and inclined forward so as to push back from the knife the edges of the upper leaves progressively.

6. In an indexing-machine, the shaping-stop n, adjustably attached to the cutting-table by means of the plate n', having a curved slot, the plate n^2, having a horizontal slot, and the bolt and nut n^3.

7. In an indexing-machine having a cylindrical knife, the cylindrical colorer o', made of some hard material and covered on the side which enters the nick cut out by the knife with an absorbent surface, and also having a well containing coloring-fluid, into which the end of the absorbent surface dips to supply the outer surface of the colorer with fluid by capillary attraction, substantially as described.

8. In an indexing-machine, the combination of the colorer o', having a cylindrical stem, o^2, with the supporting-piece o^3, having a cylindrical stem, o^4, which passes through some supporting part of the sliding carriage o^5, and appropriate set-screws in the supporting-piece o^3 and the stem o^4, such combination affording the various adjustments of the colorer.

9. In an indexing-machine, the combination of sliding carriage o^5, carrying a colorer, bracket o^3, upon which the sliding carriage is supported, spring v^2, and cam-rod o^4, pivoted upon the sector u and operating the sliding carriage.

10. In an indexing-machine, the cutting-block b', arranged as a movable part of the cutting-table, in combination with mechanism, substantially as described, to lower and raise it between each cut.

11. In an indexing-machine, the combination of the movable cutting-block b', attached to the sliding piece b^3, slotted cam g, pivoted upon the frame, and connecting-rod g^3, pivoted to the cam g and to the sector u.

12. In an indexing-machine, the combination of sliding carriage o^5, provided with spring v^2 and carrying the brush o^6 cam-rod o^4, pivoted to and operated by the sector u, and the movable cutting-block b', also operated by the sector u through the connecting-rod g^3, slotted cam g, and sliding piece b^3.

13. In an indexing-machine, a book-clamp adapted to slide upon the top of the book-carriage and be clamped thereto at any point, having the pointed pin r^4 and the pin r^3 to retain the book upon the carriage, and yet allow of flexibility in the back of the book.

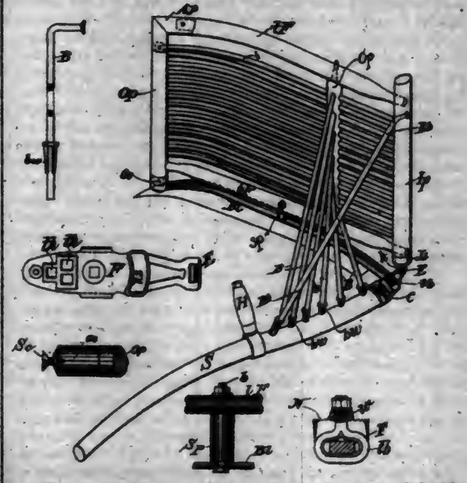
14. In an indexing-machine, the combination of shaft m', carrying a knife and operated by the sector u, the sliding carriage o^5, provided with spring v^2 and carrying a colorer, and the cam-rod o^4, such cam-rod being also pivoted to and operated by the sector u.

15. In an indexing-machine, the combination of the shaft m', carrying a knife and operated by the sector u, the sliding carriage o^5, provided with spring v^2 and carrying the brush o^6, the cam-rod o^4, also pivoted to and operated by the sector u, and the movable cutting-block b', also operated by the sector u through the connecting-rod g^3, slotted cam g, and sliding piece b^3.

16. In an indexing-machine, the combination of sliding carriage o^5, provided with spring v^2 and carrying both a colorer and the brush o^6, cam-rod o^4, pivoted to and operated by the sector u, and the movable cutting-block b', also operated by the sector u through the connecting-rod g^3, slotted cam g, and sliding piece b^3.

17. In an indexing-machine, the combination of shaft m', carrying a knife and operated by the sector u, the sliding carriage o^5, provided with spring v^2 and carrying both a colorer and the brush o^6, the cam-rod o^4, also pivoted to and operated by the sector u, and the movable cutting-block b', also operated by the sector u through the connecting-rod g^3, slotted cam g, and sliding piece b^3.

18. In combination with the knife m, the disk m^6, the disk m^7, having stem m^8, passing through and supported upon the other side of the disk m^6, and a coiled spring lying between such disks, substantially as and for the purpose described.



19. In combination with an indexing-machine, the belt-tightening device consisting of lever t, cam t^2, operated by such lever, spring s, carrying the belt-tightening roller t', and roller s^2, lying in the course of the cam t^2, and the stop w, pivoted to the frame.

20. In combination with an indexing-machine, the belt tightening and releasing device consisting of lever t, cam t^2, operated by such lever, spring s, carrying the belt-tightening roller t', the roller s^2, lying in the course of the cam t^2, and the stop s^3, the pulley j, provided with the projection j^2 and pin j^3, and the stop w, pivoted to the frame and connected with a lever or system of levers through which the pin j^3 raises the stop w upon the completion of one revolution.

21. In an indexing-machine to be operated by hand, in combination with the sector u, through which the various parts are operated, the spring z^3, attached to the frame and bearing against a pin affixed to the sector u, substantially as and for the purpose described.

22. In a label-cutting machine, the combination of the shaft m', carrying the knife m^{10} and operated by the sector u, the sliding carriage o^5, provided with springs v^2 and carrying the pusher o^{13}, and the cam-rod o^4, also pivoted to and operated by the sector u.

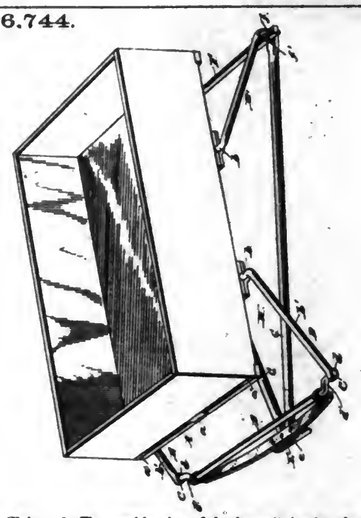
396,743. GRAIN-CRADLE. HORACE L. HEWITT, Indianapolis, Ind. Filed Aug. 25, 1888. Serial No. 283,780. (No model.)

Claim.—1. A grain-cradle having its outer post provided with a socket with a coned or convex base resting on and secured to the scythe-blade by a screw passing through a hole formed in said scythe-blade, said screw being provided with a head having its bearing-sur-

face coned, and an inner post having a socket with a hook formed at its base, engaging with an eye secured to the end of the snath and arranged to co-operate with said socket, having a coned base, and suitable adjustable braces removably secured at their ends, respectively, to the cradle-post and the snath, all combined substantially as and for the purpose described.

2. A grain-cradle having its outer post provided with a socket having a coned or convex base resting on and secured to the scythe-blade by a screw passing through a hole formed in said scythe-blade, said screw being provided with a head having its bearing-surface coned, said socket-base bearing on and secured to the scythe-blade by a suitable screw, an inner post mounted in a socket with a hook formed on its base, engaging with an eye secured to the snath, an intermediate socket-post having a beveled or rounded base and a bolt passing through it, and suitable braces secured at their ends, respectively, to the cradle-post and snath, all co-operating, combined substantially as and for the purpose described.

3. In a grain-cradle, the combination of the outer post provided with a socket having a coned or convex base, said socket-base bearing on and secured to the scythe-blade by a suitable screw, an inner post mounted in a socket, with a hook formed on its base engaging with an eye secured to the snath and arranged to co-operate with said coned sockets, top and bottom longitudinal bars or fingers secured at their respective ends to the outer and the inner posts, a post interposed between the outer and inner post, to which cradle-braces are swiveled, and suitable braces swiveled to the interposing post and the inner post by bends passing loosely through said interposing and inner posts and removably secured to the snath, for the purpose of adjusting cradle to any desirable angle, substantially as and for the purpose described.



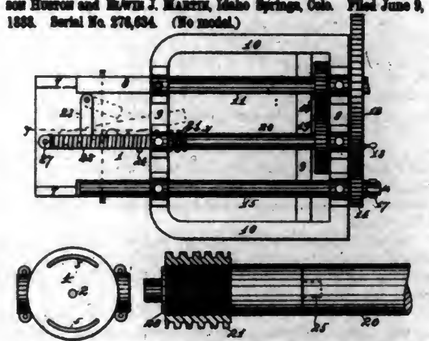
4. In a grain-cradle, the combination of the outer post provided with a socket having a coned or convex base resting on and secured to the scythe-blade by a screw passing through a hole formed in said scythe-blade, said screw being provided with a head having its bearing-surface coned, said socket-base bearing on and secured to the scythe-blade by a suitable screw, an inner post mounted in a socket, with a hook formed on its base engaging with an eye secured to the snath, top and bottom longitudinal bars or fingers secured at their respective ends to the outer and inner posts, a post interposed between the outer and inner posts, to which cradle-braces are swiveled, fingers secured at their outer end to the outer post and extending through holes in the interposing post and secured to the inner post, a socket-post having a coned base and a securing-bolt passing through said socket, scythe-blade, and bottom finger, and suitable braces swiveled to the interposing post and inner post at their top best ends and removable secured to the snath at their opposite ends, all arranged to co-operate substantially as and for the purpose described.

5. The combination, with the snath and the scythe attached thereto, of the upright *Op*, removably and adjustably secured at its lower end to the scythe at or near its outer end, the upright *Ip*, removably secured at its lower end by a hook formed thereon to the snath-fastening eye, the securing post or socket *Sp*, secured at an intermediate point between the outer and inner posts, *Op* and *Ip*, by a bolt passing through them, the socket-piece *Ap*, having its vertical arm arranged on the upper end of the post *Op* and pinned by finger *f*, the top finger, *fF*, secured to the upper end of the post *Op* and inserted at its outer end into the horizontal arm of the socket-piece, said top finger extending inward beyond the post *Op* and secured to the post *Ip* at its inner end, the finger *bF*, secured at its outer end to the post *Op*, said finger extending inwardly beyond the socket-brace *Sp* and the post *Op* and secured to the post *Ip* at its inner end, the fingers *f*, secured at their inner ends to the post *Ip*, extending outward through and beyond post *Op* and secured at their outer ends to the post *Op*, the brace *Bb*, swiveled in and extending from the upper end of the post *Ip* and removably secured to the snath, and the braces B, swiveled at regular intervals in and along the post *Op* and extending therefrom and removably secured to the snath, substantially as and for the purpose described.

6. In a grain-cradle, the combination of the snath and the scythe removably secured thereto, the outer and inner posts, *Op* and *Ip*, removably secured at their lower ends to the scythe and the snath, respectively, the top finger *fF*, connecting the upper, and the bottom finger, *bF*, connecting the lower ends of said posts, the interposing post *Op*, connecting the top and bottom fingers, the socket *Sp*, supporting the bottom finger at an intermediate point along it and removably secured to the scythe, the brace *Bb*, pivotally secured to the inner post, *Ip*, and removably inserted in and secured to the snath by the wedges or tapered sockets *bw*, and the braces B, pivotally secured to the post *Op* and inserted in and secured to the snath by wedges *bw* at intermediate points between the brace *Bb* and snath-catch, substantially as and for the purpose described.

396,744. VEHICLE-SPRING. JOHN T. HOVE, Clintonville, Pa. Filed July 31, 1888. Serial No. 281,501. (No model.)

396,744.

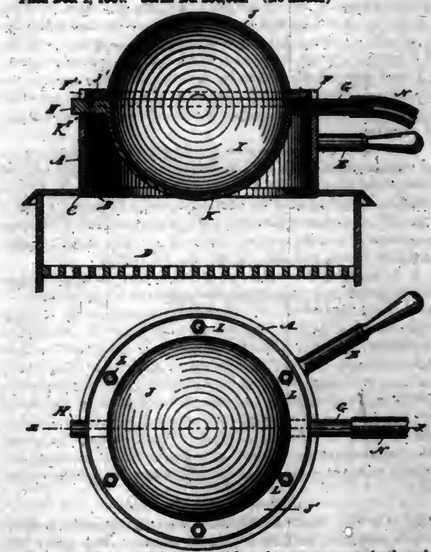


Claim.—1. The combination of the frame A, having the side bars, *a*, and central bar, *a'*, the angle-bars B B', having the transverse arms *b*, provided with the studs *i'*, and longitudinal bars *b'*, forming slightly-obtuse inner angles with the arms *b*, and having the eyes C at their ends for the attachment of connecting portions of the running-gear, and the coiled springs I, having their ends *i* hooked under the studs *i'* and their ends *i²* extended toward the corresponding ends of the frame A and secured to the central longitudinal bar thereof, substantially as specified.

2. The combination, with the frame A, the journaled angle-bars B B', and the coiled springs I, attached at one end to the said bars and at the other end to the frame A, of the transverse crank-bar D, with the journals *d* of its end cranks in the eyes C of the front angle-bars, B, and having bearings in the upturned perforated ends of the front transverse spring, and a frame connecting said springs and the ends of the longitudinal arms of the rear angle-bars, B', substantially as specified.

3. The combination, with the frame A, the angle-bars B B', and the coiled springs I, of the crank-bar D, having the crank-journals *d* at its ends, which journals have bearings in the eyes C of the crank-bars B, the front spring, E, having upturned ends provided with perforations to form bearings for said crank-bar, and the connecting-frame H, formed of the head-block *e*, secured centrally to said spring, the rearwardly-diverging bars G, and the transverse bar F, which bars G and F are secured to the ends of the longitudinal arms of the rear angle-bars, B'.

396,745. MACHINE FOR OPERATING ROCK-DRILLS. HARRISON HUSTON and HAVEN J. MARTIN, Idaho Springs, Colo. Filed June 9, 1888. Serial No. 276,634. (No model.)



Claim.—1. The combination of a fixed base provided with guideways, a bed or frame upon such base and moving in the guideways, a drill-spindle mounted in or on such bed or frame, mechanism, as described, for rotating the drill-spindle, and a feed mechanism consisting of an interchangeable and removable worm-gear on the moving bed or frame, and a removable and interchangeable rack adapted to mesh therewith and secured upon the fixed base, substantially as set forth.

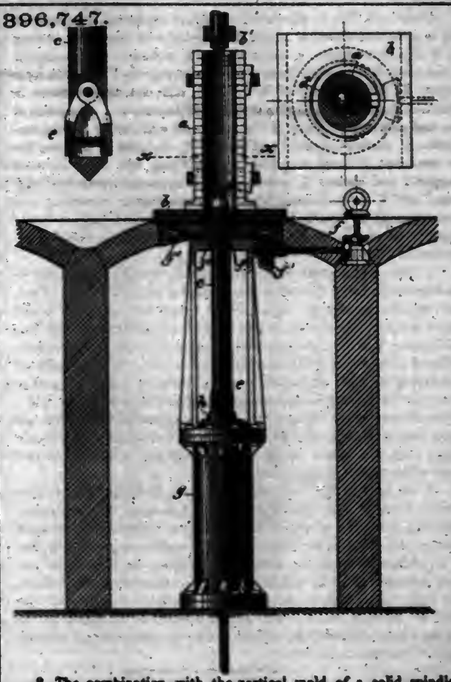
2. The combination of a fixed base provided with guideways, a bed or frame adapted to move in such guideways, a drill-spindle mounted in or on such frame or bed, mechanism, as described, for rotating the drill-spindle, and a feed mechanism consisting of a worm-gear on the moving bed or frame, and a pivoted rack on the fixed base, and stops upon such base for holding the rack in operative position, substantially as set forth.

3. The combination of the base 1, having grooved guideways and the depending lugs or bolts 3, the bed or frame adapted to move in such guideways, a drill-spindle mounted in or on such bed or frame, mechanism, as described, for rotating the drill-spindle, a feed mechanism consisting of a worm-gear on the moving bed or frame, a rack pivoted on the base 1 and meshing with the worm-gear, and stops for holding the rack in operative position, the turn-table 4, having the curved slots 5, through which take the bolts or lugs 3, having the nutted heads 36, and the pivotal connection 2 between the base 1 and turn-table 4, substantially as set forth.

396,746. GAS-RETORT. WESLEY C. JONES, Waxahachie, Tex. Filed Dec. 1, 1887. Serial No. 256,602. (No model.)

Claim.—1. The combination, with a fire-pot open at both ends, with its lower end constructed to fit the eye or lid-opening of a cook-stove, of a gas-retort made in two halves and provided with trunnions having their bearings in the said fire-pot, one of the said trunnions being hollow and connected with a pipe for leading off the gases generated in the retort, substantially as shown and described.

2. The combination, with a fire-pot open at both ends, with its lower end constructed to fit the eye or lid-opening of a cook-stove, of a spherical gas-retort made in two halves secured together, trunnions formed on the said retort and adapted to turn in bearings on the said fire-pot, one of the said trunnions being hollow and opening into the interior of the said retort, and a tube connected with the said hollow trunnion for leading off the gases generated in the said retort, substantially as shown and described.

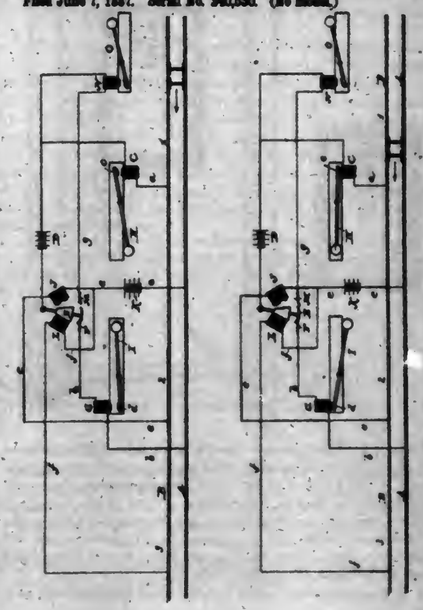


3. A spherical gas-retort made in two halves bolted together at their bases, and trunnions formed on the said retort for turning the same, one of the trunnions being hollow and opening into the interior of the said retort, substantially as shown and described.

4. The combination, with the cylindrical fire-pot A, open at both ends, the lower end being constructed to fit the eye of a cooking-stove, and the upper end having opposite slots F F, of the spherical revolvable retort J, formed of two separable parts having flanges J' K' at their meeting edges, and trunnions H G, turning in said slots, the trunnion G being hollow and communicating with the interior of the retort, and the bolts L, securing the flanges together, substantially as set forth.

396,747. APPARATUS FOR CASTING STEEL PIPES. WALTER R. KOCH, Sharpsburg, Pa. Filed May 3, 1888. Serial No. 273,162. (No model.)

Claim.—1. In an apparatus for casting steel tubes, the combination of a vertical mold, a vertical rotary spindle adapted to be forced into said mold from below, and mechanism for raising and rotating said spindle within the mold, substantially as specified.

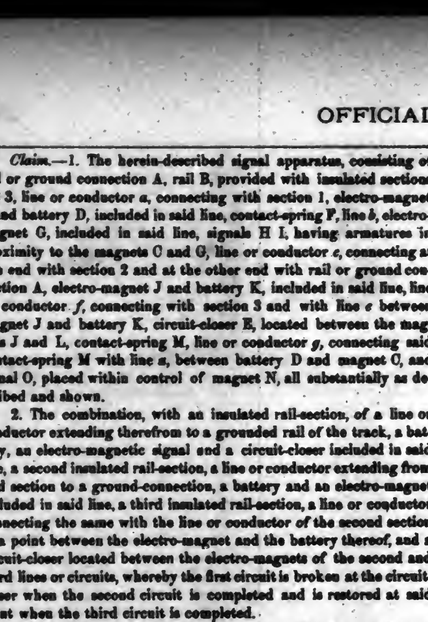


396,747.

2. The combination, with the vertical mold, of a solid spindle which closes the bottom of said mold and is capable of being raised and rotated in said mold, a bearing at the upper end of the mold to receive the upper end of the spindle, and mechanism for raising and rotating the spindle, substantially as specified.

3. The combination, with the vertically movable and rotating spindle *c*, of the spring-flue *e* at the lower end of said spindle, and the horizontal gear-wheel *f²*, having seats in its hub into which the flue enter, whereby a slow rotation is given to the spindle when the same is raised into the mold, substantially as specified.

396,748. ELECTRICAL RAILWAY-SIGNAL. WILLIAM P. KOOKOGEY, Brooklyn, N. Y., assignor to the Keokogey Electric Company. Filed June 7, 1887. Serial No. 240,530. (No model.)



Claim.—1. The herein-described signal apparatus, consisting of rail or ground connection A, rail B, provided with insulated sections 1 2 3, line or conductor *a*, connecting with section 1, electro-magnet C and battery D, included in said line, contact-spring F, line *b*, electro-magnet G, included in said line, signals H I, having armatures in proximity to the magnets C and G, line or conductor *c*, connecting at one end with section 2 and at the other end with rail or ground connection A, electro-magnet J and battery K, included in said line, line or conductor *f*, connecting with section 3 and with line *c* between magnet J and battery K, circuit-closer E, located between the magnets J and L, contact-spring M, line or conductor *g*, connecting said contact-spring M with line *a*, between battery D and magnet C, and signal O, placed within control of magnet N, all substantially as described and shown.

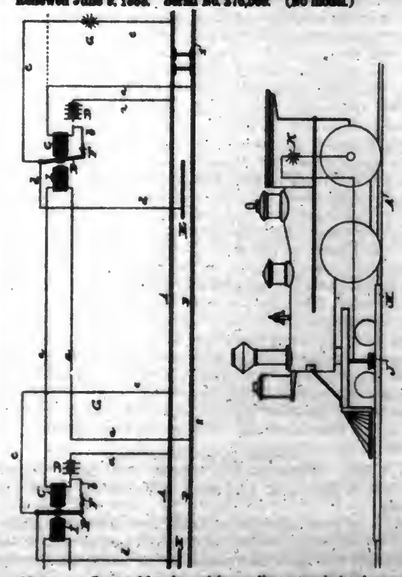
2. The combination, with an insulated rail-section, of a line or conductor extending therefrom to a grounded rail of the track, a battery, an electro-magnetic signal and a circuit-closer included in said line, a second insulated rail-section, a line or conductor extending from said section to a ground-connection, a battery and an electro-magnet included in said line, a third insulated rail-section, a line or conductor connecting the same with the line or conductor of the second section at a point between the electro-magnet and the battery thereof, and a circuit-closer located between the electro-magnets of the second and third lines or circuits, whereby the first circuit is broken at the circuit-closer when the second circuit is completed and is restored at said point when the third circuit is completed.

3. In combination with three insulated rail-sections and three electric circuits, each including one of said sections, an electro-magnetic signal in the first circuit, a circuit-closer adapted and arranged to form part of the first circuit until the second is completed and then to be withdrawn from the first, electro-magnets in the second and third circuits serving to withdraw the circuit-closer from the first circuit while the second is complete and to restore it thereto while the third is complete, and a fourth circuit adapted to be closed by the circuit-closer whenever the second circuit is completed, all substantially as described and shown.

396,749. RAILWAY-SIGNAL. WILLIAM P. KOOGSEY, Brooklyn, N. Y., assignor to the Koogsey Electric Company. Filed June 7, 1887. Renewed June 9, 1888. Serial No. 276,563. (No model.)

Claim.—1. In combination with a local electric circuit containing a light-giving device and located at the station or point to be lighted, a second circuit adapted to be closed by a train passing along the track at a point in advance of the station or light, an electro-magnet included in said second circuit, and a circuit-closer included in the light-circuit, and adapted to be attracted by the electro-magnet and to complete the light-circuit whenever the second circuit is completed through the bridging of the rails by the train.

2. The combination of rails A B, the latter provided with insulated section 1, an electro-magnet, C, and battery D, connected in circuit with insulated section 1 and with ground or rail A, a light-circuit containing the circuit-closer E and contact *c*, and an armature carried by the circuit-closer and placed within the field of magnet C, whereby the circuit-closer is attracted and caused to complete the light-circuit when the rails are bridged at the section 1.



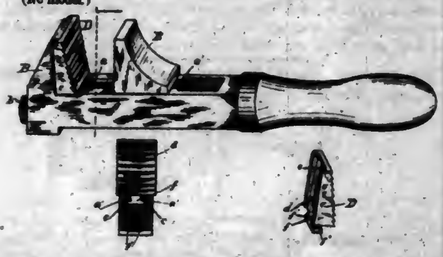
3. In combination with a railway-track having insulated rail-sections, one in advance of the point to be lighted, a local light-circuit, a circuit-closer included in said circuit, electro-magnets arranged to move the circuit-closer in opposite directions, and two independent circuits, each including one of the insulated sections and one of the electro-magnets, substantially as shown, whereby the entrance of a train upon the first insulated section is caused to effect the closing of the light-circuit and the entrance of the train upon the second insulated section is caused to break or destroy the light-circuit.

4. In combination with lines A and B, the latter having insulated sections 1 and 2, wire or conductor *a*, connected at one end with the insulated section 1 and at the other end with rail A or other ground-connection, electro-magnet C, a battery, D, included in said conductor *a*, electro-magnet H, having one end of its helix connected by a line or conductor, *g*, with section 2, and its other end connected by a line or conductor, *h*, with a battery, which is in turn connected with the rail A or other ground, wires *d e f*, lamps F, and battery G, constituting a local light-circuit, a circuit-closer, E, and contact-spring *c*, for completing said light-circuit, the armature *b* of the circuit-closer being located between the magnets C and H, all substantially as shown and described.

5. In combination with an electric lamp and a local circuit therefor, a circuit-closer included in said circuit, an electro-magnet adapted to attract the circuit-closer and to complete the light-circuit, lines or conductors extending from the electro-magnet to an insulated section of the rail in advance of the light, and a ground-connection, whereby the entrance of a train upon the insulated section is caused to energize the electro-magnet and complete the light-circuit.

6. In combination with an electric light and an electric circuit therefor, including a battery or other generator, a circuit-closer included in the light-circuit, electro-magnets arranged to act upon the circuit-closer and move it in reverse directions, and two independent circuits, each including a battery or electric generator and an independent insulated section of the track, one of said sections being located in advance of the lamp, whereby the entrance of a train upon the first insulated section is caused to complete the circuit through one of said electro-magnets, which thereupon attracts the circuit-closer and completes the light-circuit, and the entrance of the train upon the second of the insulated sections is caused to complete the second circuit and move the circuit-closer to destroy the light-circuit, substantially as set forth.

396,750. RAILWAY-SIGNAL. WILLIAM P. KOOGSEY, Brooklyn, N. Y., assignor to the Koogsey Electric Company. Filed June 7, 1887. Renewed June 9, 1888. Serial No. 276,562. (No model.)



Claim.—1. In combination with a railway-track having a series

of insulated sections, one in each block or division of the road, an electric circuit for each block or division, including the insulated rail-section thereof, a generator or source of electricity, and an electro-magnet, and a local lamp-circuit for each block or division, including a battery or generator, and a circuit-closer adapted to be operated by the electro-magnet, whereby a train entering upon an insulated rail-section is caused to complete the light-circuit and leave a lamp behind it in a luminous condition.

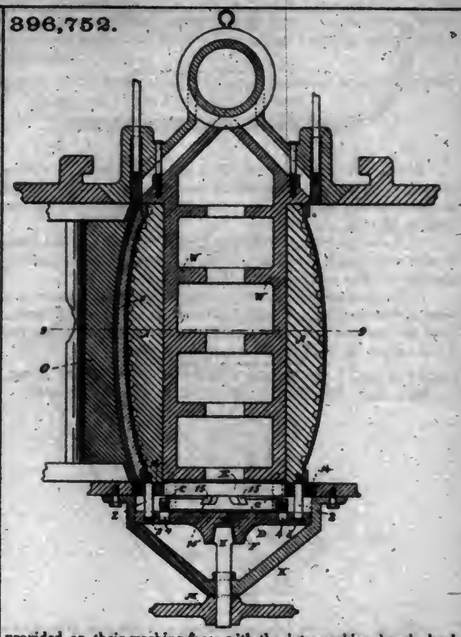
2. In combination with rails A and B, one provided with insulated sections 1 2, &c., one such section in each block or division of the road, an electric circuit for each block or division, including two electric magnets and a source of electricity, local lamp-circuits, one for each block or division, and a circuit-closer included in each lamp-circuit and located between the two electro-magnets, each in the circuit of a different block or division, whereby the circuit-closer of each lamp-circuit in succession is caused to complete such lamp-circuit as the train enters upon the insulated rail-section of the block or division to which said lamp-circuit belongs and to break or open said lamp-circuit as the succeeding one is perfected.

3. In combination with rails A B, one having insulated sections 1 2, &c., a series of circuits, *a*, one for each insulated section and including the same, and two electro-magnets, C and I, the magnet I of each circuit arranged in proximity to the magnet C of the preceding circuit, a series of local lamp-circuits, one for each insulated section, and a series of circuit-closers, one included in each lamp-circuit and located between the magnets C and I, whereby the lamp-circuits are successively perfected as a train enters successively upon the insulated rail-sections.

396,751. WRENCH ATTACHMENT. CHARLES F. LAGANKE, Lorain, and THOMAS E. GAWE, North Amherst, assignors to the Lorain Wrench Company, Lorain, Ohio. Filed Aug. 27, 1888. Serial No. 283,341. (No model.)

Claim.—1. The combination, with a wrench provided with a slot, *a*, adjacent to a jaw, B, and having side walls, *a'*, formed with inner shoulders *e*, of a pipe-wrench attachment, D, having a longitudinal lug formed with a neck, *f*, and two lateral shoulders, *f'*, the base of the attachment having bearing on said walls *a'*, the lug-neck *f* being formed between said attachment-base and the lug-shoulders *f'*, and fitting between said walls *a'*, said lug-shoulders *f'* locking behind said wall-shoulders *e*, the thickness of said entire lug and also the width of the lug-neck being slightly less than the width of said slot, the length of said slot being greater than the width of said entire lug, substantially as set forth.

2. The combination, with a wrench provided with a slot, *a*, adjacent to a jaw, B, and having the two side walls, *a'*, formed with inner shoulders, *e*, in same transverse plane with said walls, of a pipe-wrench attachment, D, provided with the two side flanges, *e*, and having a longitudinal lug formed with the neck *f* and the two lateral shoulders *f'*, the base of the attachment having bearing on said walls *a'*, the lug-neck being formed in a transverse plane between said attachment-base and the lug-shoulders *f'*, and fitting between said walls *a'*, the lug-shoulders *f'* locking under the wall-shoulders *e*, the thickness of said entire lug and also the width of the lug-neck being slightly less than the width of said slot, the length of said slot being greater than the width of said entire lug, substantially as set forth.



396,752. PAPER-BARREL MACHINE. GEORGE W. LARAWAY, Akron, Ohio, assignor of one-half to John F. Seiberling, same place. Filed Sept. 24, 1887. Serial No. 250,600. (No model.)

Claim.—1. In a paper-barrel machine, the combination, with the main staves and the interstaves, of the toggle-levers, of different lengths, and means, substantially as described, for simultaneously operating said toggle-levers.

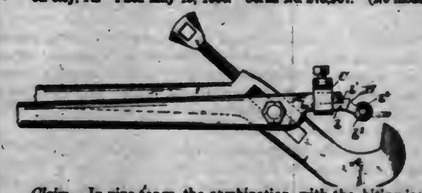
2. In a paper-barrel machine, the main staves and the interstaves provided on their working-faces with the bevel-edged plates, in combination with the toggle-levers connected with and acting directly upon both the main and inter staves and the ring for operating said toggle-levers simultaneously, as and for the purpose described.

3. In a paper-barrel machine, the main staves and interstaves

396,752.

provided on their working-faces with the intermeshing bevel-edged plates, in combination with toggle-levers of different lengths for varying the relative speed of the different staves, and an actuating-ring for operating said levers.

4. In a machine for forming paper barrels, &c., the combination of the main staves N, the interstaves O, the longer toggles, 12, the shorter toggles, 13, and the toggle-ring 11, substantially as described.



5. The combination of the interstaves O, provided with the projecting beveled plates, the main staves having also correspondingly-beveled plates underlying the beveled projections of the interstave-plates, the short toggles 13, the long toggles 12, both connected with said staves, and the toggle-actuating ring, substantially as and for the purpose set forth.

6. The combination, with the base-plate and the scroll-plate, of the yoke-pieces provided with pins B and slots, and the inner staves, also provided with pins, and means, substantially as described, for operating said scroll-plate, substantially as and for the purpose specified.

7. The combination, with the inner staves having guide-pins and the slotted base-plate having the oblique projections, of the movable yoke-pieces provided with grooves corresponding to the form of said oblique projections, and also provided with guide-pins and slots, and a rotary scroll-plate, and means for actuating the latter for operating the yoke-pieces and staves, all substantially as described.

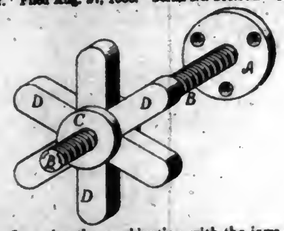
8. The combination, with the slotted base-plate and the inner staves having guide-pins, of the yokes provided with slots 16 and guide-blocks 19, and also with pins B, and a slotted scroll-plate, and means for actuating the latter for operating the yokes and staves, substantially as described.

396,753. PIPE-TONGS. ROBERT B. MAGEE and FRED C. KNOWLES, Oil City, Pa. Filed May 15, 1888. Serial No. 273,967. (No model.)

Claim.—In pipe-tongs, the combination, with the biting-jaw A', having a shoulder, *a*, of the attachment B, having a shank, *b*, shoulder *b'*, head *b²*, and cutter D, journaled in said head, and a clamp, C, embracing the jaw A and attachment B, substantially as shown.

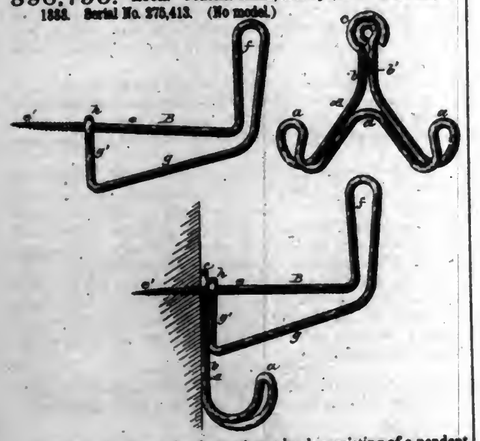
396,754. CATHETER. REUBEN H. MAYFIELD, Boulder, Colo. Filed Oct. 5, 1888. Serial No. 287,300. (No model.)

396,754.



Claim.—1. A catheter having a full open inlet end, a head adapted to be seated thereon and act as a valve, and a wire attached to such head and passing through the body of the catheter, substantially as set forth.

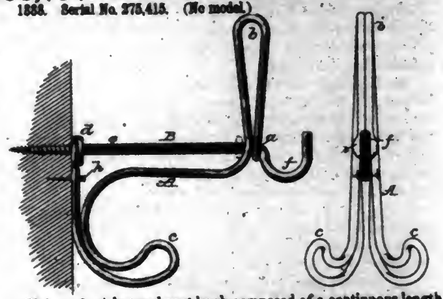
2. A catheter composed of tube 1, with full inlet end 2, a head, 3, with rim or ledge 4, and wire 5, attached to the head and passing through the tube 1, substantially as set forth.



3. The combination of tube 1, with full open end 2, the wire 5, passing therethrough, the head 3, attached to such wire and seating upon the end 2, the wire 10, and the loop 11, surrounding the wire 5 and part of the head 3, substantially as set forth.

396,755. ADJUSTABLE STRUT FOR VISES. FRANK MICHEL, Blair, Nebr. Filed Aug. 27, 1888. Serial No. 283,864. (No model.)

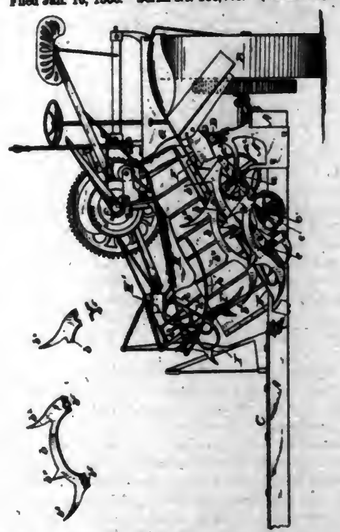
Claim.—In a vise, the combination, with the jaws thereof, of a screw, B, one end of which is riveted to a disk, A, provided with screw-holes, whereby the screw B is attached so as to project at right angles from the inner face of the lower end of the movable jaw E and pass loosely through an aperture in the fixed leg or jaw G, the screw B being provided between the jaws with a revolving nut, C, bearing against the fixed jaw G, and having radial arms by which it may be turned, substantially as described.



396,756. HOOK. PURCHIS MILES, Brooklyn, N. Y. Filed May 29, 1888. Serial No. 275,413. (No model.)

Claim.—1. A complex hat and coat hook consisting of a pendent wire base-hook having a shank provided with an eye at its upper end, and another separately-constructed wire hook having a brace provided with an eye which is coincident with the eye of the base-hook, and also having a screw-threaded shank which occupies both of said eyes, substantially as described.

2. In a complex hat and coat hook, a pendent wire base-hook having a shank provided with an eye at its upper end, in combination with a wire master-hook having a screw-threaded shank, and also a spring-brace provided with an eye, which is occupied by said shank and is coincident with the eye of the base-hook, the latter eye being also occupied by said screw-threaded shank, substantially as described, whereby in mounting the hook the base-hook may be fixedly held in position while the threaded shank of the master-hook is being driven into the wood on which it is to be mounted, and enabling the spring-brace of the master-hook to firmly engage with the shank of the base-hook, and also enabling each of said hooks to be confined against rotation independently of the other.



396,757. HOOK. PURCHIS MILES, Brooklyn, N. Y. Filed May 29, 1888. Serial No. 275,415. (No model.)

Claim.—1. A hat and coat hook composed of a continuous length of wire and having a vertical hat-hook arm containing four portions of the wire and provided with an eye at its base, and below and at the rear of said arm coat-hooks containing two portions of the wire and having a vertical shank provided at its top with an eye in line with the eye at the base of the hat-hook arm, substantially as described, said eyes being adapted to receive a supporting-arm for attaching the hook to any suitable foundation.

2. A hat and coat hook composed of a continuous length of wire and having a vertical hat-hook arm composed of four portions of said wire and provided with an eye at its base, and below and at the rear of said arm coat-hooks having a vertical shank provided at its top with an eye in line with the eye at the base of the hat-hook arm, in combination with a supporting-arm which occupies said eyes and has a hook at its outer end, substantially as described.

396,758. GRAIN-BINDING HARVESTER. LEWIS MILLER, Akron, Ohio. Filed Jan. 16, 1886. Serial No. 188,773. (No model.)

Claim.—1. The combination, with the slotted binder-table, of parallel crank-shafts, arched bars connected to cranks on said shafts to pass through the table and act on the grain thereon, and picker or gathering and packing fingers on said bars, substantially as and for purpose described.

2. The inclined and slotted elevating binder-table and the crank-shafts underneath said table, in combination with arched bars connected at their opposite ends to cranks on said shafts to pass through said table, and the picker and packer fingers on said bars, also passing through the table, all substantially as described.

3. The combination, with the needle, of the arched bars carrying gathering and packing fingers, and operating on opposite sides of and in close proximity to the plane of said needle, the parallel crank-shafts having oppositely-arranged cranks in pairs for operating said bars to act alternately on the straw, and oppositely-arranged intermediately-acting cranks, carrying also curved bars having gathering and packing fingers and acting on the ends of the straw, substantially as described.

4. In combination with the slotted binder-table, the needle or needle-guard, the crank-shafts, and the bars connecting said shafts provided with pickers or gathering-fingers and packers, and with spurs arranged between the gathering-fingers and packers, and made short for the purpose of releasing the grain and permitting a rolling motion thereof between the packers and gathering-fingers, substantially as described.

5. The combination, with the slotted binder-table, needle, and compressor, of the parallel crank-shafts, and the arched bars connecting the cranks on said shafts and provided with pickers or gathering-fingers and packers, and the intermediate spurs made shorter than the gathering and picking fingers, all substantially as and for the purpose described.

6. The frame-work supporting the binder-table, in combination with the parallel crank-shafts located underneath said table for operating the gathering-fingers and packers, and the bars or braces connecting said shafts, and in the ends of which said shafts are journaled, substantially as described.

7. The combination, with the inclined elevating binder-table, of the parallel crank-shafts located underneath said table, the connecting bars or braces in which said shafts have their bearings, said bars being provided also with bearings for the crank-shaft actuating the knife-bar, and the arched bars carrying the gathering-fingers and packers connected to and operated by said parallel crank-shafts, substantially as described.

396,759. ROTARY ENGINE. CARL MIETZ, Lisbon, N. H. Filed Apr. 24, 1888. Serial No. 271,709. (No model.)

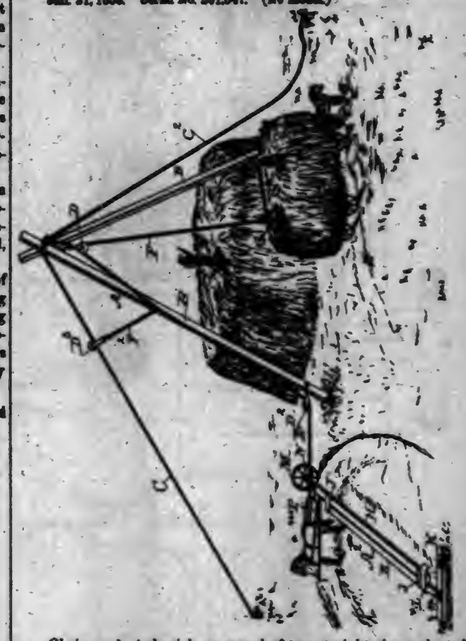
Claim.—1. As an improvement in rotary engines of the class herein described, the wings or plates composed each of two plates, one of which is slotted, and connected together by notted bolts, substantially as shown and described.

2. The herein-described wings or plates composed each of two plates, one of which is slotted and the other is curved in opposite directions at its outer end, substantially as shown and described, said plates being held together by means of notted bolts.

3. The herein-described rotary engine having the series of separate steam-compartments composed each of plates having oppositely-curved outer ends, and the steam inlet and outlet pipes, substantially as shown and described.

4. The herein-described improved rotary engine comprising the inclosing casing or cylinder having apertured sides, the main shaft, the series of separate steam-compartments composed of adjustable plates having oppositely-curved outer ends, the steam inlet and outlet pipes, the petcock-valves and their chain-connections, the governor, and the steam-supply-regulating throttle, substantially as shown and described.

396,760. CALENDAR. JESSIE M. MOORE, White Sulphur Springs, W. Va. Filed Sept. 20, 1888. Serial No. 286,761. (No model.)

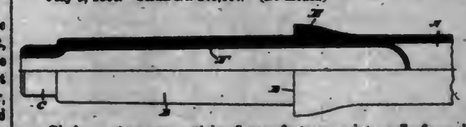


Claim.—1. The combination, with the cylinder having a longitudinal slot, of the ring fitted in said cylinder and adapted to display the number of the year through said slot, as set forth.

2. The combination of the outer cylinder having a longitudinal slot, the inner cylinder displaying the days of the months through said slot, the cap fitted on the inner cylinder and displaying the names of the days of the week through the slot in the outer cylinder, and the cap displaying the names of the months through said slot, as set forth.

3. The combination of the outer cylinder having stops on its inner surface, the cap, and the inner cylinder inserted through the opposite ends of the outer cylinder and resting against said stops, as set forth.

4. The combination of the cylinder having the bayonet-grooves on its inner surface and the caps having lugs engaging said grooves, as set forth.

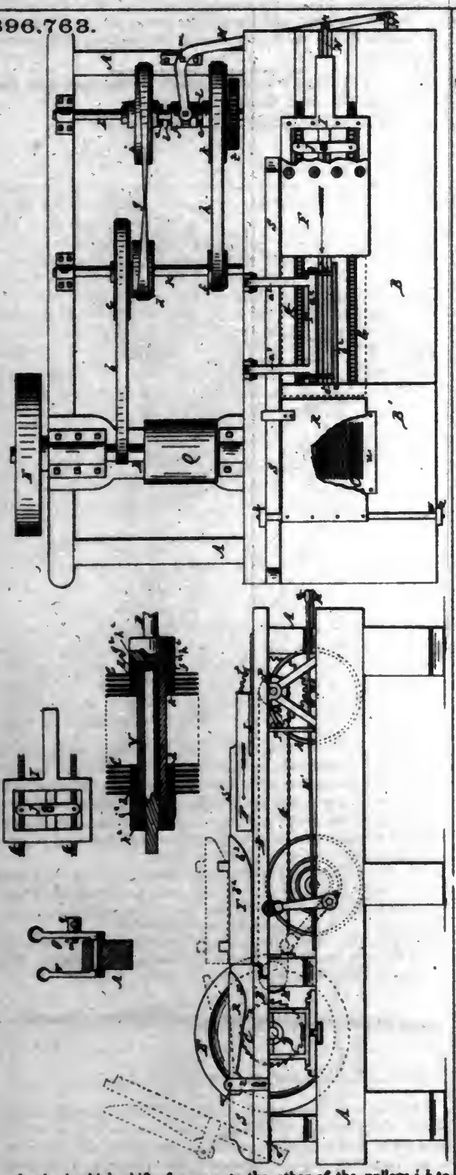


396,761. HAY-STACKER. LUTHER B. MORTON, Stuart, Iowa. Filed Jan. 21, 1888. Serial No. 261,547. (No model.)

Claim.—1. A derrick composed of two straight pieces pivoted together at their top ends, two guy-ropes fixed to the top of the derrick, a pulley attached near the top of the derrick, a pulley attached to the lower end of one of the said pieces in the derrick, and a traveling pulley on one of said guy-ropes, a pivoted sweep, and two ropes arranged and combined in the manner shown and described to operate a hay-fork, as and for the purposes stated.

2. A sweep composed of two straight bars, H, each having a fixed loop, J, a pivot, K, a shield, L, a wheel, M; and a hitching device, P, substantially as shown and described, for the purposes stated.

396,762. VEHICLE-AXLE. ANDREW PATTERSON, McKeesport, Pa., assignor to the National Tube Works Company, Boston, Mass. Filed July 5, 1888. Serial No. 279,067. (No model.)



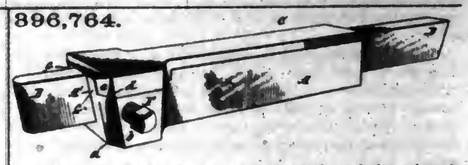
Claim.—As a new article of manufacture, an integrally-formed tubular wrought-metal axle having its bore or tube-cavity of uniform diameter or free from shoulders at the collar-points, and having the collars formed by exteriorly-exposed upsets presenting spindle-shoulders at right angles to the axis of the spindles and sloping from the collar-shoulders inwardly, so as to blend in one with the exterior of the body, the exterior diameter of the body at the point of initial engagement to form the collars corresponding with the exterior diameter of the spindles at the collar-shoulders.

396,763. MACHINE FOR SAWING STAVES. CHARLES R. PENFIELD, Rochester, N. Y. Filed Oct. 13, 1887. Serial No. 252,270. (No model.)

Claim.—1. In a machine for sawing staves, the combination, with a gang of saws, of a follower constructed to run over the saws forward and back, chains with which the follower is connected, and an evener, J, pivoted to the follower and attached to the chains, as herein shown and described.

2. In a machine for sawing staves, the combination of the table B, a gang of saws, C C, at one end of the table, a follower, F, resting on the table and arranged to run over the saws, chains G G, to which the follower is attached, a pivoted rock-lever, M, carrying at one end

396,763.

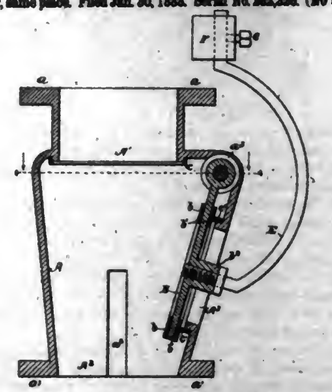


a clutch, *j*, which shifts from one to the other of the pulleys *i k* to reverse the motion, the rods N N', attached to said lever, the rod N being provided with adjustable stops *o o'*, for limiting the throw of the follower, and the weighted shifter O, provided with a swivel-head, *g*, through which the rod N' passes, as shown and described, and for the purpose specified.

3. In a machine for sawing staves, the combination of the table B, a gang of saws, C C, at one end of the table, a follower, F, resting on the table and arranged to run over the saws, chains G G, to which the follower is attached, arranged to reciprocate forward and back, a presser, R, pivoted back of the saws and in longitudinal line with the motion of the follower, and a gage, T, provided with an adjustable face-plate, *b*', located between the presser and follower and pivoted to turn transversely of the machine, said presser and gage being beveled at the ends next the follower, as shown and described, and for the purpose specified.

396,764. TOOL FOR LATHES AND PLANERS. WILLIAM W. PIPER and ADAM L. KELLY, Wheeling, W. Va. Filed Apr. 10, 1888. Serial No. 270,215. (No model.)

396,764.



Claim.—1. A tool-stock having an open channel throughout its length, in combination with a set-screw which penetrates its side and a detachable cap-plate, substantially as set forth.

2. The combination, with a tool-stock having an open channel or groove made downwardly in its body to receive a cutter-bar and a set-screw inserted in the side of the tool-stock, of a removable cap-plate adapted to fit the top surface of the tool-stock and permit a tool to slide therein when it is not engaged by the set-screw, substantially as set forth.

3. The combination, with a tool-stock which has a longitudinal groove made throughout its length, thickened side walls formed at one end, and a set-screw or bolt adapted to fit threaded perforations made through these thickened side walls, of a tool or cutter bar made to slidingly fit in the longitudinal groove of the stock, said cutter-bar being of the same width as the depth of the groove in which it sets, and a removable cap-plate which is held in place by the set-screw of a tool post or rest in which the tool-stock is inserted and clamped, substantially as set forth.

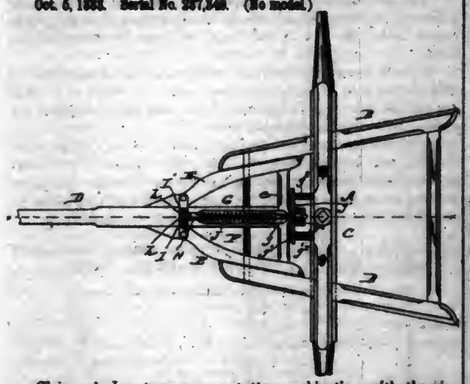
4. The combination, with a tool-stock having a rectangular cross-section, a longitudinal slotted body, two thickened side walls at one end, and shoulders produced at this end of the stock by a reduction of each thickened side wall, of a cap-plate adapted to embrace the side walls of the tool-stock and have contact with the shoulders and top surface of this tool-stock, substantially as set forth.

396,765. GAS-TRAP FOR TUYERES AND CONDUCTING-PIPES. AUGUSTUS D. POWER, Akron, Ohio, assignor of one-half to Edward A. Stouffer, same place. Filed Jan. 30, 1888. Serial No. 262,236. (No model.)

Claim.—1. A gas-trap for conducting-pipes and tuyeres, provided with inlet, outlet, and escape ports, in combination with a valve having the curved arm or stem extending outward through the escape-port and provided with an adjustable weight, all arranged and operating substantially as described.

2. The combination, with a gas-trap for conducting-pipes and tuyeres, of a pivoted valve arranged to work automatically under the action of the blast to open one port and close another and a curved and weighted arm or stem attached centrally to and extending outward from said valve through one of said ports, substantially as described.

3. A gas-trap for conducting-pipes and tuyeres, provided with an inclined escape-port, in combination with a valve adapted to be operated by the action of the blast for closing said port and a curved arm or stem attached to said valve and projecting outward through said inclined escape-port for returning said valve to close the inlet-port, substantially as described.

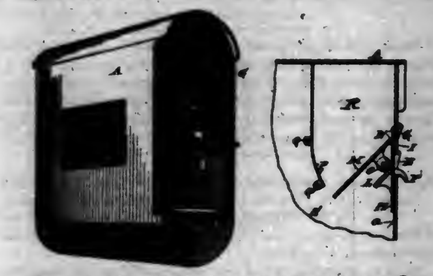


4. The combination, with the gas-trap and the escape-port thereof, of the pivoted valve and the stem or lever projecting through the escape-port and bent or curved in such manner and form that its upper end will lie in approximately the same vertical plane as the hinge or pivotal joint of the valve when the escape-port is closed, said stem or lever being provided at its upper end with an adjustable weight, all as and for the purpose described.

5. The combination, with the gas-trap casing A, provided with the ports A' and A^2, and the integrally-formed inwardly-projecting flanges surrounding said ports, of the packing-rings *c* and *c'*, surrounding said flanges and projecting beyond the inner faces or edges thereof, the double-acting valve provided on both sides with packing *b* and *b'*, and a weighted arm for automatically operating said valve, substantially as and for the purpose described.

6. In a gas-trap for conducting-pipes and tuyeres, the combination, with the valve and its stem, of the eccentrically-perforated weight mounted on and adjustable around said stem, and provided with the set-screw for holding said weight when adjusted on said stem, substantially as described.

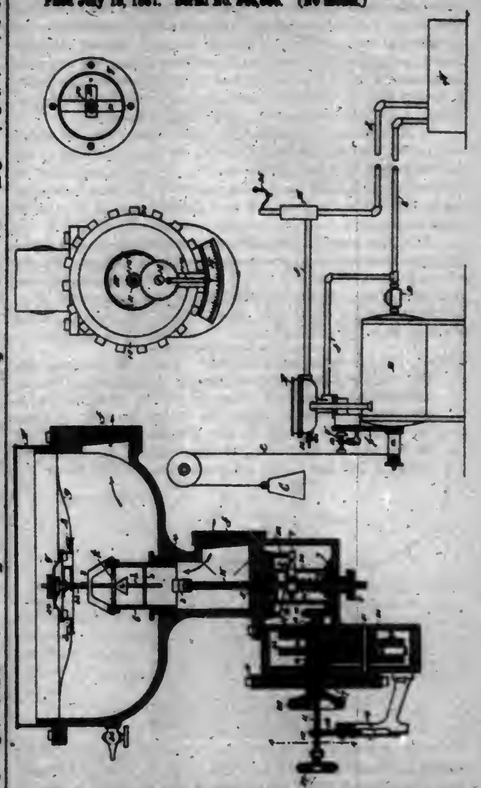
7. The gas-trap shell formed in one piece and provided with the inlet, outlet, and escape ports, one of said ports having the grooved extension to admit the valve, substantially as described.



396,766. TONGUE-SUPPORT. GEORGE H. RING, Vermont, Ill. Filed Oct. 6, 1888. Serial No. 287,849. (No model.)

Claim.—1. In a tongue-support, the combination, with the pivoted tongue and the head-block, of a horizontal coiled spring having a threaded pin or bolt fixed to its rear end, a plate fixed to the head-block and supported on the fixed posts, a nut fitted on the threaded pin and bearing against the plate to move said bolt endwise and vary the tension on the spring, and the fixed plates on the tongue to which the front end of the spring is connected, substantially as and for the purpose described.

2. In a tongue-support, the combination, with a pivoted tongue and a head-block, of a coiled horizontal spring, a clevis fixed to the front end of the spring, a pair of vertical plates fixed to the tongue and having the front bifurcated end of the clevis arranged between the upper ends thereof, a longitudinal brace arranged below said spring, and having its rear end fixed to the tongue and its front end arranged in the bifurcated end of the clevis, a coupling-bolt passing through the vertical plates, the clevis, and brace, a threaded pin secured to the rear end of the coiled spring, and a nut fitted on said pin and bearing against a fixed plate on the head-block, substantially as described.



396,767. LETTER-BOX. HENRY S. SCHAADT, St. Louis, Mo. Filed Apr. 3, 1888. Serial No. 269,447. (No model.)

Claim.—1. A letter-box having a compartment or space, R, separated from the main portion S of the interior of the letter-box by means of a valve and a partition, and also having a slide for opening and closing the box-aperture, said slide and valve being connected, and when one is moved to close the box-aperture the other is moved to open the passage from said compartment, as and for the purpose described.

2. The combination, in a letter-box, of the slide H, having the aperture I and the incline L, and the handle F, with the valve M, having the roller O and being journaled, substantially as described.

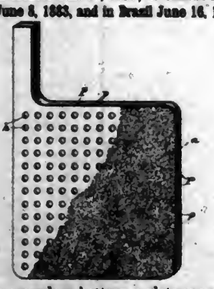
396,768. GAS-MACHINE. EDWARD D. SELF, South Orange, N. J. Filed July 18, 1887. Serial No. 244,608. (No model.)

Claim.—1. In a gas-machine, the combination, with the carburetor and the apparatus for supplying air thereto, of connections for supplying pure air to the carbureted air or gas, a valve apparatus for controlling the amount of pure air supplied to the gas, a motor the speed of which is controlled by or varies with the amount of gas delivered, and connections between said motor and said valve apparatus for operating the latter to gradually change the amount of air introduced into the gas as the gas-making progresses and the quality of the gas changes, substantially as described.

2. In a gas-machine, the combination, with the carburetor and a pump for supplying air thereto, of connections for supplying pure air to the carbureted air or gas, a valve apparatus for controlling the amount of pure air supplied to the gas, and connections, substantially such as described, between the valve apparatus and the pump, whereby the valve apparatus is operated to gradually change the amount of air supplied to the gas as the gas-making progresses and the quality of the gas changes, the rate of change being controlled by and proportioned to the speed of the pump, substantially as described.

3. In a gas-machine, the combination, with the carburetor and the apparatus for supplying air thereto, of connections for supplying pure air to the carbureted air or gas, a fluid-pressure regulator having a valve which is operated by and controls the pressure of the pure air supplied and having a movable valve-seat, and connections, substantially such as described, whereby the valve-seat may be gradually moved to change the amount of air supplied to the gas as the gas-making progresses and the quality of the gas changes, substantially as described.

4. In a gas-machine, the combination, with the carburetor and the apparatus for supplying air thereto, of connections for supplying pure air to the carbureted air or gas, a fluid-pressure regulator having a valve which is operated by and controls the pressure of the pure air supplied and having a movable valve-seat, and connections, substantially such as described, whereby the valve-seat is automatically moved to gradually change the amount of air supplied to the gas as the gas-making progresses and the quality of the gas changes, the rate of the change being dependent upon and proportioned to the amount of gas made, substantially as described.



5. In a gas-machine, the combination, with the carburetor and

the pump for supplying air thereto, of connections for supplying pure air to the carbureted air or gas, a fluid-pressure regulator having a valve which is operated by and controls the pressure of the air supplied and having a movable valve-seat, and connections, substantially such as described, between the valve-seat and the pump, whereby the valve-seat is automatically moved so as to gradually change the amount of air supplied to the gas as the gas-making progresses and the quality of the gas changes, the rate of change being controlled by and proportioned to the speed of the pump, substantially as described.

6. In a gas-making machine, the combination, with the carburetor, of the pressure-regulator F, having the valve controlled by the diaphragm and the movable valve-seat for varying the amount of air supplied to the gas, and the train of gears 19 20, &c., for communicating motion to the valve-seat and to the pointer-scale 14 15, substantially as described.

7. In a gas-machine, the combination, with the carburetor, its air-supplying apparatus, and connections for supplying pure air to the gas, of the pressure-regulator F, having the valve controlled by the diaphragm, and the movable valve-seat for varying the quantity of air supplied to the gas, the train of gears 19 20, &c., the shaft 11, having the loose sleeve 16, and the jam-nut 28, substantially as described.

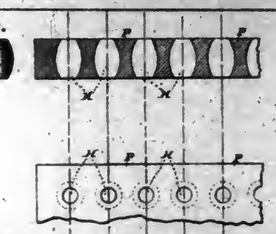
396,769. SECONDARY BATTERY. JOHN S. SELLON, Hatton Garden, County of Middlesex, England, assignor to The Electrical Accumulator Company, of New York. Filed Apr. 26, 1887. Serial No. 236,209. (No model.) Patented in England Dec. 23, 1881, No. 5,631; in Argentine Republic Nov. 21, 1882, No. 364; in British Guiana Dec. 11, 1882, No. 197/3,155; in Mexico Jan. 27, 1883; in Canada Mar. 15, 1883, No. 16,490; in Chili June 6, 1883, and in Brazil June 16, 1883, No. 53.

Claim.—1. In a secondary battery, a plate or support containing inoxidizable material supporting a sheet, plate, or conductor of practically-inoxidizable metal, and combined with an active material or material to be rendered active mechanically applied thereto, substantially as described.

2. In a secondary battery, a plate or support containing a practically-inoxidizable material combined with a practically-inoxidizable conductor supported thereby and an active material or material to be rendered active, substantially as described.

3. In a secondary battery, a support or strip containing a non-conducting material combined with a practically-inoxidizable conductor and an active material, all in substantially continuous mechanical contact, as set forth.

4. In a battery, a support or terminal containing a practically-inoxidizable material, combined with a conductor of platinum and a mechanically-applied active material, substantially as described.



5. In a battery, a plate or support containing a practically-inoxidizable material and a practically-inoxidizable metal having a woven shape, combined with a mechanically-applied active material, substantially as described.

396,770. SECONDARY BATTERY. JOHN S. SELLON, Hatton Garden, County of Middlesex, England, assignor to The Electrical Accumulator Company, of New York. Original application filed Apr. 19, 1887, Serial No. 235,495. Divided and this application filed Sept. 16, 1887. Serial No. 249,355. (No model.) Patented in England June 15, 1882, No. 2,818; in Russia July 23, 1883, No. 6,760; in Argentine Republic Nov. 21, 1882, No. 364; in British Guiana Dec. 11, 1882, No. 197/3,155; in Mexico Jan. 27, 1883; in France Mar. 10, 1883, No. 147,831; in Belgium Mar. 10, 1883, No. 60,714; in Canada Mar. 15, 1883, No. 16,490; in Italy Mar. 30, 1883, No. 15,217; in Chili June 6, 1883; in Brazil June 16, 1883, No. 53; in Spain Aug. 16, 1883, No. 917, and in Austria-Hungary Sept. 20, 1883, No. 20,705.

Claim.—1. In a secondary battery, a plate element or support having a series of holes or perforations the aperture or diameter of which is greater at the center than at the surfaces.

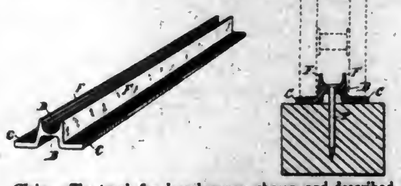
2. In a secondary battery, an element consisting of an active material combined with a plate or support having a series of holes or perforations the aperture or diameter of which is greater at or near the center than at the surfaces, substantially as described.

396,770.

3. In a secondary battery, a molded plug or button of active material having the form of two cones or pyramids united at their base.

4. In a secondary battery, a plate element or support containing a series of molded plugs or buttons of active material, each plug or button having the form of two cones or pyramids united at their bases.

5. In a secondary battery, a plate element or support having cells, perforations, or receptacles the diameter of which at or near one or both poles of the major axis is less than the diameter at one or more points intermediate said poles.



6. In a secondary battery, a plate element or support having a series of holes or perforations the aperture or diameter of which at or near the surface is less than the aperture or diameter at a point between the surfaces of said plate, combined with an active material placed in such holes or perforations, substantially as described.

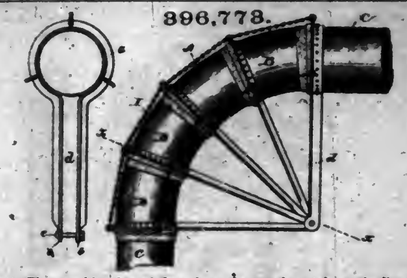
396,771. WIRE FABRIC. EDWARD P. SHELLABERGER, Beaver Falls, Pa. Filed July 6, 1887. Serial No. 243,508. (Model.)

Claim.—The combination, with the longitudinal strands or cables, of the web-wires, each bent back and forth, forming limbs extending from one strand or cable to another and alternately closed at opposite ends, and arranged with the closed ends of the limbs of one wire opposite the open ends of the limbs of the other wire, and having the wires interlocking at the angles formed at the closed ends of the limbs and held in place by said strands or cables, substantially as set forth.

396,772. TRACK FOR DOOR-HANGERS. SAMUEL SHREFFLER, Jr., Joliet, Ill. Filed Apr. 12, 1888. Serial No. 270,434. (No model.)

Claim.—The track for door-hangers, shown and described, consisting of the two vertically-arranged parallel guide members F F, having the integral web B, provided with perforations D, and connecting said members midway of their height, and each said member having an outwardly-extending flange, *c*, forming wheel-tracks, substantially as and for the purpose set forth.

396,773. ADJUSTABLE CURVED PIPE-SECTION. LYMAN SMITH, Kansas City, Mo. Filed Feb. 17, 1888. Serial No. 264,394. (No model.)



Claim.—1. The herein-described curved pipe section or elbow, consisting, essentially, of a series of movable minor sections and radial supporting-arms, as set forth.

2. In an adjustable curved pipe section or elbow, the combination, with the minor sections telescopically connected, of the radial supporting-arms pivoted at a common center, substantially as described.

3. An adjustable curved pipe section or elbow composed of a series of minor sections, each provided with a radial supporting-arm, substantially as described.

4. The combination, with a movable curved pipe section or elbow, of a series of radial arms secured together at a common center and supporting the elbow or pipe section, substantially as described.

396,773.

5. The combination of the minor pipe-sections telescopically connected, the radial supporting-rods, and the stay-chains connecting said sections, substantially as described.

6. A curved pipe-section capable of adjustment and provided with radial arms having rings and packing-rings, substantially as set forth.

7. The combination, in a curved pipe-section, of the minor sections movably connected, and the radial supporting-arms having rings embracing said minor sections, said arms being pivoted and extending from a common center, substantially as described.

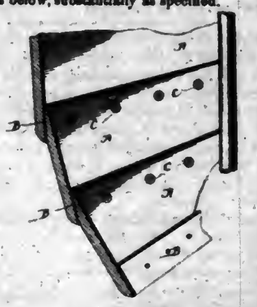
8. An adjustable curved pipe-section comprising minor sections, radial supporting-arms having rings formed of angle-iron and embracing the minor sections, and stay-chains connecting the sections and secured to said rings.

9. In an adjustable pipe-section, the combination, with the minor sections and supporting-arms provided with rings formed of angle-iron, of the packing-rings carried by the angle-iron rings.

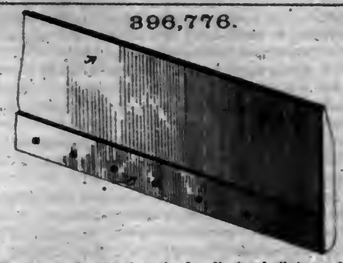
10. In an adjustable curved pipe-section, the combination of the minor sections and the radial supporting-arms having rings, one of said arms being provided with lugs, between which the remaining arms are pivotally secured by a bolt or pivot.

396,774. PAINT-OIL. ADOLPH SOMMER, Berkeley, Cal. Filed Dec. 31, 1887. Serial No. 259,487. (No specimens.)

Claim.—As a new composition, the solution in hydrocarbons of the sulpho-chlorinated marine-animal oils.



396,775. AUTOMATIC LOCKING-HOOK. FERDINAND SPLITTSTOSSER, North Branch, Minn. Filed Sept. 12, 1888. Serial No. 285,211. (No model.)



Claim.—An automatic locking-hook consisting of the hook A and the latch L, which latch is constructed of a single piece of looped wire having its two ends brought near together and pivoted in the free end of the hook, the outer or looped end of the latch being formed and adapted to fit upon and engage with the rear or opposite side of the hook, extending down on the sides thereof so as to have a bearing on both sides of this part of the hook to prevent its swinging laterally, substantially as described.

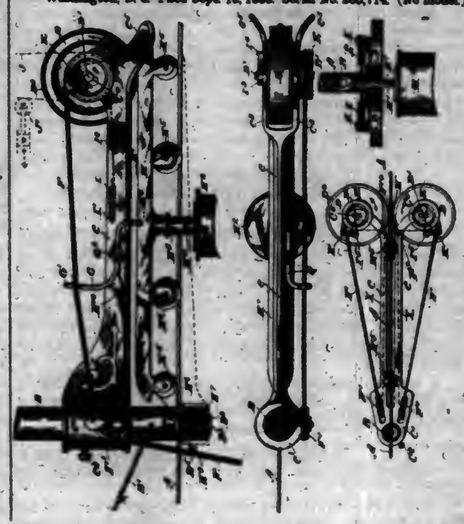
396,776. JOINT FOR BOATS. HERBERT M. SPRAGUE, Parishville, N. Y. Filed Oct. 20, 1888. Serial No. 288,672. (No model.)

Claim.—1. The combination, with the strakes of a clincher-built boat, of the rubber strips permanently secured to the inner sides of the strakes at their lower edges and adapted to bear against the outer sides of the strakes below, substantially as specified.

396,776.

2. The herein-described strake for clincher-built boats, having its upper edge beveled on the outer side and provided with the thin rubber packing-strip B, secured to its inner side at the lower edge, substantially as specified.

396,777. STEM WINDING AND SETTING WATCH. OSCAR F. STEDMAN, Ravenna, Ohio. Filed Apr. 12, 1888. Serial No. 270,444. (No model.)



Claim.—1. The combination of the endwise-moving winding-stem, the endwise-moving bar, a spring applied directly to the end of the bar for moving both the bar and the yoke, and the pivoted spring-actuated yoke carrying the winding and setting wheels, the bar being provided with a projection which extends through an opening in the pillar-plate and makes direct contact with the yoke, substantially as shown.

2. The combination of the endwise-moving winding-stem, the spring-actuated endwise-moving bar provided with a projection, the pivoted spring-actuated yoke carrying the winding and setting wheels and provided with an inclined surface, against which the projection upon the endwise-moving bar strikes, substantially as described.

3. The endwise-moving winding-stem provided with a groove near its inner end, in combination with the endwise-sliding bar having a beveled point to catch in the groove and lock the stem in position and provided with a projection at its outer end to operate the yoke, and the spring F, applied directly to the end of the bar, substantially as set forth.

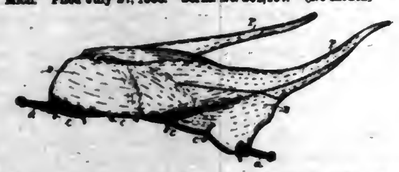
396,778. CASH OR PARCEL CARRIER. EDGAR B. STOCKING, Washington, D. C. Filed Sept. 16, 1888. Serial No. 285,714. (No model.)

Claim.—1. In a cash or parcel carrier, a car provided with a driving-surface, in combination with a driving-wheel adapted to take upon the driving-surface, substantially as specified.

2. In a cash or parcel carrier, a car provided with a driving-surface, in combination with a driving-wheel adapted to take upon the driving-surface and with means for giving motion to the driving-wheel, substantially as specified.

3. A car having oppositely-arranged driving-surfaces, in combination with driving-wheels arranged to bear upon the opposite driving-surfaces, substantially as specified.

4. The combination of a track, a supporting post or standard at the station, a car provided with a driving-surface, a driving-wheel mounted on a bracket, and a cord operatively connected with the drive-wheel and extending therefrom to a point of access, substantially as specified.

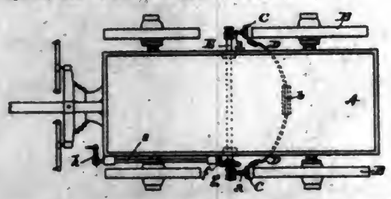


5. The combination of a track, a car having a driving-surface thereon, a drive-wheel, a bracket provided with elongated bearings for the journals of said drive-wheel, and means for moving the wheel toward the driving-surface and for operating said wheel, substantially as specified.

6. The combination of a bracket provided with elongated bearings, a driving-wheel mounted in said bearings, and a car provided with a driving-surface, substantially as specified.

7. The combination of a car having driving-surfaces, a bifurcated bracket having elongated bearings, driving-wheels, pulleys connected therewith, and cords extending from the pulleys to points between said pulleys and from thence to a point of access, substantially as specified.

8. The combination of a supporting post or standard provided with a plug and button, the latter having a spindle with a track-wire, substantially as specified.

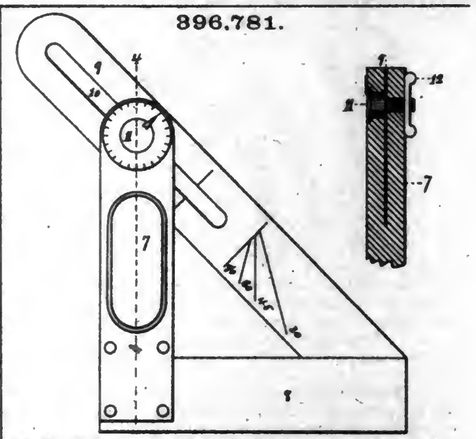


396,779. CASE FOR SULKIES. ROYAL A. STONE, Kalamazoo, Mich. Filed July 27, 1888. Serial No. 281,187. (No model.)

Claim.—1. A flexible case for a sulky, comprising a bag-like portion made in shape to incase the seat, thill cross-bar, and gear of the sulky, and having the long tube-like forward extensions at the front corners for incasing the thills.

2. The case comprising the bag-like portion for incasing the painted part of the sulky-body, gear, and thill cross-bar, and the corner tube-like forward extensions for covering the thills, in combination with the wheel-cases circular in side elevation and flat at the sides, substantially as set forth.

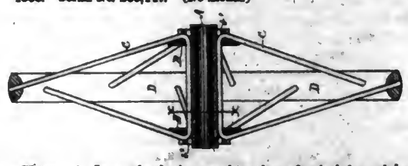
396,780. WAGON-BRAKE. LUDWIG STIFEL, Cumdale, Ohio. Filed Apr. 23, 1888. Serial No. 271,556. (No model.)



Claim.—1. The combination, with a wagon, of a bow-carrier pivoted between the bearing-wheels and having spring terminals or extensions, drag-shoes pivotally hung upon such terminals, chains connecting each shoe with the wagon-body forward of the bearing-wheels, and a winding-shaft constituting the forward holding element of said chain upon the wagon-body for winding said chain and lifting the drag-shoes from the ground out of engagement with the wheels, substantially as set forth.

2. The combination, in a wagon-brake, of the bowed carrier D, shoes C C, chains *a a*, winding-shaft E, crank-shaft *e*, and gears *f g*, substantially as set forth.

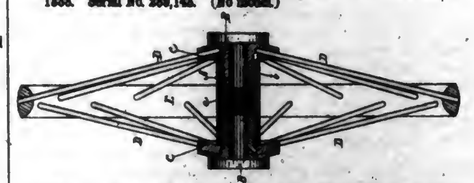
396,781. TRY-SQUARE, BEVEL, AND PROTRACTOR. FRANK S. TALMADGE, Palmer, Mass. Filed Feb. 16, 1888. Serial No. 264,262. (No model.)



Claim.—The blade 9, cut at one end at an angle of forty-five degrees and provided with slot 10 and degree-markings, in combination

396,781.

with the stock 7 and blade 8, shouldered rivet 11, and nut 12, all constructed, arranged, and operating as specified.

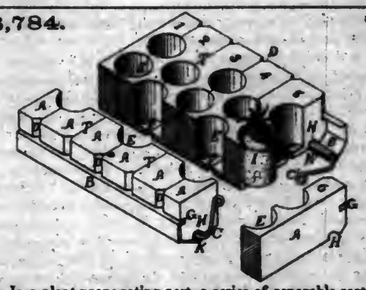


396,782. WHEEL. HORACE H. THAYER, Erie, Pa. Filed Oct. 26, 1888. Serial No. 289,147. (No model.)

Claim.—1. In a wheel, the combination of a hub-barrel having plane ends *a* and longitudinal external ribs, *a'*, flanges B, having notches *b'*, which fit over the plane ends *a* of the barrel, and spoke-wires C, which pass lengthwise of the hub through the openings *b'* in the flanges and between the ribs *a'* on the barrel and are bent out to the rim D over the outer faces of the flanges.

2. In a wheel, the combination of a hub-barrel having plane ends *a* and longitudinal external ribs, *a'*, flanges B, having notches *b'* and radial grooves b^3 on their outer faces, which lead from said notches, fitting over the plane ends of the barrel, and spoke-wires C, which pass lengthwise of the hub through the openings *b'* and between the ribs *a'* and pass out to the rim D through the grooves b^3.

396,783. WHEEL. HORACE H. THAYER, Erie, Pa. Filed Oct. 26, 1888. Serial No. 289,148. (No model.)



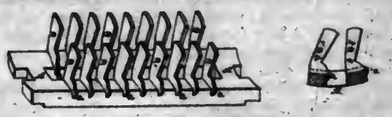
Claim.—In a wheel, the combination of the internally-screw-threaded hub-barrel A, the flanged bushings or boxes B, screwed into the hub-barrel, the spoke-holding flanges C, fitting on the boxes B at the ends of the hub-barrel and having grooves *c* in their inner surfaces to receive the beat ends of the spokes D.

396,784. PLANT-PROPAGATING NEST. LOUIS VAUGHAN, Blair, Nebr. Filed July 31, 1888. Serial No. 281,596. (No model.)

Claim.—1. In a plant-propagating nest, the combination of a series of separable sections, A, forming a nest of cells, E, and having a rectangular groove, G, parallel with the top and bottom at each end, and a semicircular groove, H, across the bottom near each end, with the guides B B', each consisting of a single piece of sheet metal having one end rolled to form a bead, K, seated in groove H, and the remainder of the sheet so bent that the other end will enter the groove G, substantially as described.

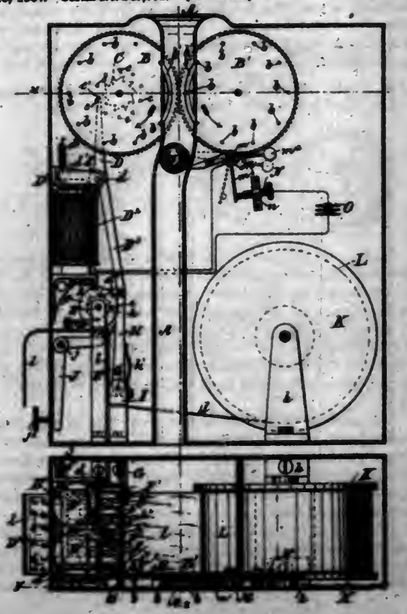
2. In a plant-propagating nest, the separable sections A and the sheet-metal guides B B', having the beads K, in combination with the two pieces of spring-wire C C, one passed through each bead and both ends of each wire shaped so as to make a spring-clamp holding said sections together in the guides, substantially as herein shown, and for the purpose specified.

396,784.



3. In a plant-propagating nest, a series of separable sections, A, having chamfers D at their ends on their sides of contact with each other, in combination with the guides B B' and the spring-wire clamps C C, substantially as shown, and for the purpose specified.

4. In a plant-propagating nest, the separable sections A, in combination with the spring-clamps C C, which elastically bind the sections snugly together, and from which the sections may be released at will and separated from each other, substantially as set forth.



5. The combined guide, foot, and elastic clamp for holding in position, supporting, and binding together the separable sections, consisting of a single piece of sheet metal, one end rolled to form a bead, K, and the remainder of the sheet bent as shown, in combination with a single piece of spring-wire passed loosely through the bead K, the ends thereof being bent to form a spring-clamp, substantially as shown and described.

396,785. THRASHING-MACHINE. AUBERT H. WAGNER, Chicago, Ill., assignor to Abel H. Frost and Chas. L. Ames, both of same place. Filed May 26, 1888. Serial No. 275,129. (No model.)

Claim.—The combination of the cross-piece of a thrashing cylinder or concave having dovetailed grooves formed in its face at right angles to its length, with thrashing-teeth having their inner ends adapted to fit in said grooves and provided with projecting points on their inner ends, which points are to be bent down behind the cross-piece, so as to lock the teeth in place, substantially as shown and described.

396,786. FARE BOX AND REGISTER. OSBAVIS G. WARNER, Mount Vernon, assignor to Virgil A. Kreppe, Kenton, N. Y. Filed Sept. 13, 1887. Serial No. 249,502. (No model.)

Claim.—1. In a counting-machine, a chute adapted to guide a coin, in combination with a series of pins or projections adapted to pass successively within said chute and be moved out of the same by the weight of a coin deposited therein, and a stop to limit the motion of the pins, whereby the said series of pins will permit of the passage of but one coin at a time.

2. In a counting-machine, the combination of a chute adapted to guide a coin, a series of pins or projections adapted to pass successively within said chute and be moved out of the same by the weight of a coin deposited therein, a stop to limit the motion of the pins, whereby said series will permit of the passage of but one coin at a time, a lever having an arm extending within said chute beneath said pins and balanced to be tipped by a coin released from said pins, and electrical contact-pieces and connections for making and breaking circuit, and enumerating-connections, said contact-pieces being adapted to be operated by said lever, whereby an enumeration is effected.

3. In a counting-machine, the combination of a chute adapted to guide a coin, a series of pins or projections adapted to pass successively within said chute and be moved out of the same by the weight of a coin deposited therein, a stop to limit the motion of the pins, whereby said series will permit of the passage of but one coin at a time, a magnet, electrical connections for charging the same, means for making and breaking circuit, an armature in proximity to said magnet, and suitably-disposed numerals having lever-connections with said armature and arranged to be moved in order by the same, whereby said electrical connections are operated and account is made at each deposit of coin.

4. In a counting-machine, the combination of a chute adapted to guide a coin, a series of pins or projections adapted to pass successively within said chute and be moved out of the same by the weight of a coin deposited therein, a stop to limit the motion of the pins, whereby said series will permit of the passage of but one coin at a time, a magnet, electrical connections for charging the same, means for making and breaking circuit, an armature in proximity to said magnet, a lever-arm connecting with said armature, and a figure-wheel for enumerating, said wheel having connection with and being adapted to be rotated by movements of said lever-arm.

5. In a counting-machine, the combination of a chute adapted to guide a coin, a series of pins or projections adapted to pass successively within said chute and be moved out of the same by the weight of a coin deposited therein, a stop to limit the motion of the pins, whereby the said series of pins will permit of the passage of but one coin at a time, a magnet, electrical connections for charging the same, contact-pieces for making and breaking circuit, a lever having an arm projecting in the path of travel of a coin deposited in said chute beneath said pins and balanced to be tipped by a coin released from said pins and operate said contact-pieces, an armature in proximity to said magnet, a lever-arm connecting with said armature, and a figure-wheel for enumerating, having connection with said last-named lever-arm.

6. In a counting-machine, the combination of a chute adapted to guide a coin, wheels provided with a series of pins or projections adapted to pass successively within said chute and be moved out of the same by the pressure of a coin deposited therein, escapement-connections with one of said wheels, a magnet, electrical connections for charging the same, means for making and breaking circuit, an armature in proximity to said magnet and adapted to operate said escapement-connections, and suitably-disposed numerals having lever-connections with said armature and adapted to be moved in order by the same, whereby said wheels are stopped, said electrical connections operated and account made before a succeeding coin passes through the said chute.

7. In a counting-machine, the combination of a chute adapted to guide a coin, wheels provided with a series of pins or projections adapted to pass successively within said chute and to be moved out of the same by the pressure of a coin deposited therein, escapement-connections with one of said wheels, a magnet, electrical connections for charging the same, means for making and breaking circuit, an armature in proximity to said magnet and adapted to operate said escapement-connections, a lever or arm having connections with said armature, and a figure-wheel for enumerating, said figure-wheel having connection with and being adapted to be rotated by movements of said lever.

8. In a counting-machine, the combination of a chute adapted to guide a coin, wheels provided with a series of pins or projections adapted to pass successively within said chute and to be moved out of the same by the pressure of a coin deposited therein, escapement-connections with one of said wheels, a magnet, electrical connections for charging the same, a lever having an arm projecting in the path of travel of a coin deposited in said chute beneath said pins and balanced to be tipped by a coin released from said pins, electrical contact-pieces adapted to be operated by said lever, an armature for oper-

ating said escapement-connections, a lever or arm provided with a pawl and having connection with said armature, and a figure and ratchet wheel for engaging said pawl.

9. In a counting-machine, the combination of a chute adapted to guide a coin, a stop device to permit of the passage of one coin at a time, a magnet, electrical connections for charging the same, a lever having an arm projecting in the path of travel of a coin deposited in said chute beneath said pins and balanced to be tipped by a coin released therefrom, electrical contact-pieces adapted to be operated by said lever, an armature in proximity to said magnet, a lever or arm connecting with said armature, a figure-wheel for enumerating, pawl-and-ratchet connections between said last-named lever and said figure-wheel and adapted to impart motion from said lever to said wheel, and an adjusting screw or stop for limiting such motion.

10. In a counting-machine, the combination of a chute adapted to guide a coin, wheels provided with a series of pins or projections adapted to pass successively within said chute and be moved out of the same by the pressure of a coin deposited therein, escapement-connections with one of said wheels, a magnet, electrical connections for charging the same, means for making and breaking circuit, an armature in proximity to said magnet and adapted to operate said escapement-connections, a wheel provided with a set of figures denoting the digits and ciphers or numbers up to any power of ten less one and the ciphers of such powers, a lever or arm having connection with said armature and adapted to impart motion to said wheel and bringing the numbers thereon *seriatim* into position for counting, one or more of these wheels provided with figures in numerical order and of increasing decimal denominations, the figures upon the several wheels being adapted to imprint numbers therefrom, the said last-named wheels forming with the first a series, the successive wheels of which have connections adapted to engage the wheel with the figures of next lower denomination, receive motion therefrom, actuate the succeeding wheel, and thereby regularly advance the numbers thereon after the higher number of the engaged wheel is each time brought into counting position and before a repetition of the numbers upon such wheel is commenced.

11. In a counting-machine, the combination of a chute adapted to guide a coin, a series of movable pins in said chute, and a stop to limit the motion of the pins, a lever having an arm projecting in the path of travel of a coin deposited in said chute and balanced to be tipped by such coin, suitably-disposed figure-wheels, a carrying device for said figure-wheels, and connections between the same and said lever-arm, said connections being adapted to impart motion to said carrying device and to regularly advance said figures to counting position as often as said arm is tipped, whereby account is made of each deposit of coin.

12. In a counting-machine, the combination of a chute adapted to guide a coin, a series of movable pins in said chute, and a stop to limit the motion of the pins, a lever having an arm projecting in the path of travel of a coin deposited in said chute and balanced to be tipped by such coin, suitably-disposed figure-wheels adapted to imprint numbers therefrom, a carrying device for said figure-wheels, connections between said carrying device and said lever-arm, said connections being adapted to impart motion to said carrying device and to regularly advance said figures to counting positions as often as said arm is tipped, and connections for taking an imprint of numbers counted by such figures.

13. In a counting-machine, the combination of a chute adapted to guide a coin, a series of pins or projections adapted to pass successively within said chute and be moved out of the same by the pressure of a coin deposited therein, a stop to limit the motion of the pins, whereby said series of pins will permit the passage of but one coin at a time, a lever having an arm projecting in the path of travel of a coin deposited in said chute and balanced to be tipped by such coin after being released from said pins, suitably-disposed figure-wheels, a carrying device for said figure-wheels, and connections between the same and said lever-arm, said connections being adapted to impart motion to said carrying device and to regularly advance said figures to counting position as often as said arm is tipped.

14. In a counting-machine, the combination of a chute adapted to guide a coin, a series of movable pins in said chute and a stop to limit the motion of the pins, a magnet, electrical connections for charging the same, a lever having an arm projecting in the path of travel of a coin deposited in said chute and balanced to be tipped by such coin and operate said electrical connections, an armature in proximity to said magnet, a wheel provided with a set of figures denoting the digits and ciphers or numbers up to any power of ten less one and the ciphers of such power, lever-connections with said armature for rotating said wheel and bringing said numbers *seriatim* to counting position, one or more other wheels provided with figures in numerical order and of increasing decimal denominations, and connections for rotating said wheels and regularly advancing the numbers thereon after the highest number upon the preceding wheel is each time brought to counting position and before repetition of the numbers on such wheel is commenced.

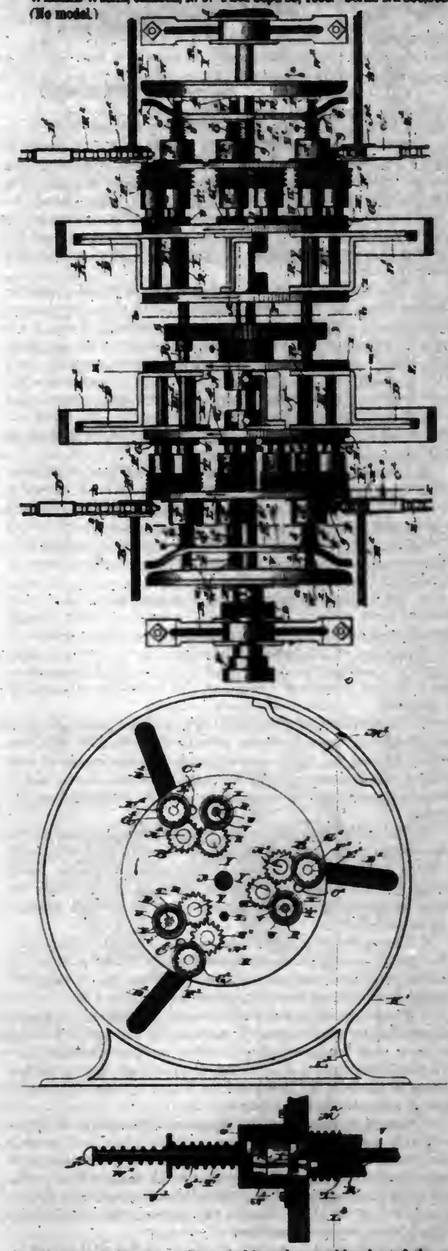
15. In a counting-machine, the combination of a magnet, electrical connections for charging the same, means for making and breaking circuit, an armature in proximity to said magnet, a lever-arm connecting with said armature, a wheel provided with a set of figures denoting the digits and cipher or numbers up to any power of ten less one and the ciphers of such power, said wheel having connections with and being adapted to be rotated by movements of said lever-arm and bring said numbers *seriatim* to position for counting, one or more other wheels provided with figures in numerical order and of increasing decimal denominations, the figures upon the several wheels being adapted to imprint numbers therefrom, connections for rotating the said several wheels succeeding the first and regularly advancing the numbers thereon after the highest number upon the preceding wheel is each time brought to counting position and before repetition of the numbers upon such wheel is commenced, a batten or battens adjacent to the figures in counting position, a handle for operating said battens, connections for feeding material upon which an imprint may be taken between said figures and said battens, and a lever adapted to move said battens against said material and press the same against said figures.

16. In a counting-machine, the combination of a chute adapted to guide a coin, a series of pins or projections adapted to pass successively within said chute and be moved out of the same by the pressure of a coin deposited therein, a stop to limit the motion of the pins, whereby said series of pins will admit of the passage of but one coin at a time, a lever having an arm projecting in the path of travel of a coin deposited in said chute and balanced to be tipped by such coin after being released from said pins, suitably-disposed figures adapted to imprint numbers, connections between said figures and said lever-arm, said connections being adapted to regularly advance said figures to counting position as often as said arm is tipped, a batten or battens adjacent to the figures in counting position, connections for feeding material upon which an imprint may be taken between the figures and battens, and a lever adapted to move said battens against said material and press the same against said figures.

396,787. SHOE. HARRIS WARD, Leon, Ill. Filed Feb. 2, 1888. Serial No. 262,797. (No model.)

Claim.—A shoe having the quarters in two sections, A and B, substantially as described, A being provided above the counter with an extension, C, and B cut away to correspond with the extension C, so that when the shoe is completed the seam which unites the quarters above the counter falls on the inner side of the center of the heel.

396,788. EAR-JEWEL. GEORGE W. WASHBURN, West New Brighton, N. Y. Filed July 13, 1888. Serial No. 279,225. (No model.)



Claim.—1. The combination, with an ear-wire or the like, of a hollow fastening-nut comprising an internal spring-plate in the form of an annular disk having inwardly-projecting and rearwardly-flexible arms which grasp the wire between their ends, and annular front and back plates united at the perimeter of the nut, with the margin of said spring-plate between their margins, said front plate having an abutment for said arms on its inner side and said back plate forming a flexing-space behind said arms, substantially as hereinbefore set forth.

2. In combination with an ear-wire or the like, of plain wire, a hollow fastening-nut comprising an internal spring-plate having inwardly-projecting and rearwardly-flexible arms which grasp the wire between their ends, and a rearwardly-projecting pull-piece connected with said arms for retracting them to release the nut, substantially as hereinbefore set forth.

3. In combination with an ear-wire or the like, a hollow fastening-nut provided with an internal spring-plate having inwardly-projecting arms which grasp the wire between their ends, a pull-piece connected at its inner end with said arms and having at its protruding

rear end a convex-backed head, and a back plate having a convex outer surface opposed to the latter, substantially as hereinbefore set forth.

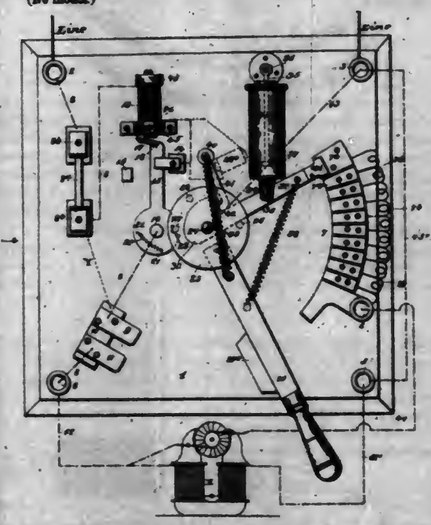
396,789. MACHINE FOR THREADING SHEET-METAL RINGS. WILLIAM WEBER, Camden, N. J. Filed Sept. 25, 1888. Serial No. 286,263. (No model.)

Claim.—1. In a threading-machine, the combination of the revolving disks H I, the threaded chucks T, journaled therein, the lever-arms pivoted to the disks, the threaded chucks F', journaled in the lever-arms and adapted to close against the chucks T, the cams to operate the lever-arms, and means for positively rotating the chucks T, substantially as described.

2. In a threading-machine, the combination of the revolving disks H I, the threaded chucks T, journaled therein and having the gears U, the lever-arms pivoted to the disks, the threaded chucks F', journaled in the lever-arms and having the gears G', the gears Z, engaging gears U, the gears B', engaging gears Z and G', and cams for moving the lever-arms, substantially as described.

3. The combination of the revolving shaft having the disks H I, the threaded chucks T, journaled in the disks and having the pinions S, the threaded chucks F', mounted so as to move relatively to chucks T, and the gear P, loose on the shaft and engaging said pinions S, and means, substantially as set forth, to rotate the gear P.

4. The combination of the revolving shaft having the disks, two sets of chucks supported by the disks, one set of chucks being movable relatively to the other set, the gears S, the gears O P, loose on the shaft and secured together, said gear P engaging the gears S, the gear D, loose on the shaft, the driving-shaft having the gear G, engaging gear D, the shaft L, journaled in the disks and having the gear M, engaging gear D, and the gear N, engaging gear O, substantially as described.



5. In a threading-machine, the combination of the revolving shaft having the disks H I, the gear P, loose on said shaft, the shafts R, journaled in the disks and having the chucks T, the gears U and gears S, the latter engaging the gear P, the shafts Y, journaled in the disks and having the gears Z, engaging gear U, the shafts A', journaled in the disks and having the gears B', engaging gears Z, the lever-arms fulcrumed on the shafts A', the cams to operate said arms, the shafts E', journaled in the lever-arms and having the chucks F' and gears G', the latter being at all times in engagement with the gears B', and mechanism, substantially as described, to rotate the gear P.

396,790. SWAB FOR LIQUID BLACKING. GEORGE S. WOLFF, Philadelphia, Pa. Filed Jan. 6, 1888. Serial No. 257,752. (No model.)

Claim.—The within-described device for applying liquid blacking, said device consisting of a carded web of wool held in the form of an open elastic swab, all substantially as specified.

396,791. AUTOMATIC SWITCH FOR ELECTRIC MOTORS. GEORGE H. WHITTINGHAM, Baltimore, Md. Filed May 12, 1888. Serial No. 273,065. (No model.)

Claim.—1. A switch comprising an operating-lever carrying a circuit-closing plate, a resistance, an arm extending from the operating-lever to the resistance and connected with a dash-pot, and a device connected with the operating-lever for maintaining the arm against movement until said operating-lever is connected with the circuit which it is adapted to close, substantially as specified.

2. The combination, with the lever and resistance, of a switch-bar and a latch arranged in the path of the lever to be operated in one direction and a spring for operating the latch in the opposite direction, a keeper, and a magnet for controlling the keeper, substantially as specified.

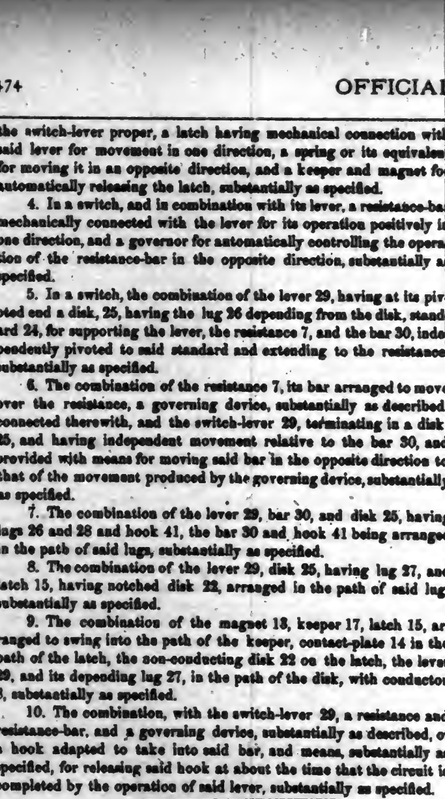
3. In a switch, and electrically connected with the conductors thereof, a resistance, a resistance-bar, mechanism, substantially as described, for automatically controlling its movement in one direction,

the switch-lever proper, a latch having mechanical connection with said lever for movement in one direction, a spring or its equivalent for moving it in an opposite direction, and a keeper and magnet for automatically releasing the latch, substantially as specified.

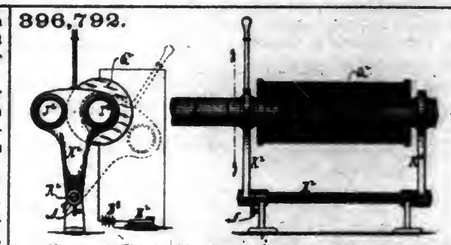
4. In a switch, and in combination with its lever, a resistance-bar mechanically connected with the lever for its operation positively in one direction, and a governor for automatically controlling the operation of the resistance-bar in the opposite direction, substantially as specified.

5. In a switch, the combination of the lever 29, having at its pivoted end a disk, 25, having the lug 26 depending from the disk, standard 24, for supporting the lever, the resistance 7, and the bar 30, independently pivoted to said standard and extending to the resistance, substantially as specified.

6. The combination of the resistance 7, its bar arranged to move over the resistance, a governing device, substantially as described, connected therewith, and the switch-lever 29, terminating in a disk, 25, and having independent movement relative to the bar 30, and provided with means for moving said bar in the opposite direction to that of the movement produced by the governing device, substantially as specified.



7. The combination of the lever 29, bar 30, and disk 25, having lugs 26 and 28 and hook 41, the bar 30 and hook 41 being arranged in the path of said lugs, substantially as specified.



8. The combination of the lever 29, disk 25, having lug 27, and latch 15, having notched disk 22, arranged in the path of said lug, substantially as specified.

9. The combination of the magnet 13, keeper 17, latch 15, arranged to swing into the path of the keeper, contact-plate 14 in the path of the latch, the con-conducting disk 22 on the latch, the lever 29, and its depending lug 27, in the path of the disk, with conductor 8, substantially as specified.

10. The combination, with the switch-lever 29, a resistance and resistance-bar, and a governing device, substantially as described, of a hook adapted to take into said bar, and means, substantially as specified, for releasing said hook at about the time that the circuit is completed by the operation of said lever, substantially as specified.

396,792. ELECTRO-MAGNETIC TRANSMITTER. JOHN T. WILLIAMS, Mount Vernon, N. Y. Filed May 1, 1886. Serial No. 200,944. (No model.)

Claim.—1. The combination, with a series of helices placed at suitable distances apart, and with a tube, trough, or track extending through said helices, of a flexible core or carriage which can freely pass through said helices, a series of independent circuit-closers, one for each helix, consisting of spring-tappets adapted to be actuated by the core or carriage, and contact-pieces and the connections of the helices with a dynamo-machine or other source of electricity, substantially as described.

2. The combination, with a series of helices placed at suitable distances apart, and with a tube, trough, or track extending through said helices, of a flexible core or carriage consisting of two heads and an intermediate flexible magnetizable material which can freely pass through said helices, a series of circuit-closers, one for each helix, detached from said carriage, and their connections with a dynamo-machine or other source of electricity, said circuit-closers being actuated by the passing carriage, and serving to close and break said circuits through the successive helices in the series, substantially as described.

3. The combination, with a series of helices placed at suitable distances apart, and with a suitable tube, trough, or track extending through said helices, of a core or carriage which can freely pass through said helices, two or more anti-heating collars secured to said carriage, a series of circuit-closers, one for each helix, and the connections of said helices with a dynamo-machine or other source of electricity, substantially as described.

4. The combination, with a series of helices placed at suitable distances apart, and with a tube, trough, or track extending through said helices, of a flexible core or carriage which can freely pass through said helices, two or more anti-heating collars secured to said carriage, a series of circuit-closers, one for each helix, and their connections with a dynamo-machine or other source of electricity, substantially as described.

5. The combination of a tube, trough, or track, helices placed at suitable distances apart thereupon, a circuit-closer for each helix, connections between the helices and a dynamo or other source of electricity, a traveling carriage which actuates the circuit-closers, and an electro-magnetic brake for stopping the carriage, substantially as described.

6. The combination, with a tube, trough, or track, of a magnetizable carriage, an electro-magnetic brake mounted on the tube, trough, or track, a battery or other source of electricity having a circuit through the brake, and a circuit-closer connected with the brake for closing the circuit through the latter to stop the carriage, substantially as described.

7. The combination, with a tube, trough, or track, of a magnetizable traveling carriage and an electro-magnetic brake mounted on the tube, trough, or track, and disconnected from the carriage for stopping the latter, substantially as described.

8. The combination, with a tube, trough, or track, of a magnetizable traveling carriage, a tubular brake-helix, through which the tube, trough, or track passes, a battery or other source of electricity having a circuit through the brake-helix, and a circuit-closer connected with the brake-helix for closing the circuit therethrough to stop the carriage, substantially as described.

9. The combination of a tube, trough, or track, a series of helices at suitable distances apart, a series of circuit-closers, one for each helix, connections between the helices and a dynamo-machine or other source of electricity, a traveling carriage which operates the circuit-closers, and a laterally-movable carriage-supporting switch for diverting the carriage out of line with the main portion of the tube, trough, or track, substantially as described.

10. The combination of a tube, trough, or track, a series of helices at suitable distances apart, a series of circuit-closers, one for each helix, connections between the helices and a dynamo-machine or other source of electricity, a traveling carriage which operates the circuit-closers, an electro-magnetic brake for stopping the carriage, and a laterally-movable carriage-supporting switch for diverting the carriage out of line with the main portion of the tube, trough, or track, substantially as described.

11. The combination of a tube, trough, or track, a series of helices at suitable distances, a series of circuit-closers, one for each helix, connections between the helices and a dynamo-machine or other source of electricity, a traveling carriage movable through the helices and which operates the circuit-closers, and a carriage-supporting switch consisting of a movable section of the tube, trough, or track, for moving the carriage out of line with the main portion of the tube, trough, or track, substantially as described.

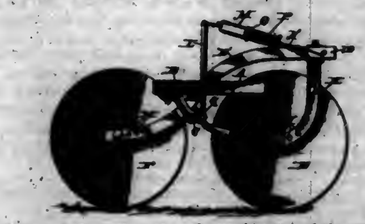
12. The combination, with a tube, trough, or track and carriage-impelling helices thereupon at suitable intervals, of a carriage consisting of two heads and a flexible magnetizable connection between the heads, substantially as described.

13. The combination of a tube or track, electro-magnets, a traveling carriage impelled by the electro-magnets, an electro-magnetic brake mounted on the tube or track to stop the carriage, and a carriage-supporting switch-section movable into and out of line with the main portion of the tube or track, substantially as described.

14. The combination, with a carriage, G, composed of two heads and a magnetizable flexible connection between the heads, of a helix, G, mounted on said flexible connection, a battery, g^6, located in one of the carriage-heads, and connections between the battery and helix, substantially as described.

15. The combination, with a tube, trough, or track, and with a magnetizable core or carriage adapted to move therein or thereon, of a brake-helix, a circuit-closer connected to the brake-helix and actuated by the moving carriage, a secondary electro-magnet for holding the circuit through the brake-helix closed, and the connections of the brake-helix and the secondary electro-magnet with a battery or other source of electricity, substantially as described.

16. The combination, with a tube, trough, or track, and with a magnetizable core or carriage adapted to move therein or thereon, of the switch-frame K^2, the latch for locking the switch-frame, and the electro-magnet L^2, for opening the latch, substantially as described.



17. The combination, with the carriage G, of anti-heating collars g^4, substantially as described.

18. The combination, with the carriage G, of anti-heating collars g^4 and slots g^5 in the said collars, substantially as described.

19. The combination, with the brake-helix G^2, of the electro-magnet L^2 and the armature M^2, to maintain a circuit in the brake-helix G^2 until the connection is otherwise broken, substantially as described.

20. The frame K^2, mounted on the rock-shaft R^2 and carrying the sections J^2 I^2 of the main tube or track, in combination with a brake-helix and a circuit-closer, substantially as and for the purpose described.

396,793. RIDING-PLOW. HENRY W. WILDMAN, Leon, Ill. Filed Oct. 26, 1888. Serial No. 289,163. (No model.)

Claim.—1. In a wheel-plow, the combination of the axle B, extended laterally from said plow and suitably attached to said plow, and the frame D, supported at each end by carrying-wheels E and F and attached at some point between said wheels to the outer end of said axle, substantially as shown, and for the purpose specified.

2. In a wheel-plow, the combination of the axle B, the frame D, attached intermediately to said axle, wheels E and F, seated, respectively, on the ends of said frame, and suitable means to prevent the inversion of said frame, substantially as shown, and for the purpose described.

3. In a wheel-plow, the combination of the frame A, axle B, rod-straining-bar L, seated intermediately of said axle and attached at its inner end to said frame, arm N, stirrup M, the spring P, and frame D, substantially as shown, and for the purpose specified.

396,794. FODDER-CUTTER. JACOB S. WEIMER, Canton, Ohio. Filed Oct. 8, 1888. Serial No. 287,543. (No model.)

Claim.—1. In a fodder-cutter, the combination of the cutter-bar C, provided with the bent or curved fingers *d*, and the cylinder B, provided with the twisted wings D and having attached thereto the cutting-knives *b*, said cutting-knives being bent or curved to correspond with the curvature of the fingers *d*, substantially as and for the purpose specified.

2. In a fodder-cutter, the combination, with the cutter-bar C, provided with the concaved fingers *d*, of the cylinder B, the wings D, and the cutting-knives *b*, substantially as and for the purpose specified.

3. The cutter-bar C, provided with the bent or curved fingers *d*, the strengthening-rib *c*, the cylinder B, provided with the twisted wings D, and the bent or curved cutting-knives *b*, substantially as and for the purpose specified.

4. The cutter-bar C, provided with the bent or curved fingers *d*, the cylinder B, provided with the wings D, and the cutting-knives *b*, having their outer ends bent below the heels of said knives *b*, substantially as and for the purpose set forth.

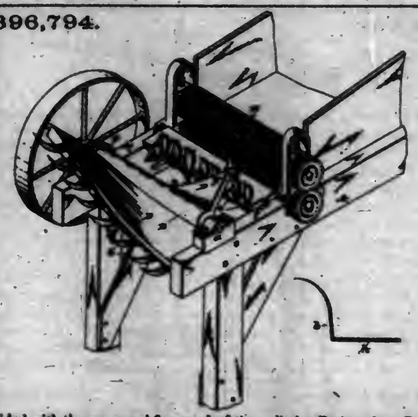
396,795. ELECTRIC SIGNALING APPARATUS. JOHN YOUNG, Chicago, Ill., assignor to the Western Electric Company, same place. Filed July 13, 1886. Serial No. 133,011. (No model.)

Claim.—1. The combination, with the wheel or presser *f*, of a series of keys or levers, *b*, normally closed against corresponding contact-points, *c*, and the clock-work and the contact-points *d* of the battery-circuit, whereby the keys or levers *b*, respectively, are disconnected momentarily from their normal contact-points and connected successively to the battery-circuit as the wheel or presser is brought against the said keys or levers, substantially as and for the purpose specified.

2. The combination, with the dial, of a series of double-contact keys and their contact-points, the arm *e*, operated by clock-work, and provided with a wheel or presser at each end, whereby the keys are depressed successively as the arm is rotated by the clock-work, substantially as and for the purpose specified.

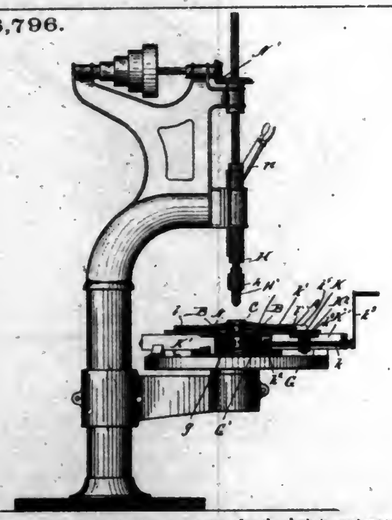
396,796. MACHINE FOR MAKING METAL WHEELS. GEORGE J. ZIMMERMAN, La Porte, Ind., assignor to the Niles & Scott Company, same place. Filed Oct. 27, 1888. Serial No. 289,278. (No model.)

Claim.—1. The combination, with a chuck for clamping and centering the wheel, of a revolving tool having a central cutting portion, H', and provided with a depending cutter-flange, *h*, for simultaneously cutting or reaming off the ends of the spokes and cutting holding-notches or tenons therein, substantially as specified.



2. The combination, with a chuck for clamping and centering the rim or tire of the wheel, of a support for the hub and a revolving tool or reamer for cutting off the ends of the spokes on a true circle about the axis of the wheel, substantially as specified.

3. The combination, with a chuck for clamping and centering the rim or tire of the wheel, of a support for the hub and a revolving tool or reamer having a central cutting portion, H', for cutting off the ends of the spokes on a true circle about the axis of the wheel, said revolving tool having a cutter flange or shoulder, *h*, for simultaneously cutting holding-notches or tenons in the outer face of the spokes, substantially as specified.



4. The combination, with a chuck for clamping and centering the rim or tire of the wheel, of a support, *g*, for the hub to rest upon, a plate, N, above said support, having an opening for the lower end of the hub to fit in, and a revolving tool for cutting off the ends of the spokes, substantially as specified.

5. The combination, with a chuck for clamping and centering the

396,794.

396,796.

rim or tire of the wheel, of a support, *g*, for the hub to rest upon, a plate, N, above said support, having an opening for the lower end of the hub to fit in, and a revolving tool for cutting off the ends of the spokes, said tool having a cutter flange or shoulder for simultaneously cutting holding-notches or tenons in the outer face of the spokes, substantially as specified.

6. The combination, with the chuck, of a revolving tool, H', having a cutter flange or shoulder consisting of independently-adjustable knives *h*, substantially as specified.

7. The combination, with a revolving tool, H', of independently-adjustable cutters *h* and a clamp-ring, *h'*, for securing said cutters to said revolving tool, substantially as specified.

8. The combination, with a revolving tool, H', furnished with shoulder H^3, of the individual cutters *h*, socket-ring h^3, having shoulders h^5 and screw-threads h^4, and screw-threaded holder-ring h^5, substantially as specified.

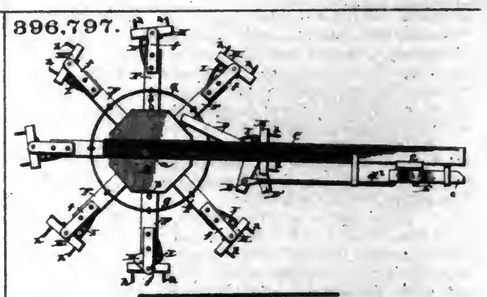
9. The combination, with revolving tool H', furnished with shoulders H^3, of the individual cutters *h*, socket-ring h^3, having shoulders h^5 and screw-threads h^4, and screw-threaded holder-ring h^6 and clamp ring *h'*, substantially as specified.

10. The combination, with a revolving reamer or tool, H', of table or bed G, radially-sliding chuck-clamps K, their guides K', adjusting-screws *k*, gears *k'*, and gear k^2, meshing with all said gears *k'*, substantially as specified.

11. The combination, with a revolving tool, of table or bed G, radially-sliding chuck-clamps K, screw-threaded blocks K^3, to which clamps K are adjustably secured, guides K', adjusting-screws *k*, gears *k'*, and gear k^2, substantially as specified.

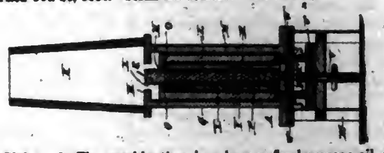
12. The combination, with radially-sliding clamps K, their guides K', and operating-screws *k*, of an adjustable support, *g*, for the hub of the wheel and a revolving tool, substantially as specified.

13. The combination, with radially-sliding clamps K, their guides K', and operating-screws *k*, of an adjustable support, *g*, for the hub of the wheel and a revolving tool, said tool having a flange or shoulder to cut notches or tenons in the faces of the spokes, substantially as specified.



14. The combination, with radially-sliding clamps K, their guides K', and operating-screws, of an adjustable support, *g*, for the hub and a plate, N, having a recess to receive the lower end of the hub, as specified.

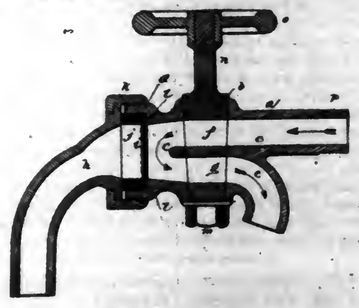
396,797. CHECK-ROW PLANTER. SQUIRE B. ALLEY, Selma, Kans. Filed Aug. 2, 1888. Serial No. 281,714. (No model.)



Claim.—The herein-described planter attachment, composed of the frame, the wheel having tappets on each side, the T-lever E, the elbow-levers D and D', connected with the arms of the T-lever, the cross-bars having prongs pivoted midway of their ends to the spokes of the wheel, and the springs secured at one end to the spokes and having their other ends bearing on the said cross-bars throughout their length, substantially as shown.

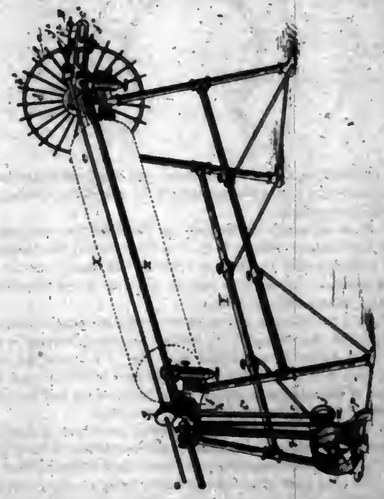
396,797.

396,798. BURNER. RUSSELL P. AMBLER, De Funiak Springs, Fla. Filed Oct. 20, 1887. Serial No. 252,987. (No model.)



Claim.—1. The combination, in a burner for kerosene-oil, of the base A, having the case G, the vertically-movable gland arranged in the case and having its upper end closed and provided with an opening, N, the wick-tube arranged in the said gland and communicating with the oil-reservoir, channels or spaces M and R being formed between the opposing sides of the case G, the gland, and the wick-tube, the said channels communicating with the outer air, substantially as described.

2. The combination, in a burner for kerosene-oil, of the base A, having the case G, provided at its upper end with the plate H, having the opening I, the vertically-movable gland arranged in the said case and having its upper end closed and provided with the opening N, the wick-tube arranged in the gland and communicating with the oil-reservoir, channels or spaces M R being formed between the opposing sides of the case, the gland, and the wick-tube, and said channels communicating with the outer air, substantially as described.



3. The combination, in a burner for kerosene-oil, of the base-plate provided with the openings S, and having the channel B communicating with the reservoir, the wick-tube arranged on the base and communicating at its lower end with the channel B, the vertically-movable gland L, arranged around the wick-tube and having its upper end closed and provided with an opening, N, above the upper end of the wick-tube, the casing G, supported on the base and arranged around the gland, the said casing having the plate H at its upper end provided with the opening I, for the purpose set forth, channels M and R being formed between the opposing sides of the casing, the gland, and the wick-tube, and communicating with the openings S, and the vertically-adjustable plate U, having the wedge-shaped studs W projecting upward through the openings S and supporting the gland, substantially as described.

396,799. AIR-FILTER. NAPOLEON BEAUREGARD, San Francisco, Cal. Filed Dec. 30, 1887. Serial No. 259,433. (No model.)

Claim.—In a faucet-filter, the combination of a body having two longitudinal passages and a plug passing through both passages, said plug having two perforations on the planes of the passages in the body, but askew with reference to each other, a filtering-diaphragm on the side of the plug away from the inlet, and an outlet on the side of the plug away from the diaphragm, all substantially as described.

396,800. FEED DEVICE FOR GIN-SAW SHARPENERS. WILLIAM BERAN and PAUL FRITSCHENER, Texarkana, Tex. Filed May 12, 1888. Serial No. 273,737. (No model.)

Claim.—1. An expanding feed-wheel having a flexible rim notched or provided with openings and made adjustable in the direction of its length, for the purpose of imparting a variable feed, substantially as shown and described.

2. An expanding feed-wheel consisting of a flexible rim notched or provided with openings and made adjustable in the direction of its length, in combination with a series of radial spokes sustaining said rim, and a central expanding hub for tightening said spokes and rim, substantially as shown and described.

3. An expanding feed-wheel, A, consisting of the combination of a flexible notched rim, *a*, radial spokes a^2, with feet b^2 for the rim made adjustable on the spokes, the hub-frame 71, carrying said spokes, and a conical or tapering collar, 70, arranged on the hub to bear against the spokes and adjust them outwardly, substantially as described.

4. The combination, with the expanding feed-wheel A, of the clamp 60, with tightening-screw 64, and the split-ring bushings 61 and 62 for centering the expanding wheel on shafts of different sizes, substantially as described.

5. The combination, with the hub 71 in the expanding wheel, and the conical collar 70, of the tightening-screw 81, the split clamping-frame 80 for said tightening-screw, and the tightening-screw 85 for the split clamping-frame, substantially as and for the purpose described.

6. The combination, with the adjustable screw-threaded conical collar 70, having socket 75, of the turning-handle 77, having pin 76, for turning said collar, substantially as shown and described.

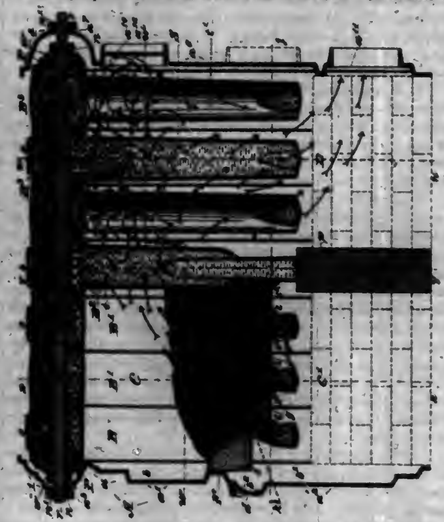
7. The combination, with the spokes in the expanding wheel having forked projections 94, projecting toward each other, of the headed screw 95, secured to the hub of the wheel, and a spiral spring, 96, arranged upon the screw between its head and the forked projections of the spokes to force the latter in toward the center, substantially as shown and described.

8. The combination of the expanding feed-wheel A, having toothed rim *a*, the frame a^3, with slot c^3, the worm-wheel f^2, shaft g^2, bearing h^2, and gear i^2, made together adjustable in the slot of the frame a^3 to correspond with the size of the feed-wheel, the shaft m^2, having gear-wheel j^2 made adjustable thereon, and fixed gear-wheel k^2, and the shaft *e*, having gear-wheel l^2 and connected with the driving mechanism, as described.

9. The combination, with the main frame Y, and rotary shafts Z and *e*, having the variable feed devices at one end, of the bracket-arm *f*, gear *g*, arranged on shaft *e*, cone-pulley *i* and gear *k*, arranged on shaft Z, vertically-adjustable post *q*, carrying shaft Z, band i^2, and cone-pulley *j*, with shaft and drive-pulleys, substantially as and for the purpose described.

396,801. CIGAR-PERFORATING MACHINE. ERNST BERNHARDT, Newport, Ky. Filed Mar. 12, 1888. Serial No. 266,966. (No model.)

Claim.—1. In a cigar-perforating machine, the combination, substantially as specified, of the bed-plate having end-guides, *a* F, leg-bearings *a'*, and a back stop, the reciprocating plate B *b*, movable in



396,801.

said guides, the bar C, and points D, secured in said bar, the buttons *b'*, for securing said bar to the plate B, having a projecting flange, *b*, the rock-shaft E, crank-arms E', and links G, connecting said crank-arms to the plate B, and the lever H, secured upon said shaft for the purpose of rocking the same, and thereby imparting a reciprocating movement to the plate B and the piercing-points carried by it.

2. The combination, substantially as specified, of the bed-plate A, having upwardly-projecting bars *a* a^3, lugs *a'*, and stop-bolt a^5, and the angle-pieces F, secured thereon, the reciprocating plate B, having a projecting flange, *b*, needle-bar C, and needles D, the buttons *b'*, to secure said needle-bar in place, the rock-shaft E, crank-arms E', and links G, connecting said crank-arms, and the plate carrying the piercing-points D, and the lever H, secured upon said shaft for the purpose of rocking the same, and thereby actuating the piercers, the whole constructed to operate in the manner set forth.

396,802. HOT-WATER HEATING APPARATUS. NATHANIEL A. BOYNTON, New York, N. Y., assignor to the Boynton Furnace Company, same place. Filed Oct. 31, 1888. Serial No. 289,617. (No model.)

Claim.—1. A hot-water heating apparatus which is composed, essentially, of transversely-placed intercommunicating water-sections, each of which has vertical side passages, transverse horizontal top and bottom passages, and longitudinal top and bottom passages, the longitudinal top passages being in plane with the transverse horizontal top passages and the longitudinal bottom passages being in plane with the transverse horizontal bottom passages, a front closing-plate or end section which has an opening for supplying fuel, and a rear closing-plate or end section which has a smoke-exit opening, substantially as set forth.

2. In a hot-water heating apparatus, the combination, with the combustion-chamber, the bottom transverse water-passages, and the transverse grate-sections, of the front plate or end section provided with the opening b^3 and door *d*, and the intermediate fire-brick lining having the recess *f'* coincident with the opening b^3 and with the upper surface of the transverse water-passages, and the corresponding grate-sections, substantially as and for the purposes described.

3. A hot-water heating apparatus the fuel-chamber of which has at its bottom transversely-placed water-tubes which connect with the side walls of the chamber, and which are provided upon their sides with longitudinal ledges for the support of the grate-sections of such fuel-chamber, such water-tubes and such grate-sections being arranged in alternation side by side, and constituting together the fuel-support of such heating apparatus.

4. In a hot-water heating apparatus, the combination, with the fuel-chamber thereof, of transverse water-circulating tubes, each of which has a curved upper surface and a longitudinal supporting-ledge, and grate-sections which are provided with transverse bars which have an end bottom-curved overhang which coincides with the curvature of the upper portion of the transversely-extending water-tubes.

5. In a hot-water heating apparatus, the combination, with the lateral walls of the combustion and fuel chamber thereof, of transversely-extending water-circulating tubes, and independent detachable transversely-extending grate-sections, the upper surface of which is in a plane with the upper extremity of the water-circulating tubes, whereby the grate-sections and the water-tubes each constitute a part of the fuel-bearing surface.

6. In a hot-water heating apparatus, a combustion-chamber the fuel-space of which is closed at its sides, at its top, and at its bottom by vertical water-sections which are placed in continuous contact, at the rear by a bridge-wall water-passage, and at the front by an exterior closing-plate and an interior fire-brick lining.

7. In a hot-water heating apparatus, the combination, with the water-sections B, B' B', and B², having inwardly-projecting curved vertical surfaces, of the grate-sections G, having tapered and inwardly-curved ends, substantially as and for the purposes set forth.

8. In a hot-water heating apparatus, a water-section which embraces top transverse water-passages, a top longitudinal water-passage, side vertical water-passages, a bottom horizontal water-passage which constitutes a bridge-wall, and vertical water-tubes which connect the top transverse water-passages with the transverse bridge-wall water-passage.

9. In a hot-water heating apparatus, the combination, with the water-sections B, B' B', and B², having projecting grate-supports, as described, of the cross-barred grate-sections G, adapted to such grate-supports, and the fire-brick lining F', having the slicing recess or passage *f*, coincident with the upper surface of the grate-sections, substantially as and for the purpose described.

10. In a hot-water heating apparatus, the combination of a series of centrally-open combustion-chamber water-sections, a bridge-wall water-section, a series of smoke-chamber water-sections, each having side and intermediate vertical water-tubes, and front and rear closing-plates or end sections, the several water-sections and closing-plates being connected together for operation, substantially as described.

11. In a hot-water heating apparatus, the combination of centrally-unobstructed combustion-chamber water-sections, a bridge-wall water-section and smoke-chamber water-sections, each of which is provided with intermediate vertical water-circulating tubes, each of which is non-coincident with the vertical tubes of the contiguous water-section, thereby forming zigzag smoke-flues, a front closing-plate or door-section, and a rear closing-plate which has an upper direct exit-opening and a lower indirect exit-opening which is in a plane below the lower extremity of the several water-sections, whereby, when the direct exit-opening is closed, the products of combustion are caused to pass first across the surfaces of the vertical water-tubes and then downwardly across the surfaces of the bottom horizontal tubes of the smoke-chamber water-sections, substantially as and for the purposes set forth.

12. The combination, in a hot-water heating apparatus, of front and rear closing-plates or end sections, each having perforations for a securing-rod, intermediate water-sections, each having vertical side passages, transverse and longitudinal horizontal bottom passages, a central longitudinal horizontal top passage, and transverse horizontal top passages which abut upon and discharge into the longitudinal top passage, and securing-rods which extend from end to end of the assembled longitudinal passages and through the perforations in the closing-plates or end sections.

13. In a hot-water heating apparatus, the combination, with a series of transversely-placed water-sections, each having transverse horizontal passages and each having longitudinal water-passages in a plane with and communicating directly with the transverse horizontal passages and with end sections or closing-plates having perforated bosses, as described, of longitudinal holding-rods which extend through the longitudinal water-passages and through the perforations, the securing-plate P, washer *w*, and nut *n*, inside the end sections, for clamping the water-sections, and the securing-nut *n'*, for clamping the closing-plates or end sections to the series of water-sections.

14. A hot-water heating apparatus which embraces a series of vertically and transversely placed water-sections, each of which has right and left vertical water-passages, a bottom transverse water-passage, bottom longitudinal water-passages, a top central longitudinal water-passage, and top transverse water-passages which open directly into the top central longitudinal water-passage, a front closing-plate which has openings for fuel-supply, fuel-agitation, and refuse-discharge, and a rear closing-plate which is provided with a smoke-exit opening, the parts being connected for operation, as described.

396,803. WATER-CLOSET-SEAT PROTECTOR. ROSELLEBY BARNES, Chaska, Minn. Filed Oct. 18, 1888. Serial No. 288,800. (No model.)

Claim.—1. In an adjustable cover such as described, the combination, with the sections A A', of a hinge connecting their proximate ends and a movable pivotal connection between the leaves of the hinge and sections, whereby the sections may be moved longitudinally of the leaves and swung thereon to vary the size of the opening, substantially as described.

2. In an adjustable cover such as described, the combination, with the arc-shaped sections A A', of a hinge having the arc-shaped leaves and adjustable connections between said leaves and the arc-shaped sections, whereby they may be adjusted in the direction of their arcs, substantially as described.

3. In a portable and adjustable cover such as described, the combination, with the sections A A', having the slots or sockets in their ends, of the adjustable connection consisting of a hinge, the leaves whereof are each pivoted and movably secured within the sockets in the ends of the sections to permit of the longitudinal and lateral adjustment of the sections, substantially as described.

4. The combination to form a portable cover such as described, of the two sections A A' and an interposed connection, A³, uniting the ends of the sections, comprising two leaves hinged together and provided with slots, each of said slotted leaves being attached to the end of one of the sections by a pin, whereby the sections are permitted a longitudinal and lateral movement, as set forth.

5. In an adjustable cover such as described, the combination, with the two sections A A', each composed of the hinged sections *a a'*, of the hinge having the two leaves and adjustable connections between the leaves and sections A A', substantially as and for the purpose specified.

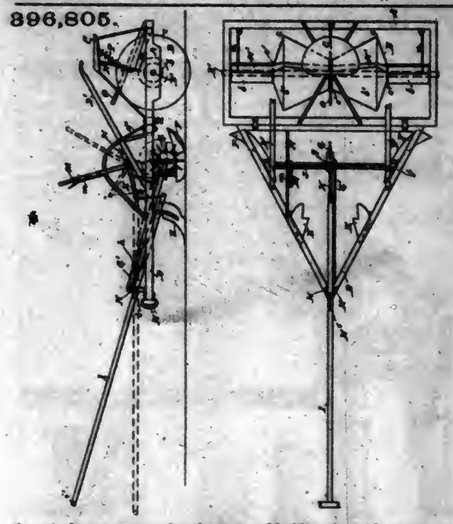
6. In combination with the arc-shaped sections A A', each formed of two segments hinged together to fold flat, a hinge having the intermediate connecting-link, A³, interposed between and connecting the proximate ends of said sections, as and for the purpose set forth.

7. In a portable cover such as described, the combination, with the folding sections A A', each provided with a slot, as at a^9, of the hinge-connection A³, consisting of two leaves hinged to an intervening link, and each formed with a slot, said leaves being received in the slots in the ends of the sections and held therein by pins passing through the slots, as and for the purpose specified.

396,804. LINIMENT. WILLIAM R. REID, St. Margaret's Bay, Nova Scotia, Canada. Filed Nov. 30, 1888. Serial No. 292,296. (No specimens.) Patented in Canada June 26, 1887, No. 27,076.

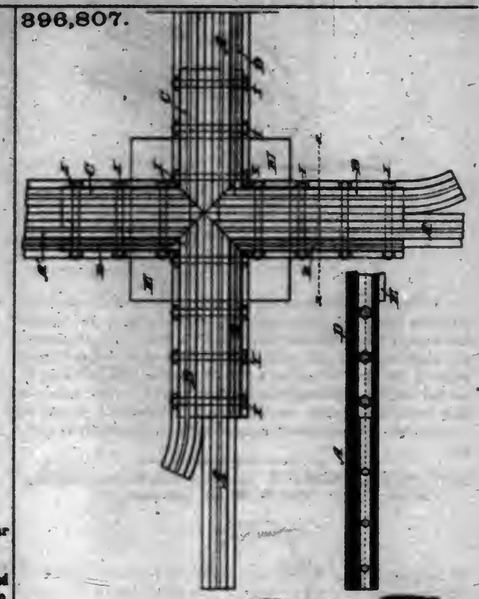
Claim.—The herein-described composition of matter to be used as a preventive against and for the relief of the bites of mosquitoes, black flies, and other insects, consisting of castor-oil, kerosene-oil, glycerine, and essence of peppermint, substantially in the proportions specified.

396,805. CULTIVATOR FOR LISTED CORN. JOSEPH W. BROWN, Miltonvale, Kans. Filed May 26, 1888. Serial No. 276,103. (No model.)



Claim.—1. In a cultivator for listed corn, the combination, with a frame, of a tongue pivoted to the front end of the frame, a hand-lever connected to the rear end of said tongue for raising the front end of the frame, a sectional lister trench-roller journaled at the rear of the frame, and the blades secured to the frame intermediate between the said tongue and roller, substantially as and for the purpose set forth.

2. In a cultivator for listed corn, the combination, with the frame, of the uprights secured to the front end of the frame, the tongue pivoted to said uprights, an arm and a hand-lever pivoted to the frame, and a chain connecting the free end of the arm with the rear end of the tongue, substantially as and for the purpose set forth.



3. In a cultivator for listed corn, the combination, with the frame, of the uprights secured to the front end of the frame, the tongue and the spacing-wheel lever pivoted to said uprights, an arm and a hand-lever pivoted to the frame, and separate chains connecting the said arm with the rear end of the tongue and with the said lever, respectively, substantially as and for the purpose set forth.

4. In a cultivator for listed corn, the combination, with the listing trench-roller, of the scraper bearing against the surface of the roller and provided with a projecting handle, the arms projecting rearwardly at right angles to the scraper and pivoted to the frame, and the spiral spring secured to the seat and holding the said scraper clear of the roller, substantially as and for the purpose set forth.

396,805.

396,807.

396,806. SPRING-BED. EDWARD H. CAYLOR, Columbus, Ohio, and CHARLES H. MCCHESNEY, Belvidere, Ill. Filed June 6, 1887. Serial No. 240,435. (No model.)

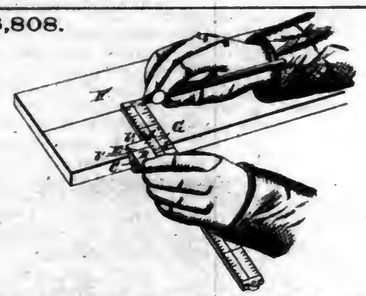
Claim.—A bed-bottom consisting of a series of longitudinal slats, each of said slats being independent of the other and bearing a series of longitudinal springs, said springs constituting the support for the bed-mattress, and an independent series of adjusting cross-stays connecting adjacent slats and constituting the only connection between said slats, said cross-stays consisting of connected coils resting, respectively, upon the upper surfaces of adjacent slats, and having retaining-clips biting into the under surfaces of said slats, whereby the width of the bed-bottom may be varied by moving the slats toward or from each other and the bed-bottom may be rolled, substantially as described.

396,807. RAILWAY-CROSSING. JAMES T. CLARK, Milwaukee, Wis.; Mary P. Clark administratrix of said James T. Clark, deceased. Filed Feb. 6, 1888. Serial No. 263,122. (No model.)

Claim.—1. The combination, with the intersecting main rails of a railway-crossing, of lateral re-enforcements having longitudinally-inclined treads which ascend toward the intersections of the main rails to the level of the treads of said main rails, substantially as and for the purposes set forth.

2. The combination, in a railway-crossing, with the main rails, of inclined rails or re-enforcements applied to the sides of said main rails, and having their top faces inclined downwardly toward the approaches to the crossing, substantially as and for the purpose set forth.

3. The combination, with the main rails of a railway-crossing, of inclined rails or re-enforcements, each adapted at the head and base to the head and base of the adjacent main rail and secured to the outer side thereof, and having its top bearing-face inclined downwardly toward its outer end, substantially as and for the purpose set forth.



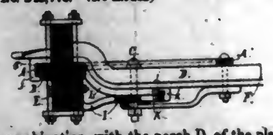
4. The combination, with the intersecting rails of a railway-crossing, of inclined rails or re-enforcements placed outside of and adjacent to said rails, and having their bearing-faces gradually inclined from their outer ends upwardly toward the intersections of the crossing to the level of the top faces of the main rails, substantially as and for the purpose set forth.

396,808. GAGE-HEAD FOR POCKET-RULES. GEORGE W. COBURN, Belleville, Kans. Filed Apr. 26, 1888. Serial No. 271,964. (No model.)

Claim.—1. A gage-head for pocket-rules, consisting of a rectangular plate having a line, E, on its upper surface, and a finger-opening formed vertically through it near one end, and a flange depending from said plate at right angles to its under surface, as set forth.

2. A gage-head for pocket-rules, consisting of a flat plate portion, B, provided with opposite parallel edges *b b'*, an edge, b^9, on its inner end at right angles to said parallel edges, a suitable opening, D, adjacent to its outer rounded edge for the insertion of the point of the index or fore finger, and the flange C, depending from the plate B, at right angles to the edges *b b'* and at a suitable distance from the edge b^9, substantially as described.

396,808.

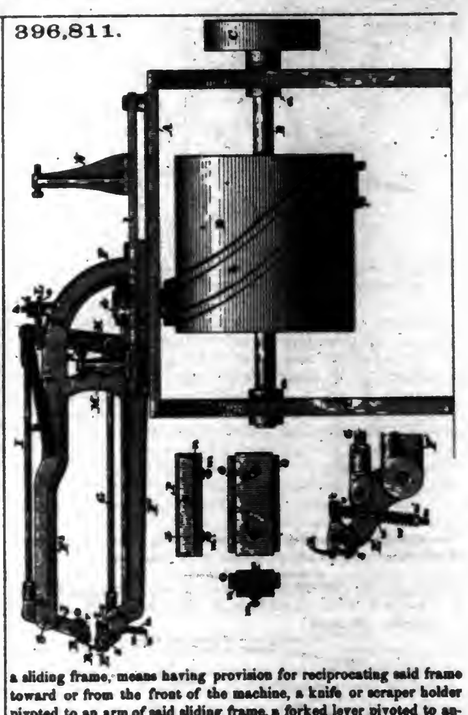


3. The herein-described gage-head for pocket-rules, consisting of the metal plate B, provided with the finger-opening D, the parallel side edges, *b b'*, and the inner end edge, *b²*, at right angles to said parallel edges, and having the score-line E across its upper surface at right angles to the edges *b b'* and at a suitable distance from the edge *b²*, and the flange C, depending from the plate B, with its inner surface at right angles to said plate and aligned with the score-line E, and its outer surface inclining toward its inner surface, substantially as specified.

396,809. RESPIRATOR. HUGH M. COCHRAN, McConnellsville, Ohio. Filed Dec. 10, 1888. Serial No. 293,161. (No model.)

Claim.—A head-protector and breathing-cap consisting of an air-space, *k*, in combination with an oxygen-chamber, an opening, *i*, communicating between said oxygen-chamber and air-space, an opening, *g*, communicating between said air-space and the external air, a stopper for said opening *i*, a stopper for said opening *g*, and a chain or cord connecting said stoppers, substantially as described.

396,810. FIFTH-WHEEL. SAMUEL B. COX and JOHN W. ANDERSON, Lancaster, Pa.; said Cox assignor to said Anderson. Filed Sept. 5, 1887. Serial No. 248,770. (No model.)



Claim.—The combination, with the perch D, of the plate A, having the rearwardly-extending arm L, provided with a recess, *j*, the axle-plate B, the perch-plate having the clip *f*, which engages the peripheries of the plates A and B, a connection between the axle and king-bolt, located beneath the arm L of the plate A and provided with a flanged lug which engages the recess in the said arm L, and the king-bolt, all constructed and arranged substantially as described.

396,811. MACHINE FOR STRETCHING HIDES OR SKINS. GEORGE B. DANFORTH, Lynn, Mass., assignor of one-half to Anton B. Hoffmann, same place. Filed Sept. 26, 1888. Serial No. 286,446. (No model.)

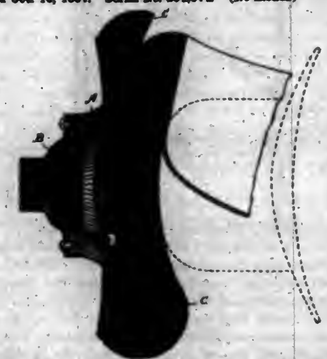
Claim.—1. In a machine for stretching hides or skins, the combination of a sliding frame, means having provision for reciprocating said frame toward or from the front of the machine, a knife or scraper holder pivoted to an arm of said sliding frame, a forked lever pivoted to another arm of said frame, a block of rubber rigidly secured in the forked end of said lever, means having provision for locking said lever and said knife-holder in position, with the edge of said knife in close proximity with one side of said block of rubber during the rearward movement of said reciprocating frame, means having provision for unlocking said lever and knife-holder when said frame is at or near its rearmost point, and means having provision for locking said lever and knife-holder when said frame is at or near the front of the machine.

2. In a machine for stretching hides or skins, the combination of

396,811.

a sliding frame, means having provision for reciprocating said frame toward or from the front of the machine, a knife or scraper holder pivoted to an arm of said sliding frame, a forked lever pivoted to another arm of said frame, a block of rubber rigidly secured in the forked end of said lever, a nearly vertical lever pivoted to said frame near its rear end, rods connecting said lever with said block-holding lever and said knife or scraper holder, means having provision for locking said vertical lever in its rearmost position when said frame is at or near the front end of the machine, a spring for moving the end of said vertical lever toward the front of the machine, and means having provision for unlocking said lever when the said sliding frame is at or near the rear end of the machine.

3. In a machine for stretching hides or skins, the combination of a sliding frame, means having provision for reciprocating said frame toward or from the front of the machine, a knife or scraper holder pivoted to an arm of said sliding frame, a lever pivoted to another arm of said frame and provided upon one end with a fixed rubber surface, means having provision for locking said lever and knife-holder in position, with the edge of said knife in close proximity with said rubber surface during the rearward movement of said reciprocating frame, means having provision for unlocking said lever and knife-holder when said frame is at or near its rearmost point and moving said knife farther to the front and said rubber surface farther to the rear, thus making a more convenient space or opening between said rubber surface and said knife for the admission or removal of the material being operated upon, and means having provision for locking said lever and knife-holder in their original positions when said frame is at or near the front end of the machine preparatory to again moving to the rear and operating upon the material seized between said rubber surface and said knife or scraper.



4. In a machine for stretching hides or skins, the combination of a sliding frame, a knife-holder pivoted to an arm of said frame, a lever pivoted to another arm of said frame and provided at one end with a fixed rubber surface, means having provision for locking said knife-holder and said lever when said frame is at or near the front end of the machine, so that the edge of the knife will be in close proximity to the said rubber surface during the rearward movement of said frame, means having provision for unlocking said lever and said knife-holder when said frame is near the rear end of the machine and moving said rubber surface and knife away from each other, a truck or roll secured to said frame, and a cam-wheel so situated and constructed as to engage with said truck and reciprocate said frame toward and from the front of the machine.

5. In a machine for stretching hides or skins, the combination of a reciprocating frame, a forked lever pivoted to the end of an arm of said frame, a box secured in a fixed position in the forked end of said lever and open at both ends, and a block of rubber mounted in

said box in such a manner that it is held in a fixed position therein when the machine is in use, but may be adjusted therein when desired.

6. In a machine for stretching hides or skins, the combination of a reciprocating frame, a knife-holder pivoted to an arm of said frame, a block pivoted to the outer end of said lever and provided with a rearwardly-extending arm, a rod pivoted to said arm and passing through said knife-holder, a nut mounted upon the lower end of said rod, springs interposed between said nut and the under surface of said holder and between the upper surface thereof and said arm, and a knife secured to said lever, all substantially as and for the purposes described.

396,812. HATTER'S BRUSH. WILLIAM A. FABER, Danbury, Conn. Filed Oct. 10, 1887. Serial No. 251,874. (No model.)

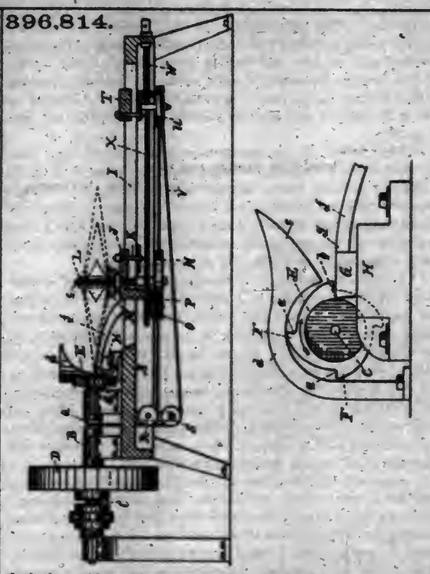
Claim.—The rotary brush having its face concaved, the bristles projecting from the edges or sides being longer than those extending from the face, whereby the concaved portion of the brush is adapted to operate on the crown of the hat, and the side or edge portion adapted to brush the brim of the hat, substantially as set forth.

396,813. BOOK-SHELF. JOHN M. D. FRANCE, St. Joseph, Mo. Filed Jan. 30, 1888. Serial No. 262,440. (No model.)

Claim.—In a book-shelf, the combination, with the casing F and the metallic grooved bars C, secured horizontally in mortises formed in the sides of said casing, of the sliding board A, the metallic bars B, secured to the sides of said board A, said bars B provided with a mortise, *b*, to receive the tenon *a* of the board A, and a tongue, *b'*, adapted to fit and slide in the groove *c* of the bar C, substantially as and for the purpose described.

396,814. MACHINE FOR TRIMMING WIRE SPOKES. PETER SWENSON, Toledo, Ohio. Filed Oct. 17, 1888. Serial No. 288,268. (No model.)

Claim.—1. In a machine for the purpose described, the combination of a rotary cutter-head provided with peripheral cutting-teeth, with a stationary knife-block operated in connection therewith, an adjustable wheel-support, and a rotary shaft positively and automatically operated from the mechanism actuating the said cutter-head, substantially as described.



2. In a machine for the purpose described, the combination of the rotary cutter-head, the stationary knife-block operating in connection therewith, and an adjustable wheel-support provided with a rotary shaft and dog to rotate the wheel.

3. In a machine for the purpose described, the combination of the rotary cutter-head provided with peripheral teeth, the stationary cutting-block adjusted in proximity to said teeth, the slidingly-adjustable wheel-support provided with a rotary wheel-carrier, and the guide-rails for guiding the spokes to the rotary knife, all arranged substantially as described.

4. In a machine for the purpose described, the combination, with the bed of the machine provided with a longitudinal slot, I, of the rotary cutter-head mounted at one end of the bed, the stationary cutting-block mounted upon the bed in proximity to the cutter-head, the wheel-support consisting of the bearings J, slidingly adjustably engaging with the slot of the bed and provided with the adjusting-screw X, and the rotary shaft L, provided with a dog, M, substantially as described.

5. In a machine for the purpose described, the combination, with

396,814.

the bed provided with the longitudinal slot I, of the rotary shaft C, the rotary cutter-head F, mounted thereon and provided with the peripheral cutting-teeth *a*, the stationary cutting-block G, mounted upon the bed in proximity to the rotary cutter-head, the slidingly-adjustable wheel-support mounted upon the bed and carrying the rotary shaft L and dog M, the guide-rails *d* and *f*, the drive-connection between the shaft C, and the rotary shaft of the wheel-support, all substantially as described.

6. In a machine for the purpose described, the combination, with the bed of the machine and the longitudinal slot I formed therein, of the rotary shaft C, mounted in suitable bearings thereon, the rotary cutter-head E, secured to said shaft and provided with the peripheral cutting-teeth F, the knife-block G, mounted upon the bed, the slidingly-adjustable wheel-support, the shaft L and dog M, mounted upon said wheel-support, the pulleys N and P, carried by the wheel-support, the pulley Q, mounted upon the shaft C, the pulleys R and S, stationarily mounted below the shaft C, the pulley U, adjustably mounted below the bed and provided with the adjusting-screw W, and the endless cord V, all the parts being arranged to operate substantially as and for the purpose described.

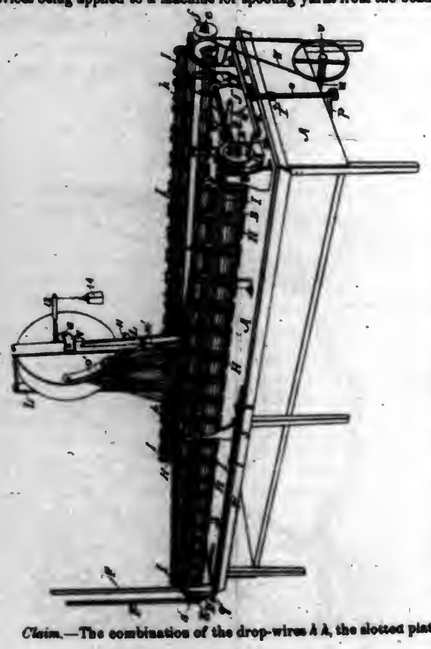
396,815. COUNTER. ELIJAH T. HARRIS, Chicago, Ill. Filed Oct. 29, 1888. Serial No. 289,466. (No model.)

Claim.—1. The combination, with two sections of a counter-front, of a casting provided with sockets adapted to receive the opposing ends of said sections, said casting being provided with a wing extending between the ends of the said sections to the rear, said wing extending laterally at the rear in opposite directions and secured by screws to the ends of said sections, substantially as and for the purpose specified.

2. As an article of new manufacture, a counter having a front made up of pieces placed edge to edge, said front being in sections, the different sections being secured rigidly together by castings between the different opposing ends thereof, said castings being each provided with sockets adapted to receive said ends and with a wing extending to the rear and rigidly secured to the opposing ends of the sections, substantially as and for the purpose specified.

3. A device for uniting two opposing ends or sections of a counter-front together, consisting of a casting conforming to the outline of the counter and provided with sockets adapted to receive the said opposing ends, and a wing extending to the rear and extended in opposite directions and rigidly secured to said ends inserted in said sockets by wood-screws, substantially as and for the purpose specified.

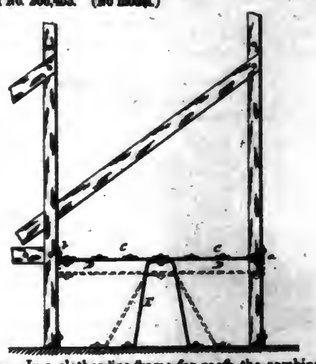
4. The combination, with the counter-top having saddles attached to the under side thereof, of an upright counter-front upon which said saddles rest, said front consisting of pieces placed with edges together, said pieces being held in place by braces or castings secured to said front, substantially as and for the purpose specified.



5. As an article of new manufacture, a counter consisting of the top, saddles secured thereto, said saddles being placed in line and resting upon the upper edge of the counter-front, said counter-front being in sections, the different ends of said sections being rigidly secured together by castings, and a brace secured centrally to the different sections of the counter-front, substantially as and for the purpose specified.

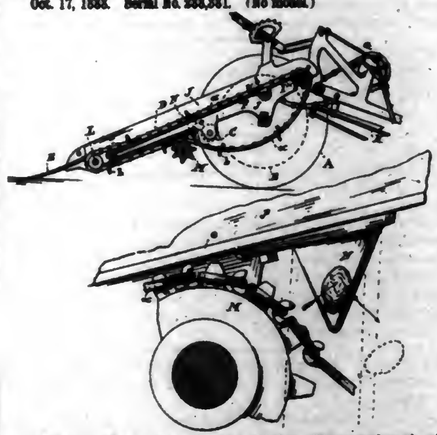
6. A counter-front made up in sections, each section consisting of longitudinal pieces placed one above the other and secured or braced by a casting, *a*, which conforms to the surface of the front and which is provided with arms projecting through the front, and a locking device for holding the brace in position, in combination with castings *c*, placed between the different sections and rigidly secured thereto, substantially as and for the purpose specified.

7. A brace, *a*, provided with projecting arms, said brace conforming to the outer surface of a counter-front and being secured thereto by locking devices inserted in the arms at the rear, substantially as shown and described.



396,816. MACHINE FOR SPOOLING YARN. FRANK HASKELL, Westbrook, Me. Filed Aug. 20, 1887. Serial No. 248,126. (No model.)

Brief.—The object of the invention is to provide improved devices for stopping the machine upon the breaking of a thread, the devices being applied to a machine for spooling yarns from the beam.



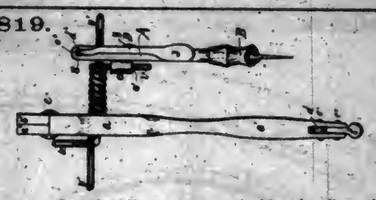
Claim.—The combination of the drop-wires *h h*, the slotted plates *i* and *i'*, plate i^2, having the opening, as described, the rocker *a'*, levers b^1 and *d'*, and guide 10, rod *c'*, gears *f'* and *k'*, catch *m'*, lever *k'*, rod *p'*, lever *q'*, rod *r'*, spring 3, and shipper-guide *s'*, substantially as described.

396,817. CLOTHES-LINE FRAME. FERDINAND W. HOFFLE, New York, N. Y., assignor to Eben S. Allen, same place. Filed Mar. 7, 1888. Serial No. 266,453. (No model.)

Claim.—In a clothes-line frame for roofs, the combination of the outer and inner supporting-frames, path-supports attached thereto, transverse slats attached to said supports, longitudinal slats attached to said transverse slats, and adjustable yokes of inverted-U shape attached at their lower ends to the roof and at their upper parts or bridges to the transverse slats, each of said yokes being composed of a single piece of metal possessing sufficient flexibility for adjustment, substantially as set forth.

396,818. POTATO-DIGGER. ISAAC W. HOOVER, Avery, Ohio. Filed Oct. 17, 1888. Serial No. 288,361. (No model.)

Claim.—1. In a potato-digger, catch-irons N, secured to the side plates of said digger with the face side thereof depending in front of the sprocket-wheels M in an oblique direction to the plane in which said wheels revolve, in combination with the flanges *c* of said plates, constructed and arranged in the manner as shown, and for the purpose described.



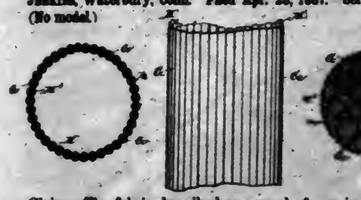
2. In a potato-digger, the endless elevator D, located between the side plates, J, sliding upon the stationary rack F, driven from the sprocket-wheels I I, and guided over the roller L, sprocket-wheels M M, arranged to carry the elevator on the return course and to free the chains thereof from deposits thereon, the catch-irons N, suspended from said side plates to ward off said deposits, and the side-plate flanges *c*, substantially as and for the purpose set forth.

396,819. TOOL FOR SPLICING WIRE. HERBERT G. HUBBELL, Havana, N. Y. Filed Aug. 21, 1888. Serial No. 282,580. (No model.)

Claim.—1. A wire-clamp having a graduated series of grooves between the fulcrum-disks and handles of the clamp, each disk having a radially-slotted opening, *g*, forming a cutting-edge, g^2, and each handle a bifurcated open end and locking mechanism mounted in the bifurcated ends, substantially as described.

2. The stock parts *a b*, having a graduated series of grooves and handles, *a' b'*, in combination with a locking rack and latch, the rack

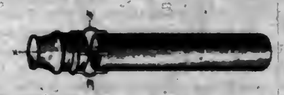
396,819.



being pivoted within the bifurcated free end of one handle, and the latch pivoted to turn within a like bifurcation of the other handle, substantially as described.

3. A wire-clamp consisting of stock parts united by a fulcrum-pin and having a graduated series of grooves between the fulcrum-disks and handles of the clamp, the largest groove of the series being nearest the fulcrum-pin, and the disks each having a radially-slotted opening forming cutting-edges, in combination with a locking rack and latch of the handles of the clamp, substantially as set forth.

4. A wire-winder consisting of the block A, having a bifurcated end, a laterally-projecting boss having a hole through it, and a latch pivoted in the side of the block to shut across its bifurcated end, substantially as described.



5. A wire-winder consisting of the block A, having a bifurcated end and a hole at right angles to the plane of bifurcation, in combination with a thumb-latch pivoted to shut across said bifurcation, substantially as described.

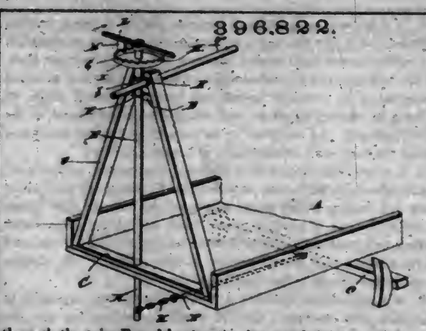
396,820. STIFFENING FABRIC FOR GARMENTS. NICHOLAS JENKINS, Waterbury, Conn. Filed Apr. 26, 1887. Serial No. 236,412. (No model.)

Claim.—The fabric described composed of a series of compound stiffeners of horse-hair or analogous elastic filaments and rubber, each of said compound stiffeners being covered, and the stiffeners of the series united by a covering of cotton or analogous yarns, G, extended across from one compound stiffener to the next, forming the fabric, as herein specified.

396,821. BICYCLE-WHISTLE. FREDERICK L. JOHNSON, Wallingford, Conn. Filed May 16, 1888. Serial No. 274,077. (No model.)

Claim.—1. The herein shown and described whistle, composed of a barrel, a mouth-piece having its lower edge of exactly the same size as and in direct line with the barrel, exterior arch-shaped stay-pieces connecting the mouth-piece and the barrel, the barrel being wholly unobstructed throughout its length and closed at the end opposite the mouth-piece, and a valve supported entirely in the mouth-piece and having its edge in the plane of the lower edge of the mouth-piece and having a continuous annular space between the edge of the valve and the wall of the mouth-piece, substantially as described.

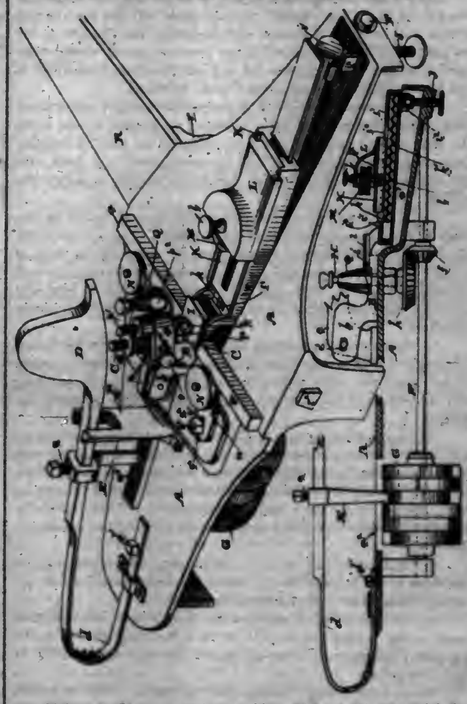
2. In a whistle, the combination, with the barrel and the mouth-piece, of the exterior arch-shaped stays connecting the mouth-piece with the barrel, substantially as set forth.



3. In a whistle, the combination, with the barrel and the mouth-piece having its upper end contracted, of the tubular valve fitted in the mouth-piece and having the sides at its upper end dented in, substantially as described, for the purpose specified.

396,822. BRAKE FOR HAY-WAGONS. FRANK E. LATHROP, Wichita, Iowa. Filed Oct. 30, 1888. Serial No. 289,554. (No model.)

Claim.—1. The combination, with a hay-rack, of the tube E, secured thereto in a vertical position and having the rack I at its upper end, the tube or rod K in the tube E, the lever pivoted at the upper end of said tube or rod K, adapted to rotate the same, and having the detent *M* to engage the rack, for the purpose set forth, and the chain or connection between the lower end of said tube or rod K and the brake-beam, substantially as described.



2. In brake attachments for hay-wagons, the combination, with the rack or standard, of the tube E, the clamp-bolt securing the same in a vertical position to the hay-rack, the tube or rod K, extending

396,822.

through the tube E and having the lever at its upper end, by which it may be turned, devices, substantially as set forth, to lock the tube or rod K in the tube E, the chain secured to the lower end of the tube or rod and adapted to be connected to a brake bar or beam, and the hook to engage the boom-pole, and having the collar at its inner end movable vertically on the tube E, substantially as described.

396,823. SAW-SETTING MACHINE. ALEXANDER LOGAN, Monterey, Cal. Filed Nov. 10, 1888. Serial No. 290,479. (No model.)

Claim.—1. In a saw-setting machine and in combination with the set-punch and anvil, the hammer having the spring-handle; the rod E, adjustable on the handle, and rotating cams acting on the rod to raise and relieve the hammer, whereby it delivers its blow, substantially as herein described.

2. In a saw-setting machine and in combination with the set-punch and anvil, the hammer having the spring-handle, the rod E, adjustable on the handle, and the series of rotating cams acting on the rod to effect the blow of the hammer, said cams having each a different number of acting-surfaces, whereby the number of blows in a given time is varied by the adjustment of the rod from one cam to another, substantially as herein described.

3. In a saw-setting-machine, a hammer having a spring-handle, an adjustable rod thereon, set-punch, and anvil, in combination with a rotary power-shaft having cams engaging said rod for operating the hammer, and a toothed wheel rotated by the power-shaft and engaging the teeth of the saw to effect its feed, said wheel having a conical shape, whereby its teeth are formed in converging planes to adapt it for different saws, substantially as herein described.

4. In a saw-setting machine, a hammer having a spring-handle, an adjustable rod thereon, and a set-punch and anvil, in combination with a rotary power-shaft having cams engaging said rod and operating the hammer, and a toothed wheel rotated by the shaft mounted and adapted to be vertically moved and having a conical shape, its teeth lying in converging planes, said wheel engaging the teeth of the saw for feeding it, and adapted by its vertical movement to receive and feed different saws, substantially as herein described.

5. In a saw-setting machine, a hammer, a set-punch, and an anvil, in combination with the rotary toothed wheel for engaging the teeth of the saw and feeding it, the spring-handle of the hammer, the adjustable rod E thereon, the rotary power-shaft and power-connections therefrom to operate the toothed feed-wheel, and the pair of reversed cams for acting on the rod alternately as the rotation of the shaft is reversed, substantially as herein described.

6. In a saw-setting machine, a hammer, set-punch, and anvil, in combination with the rotary toothed wheel for feeding the saw, the spring-handle of the hammer, the adjustable rod E thereon, the rotary power-shaft, the vertical shaft carrying the toothed feed-wheel, and the gears for operating it from the power-shaft, and the pair of reversed cams for acting on the rod alternately as the rotation of the shaft is reversed, substantially as herein described.

7. In a saw-setting machine, the anvil having a stem adapted to be moved forward or back and set by a screw, whereby the anvil is adjusted, substantially as herein described.

8. In a saw-setting machine, the set-punch and the adjustable bracket by which it is carried, in combination with the anvil having a stem, the set-screw connected with said stem, and the slot in the set-punch bracket through which the set-screw passes, whereby the anvil is connected with the bracket and may be adjusted both with it and independently, substantially as herein described.

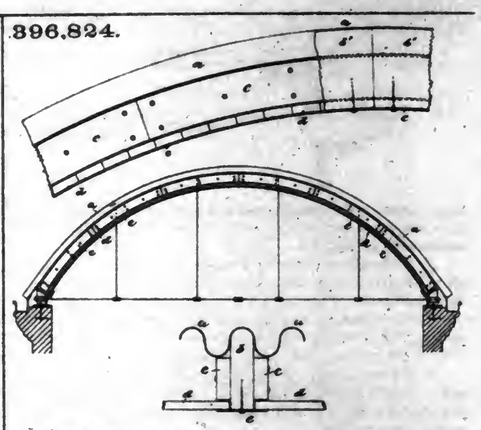
9. In a saw-setting machine, the adjustable anvil, in combination with the blade-supporting plate I, hinged or pivoted to the anvil, the stem of said plate, and the screw engaging the stem by a sliding connection, whereby the plate may be moved back and forth with the anvil and have its inclination varied, substantially as herein described.

10. In a saw-setting machine, the combination of the sliding carriage K, the independently-sliding bearing-plate L on the carriage, the setting-up wheel carried by said plate for engaging the back of the saw-blade, the spring acting continuously on the carriage to hold the wheel up with its work, and the set-screw and nut for primarily adjusting the bearing-plate on the carriage, substantially as herein described.

11. In a saw-setting machine, the blade-supporting plate I, having a slotted hollow stem, in combination with the sliding carriage mounted on said stem, the spring within the stem and acting on the carriage, and the setting-up wheel on the carriage, substantially as herein described.

12. In a saw-setting machine, the blade-supporting plate having a slotted hollow stem, in combination with the sliding carriage mounted on said stem, the spring within the stem and acting on the carriage, the independently-sliding bearing-plate on the carriage, the setting-up wheel carried by the plate, and the set-screw and nut for primarily adjusting the plate and wheel on the carriage, substantially as herein described.

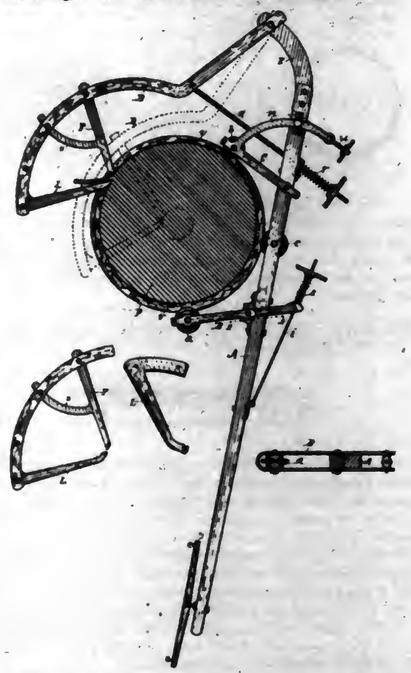
13. In a saw-setting machine, the limiting-rollers acting against the teeth of the saw and having slotted arms with set-screws for adjusting them, substantially as herein described.



14. In a saw-setting machine, the spring-controlled setting-up wheel acting against the back of the saw, in combination with the adjustable limiting-rollers acting against its teeth, substantially as herein described.

15. In a saw-setting machine, the combination of the set-punch, the anvil, and the flanged roller bearing on top of and against the back of the saw, substantially as herein described.

16. In a saw-setting machine, the bracket and the set-punch carried thereby, and the anvil carried by said bracket, in combination with the slotted bearing-arm carried by and adjustable on the bracket, and the flanged roller having a stem carried by the bearing-arm, substantially as herein described.



17. In a saw-setting machine, the adjustable bracket and the set-punch carried thereby, and the adjustable anvil carried by said bracket, in combination with the slotted bearing-arm carried by and adjustable on the bracket, and the flanged roller having a stem carried by and vertically adjustable in the bearing-arm, substantially as herein described.

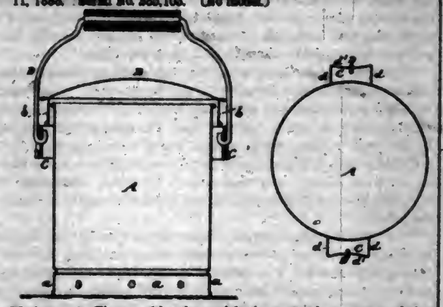
396,824.

c, and the lining-boards *d*, inserted in the grooves between *c* and *c*, as herein specified.

396,825. TREE-FELLER. GARRETT W. LOW, Kalamazoo, Mich., assignor to Byron W. Shepardson, same place. Filed July 19, 1887. Renewed Aug. 3, 1888. Serial No. 281,873. (No model.)

Claim.—1. The combination of a lever, a spring-actuated arm pivoted thereto and arranged to project on the opposite side of a tree, said arm being provided with a cutting-tool and a gage to control the depth of cut, and the lever being provided with guides adapted to follow the groove during the operation of cutting, and thus support the machine, substantially as set forth.

2. A lever having a pivoted spring-actuated arm arranged to project on the opposite side of the tree, said arm being provided with a cutting-tool and gage, substantially as set forth.



3. The combination of a frame bearing a cutting-tool, an adjustable guide, and a guide adapted to yield against a spring resistance, substantially as set forth.

4. A frame partially or entirely encompassing the tree, having suitable guides to hold it in place, and provided with a cutting-tool and a gage preceding said tool having a sharpened end, substantially as set forth.

396,824. LINING FOR CORRUGATED-SHEET-METAL ROOFS. WILHELM LORENZ, Carlsruhe, Baden, Germany. Filed Nov. 10, 1888. Serial No. 290,474. (No model.)

Claim.—A lining for corrugated-sheet-metal roofs, consisting of bearers *b*, applied in the undulations, with splice-pieces *c c*, band-iron

396,826. MILK-PAIL. JOHN E. MAYER, Muir, Wis. Filed Sept. 11, 1888. Serial No. 285,103. (No model.)

Claim.—1. The combination, with the pail, the cover, and the bail, of the ears having arms to support the cover and having the portion between and connecting the outer ends of the arms deflected inward between its ends, substantially as described, and for the purpose specified.

2. The combination, with the pail and the cover, of the ears secured to the pail and having formed integral therewith the arms *d d*, secured to the pail, with the horizontal portion *d'*, connecting said arms, curved upon its outer edge, as shown, and the bail having its ends secured to the middle of said portions *d'*, substantially as and for the purpose specified.

396,827. REMOVABLE SEAT FOR VEHICLES. JOHN P. MOORE, Fremont, Ohio. Filed Oct. 24, 1888. Serial No. 289,053. (No model.)

Claim.—1. In a seat for vehicles, the combination of the bottom arranged close to the dash and supported on suitable standards and the seat-cover hinged at its edge to the edge of the bottom, substantially as specified.

2. In a seat for vehicles, the combination, with the bottom arranged close to the dash, of the arms at the ends of the bottom, and the seat-cover hinged to the rear edge of the bottom and adapted to be held in a vertical position to form, with the dash and the arms, a suitable luggage-receptacle, substantially as specified.

3. In a seat for vehicles, the combination of the bottom arranged adjacent to the dash, the bowed arms arranged at the ends of the bottom, the aprons M M, arranged on the arms, and the seat-cover hinged to the rear edge of the bottom and provided at its rear edge with an overhanging flange to bear against the rear edge of the bottom when the cover is raised, substantially as specified.

4. In a seat for vehicles, the combination of the bottom arranged adjacent to the dash, the arms provided with aprons arranged at the ends of the bottom, the riser on the rear edge of the bottom, and the seat-cover hinged to the said riser and projecting at its front edge beyond the same, substantially as specified.

5. In a seat for vehicles, the combination, with the bottom provided with a suitable cover, of the standards affixed to the bottom and having the legs C, provided with hooks to engage keepers on the vehicle, and the legs C', provided with eyes engaging bolts on the vehicle, substantially as specified.

6. In a seat for vehicles, the combination, with the bottom provided with a suitable cover, of the standards affixed to the bottom and having the rear legs, C' C', provided at their lower ends with hooks *c' c'*, engaging keepers on the floor of the vehicle, the front legs, C, provided at their lower ends with eyes *c c*, fitting over threaded bolts G on the floor of the vehicle, and the thumb-nuts engaging the bolts above the eyes to hold the latter in position thereon, substantially as specified.

7. A seat arranged close to the dash-board of a vehicle and provided with a hinged cover, which when thrown up into a vertical position forms a space or receptacle for luggage, substantially as specified.

8. The bottom arranged adjacent to the dash-board so that the latter will form a side wall for the bottom, combined with the seat hinged to the bottom, so that when the seat is arranged down on the bottom the dash-board will form the back for the seat, and when the seat is thrown up vertically the dash-board will form one side of the luggage-receptacle while the seat will form the other side, as set forth.

396,828. DENTAL CHAIR. ZACH B. MOORMAN, Honey Grove, Tex. Filed June 21, 1888. Serial No. 277,705. (No model.)

Claim.—1. In a dental chair, the combination of the legs A and B, pivoted together and provided with the extensions A' and B', which are connected at their upper ends by the cross-bars *a'* and *b'*, the seat pivotally connected to the cross-bar *a'* and engaged with the cross-bar *b'*, the foot-rest provided with arms *h h*, pivoted to the inner sides of the legs A A, and having legs I I engaging ratchets on the said legs, the backwardly-folding back D, pivoted to the upper ends of the extensions A', and the flexible and extensible arms E E, connected at their ends, respectively, to the back and the upper ends of the extensions B', substantially as specified.

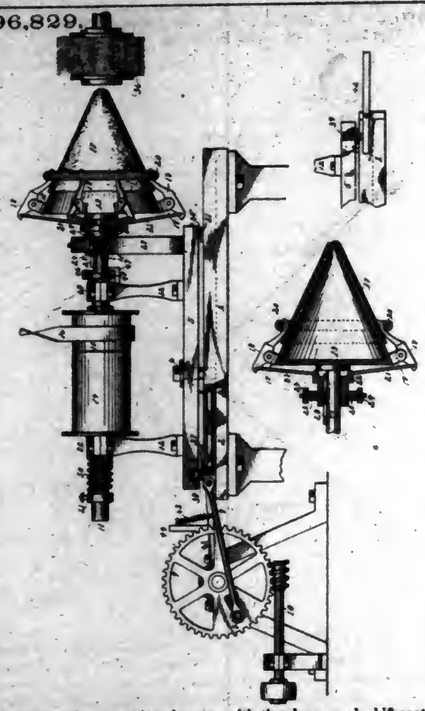
2. In a dental chair, the legs A and B, pivoted together, the seat and the back, in combination with the foot-rest having the arms *h h*, pivoted to the inner sides of the legs A, the swinging arms I, mounted on the foot-rest and provided at their lower ends with the lateral studs or projections K, adapted to engage ratchets on the legs A to hold the foot-rest at the desired inclination, substantially as specified.

396,829. MACHINE FOR STIFFENING HATS. FRANK J. MURPHY and ANTHONY M. RUSSELL, Danbury, Conn. Filed Apr. 10, 1888. Serial No. 270,172. (No model.)

Claim.—1. The combination, with a stiffening-brush, of a rotary cone by which the hat-bodies are carried and a reciprocating slide upon which the cone is journaled.

2. The combination, with a rotating stiffening-brush, of a rotary cone by which the hat-bodies are carried, a reciprocating slide upon which the cone is journaled, and a spring, 32, acting to hold the cone in contact with the brush.

3. The combination, with a stiffening-brush, of a rotary cone by which the hat-bodies are carried, a spring, 20, by which they are held thereon, and a reciprocating slide upon which the cone is journaled.



4. The spindle having at its forward end a cone to receive the hat-bodies and a sliding sleeve, 22, in combination with arms 18, pivoted at the rear end of the cone, a spring, 20, at the forward ends of the arms, and rods connected to the rear ends of the arms and to the sleeve, whereby when said sleeve is moved away from the cone the forward ends of the arms are lifted, thereby expanding the spring, so that a hat-body can be removed and another substituted.

5. The spindle having a cone at its outer end to receive hat-bodies, a sliding sleeve, and a spline for holding said sleeve against rotation independently of the spindle, in combination with arms pivoted to the cone, a spring carried by the forward ends of the arms, and rods connecting the rear ends of the arms with the sleeve.

6. The spindle having a cone at its outer end and a sliding sleeve, in combination with arms pivoted to the cone, a spring engaging the forward ends of the arms, rods connecting the rear ends of the arms with the sleeve, and a hand-lever for moving said sleeve.

7. The spindle having a cone at its outer end and a sliding sleeve having a groove, in combination with arms pivoted to the cone, a spring, 20, carried by the arms, half-collars engaging the groove in

396,829.

the sleeve, rods connecting the arms with the sleeve, and a bifurcated lever engaging the half-collars, whereby the sleeve is reciprocated to expand the arms.

8. The spindle having a cone at its outer end to receive hat-bodies and a sliding sleeve, in combination with arms pivoted to the cone and curved upward at their forward ends, a spring lying in the curved ends of the arms, and rods connecting the rear ends of the arms with the sleeve.

9. The combination, with the spindle having a cone at its outer end, arms pivoted to said cone, a spring, 20, and a sliding sleeve on the spindle, of rods connecting the rear ends of the arms with the sleeve, a standard having recesses 27ª, and a bifurcated lever pivoted to said standard and engaging the sleeve and having a pin, 29, engaging said recesses, whereby the lever is locked at the extreme of its oscillation.

10. The combination, with the spindle having a cone at its outer end, arms pivoted to said cone, a spring, 20, and a sliding sleeve having a groove, of rods connecting the rear ends of the arms with the sleeve, a spindle having recesses 27ª, and a bifurcated lever loosely pivoted to said standard, the arms of which engage half-collars in said groove, and having a pin engaging said recesses, as and for the purpose set forth.

11. The spindle having cone 13 at its forward end and sliding sleeve 22, in combination with arms 13, pivoted to ears at the rear end of the cone, a spring surrounding the cone and engaging the forward ends of the arms, and rods connecting the rear ends of the arms with the sliding sleeve, whereby the forward ends of the arms are lifted, thereby expanding the spring, so that hat-bodies may be removed and placed in position to be acted upon.

12. The combination, with the brush, cone, and spindle, of longitudinally-reciprocating slide 3, turning plate 5, pivoted thereto and carrying the spindle, spring 32, acting to draw slide 5, the spindle, &c., toward the brush, and spring 39, having a shoulder which acts to lock the turning plate at its retracted position.

13. The combination, with the brush, cone, and spindle, of longitudinally-reciprocating slide 3, the turning plate pivoted thereto and carrying the spindle, spring 32, acting to draw the turning plate, spindle, &c., toward the brush, spring 39, acting to lock the turning plate at its retracted position, and tripping-lever 42, acting to release spring 39, so that spring 32 can act to draw the turning plate forward, thereby placing a hat-body upon the cone in contact with the brush.

14. The combination, with the spindle, cone, and turning plate having standards in which the spindle is journaled, of the reciprocating slide to which the turning plate is pivoted, wheel 9, having a crank-pin, and a link connecting said crank-pin with the slide.

15. The combination, with the spindle, and the turning plate having standards in which the spindle is journaled, of slide 3, to which the turning plate is pivoted, gear-wheel 9, having a crank-pin, a link connecting said crank-pin to the slide, and rotating shaft 10, having a worm engaging wheel 9, substantially as described.

16. The reciprocating slide, the turning plate pivoted thereto, and a spindle and cone journaled on said turning plate, in combination with the stiffening-brush and spring 32, acting to draw the turning plate forward, so that a hat-body upon the cone will be acted upon by the brush, a spring, 39, at the rear end of the turning plate, having a shoulder engaging the edge of the slide to hold the turning plate at its retracted position, and tripping-lever 42, which releases the turning plate, thereby placing the hat-body upon the cone in contact with the brush.

17. The cone and spindle carried by the turning plate, the slide to which the turning plate is pivoted, spring 32, acting to draw the turning plate forward, and spring 39, acting to hold it at its retracted position, in combination with tripping-lever 42, wheel 9, having a crank-pin to which the slide is connected, and a pin, 45, acting upon the tripping-lever to disengage spring 39, as and for the purpose set forth.

18. The reciprocating slide, the turning plate pivoted thereto, spring 32, acting to draw the turning plate forward, and spring 39, acting to lock it at its retracted position, in combination with the tripping-lever acting to release spring 39, spring 43, for returning the tripping-lever to its normal position, and wheel 9, having a pin which engages said lever at each revolution, as and for the purpose set forth.

19. The brush, the reciprocating slide, the turning plate pivoted thereto and carrying the cone and spindle, and spring 32, acting to draw the turning plate forward, in combination with plates 31 and 37, secured to the slide, and rollers in the turning plate which travel on plates 31 and 37.

20. The reciprocating slide having plate 31, the turning plate pivoted to said slide and carrying the spindle and cone, and a spring, 32, whose opposite ends are secured to plate 31 and to the turning plate, in combination with spring 39 upon the turning plate, having a shoulder engaging the slide to lock the turning plate in its retracted position against the power of spring 32.

21. The brush, the reciprocating slide, the turning plate pivoted to the slide and carrying the spindle and cone, and provided with a roller, 33, in combination with plate 34, having an incline, 35, and spring 32, acting to hold said roller in contact with plate 34, so that during the return movement of the parts roller 33 will ride down the incline, thereby placing the tip of the hat in contact with the brush.

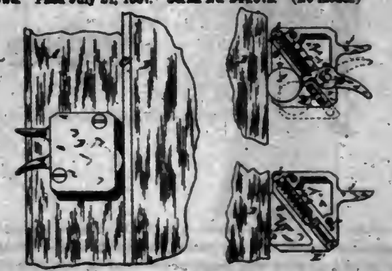
22. The reciprocating slide, the turning plate pivoted thereto, and spring 32, acting to draw the turning plate forward, in combination with the spindle journaled on the turning plate, belt 16, and fast and loose pulleys on the spindle, over which said belt passes, whereby said spindle is caused to rotate during the backward movement of the slide and to remain stationary during the forward movement thereof.

23. The combination, with the stiffening-brush, the reciprocating slide, the turning plate, springs 32 and 39, and the tripping-lever, of the spindle journaled upon the turning plate, and fast and loose pulleys, and the cone upon said spindle, whereby when the parts have reached their forward position the turning plate is released and swung forward, placing the hat-body upon the cone in contact with the brush, in which position it remains during the backward movement.

24. The combination, with the brush, the slide, the turning plate, springs 32 and 39, and the tripping-lever, of the spindle and cone journaled on the turning plate, plate 34, having incline 35, and roller 33, engaging plate 34, whereby when the tip of the hat-body is reached during the operation of stiffening the roller will ride down the incline, thereby swinging the turning plate farther forward and placing the tip in contact with the brush.

25. The combination, with the brush, the turning plate, and the spindle journaled in boxes 49 and 52, and having collars 48 and 51, of adjusting-plates 46, adapted to lie between collar 41 and journal-box 49, and spring 50, bearing against collar 51 and journal-box 52, whereby said spindle may be adjusted relatively to the brush to place more or less of the hat-body in contact therewith during the operation of stiffening.

26. The combination, with the brush, the cone, means, substantially as described, for retaining hat-bodies thereon, and the spindle, of the reciprocating slide, the turning plate pivoted thereto and having bearings in which the spindle is journaled, a spring acting to hold the turning plate at its retracted position, a tripping-lever acting to release the turning plate at a predetermined time, and a spring acting to draw the turning plate forward when released, so that the hat-body is placed in contact with the brush.



27. The combination, with the brush, the cone, means, substantially as described, for retaining hat-bodies thereon, and the spindle, of the reciprocating slide, the turning plate pivoted thereto and having bearings in which the spindle is journaled, a spring acting to hold the turning plate at its retracted position, a tripping-lever acting to release the turning plate at a predetermined time, and a spring acting to draw said slide forward when released.

28. The combination, with the brush, the cone, means, substantially as described, for retaining hat-bodies thereon, and the spindle, of the reciprocating slide, the turning plate pivoted thereto and having bearings in which the spindle is journaled, a spring acting to hold the turning plate at its retracted position, a tripping-lever acting to release the turning plate at a predetermined time, a spring acting to draw the turning plate forward when released, plate 34, having incline 35, and roller 33, engaging said plate and incline, as and for the purpose set forth.

29. The brush, the reciprocating slide, and the turning plate pivoted thereto and carrying a spindle and cone, in combination with springs 32 and 39, tripping-lever 42, clamping mechanism whereby the hat-body is held upon the cone, and hand-lever 24, for operating said clamping mechanism and for drawing the upper slide to its retracted position against the power of spring 32.

30. The combination, with the brush, the slide, the turning plate, springs 32 and 39, and the tripping-lever, of the cone and spindle, clamping-spring 20, arms for distending said spring, a sliding sleeve upon the spindle, rods connecting said arms with said sleeve, and a hand-lever for operating the sleeve, as and for the purpose set forth.

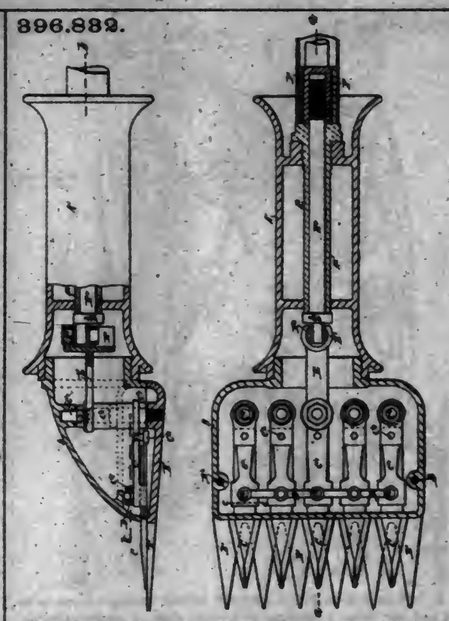
396,830. SASH-HOLDER. A. GORDON MURRAY, Cedar Rapids, Iowa. Filed July 21, 1887. Serial No. 244,572. (No model.)

Claim.—1. In a sash-fastener, the combination of the case D, the diagonally-moving slide E, having a diagonal face opposite the window stop or jamb, the holder F, and the finger-lever G, all constructed, arranged, and adapted to operate substantially as and for the purpose specified.

2. In a sash-fastener, the combination of the case D, the inclined pin *c*, the diagonally-moving slide E, having lug *e*, adapted to slip on said pin, and slot *g*, adapted to allow the slide to move on the fastening-screw *f*, the holder F, and the finger-lever G, substantially as and for the purpose specified.

396,831. MOLDING DEVICE. MICHAEL O'CONNOR, South Pittsburg, Tenn. Filed Aug. 16, 1888. Serial No. 282,968. (No model.)

Claim.—1. In a molding device, a casing provided with an opening extending inward from its outer edge, substantially as shown, two jaws pivoted within the casing and constructed to form an aperture between them in line with the opening in the casing, and suitable means for opening said jaws, substantially as and for the purposes described.



2. The combination, with a casing, A, provided with an opening, *a*, and the plate B, having an aperture with a threaded wall, of the pivoted jaws C, having concavities *c*, bar D, connecting-pieces A, and screw E, substantially as set forth and described.

396,832. ANIMAL-SHEARS. VERNON PETERSEN, Brisbane, Queensland. Filed Dec. 8, 1887. Serial No. 257,243. (No model.)

Claim.—1. The combination, with the tubular handle provided with bearings for the spindle and having the socket formed in its end, of the hollow cutter-head provided with a sleeve to engage the hollow handle for detachably connecting said parts together, substantially as set forth.

2. The combination of a hollow cutter-head, a stationary comb-plate forming the base of said cutter-head, movable cutter-teeth secured to the front ends of pivoted arms, the upstanding sleeve or boss on the central arm, the pin O', having bearings in the upper and lower

396,832.

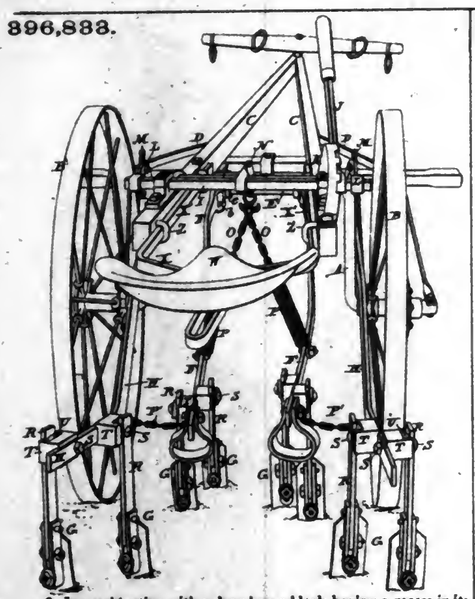
walls of the case, the backwardly-extending arm E, provided with a slot-piece at its rear end, and the rock-shaft or main spindle supported in bearings in the hollow handle-piece and having its crank-pin engaging said slot-piece, substantially as specified.

3. The combination of a tubular handle, a hollow cutter-head detachably connected therewith, a stationary comb-plate detachably connected with and forming the base of said head, cutter-blades connected with said comb-plate and projecting beyond the front wall of said head, movable cutter-teeth pivoted within said head on independent pivots, the pin O', having bearings within the walls of the head, the connecting-bar connecting the movable cutters, the pin O', the backwardly-extending arm E, having the slot-piece at its rear end, and the rocking lever supported within the hollow handle-piece and connected at its front end with the slot-piece on said arm E, substantially as set forth.

4. A cutter tooth or blade for animal-shears, having a shank bent upon itself, and a bearing at the outer end of the bent portion for the body of the tooth, whereby an elastic cutter tooth or blade is obtained, substantially as and for the purpose specified.

396,833. CULTIVATOR. ADELBERT G. POWERS, Hillsborough, N. Y. Filed Sept. 26, 1888. Serial No. 286,650. (No model.)

Claim.—1. In a cultivator, the combination, with the wheeled frame having an arched axle and a draw-bar, of two series of drag-bars, one series mounted upon the draw-bar between the upright portions of the axle and adapted to swing vertically and laterally, and the other series mounted upon the drag-bar and extending between the wheels and the upright portions of the axle and adapted to swing vertically, all substantially as shown.



2. In a cultivator, the combination, with a frame and a draw-bar, of two drag-bars pivotally connected with the latter, a rock-shaft located above each drag-bar, and coiled springs connecting the drag-bars with the rock-shaft and adapted to draw the drag-bars equally toward each other, all substantially as shown.

3. In a cultivator, the combination, with a frame and a draw-bar, of two drag-bars, a rock-shaft provided with an arm above and midway between the drag-bars, and springs connecting each drag-bar with the arm.

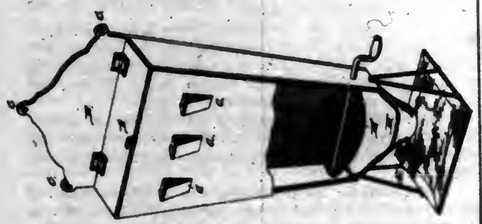
4. In a cultivator, the combination, with the wheeled frame, of the drag-bars, the rock-shaft, springs connecting the rock-shaft with each of the drag-bars and adapted to draw them toward each other, and stirrups mounted upon the drag-bars.

5. In combination with a drag-bar having a hole or perforation, a tooth-standard having a similar hole or opening and adapted to be applied to the side face of the drag-bar, a perforated beveled plate or washer adapted to be applied to either face of the standard, and a bolt passing through the bar, standard, and washer, all substantially as shown, whereby the standard may be inclined relatively to the line of draft when desired.

396,833.

6. In combination with a drag-bar, a block having a recess in its front and rear faces, a tapering or beveled plate or washer, a tooth-standard, and a bolt passing through all of said parts.

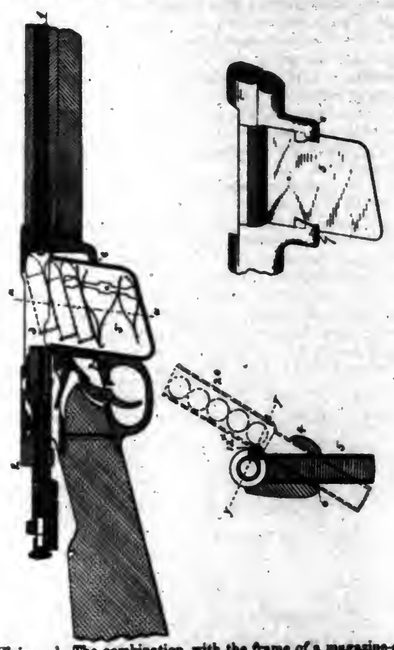
7. In combination with a drag-bar, a block recessed to fit thereon, a tapering or beveled plate or washer fitting into a recess in the outer face of the block, a tooth-standard, also mounted within the outer recess, and a bolt passing through all of said parts.



8. In a cultivator, the combination, with the frame, of brackets secured thereto, a tank provided with hooks on its side to engage the brackets, a valved outlet, and means for opening and closing said delivery-valve.

9. In a cultivator, the combination, with the wheeled frame, of a tank mounted thereon and provided with a stirrer, a yielding friction-wheel adapted to bear upon one of the driving-wheels, and connections between the friction-wheel and stirrer.

10. In a cultivator, the combination, with the wheeled frame, of a tank mounted thereon, a stirrer provided with a grooved wheel at its upper end, a shaft mounted upon the frame provided at one end with a friction-wheel and at the other end with a grooved wheel, yielding support for the shaft, and a belt passing about the grooved wheels.



11. In a cultivator, the combination, with the wheeled frame, of a tank mounted thereon and provided with a stirrer having a grooved wheel at its upper end, an upright mounted upon the frame and provided with a slot, a second upright, a shaft mounted in the uprights and provided at one end with a friction-wheel and at the other end with a grooved wheel, a belt passing about the grooved wheels, and spring adapted to hold the shaft to its seat.

396,834. HOUSEHOLD SIFTER. JOHN T. GIBBS, Riverside, Cal. Filed June 13, 1888. Serial No. 276,982. (No model.)

Claim.—In a combined flour or meal bin and sifter, the bin A, the screen in the lower end of the bin, the agitator mounted in the bin above the screen, and the tapering funnel affixed to the lower end of the bin below the screen, in combination with the pan or holder K, arranged under the mouth of the funnel, and the supporting-rods at opposite sides of the said pan or holder and pivotally connecting the same to the lower end of the bin, whereby the pan can be swung back and forth, substantially as specified.

396,835. MAGAZINE-GUN. ANDREW H. RUSSELL, U. S. Army. Filed June 11, 1888. Serial No. 276,675. (No model.)

Claim.—1. The combination, with the frame of a magazine-gun, of magazine-supports near the receiver, a laterally-movable magazine borne on said supports, said magazine having an opening of the length of the cartridge in the direction of the receiver, and a cartridge-follower in the magazine tending to press the cartridges sidewise toward the receiver, whereby the mouth of the magazine may be exposed at the side of the receiver for loading or the magazine may feed directly to the receiver without intervening carrier, substantially as described.

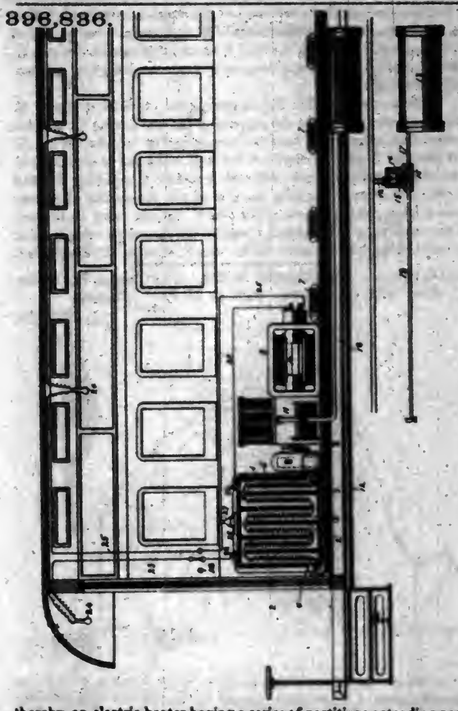
2. The combination, with the receiver of a magazine-gun having a lower opening, of a magazine hung on pivots beneath the receiver, so as to swing laterally, as set forth.

3. The combination, with the receiver of a magazine-gun, of a magazine having a side movement relatively to the receiver, so as to expose the mouth of said magazine, and a feed-case guide in the frame substantially in line with said mouth when opened, whereby the feed-case may be held, substantially as described.

4. The combination, with the receiver of a magazine-gun, of a movable magazine having a plurality of cartridge-chambers, said magazine having a side movement in both directions, so as to present the mouth of a cartridge-chamber at either side of the receiver, substantially as described.

396,836. ELECTRIC LIGHTING AND HEATING CARS. JAMES F. SHAWHAN, Dayton, Ohio, assignor of one-half to James W. Carpenter, same place. Filed Mar. 23, 1888. Serial No. 268,269. (No model.)

Claim.—1. The combination, in a car having a fluid-pressure brake apparatus, of a motor receiving its power from the brake apparatus, an electric generator driven by the motor, and an electric heating apparatus connected with the generator, substantially as described.



2. The combination, in a car having a fluid-pressure brake apparatus, of a motor receiving its power from the brake apparatus, an electric generator connected to the motor, an electric heating apparatus and electric lights, and circuits and connections between the generator, heater, and lights, substantially as described.

3. The combination, in a car, of a motor, an electric generator, an electric heating apparatus connected with the generator, a fan also connected with the motor, and pipes connected with the heater and distributing the air therefrom throughout the car, substantially as described.

4. The combination, in a car, of a motor, an electric generator connected to the shaft of the motor, a fan also connected to the shaft of the motor, an electric heater connected in circuit from the generator, and pipes leading therefrom to distribute the air throughout the car, substantially as described.

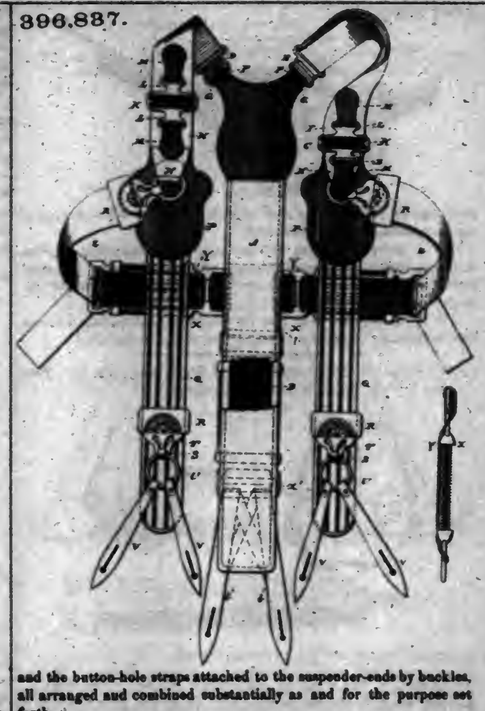
5. The combination of a motor, an electric generator driven thereby, an electric heater having a series of partitions extending partially through the heater, a series of electric conductors of high resistance, and a fan for propelling the air through the heater in contact with the heated conductors, substantially as described.

396,836.

6. The combination, with a car provided with a fluid-pressure brake apparatus and a reservoir connected therewith, of a motor, an electric generator, a heater, a number of electric lamps, circuits from the generator, including the heater and lamps, and switches whereby the heater or the lamps, or both the heater and lamps, may be connected in circuit with the generator, substantially as described.

7. The combination, in a car provided with the ordinary fluid-pressure brake apparatus, of a reservoir connected with said apparatus, a valve interposed between the brake apparatus and reservoir, a motor connected with said valve, and an electric generator operated by said motor, substantially as described.

8. The combination, with a car provided with the ordinary fluid-pressure brake apparatus, of a reservoir connected with said brake apparatus, a motor connected with the valve, and a generator driven by said motor, whereby the motor is operated directly from the brake apparatus when the pressure is greater therein than in the reservoir and from the reservoir when the pressure therein is greater than in the brake apparatus, substantially as described.

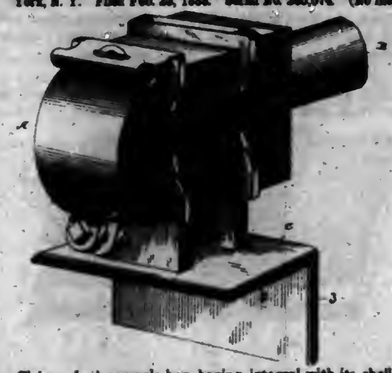


396,837. SHOULDER-BRACE. ROBERT V. SHOCKEY, Hastings, Nebr. Filed Sept. 24, 1888. Serial No. 286,201. (No model.)

Claim.—1. The combination, with the elongated pocket incasing the spring-stay and forming the common back piece, of the pad at the upper end of the same provided with buckle-frames connected thereto by loops, the suspenders engaging said loops and provided with collar-pads and suspender-ends, the laterally-extending spring-buckles, and the inelastic webbing, and clamping-slides for connecting the spring-buckles and suspenders, substantially as described.

2. In combination with the central elongated pocket provided with the spring-stay, the centrally-detachable shoulder-straps, and the suspender-ends, the spring-buckles re-enforced with elastic webbing, and the button-hole straps, substantially as described.

3. The combined shoulder-braces and suspenders, composed of the elongated pocket incasing the spring-stay and forming the common back piece, A, the shoulder-straps composed of the separate sections, each adjustably connected to the back piece and adapted, by means of the ring-loop and clamping-slide on their respective ends, to be instantly connected or disconnected, the collar-pads P, having their upper ends secured to the upper section slightly above the ring loops, and their lower ends to the suspender-ends Q, whereby they form a cushion beneath the connecting ends of the shoulder-straps,



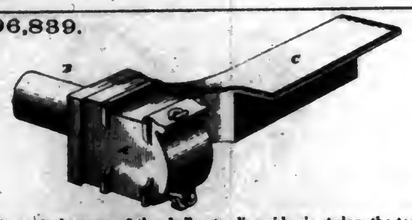
396,837.

and the button-hole straps attached to the suspender-ends by buckles, all arranged and combined substantially as and for the purpose set forth.

4. The combination, with the central elongated pocket provided with the spring-stay, the shoulder-straps secured thereto, made in two detachable sections, and the collar-pad, of the spring-buckles re-enforced with elastic webbing, the suspender-ends, and the button-hole straps, substantially as described.

396,838. CABLE-CAR-TRUCK SUPPORT. JOHN STEPHENSON, New York, N. Y. Filed Feb. 23, 1888. Serial No. 265,074. (No model.)

Claim.—1. A car-axle box having integral with its shell an extension of its lowest side in the form of an angle-plate, constituting bearing-faces at an angle to each other to receive and hold the corner of a grip-supporting truck or frame, substantially as described.



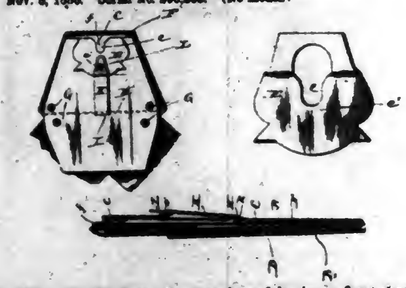
2. A car-axle box having integral with its shell a downward extension of its rear wall, forming a vertical plate, constituting a bearing-face for the attachment of a grip-supporting truck or support, substantially as set forth.

3. A car-axle box having integral with its shell an extension of the lower part, having a horizontal bearing-face extending transversely to the axle-journal and adapted to receive and sustain a corner of a grip-supporting truck, substantially as set forth.

396,839. AXLE-BOX FOR CABLE-CAR TRUCKS. JOHN STEPHENSON, New York, N. Y. Filed Feb. 23, 1888. Serial No. 265,075. (No model.)

Claim.—1. A car-axle-box shell with an integral arm from the

896,839.



back vertical corner of the shell extending sidewise below the top of the shell, substantially as described.

2. A car-axle-box shell with an integral arm extending sidewise in a plane below the box-top, the end of the arm having a vertical plane and adapted to hold the corner of the cable-grip frame or carriage, substantially as described.

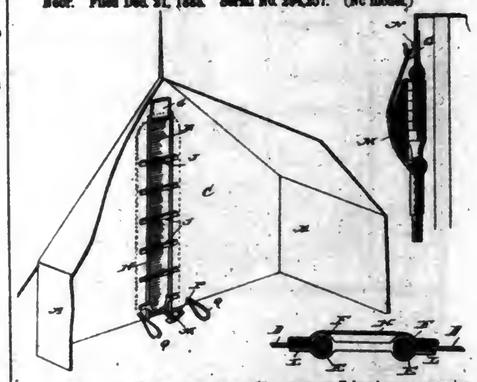
3. A car-axle-box shell with an integral arm extending sidewise and terminating in angle-bar form, substantially as described.

896,840. NECKSCARF. HENRY STERR, Shelbyville, Ky. Filed Nov. 8, 1888. Serial No. 290,263. (No model.)

Claim.—1. The frame for a neckscarf, having a front sheet, B, the rear sheet, C, secured to the front sheet and provided with a transverse slot, I, the elastic tongue K, extending at one end through the said slot and provided at its free end with a loop, L, and the removable pin H, extending transversely between the front and rear plates and engaging the extremity of the tongue K, combined with the cover folded around the front sheet, substantially as specified.

2. The frame for a neckscarf, having a front sheet, a rear sheet provided with a notch to engage the collar-button, and an intermediate sheet interposed between the front and rear sheet and adapted to bear against the head of the collar-button, combined with a cover arranged between the front sheet and the intermediate sheet and folded around the front sheet, substantially as specified.

896,841. PAPER-FILE. ALEXANDER P. ST. JOHN, Mobile, Ala. Filed Oct. 16, 1888. Serial No. 288,223. (No model.)



Claim.—1. In a newspaper-file, the folding frame narrower than one leaf of the paper and provided with a supporting-bar to lie in the crease of the paper, in combination with the pins puncturing the paper and the retaining-bar parallel with the supporting-bar and provided with sockets or depressions fitting on the free ends of the said pins, substantially as specified.

2. In a newspaper-file, the folding frame comprising the supporting-bar provided with pins M, the top and bottom bars extending through perforations near the ends of the supporting-bar, and the folding bar connecting the outer ends of the top and bottom bars and parallel with the supporting-bar, in combination with the retaining-bar affixed to the inner extremities of the top and bottom bars and covering the free ends of the said pins, substantially as specified.

3. In a newspaper-file, the supporting-bar provided with pins M, the wire frame having the top and bottom bars, D D', which extend at their free ends through perforations in the supporting-bar, the stud E on the extension of the top bar, and the stop H on the lower end of the supporting-bar, in combination with the retaining-bar provided with a socket, *f*, engaging the stud E and bearing against the stop H, and the catch engaging the lower end of the retaining-bar, substantially as specified.

4. In a newspaper-file, the supporting-bar provided with pins M, the wire frame affixed to the supporting-bar and having its top and bottom bars extended beyond the supporting-bar to form the arm G and the stud E, and the stop H on the supporting-bar, in combination with the retaining-bar provided with a socket, *f*, engaging the stud E, the perforation *g*, engaging the arm G, and the sockets or depressions receiving the free ends of the pins M, and the catch on the end of the supporting-bar engaging a stud on the end of the retaining-bar to hold the latter in contact with the stop H, substantially as specified.

896,842. TENT-CLOSING-DEVICE. HENRY THOMAS, Fort Omaha, Nebr. Filed Dec. 21, 1888. Serial No. 294,357. (No model.)

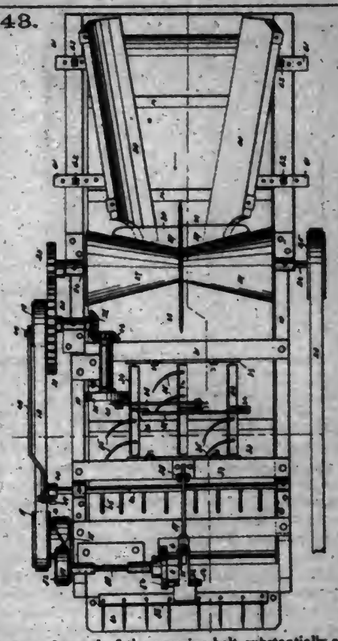
Claim.—1. In combination with a tent-wall having an opening formed therein, a guide-piece secured to each of the perpendicular edges of said opening, and a flexible curtain secured at its upper end above said opening, and provided at intervals with clips embracing at each end the guide-pieces at the edges of the opening, substantially as specified.

2. In combination with a flexible tent-wall having an opening formed therein, a flexible curtain secured at its upper end so as to cover said opening, a guide-rope combined with each perpendicular edge of the opening, and clips combined with said curtain at intervals, said guide-rope serving as guides for said clips, and a loop, M, placed upon one of the clips, and a hook, N, placed upon the tent-wall above the opening, substantially as specified.

3. In combination, a clip, J, and a tent-curtain, H, said clip being secured to said curtain by its part I, and embracing a guide-rope in the opening of the tent-wall by its part K and overlapping the tent-wall by its part L, substantially as specified.

4. In combination with a flexible tent-wall having an opening formed therein, a guide-rope secured in a hem formed in the edges of the opening of said tent-wall, and a flexible curtain secured at its upper end above said opening, and provided at intervals with clips embracing at each end the guide-rope at the edges of the tent-opening, substantially as specified.

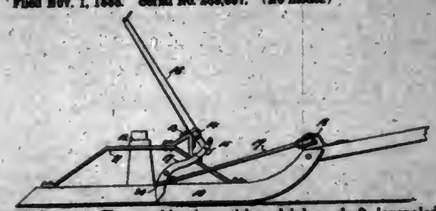
896,843. BAND-CUTTER AND FEEDER FOR THRASHING-MACHINES. JASON W. TURNER, Van Wert, Ohio. Filed May 10, 1887. Renewed Dec. 27, 1888. Serial No. 294,772. (No model.)



Claim.—1. In a band-cutter and feeder, the combination of a cutter, conical rollers having their ends abutting against said cutter, and blades secured to said rollers, substantially as described.

2. In a band-cutter and feeder, the combination of a cutter, conical rollers having their smaller ends abutting against the said cutter, and blades secured to the rollers and having their outer edges parallel with the axis of the said rollers, substantially as herein shown and described.

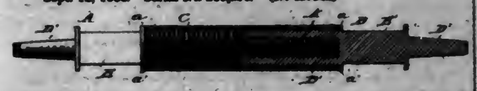
3. In a band-cutter and feeder, the combination, with the cutter-shaft 24, of the longitudinal rocking bars 34, provided with the curved spreading prongs 35 and the upwardly-extending arms 36, one of the said arms being longer than the others, the cross-bar 37, loosely connected to the arms 36, the disk 41, provided with crank-pin 40, the rod 38, connected to the crank-pin and to the long arm 36, the shaft 42, carrying the said disk and provided at its other end with the bevel gear-wheel 43, and means for operating the shaft 20 from the cutter-shaft, substantially as herein shown and described.



4. In a band-cutter and feeder, the combination, with an endless carrying-belt, of spreading prongs vibrating transversely to the direction of travel of the said belt, and feed-regulating prongs vibrating in the direction of travel of the carrying-belt, substantially as herein shown and described.

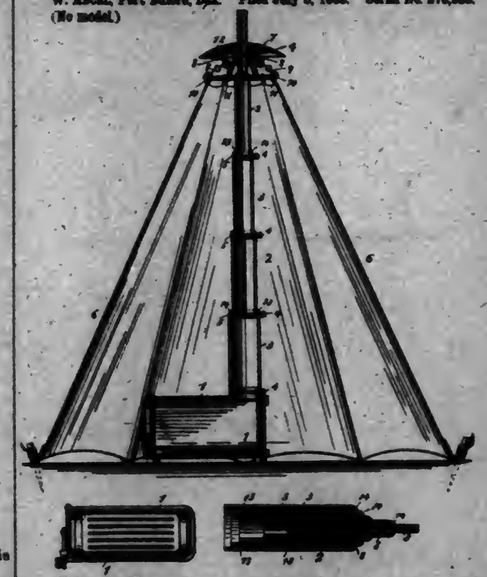
896,848.

Claim.—5. In a band-cutter and feeder, the combination, with an endless carrying-belt, of spreading prongs vibrating transversely to the direction of travel of the said belt, feed-regulating prongs vibrating in the direction of travel of the carrying-belt, and a vibrating rake in front of the feed-regulating prongs, substantially as herein shown and described.



896,844. SLEIGH-BRAKE. WILLIAM R. WILCOX, Portland, Oreg. Filed Nov. 1, 1888. Serial No. 289,697. (No model.)

Claim.—1. The combination, with a sleigh, a shaft journaled transversely of the same, provided with forwardly-extending arms, and a lever attached to one extremity of said shaft, of downwardly-curved ice-hooks pivoted one at each side of the said shaft-arms, an evener pivoted to the body of the sleigh, and rods connecting the ends of the said evener with each set of ice-hooks, substantially as shown and described.

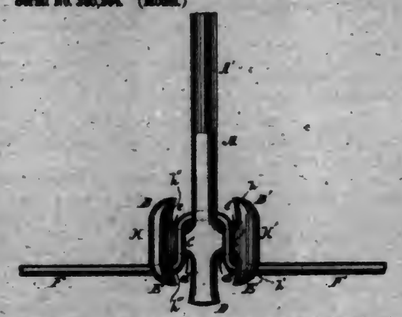


2. The combination, with the runners of a sleigh, a rave attached to each runner, a shaft journaled upon the said raves, provided with forwardly-extending arms, and a lever secured to one extremity of the said shaft, of downwardly-curved ice-hooks pivoted one at each side of the said shaft-arms, an evener pivoted upon the body of the sleigh, links attached at the lower ends of the said ice-hooks, and a bifurcated rod pivoted to each end of the evener and connected with each set of ice-hooks, substantially as and for the purpose specified.

896,845. AXLE. CHARLES H. WILSON, Jersey City, N. J. Filed Sept. 12, 1888. Serial No. 285,251. (No model.)

Claim.—An improved axle consisting of the two sections A B, each having their inner ends externally screw-threaded, the section A being provided with the reduced screw-threaded portion or shank A', and the section B with the internally-screw-threaded cavity B', to receive the said reduced portion or shank, and the internally-threaded sleeve C, fitting on the screw-threaded portions of the said sections, substantially as herein shown and described.

896,846. COMBINED STOVE-PIPE AND TENT-SUPPORT. JOHN W. ASKIN, Fort Buford, Dak. Filed July 3, 1888. Serial No. 278,988. (No model.)

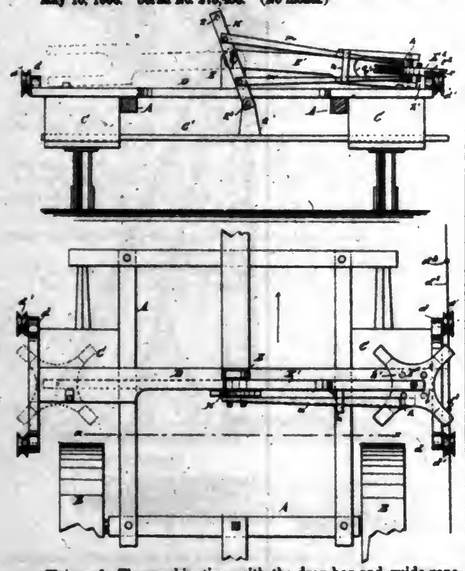


Claim.—1. The combined stove-pipe and tent-support composed of hollow telescopic sections having parallel sides, and means for detachably securing them together when drawn out, in combination with a stove and a tent, as shown and described.

2. The stove 1 and stove-pipe 2, consisting of telescopic sections 3, formed with enlargements 13 at one end and inwardly-bent ends 14 at the other, and secured by pins 4, projecting through their overlapping ends, and having screw-threaded ends 5, engaging screw-holes in the overlapping ends, in combination with the flanged sleeve 7 secured to the top stove-pipe section and having chains 9, and the tent 6, with ring 10 at its top, connected to chains 9, substantially as described.

3. The stove 1 and stove-pipe 2, consisting of telescopic sections 3, with means for detachably securing them in extended position, and the tent 6, detachably secured to the top stove-pipe section projecting above the tent, in combination with the detachable shield 12, adapted to slide over the top stove-pipe section and supported on sleeve 7, substantially as described.

896,847. WIRE HOOK. PETER ASHEIM, New York, N. Y., assignor to Sylvester Y. L'Hommedieu & Co., same place. Filed Sept. 13, 1888. Serial No. 285,204. (Model.)



Claim.—1. An insulated hook for supporting electric wires, consisting of two arms arranged parallel to a main stem by means of a cross-bar on each side of which they project.

2. In an insulated hook for supporting electric wires, the combination, with the stem A, of the spurs B B', pointing toward the base of the stem, the spurs E E', pointing in the opposite direction, and the cross-bar C C', substantially as described.

3. In an insulated hook for supporting electric wires, the combination, with the stem A, of the spurs B B', pointing toward its base,

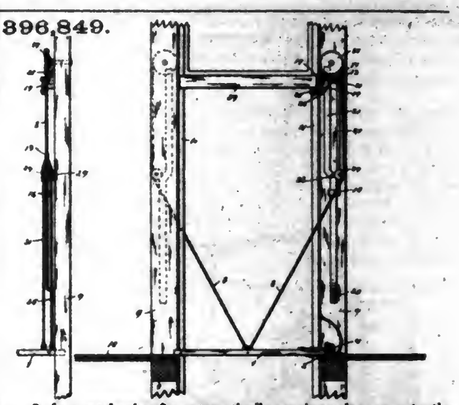
the spurs E E', pointing toward its extension D, the cross-bar C C, and the stem-extension D, as and for the purposes set forth.

396,848. CHECK-ROWING ATTACHMENT. GEORGE I. BAKER, Fall River, Kans., assignor to Leslie Seim Trusler, same place. Filed May 10, 1888. Serial No. 273,488. (No model.)

Claim.—1. The combination, with the drop-bar and guide-rope, of a horizontal arm pivoted above the drop-bar, a rocking bar connected with the latter, a star-wheel pivoted in said arm, and means, substantially as shown and described, for reciprocating the drop-bar from the star-wheel, as and for the purpose specified.

2. The combination, with the drop-bar and guide-rope, of a reversible horizontal arm pivoted above the drop-bar, a rocking bar pivoted to the latter at one end, a star-wheel horizontally pivoted in said arm, and means, substantially as shown and described, for reciprocating the drop-bar from the star-wheel, whereby the star-wheel may be carried from one side of the planter to the other, as desired.

3. The combination, with the drop-bar and guide-rope, of a reversible horizontal arm pivoted above the drop-bar, a rocking bar pivoted at one end of the latter, a star-wheel horizontally pivoted in said arm, having the extremity of its members grooved and slotted to receive the guide-rope, and mechanism, substantially as shown and described, for actuating the rocking bar from the star-wheel, as and for the purpose specified.

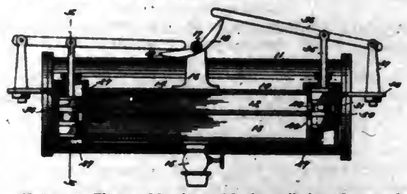


4. The combination, with the drop-bar and guide-rope, of a reversible horizontal arm pivoted above the guide-bar, a rocking bar having one end pivotally connected with the latter, a star-wheel horizontally pivoted in said arm, having the extremity of its members grooved and slotted to receive the guide-rope, projections integral with the top and bottom of the star-wheel, and reciprocating bars pivoted upon the rocking bar alternately engaged by the said projections, substantially as and for the purpose specified.

396,849. HATCHWAY. JAMES A. BARCLAY, St. Paul, Minn. Filed Apr. 21, 1888. Serial No. 271,441. (No model.)

Claim.—1. In a mechanism for automatically operating elevator hatch-doors by means of a cable, the combination, with a frame or traveler consisting of the sleeves 13 and 16, and the bar 27, connecting said sleeves, of the projecting arm 19, pivoted to the traveler and adapted to engage a passing elevator, the sheave 29, upon which said cable is adapted to run journaled upon the traveler, and the door 1, attached to said cable and fitted with a slotted hinge, 3, and a support or stilt, 4, by means of which the door is lifted and tilted laterally, so as to pass the elevator-guide, substantially as described.

2. In a mechanism for automatically opening hatch-doors by means of a cable, the combination, with a suitable support or track, 31, of a traveler or frame connected to said cable and adapted to run upon said track as impelled by contact with a passing elevator, and the sheave 29, on which said cable is adapted to run, journaled upon said traveler, so that when the cable is operated by the traveler the angle at which it pulls upon the hatch-door is greatest when the door is closed, substantially as described.



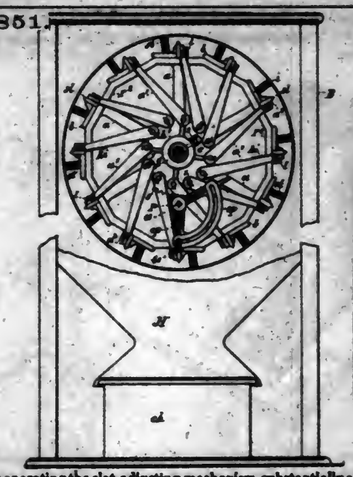
396,849.

3. In a mechanism for automatically opening a door or gate, the combination, with a suitable support or track, of a pulley, 37, a cable attached to said door or gate and passing over said pulley, a traveler or frame attached to said cable and adapted when impelled by contact with a passing body to run upon said track and operate the cable, and the sheave 29, journaled upon said traveler, by means of which the direction in which the cable pulls upon the door or gate is determined, substantially as described.

4. In an elevator, the combination, with the hatch-doors 1 1, of tapering form, hinged at their narrower ends to the floor of the building on opposite sides of the hatchway, with their inner edges meeting each other when closed in a diagonal line from the inner side of one guide-post to the outer side of the other and completely covering the hatchway-opening, of the hook-and-eye hinges 3, attached to the inner corners of each of said doors, having slotted eyes admitting of vertical play in the joints, and supports or stilts 4, by means of which the doors when opened are tilted outwardly and so held by the stilts, substantially as described.

396,850. STEAM-ENGINE. HENRY SHARE, Chester, Ill. Filed July 28, 1888. Serial No. 281,264. (No model.)

Claim.—1. The combination, with the cylinder of an engine, of the steam-chest 10, divided longitudinally into the compartments 12 and 13, the vertical cylindrical casings 27 at the ends of the steam-chest and communicating with the compartments 12 and 13 of the steam-chest and with the steam-cylinder, the valves 30 in the cylindrical casings 27, and means for operating the said valves, substantially as herein shown and described.



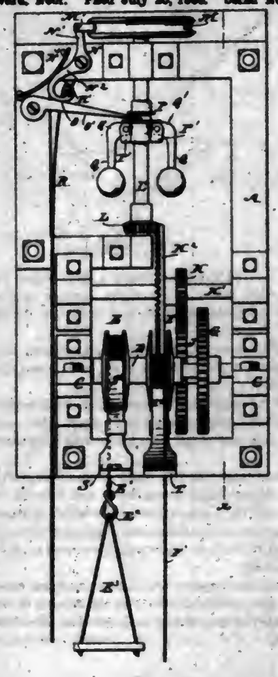
2. The combination, with the steam-cylinder 11 and the drive-shaft 21, provided with the cam 22, of the steam-chest 10, provided with the compartments 12 and 13, the cylindrical casings 27 at the ends of the steam-chest and communicating therewith and with the steam-cylinder 11, the valves 30 in the cylindrical casings 27 and provided with the rods 35, the pivoted levers 36, to which the valve-rods 35 are pivoted, the rock-shaft 17, provided with the curved fingers 18 and the lever 19, the pitman 26, the link 25, the cam-rod 24, and the yoke 23, substantially as herein shown and described.

396,851. FLOUR-BOLT. JAMES B. ALLFREE, Indianapolis, Ind. Filed Jan. 31, 1887. Serial No. 225,991. (No model.)

Claim.—1. In a flour-bolt, the combination, with a reel, of a series of buckets extending lengthwise within it, and adjustable slats connected with their backs for increasing the height thereof, substantially as shown and described.

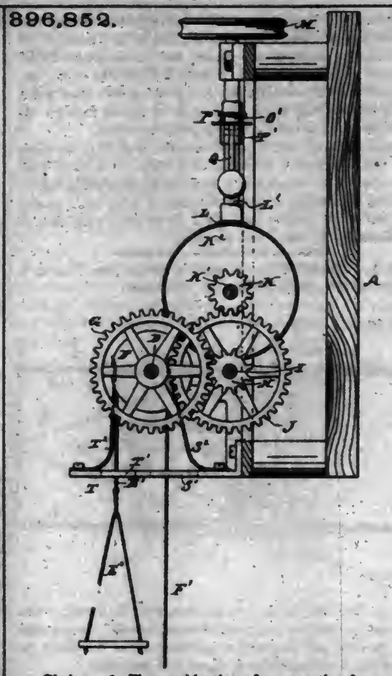
2. A flour-bolt comprising, in combination, a reel mounted upon a suitable shaft, a series of elevating-buckets within such reel, having adjustable slats connected to their backs for increasing the height thereof, circular frames at each end, also mounted on the main shaft and connected through intermediate arms to such adjustable slats, a counter-shaft having bearings in the reel-head and interior spider, a pinion, a segment-rack gearing with said pinion and connected to the circular frame, and a lever mounted on the outer end of such counter-shaft for operating the slat mechanism, substantially as shown and described.

396,851.



shaft for operating the slat-adjusting mechanism, substantially as shown and described.

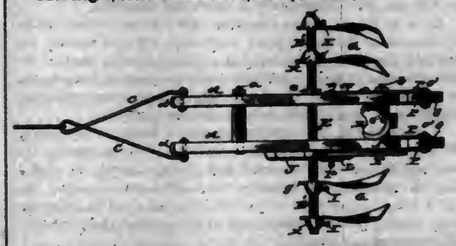
3. A flour-bolt comprising, in combination, a reel mounted upon a suitable shaft, and a series of adjustable buckets within it, with means, substantially as described, for setting such buckets closer to the cloth at one end of the reel than at the other.



4. In a flour-bolt, the combination of a reel and shaft, spiders secured to such shaft, elevating-buckets carried by the spiders, having adjustable slats secured to the backs of such buckets for increasing the radius thereof, circular frames at each end mounted on the main shaft, a segment-rack on each frame connected through intermediate arms to such adjustable slats, a counter-shaft having bearings in the reel-head and adjacent spider, a pinion carried by such counter-shaft which engages with the segment-rack, and a lever mounted on the outer end of such counter-shaft for operating the slat mechanism, substantially as shown and described.

5. In a flour-bolt, the combination, with a reel, of a series of buckets extending lengthwise within it, set closer to the cloth at the discharging than at the receiving end thereof, substantially as shown and described.

396,852. FIRE-ESCAPE. JAMES G. BERROW and FRANK A. PERRY, Seward, Nebr. Filed July 26, 1888. Serial No. 280,964. (No model.)



396,852.

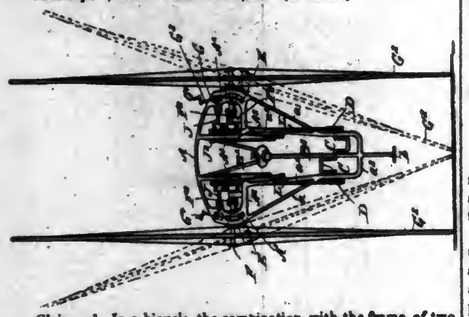
Claim.—1. The combination of a supporting-frame, a winding-drum, a descending-cable, a governor-shaft, weighted swinging governor-arms, a pivotal lever in operative connection with the governor-arms, a brake-wheel connected to the winding-gear, and a pivotal brake-lever having a brake-shoe and a cam engaged by the pivotal lever operated by the governor-arms, substantially as described.

2. The combination of a supporting-frame, a winding-drum, a descending-cable, a brake-wheel in connection with the winding-drum, a brake-lever pivoted to the frame and having a curved cam-arm, a cam-lever engaging the cam-arm, speed mechanism by which the said cam-lever is controlled, and a hanging hand rope or cable, also attached to the said cam-arm of the brake and guided on the frame, substantially as described.

396,853. CULTIVATOR. WILLIAM F. BERRY, Blanchard, Iowa. Filed Aug. 7, 1888. Serial No. 282,133. (No model.)

Claim.—1. In a cultivator, the combination, with the runners A A, having each a series of apertures, D D, coincident with each other, of the shaft E, adapted to be journaled in any one pair of said apertures, the ends of said shaft extended beyond the sides of runners A said shaft provided with a series of covering-blades detachably secured to said ends, a collar, *c*, formed on said shaft, and a lever detachably mounted thereon, said lever and collar arranged upon the opposite outer sides of the runners A, whereby said shaft may be held in position in said apertures, substantially as and for the purpose described.

2. In a cultivator, the combination, with the runners A, a transverse shaft journaled thereon, and provided at its outer ends with covering-blades G, of the disks O, arranged to the rear ends of said runners, said disks journaled in ends of the arms P P, pivoted at their front ends to the runners, said disks adapted to be raised and lowered in relation to the lower rear edges of said runners, substantially as and for the purposes hereinbefore described.



3. In a cultivator, the combination of the runners A, provided with a series of apertures, D D, a transverse shaft, E, adapted to be

adjustably journaled in the apertures, said shaft extended at each side of the runners and provided with covering-blades G, a lever, F, for adjusting the cutting depth of said blades, and the adjustable fender O', consisting of a disk, O, journaled in arms P P, pivoted to the runners A and provided with an aperture, *p*, registering with apertures *s*, formed in the runners, and a pin adapted to be passed through the aperture, substantially as and for the purposes described.

4. In a cultivator, the combination, with the shaft E, of the blade attachment, said attachment consisting of a collar, H, adjustably secured to the shaft E, provided with a downwardly-depending lug, H', having a rabbet, *h*, forming a square shoulder, *h'*, adapted to receive the squared end of the blade G, and means for securing such blade to the lug, substantially as shown and described.

396,854. VELOCIPEDE. RICHARD R. DOWDS, New York, N. Y.

Filed Sept. 1, 1888. Serial No. 284,339. (No model.)

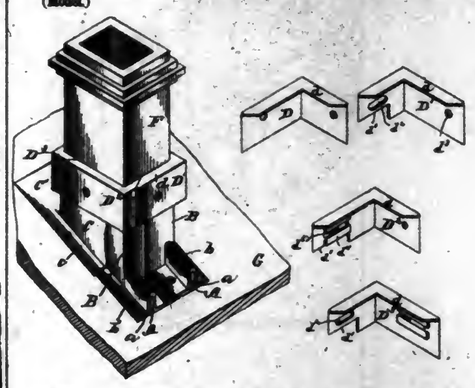
Claim.—1. In a bicycle, the combination, with the frame, of two shafts connected by universal joint, one of the said shafts having a main wheel fixed thereto, and mechanism, substantially as described, for inclining said wheel, substantially as shown and described.

2. In a bicycle, the combination, with a frame having an arc slot, of a movable block in said slot, two shafts connected by universal joint, one of said shafts being mounted in the block aforesaid and having a main wheel fixed thereto, and mechanism, substantially as described, for inclining the said wheel, substantially as shown and described.

3. In a bicycle, a frame having an arc slot, a movable block in said slot, and two shafts connected by universal joint, one of said shafts being mounted in the block aforesaid and having a main wheel fixed thereto, in combination with an internally-screw-threaded sleeve pivotally secured to the frame aforesaid and a screw-threaded rod in said sleeve, substantially as shown and described.

4. In a bicycle, a frame having two shafts, J F', mounted therein, each of said shafts being provided with a friction-wheel, and means, substantially as specified, for lifting one frictional wheel out of contact with the other, substantially as shown and described.

5. In a bicycle, the combination, with a frame, of two shafts, J F', one end of the shaft J being mounted in a pivotal bearing, the other end thereof being mounted in a sliding bearing, each of the shafts aforesaid being provided with a friction-wheel, and means, substantially as specified, for elevating the sliding bearing and connected parts aforesaid, substantially as shown and described.



6. In a bicycle, the combination, with a frame, of two shafts, J F', one end of the shaft J being mounted in a pivotal bearing, the other end thereof being mounted in a sliding bearing, the shaft J being also provided with a friction-wheel and a sprocket-wheel, the shaft F' being also provided with a friction-wheel, a rod for lifting the sliding bearing and connected parts, and a sprocket-chain, substantially as shown and described.

7. In a bicycle, a frame provided with two shafts, J F', each having a friction-wheel, the shaft J being mounted in a pivotal and a sliding bearing, as specified, in combination with a segmental rack, lever M, and rod O, one end of said rod being connected to the sliding bearing aforesaid, substantially as shown and described.

8. In a bicycle, a frame provided with two shafts, J F', the shaft J having a sprocket-wheel and a friction-wheel fixed thereto, the shaft F' being also provided with a friction-wheel, a treadle-crank journaled in the frame, a sprocket-wheel fixed to said crank, and a sprocket-chain connecting the two sprocket-wheels aforesaid, in combination with the levers M N, connecting-rod N', and segmental rack N², substantially as shown and described.

9. In a bicycle, a frame consisting of the top piece, A, arms B', supporting the seat, a looped or bottom part, a^6, and a bar, B², the upper end of said bar being fixed to the arm B', the lower part thereof being fixed to the looped part aforesaid, the extreme lower end of said bar being provided with a step, substantially as shown and described.

396,855. PROTECTOR FOR CHIMNEYS. ADAM P. BEBBER and JOHN A. MYERS, Finney, Kans. Filed Feb. 16, 1887. Serial No. 227,836. (Model.)

Claim.—1. The combination, with the base-guards secured to the roof, of the corner-pieces fitted to the chimney and base-guards, and a cap overlapping the tops of the corner-pieces and projecting into the mason-work of the chimney, substantially as set forth.

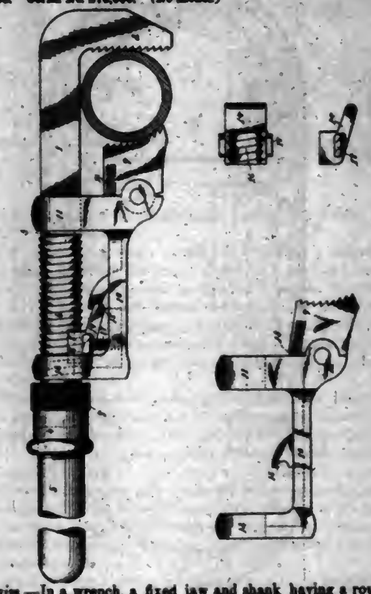
2. The combination, with the base-guards secured to the roof at the lower side of the chimney, of corner-pieces fitted to the chimney and to the base-guards, and other corner-pieces fitted to the chimney and to the roof at the upper side of the chimney, the latter corner-pieces being provided with flanges overlapping the base-guards, and a cap fitted to the tops of the corner-pieces, substantially as set forth.

3. The combination, with the base-guards at the sides of the chimney, of the corner-pieces forming the body of the protector, and the sectional cap composed of overlapping quarter-sections, the said sections being provided with elongated slots and bolt-holes in their overlapping ends, whereby the cap may be enlarged or contracted, substantially as set forth.

4. The combination, with the chimney and sectional body portion of the protector, of the sectional cap provided with an internal flange entering the chimney-wall intermediate of the roof and top of the chimney, substantially as set forth.

396,856. HOE. ROBERT M. BROWN, Fort Gaines, Ga. Filed Sept. 24, 1888. Serial No. 286,155. (No model.)

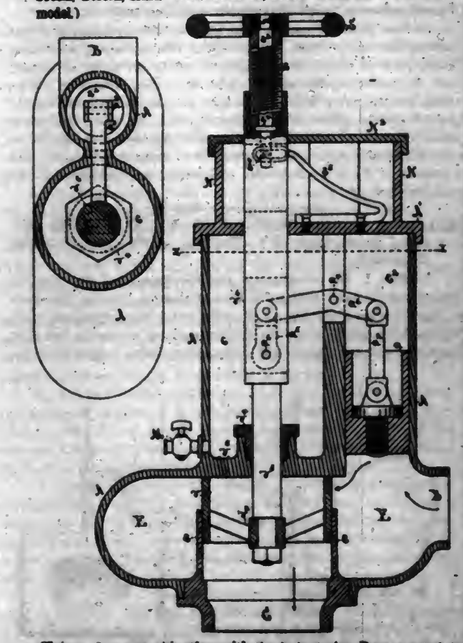
Claim.—1. A hand-hoe consisting of a blade whose cutting-edge is curved downward, and a shank which extends rearward in the same plane with the blade, as shown and described, for the purpose specified.



2. A hand-hoe whose blade is curved upward at its rear edge, and whose shank extends from the blade in the same plane therewith, as shown and described.

3. A hand-hoe consisting of a blade whose cutting-edge is curved downward and its rear edge upward, and a shank which extends rearward from the blade and in the same plane with it, as shown and described.

4. A hand-hoe consisting of a blade whose cutting-edge is curved downward, a U-shaped shank whose lower arm extends rearward in the same plane with the blade, and a handle which is attached to the upper and shorter arm of said shank and is placed at an angle of about forty-five degrees to the said blade and lower arm of the shank, as shown and described.

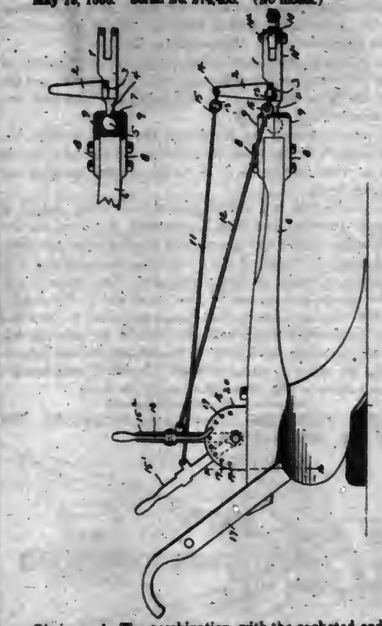


5. The combination, with a hoe-blade and a shank extended rearward, of guard-wires which extend from the corners of the blade to the outer extremity of the shank, as shown and described, for the purpose specified.

396,857. WRENCH. LARS P. CARSTENSEN, Bridgeport, Conn., assignor to the Armstrong Manufacturing Company. Filed June 11, 1888. Serial No. 276,998. (No model.)

Claim.—In a wrench, a fixed jaw and shank having a rounded portion, and a screw having a longitudinal opening to receive said rounded portion and turning freely thereon, in combination with a movable jaw, a carrier therefor which slides freely over the shank and screw, and a spring-actuated dog upon the carrier which is adapted to engage the screw, so that when the latter is turned the carrier and jaw are moved thereby, and when the dog is disengaged the carrier and jaw may be moved independently of the screw.

396,858. RELIEF-VALVE. ALBERT H. CARVER and NORMAN J. STONE, Boston, Mass. Filed June 16, 1888. Serial No. 277,393. (No model.)



Claim.—1. In combination with the induct-pipe B, connected to the delivery of the pump, and the educt-passage C, connected to its suction, the piston *a*, pivoted lever a^5, and valve V, arranged to allow the water by its pressure to open the valve and permit the water to flow from passage B outward through passage C, substantially as described.

2. In combination with the induct-pipe B, connected to the delivery of the pump, and the educt-passage C, connected to its suction, the piston *a*, pivoted lever a^5, valve V, arranged to allow the water by its pressure to open the valve and permit the water to flow from passage B outward through passage C, and the spring s^3, arranged to close the valve V when the pressure is diminished upon the piston *a*, substantially as described.

3. The combination of the valve V, its valve-stem v^2 v^4, the tubular rod *s*, adjustable within the rod v^2 by its screw-thread, the rod s^2, passing through the same and carried therewith, and the spring s^3, pivoted to the latter rod, substantially as described.

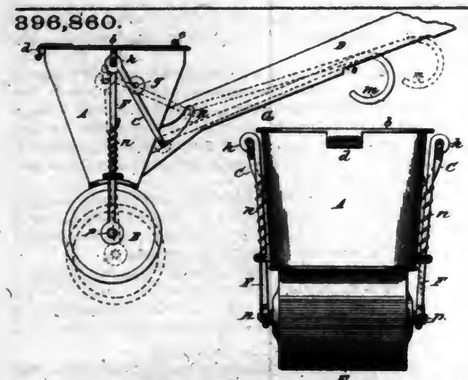
4. The combination of the induct-passage B, the educt-passage C, the chamber E, the tubular walls *c* c^2, and the valve V, fitted to and arranged to move up and down within said walls and connected to its rod v^2 by the vertical strut *o* around its upper edge, substantially as described.

396,859. CLEVIS. MARSHAL T. COLE, Claremont, Minn. Filed May 18, 1888. Serial No. 274,453. (No model.)

Claim.—1 The combination, with the socketed end of a plow-frame, of a clevis having a ball on its end fitted in said socket, laterally-extending vertical and horizontal arms on said clevis, and rearwardly-extending rods connected to said arms, substantially as described.

2. The combination, with a plow-frame, of a clevis connected thereto by a universal joint, lateral arms formed on said clevis, and levers having connections with said arms for adjusting said clevis, substantially as described.

3. The clevis 1, having vertical arm 2, horizontal arm 3, and rearwardly-extending arm 4, with ball 5, substantially as described.



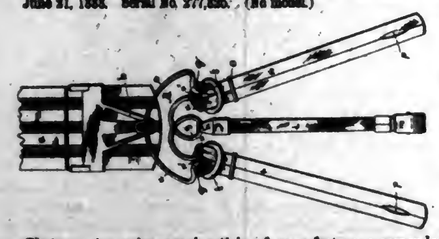
4. The combination, with plow-beam 6, having castings 8, with recessed heads 9, forming socket 7 and secured to plow-beam 6, of the clevis 1, having vertical arm 2, horizontal arm 3, rear arm, 4, with ball 5, located in recess 7, and the rods 11 and 12, connected to arms 2 and 3, with levers 15' and 15², pivoted to plow-beam 6 and having spring-actuated catch-levers 18, and the brackets 20, with series of holes 19, with which catch-levers 18 engage, substantially as described.

396,860. GRIDDLE GREASING AND OILING UTENSIL. SAMUEL R. CORTRIGHT, Scranton, Pa. Filed Jan. 13, 1888. Serial No. 260,643. (No model.)

Claim.—1. In a griddle greasing and oiling utensil, the combination of the supply-can and distributing-roller connected by the spring-supported sliding guides F and roller-bearings, substantially as set forth.

2. The combination, in a griddle greasing and oiling utensil, of the can A, the distributing movable roller B E, connected by the

396,860.



springs *n* and sliding roller-supports F, and means for so connecting them with the roller and can that these are readily separated or brought into pressure-contact, substantially as described.

3. In a griddle greasing and oiling utensil, the combination of the can, the distributing-roller spring-supported and movable, and the lever-acting device or follower C, for separating the roller and can-bottom, as specified and set forth.

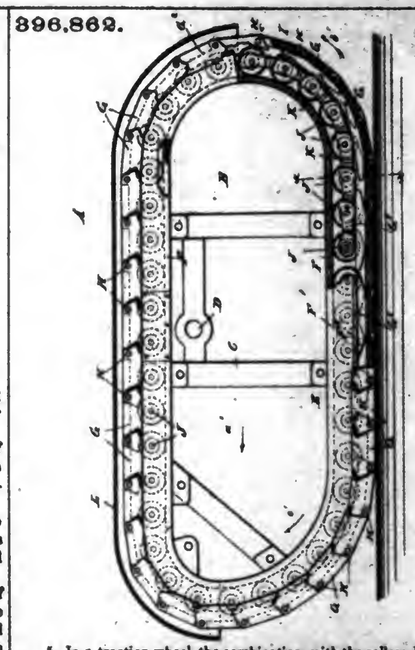
4. The combination of the supply-can, the movable roller, the springs and supports for the same, the follower and the rod G, and its finger-hook *m*, within the handle D, all for the purposes specified and substantially set forth.

5. The combination, in a griddle greasing and oiling utensil, of a supplying-can provided with slotted, perforated, or woven concave bottom and hollow handle, spring-supported movable roller journaled in the sliding supports F beneath the can-bottom, and provided with absorbent surface-covering E, spring-controlled roller supports and bearings, the springs *n*, connected by their upper end to the supply-can and to the roller-supports by their lower end, so as to draw the roller up in pressure-connection with the bottom the can, the follower, and the operating-rod G, with its finger-hook, for the purpose of separating the roller, by pressure of the follower C, from contact with the can-bottom at will, all as substantially set forth.

396,861. SUSPENDERS. CARSON P. CRANE, Columbus, Ohio. Filed June 21, 1888. Serial No. 277,226. (No model.)

Claim.—As an improved article of manufacture, a suspender attachment formed of a single piece of material bent to form the curved bar *c*, side loops or eyes formed with recesses *q*, and a loop or eye between said side loops, all of said loops being beneath the curved bar, with the central loop on a higher plane than the side loops, substantially as shown and described.

396,862. TRACTION-WHEEL. LE ROY O. DREW, Carthage, Dak. Filed Sept. 6, 1888. Serial No. 284,709. (No model.)



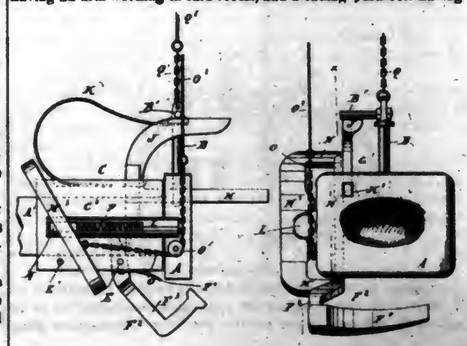
Claim.—1. In a traction-wheel, the endless chain I, consisting of a series of pivoted links, G, each provided with parallel track-plates G^3, projecting beyond the ends of the bottom thereof, substantially as herein shown and described.

2. In a traction-wheel, the endless chain I, consisting of a series of pivoted links, each formed of the side pieces, G^2, having the recessed ends G^2 and the bottom G^4, provided with the parallel track-plates G^3, projecting beyond the ends of the bottom, substantially as herein shown and described.

3. In a traction-wheel, the combination, with the U-shaped track E, provided with the outwardly-extending flanges F^2, of the endless chain I, composed of a series of pivoted links, G, provided with inwardly-projecting flanges G', substantially as described.

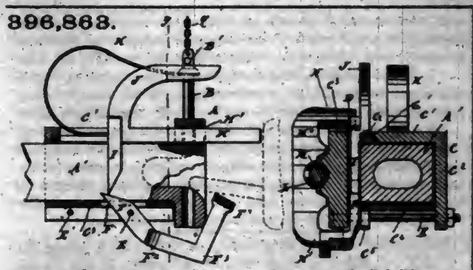
4. In a traction-wheel, the combination, with the rollers J, of the links K, each provided with apertures K' for the reception of the trunnions of the rollers, the hub K^2, surrounding the aperture, and the apertures K^3, substantially as described.

396,862.



5. In a traction-wheel, the combination, with the rollers J, of the links K, each provided with the apertures K' K^2, the hub K^2, the notch K^3, and the stop K^4, having flange K^5, substantially as herein shown and described.

6. In a traction-wheel, the combination, with an elongated frame forming an inside track and provided with outwardly-extending flanges, of rollers traveling on the said inside track, links for connecting the trunnions of the said rollers to form an endless chain, and a second endless chain provided with flanges fitting on the flanges of the frame and also provided with parallel plates forming an outside track for the said rollers, substantially as shown and described.



7. In a traction-wheel, the combination, with an elongated frame forming an inside track and provided with outwardly-extending flanges, of links having flanges fitting on the flanges of the said track, bolts for connecting the said links with each other to form an endless chain, bottom plates held on each link and adapted to pass onto the ground, parallel plates held on the said links to form a continuous track, rollers mounted to travel on the said parallel plates and also on the said inside track, and a second set of links for connecting the trunnions of the said rollers with each other, substantially as shown and described.

396,863. ATTACHMENT FOR PIN-AND-LINK COUPLERS. WILLIAM L. DWYER, Albany, N. Y. Filed Aug. 16, 1888. Serial No. 282,868. (No model.)

Claim.—1. The combination, with the draw-head of a pin-and-link car-coupler, of a detachable hood-like casing covering the shank of the draw-head, one side plate of the casing being separated medially from the adjacent side of the shank to form a recess, a link-lifter having an arm working in said recess, and a sliding push-bolt having

396,863.

a tappet, also working in said recess and engaging the link-lifter arm, substantially as described.

2. The combination, with a coupler draw-head, of a detachable hood-like casing covering the shank of the draw-head and its side plates projecting below the same, a detachable bottom plate fitted between the projecting lower edges of the casing, bolts passed transversely beneath the bottom plate and through the said projecting parts of the casing, and pin sustaining and releasing devices and link-lifting devices mounted on the said casing and bottom plate, substantially as described.

3. The combination, with a coupler draw-head, of a detachable hood-like casing covering the shank of the draw-head, projecting on opposite sides below the shank, and separated on one side from the shank to form a vertical recess, a detachable bottom plate fitted between the projecting parts of the casing and formed with a slot in range of the vertical recess and a downward-projecting eye-lug inside the said slot, a link-lifting lever mounted in said slot and in the recess thereabove, and a bolt passed transversely through the bottom projecting parts of the casing, the eye-lug, and the link-lifting lever, substantially as described.

4. The combination, with a coupler draw-head, of a pivotal link-lifting lever pivoted by a fixed fulcrum to move in the vertical plane in front of the draw-head, a push-bolt projectible from the front of the draw-head, and operating-connections between the pivotal link-lifting lever and the push-bolt by which the link-lifting lever is raised when the push-bolt is retracted, substantially as described.

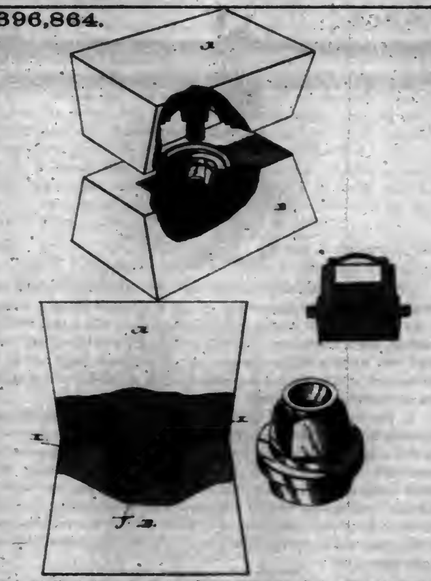
5. The combination, with a coupler draw-head, of a swinging link-lifting lever having a cam-arm and a push-bolt projectible from the front of the draw-head and carrying a tappet to strike the cam-arm of and raise the link-lifting lever, and then to pass the said cam-arm and release the link-lifting lever, substantially as described.

6. The combination, with a coupler draw-head and a drop coupling-pin having an arm projecting laterally from its head, of a sliding push-bolt projectible from the front of the draw-head and carrying an upward and forward extending arm to pass beneath the lateral pin-arm and sustain the pin, substantially as described.

7. The combination, with a draw-head, a drop coupling-pin having a lateral arm, and a link-lifting lever, of a sliding push-bolt projecting from the front of the draw-head and carrying both a pin sustaining and releasing arm and a tappet to operate the link-lifting lever, substantially as described.

8. The combination, with a coupler draw-head, of a sliding push-bolt carrying a coupling-pin-head-supporting arm, a link-lifting lever, a coupling-pin-raising device, a sliding presser-bar having arms to strike and project the sliding bolt and to strike and raise the link-lifting lever, and means for operating the said presser-bar from outside the coupler, substantially as described.

9. The combination, with a draw-head, of coupling-pin lifting and sustaining devices, a sliding push-bolt carrying the pin-supporting device, a sliding presser-bar to carry the push-bolt forward, draw devices for sliding the presser-bar forward, and a spring to return the presser-bar automatically, substantially as described.

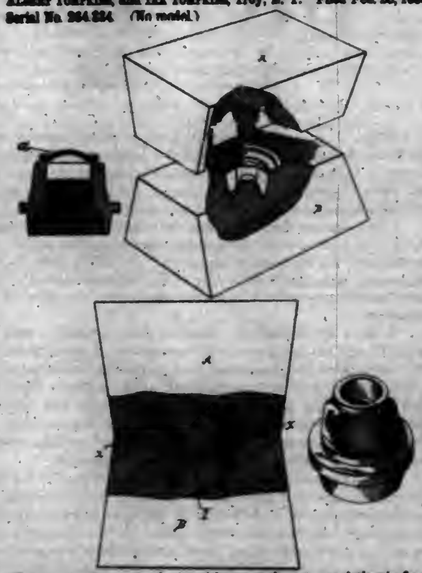


10. The combination, with a draw-head and coupling-pin raising and sustaining devices, of a tubular slotted guide fixed to the draw-head, a block sliding therein having a neck projecting through the slot, and a presser-bar carried by said neck to work the pin-sustaining devices, substantially as described.

11. The combination, with a coupler draw-head, of a detachable hood-like casing covering the shank of the draw-head and having a longitudinal slot provided with an undercut side wall and a correspondingly-beveled bolt mounted to slide on the said shank in the undercut slot and to be projected from the front of the draw-head, substantially as described.

396,864. DIE FOR MAKING AXLE-NUTS. ROWIN FIRTH, ALBERT TOMPKINS, and IRA TOMPKINS, Troy, N. Y. Filed Nov. 14, 1887. Serial No. 255,192. (No model.)

Claim.—1. In an apparatus for making drop-forged steel axle-nuts, the blocks A B, having the dies formed in their opposing sides,

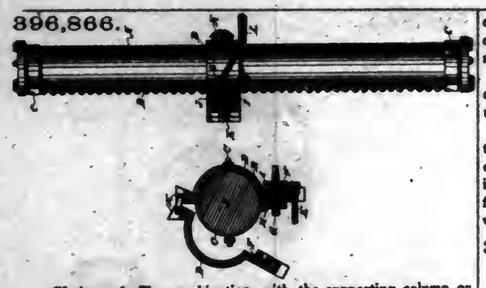


396,864.

the said dies being adapted to the contour of an axle-nut, substantially as described.

2. In an apparatus for making drop-forged steel axle-nuts, the blocks A B, having the dies formed in their opposing sides, which dies have the central projecting portions, which do not come together when in operation, but leave a surplus of metal at that point, as set forth.

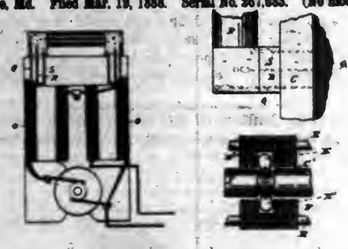
396,865. METHOD OF MAKING AXLE-NUTS. ROWIN FIRTH, ALBERT TOMPKINS, and IRA TOMPKINS, Troy, N. Y. Filed Feb. 23, 1888. Serial No. 264,834. (No model.)



Claim.—1. The method of making an axle-nut, consisting in forging the same from steel or iron, then counterboring the nut to form the oil-chamber, and finally cutting screw-threads on the inner side of the nut, as set forth.

2. The method of making an axle-nut, consisting in forging the same from steel or iron, then counterboring the nut to form the oil-chamber, and then capping the outer end of the nut to complete the oil-chamber, as set forth.

396,866. ADJUSTING AND SUPPORTING DEVICE FOR DRILLS. GEORGE H. FISHER, Pleasant Valley, Cal. Filed Mar. 6, 1888. Serial No. 266,574. (No model.)



396,866.

Claim.—1. The combination, with the supporting column or standard and the independent rack-bar, of the hinged clamp D, fitted to the standard and having the projection K, to which the drill is attached, and a transverse shaft passing through said clamp and provided with a pinion which engages the rack-bar, said clamp having a slot through which the rack-bar passes and in which the pinion operates, substantially as described.

2. The hinged clamp fitted to the supporting standard or column of a rock-drill, and having a projection or arm at one side to which the drill is fixed, a projection upon the opposite side having a transverse shaft carrying a pinion, said clamp having a slot in which the pinion operates, and a ratchet-wheel, and a pawl engaging the ratchet-wheel, in combination with an independent rack-bar passing through the slot in the clamp, and yokes to which the ends of the rack-bar are secured, said yokes turning loosely about the column, substantially as herein described.

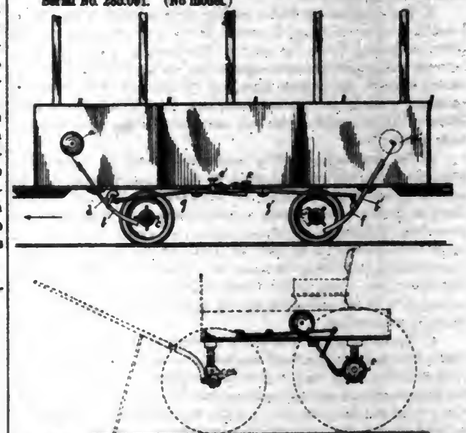
396,867. DYNAMO-ELECTRIC MACHINE. PERRIN GRAFF, Baltimore, Md. Filed Mar. 19, 1888. Serial No. 267,633. (No model.)

Claim.—1. In a dynamo-electric machine, the combination, with the frame thereof, the armature and the armature-shaft supported therein, the commutator, and the contact-brushes, of the field-magnets whose cores are composed of a series of disks and an aperture extending throughout the length of said magnets.

2. In a dynamo-electric machine, the combination, with the frame thereof, the armature and the armature-shaft supported therein, the commutator, and the contact-brushes, and the field-magnets having an aperture extending therethrough, of the regulator located in said aperture and constructed to automatically regulate the speed of the armature.

3. In a dynamo-electric machine, the combination, with the frame thereof, the armature and the armature-shaft supported therein, the commutator, and the contact-brushes, and the field-magnets having an aperture extending therethrough, of the regulator located in said apertures and shunt-coils connected therewith, said regulator being so constructed that when the strength of the current of the field-magnets is increased one or more shunt-coils are automatically put into circuit and the speed of the armature regulated.

4. In a dynamo-electric machine, the combination, with the frame thereof, the armature and the armature-shaft, the commutator, and contact-brushes, and the field-magnets having an aperture extending therethrough and shunt-coils wound thereon, of the regulators located in said apertures and having contact-points which correspond with the termination of the shunt-coils, whereby said shunt-coils are thrown into or out of circuit accordingly as the strength of the field-magnets is increased or decreased.

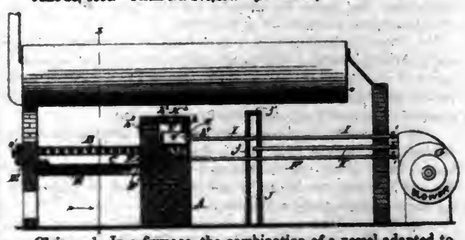


5. The combination, with a magnet having an aperture therein and shunt-coils wound thereon, of a regulator-bar located in the aperture and having contact-points to correspond with the terminals of the shunt-coils, whereby said shunt-coils are thrown into or out of circuit accordingly as the strength of the magnet is increased or decreased.

6. The combination, with a magnet having an aperture therein and shunt-coils wound thereon, and a scale located on its surface, of a regulator-bar having a pointer located in the aperture and provided with contact-points to correspond with the terminals of the shunt-coils, whereby said shunt-coils are thrown into or out of circuit accordingly as the strength of the magnet is increased or decreased, and the pointer indicates the strength of the current upon the scale.

7. The combination, with the contact-brushes united by a cord, of a segment-rack and bar or lever engaging in the same, whereby upon movement of the lever the position of the brushes is regulated.

8. In a dynamo-electric machine, the combination, with an armature-shaft and an armature mounted thereon whose core is composed of disks kept apart from each other by smaller intervening insulating-disks, said armature being partially hollowed out in its center, of fan-blades mounted on the shaft within the hollowed-out portion, whereby a current of air is created within the armature.



396,868. PEDAL BELL-SIGNAL DEVICE. JOHN R. GRIFFIN, Chicago, Ill., assignor, by direct and mesne assignments, to Julia Frances Griffin and Thomas H. Keefe, both of same place. Filed Sept. 10, 1888. Serial No. 285,091. (No model.)

Claim.—1. The combination, with one or more radial projections rigidly secured to the rotatory axle or hub of a vehicle, of a gong secured to the body or frame-work of the vehicle, a bell-hammer mounted on a pivoted arm and actuated to sound said gong by the pivotal movement of the arm when operated by the revolving of said radial projections, and a pedal device, also secured to the body or frame-work of the vehicle and yieldingly connected with the said pivoted arm, whereby on depressing said pedal device said pivoted arm is brought into the path of the revolving radial projections and operated thereby, substantially as and for the purpose specified.

2. The combination, with the revolving axle or hub of a vehicle, of radial wings or projections thereon rigidly secured thereto, a pedal device, and a pivoted bell-hammer support secured to the body or frame-work of said vehicle, whereby on depressing the pedal one end of the bell-hammer support is moved into the pathway of and actuated by the rotation of the wings or radial projections as said vehicle is propelled, substantially as and for the purpose specified.

396,869. FURNACE. FRADELSSON HARRIS, St. Louis, Mo. Filed June 23, 1888. Serial No. 278,497. (No model.)

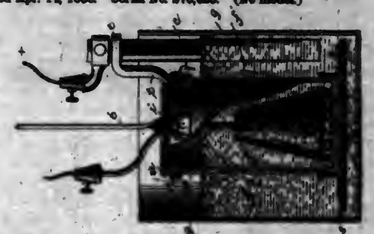
Claim.—1. In a furnace, the combination of a vessel adapted to contain water and arranged adjacent to the fire-chamber, and an air-blast pipe arranged to direct a current of air to mingle with and force the vapors arising from said vessel into the fire, substantially as and for the purposes specified.

2. In a furnace, the combination, with the grate, of a water trough or vessel arranged therebelow and an air-blast pipe having its discharge arranged to open above the said trough between the same and the grate, substantially as set forth.

3. The grate and the partitions or plates arranged below the same, forming chambers, combined with the water-trough bottoms for said chambers hinged at one edge, catches for securing the opposite edges of the troughs, and the air-blast pipes arranged to open into said chambers above the troughs, substantially as set forth.

4. The combination, in a furnace, of a vessel adapted to contain water and arranged adjacent to the fire-chamber, and an air-blast pipe extended into the furnace from the rear, whereby the air will be heated in its passage through the pipe, the said pipe being arranged to direct a current of air to mingle with and force into the fire the vapors arising from the vessel, all substantially as and for the purposes specified.

5. In a furnace, the combination of the fire-chamber, the main bridge-wall, a vessel adapted to contain water and arranged adjacent to the fire-chamber, the second or auxiliary bridge-wall arranged in rear of the main bridge-wall and made hollow, and having exit port or ports, the air-blast pipe leading into the second bridge-wall, and the air-blast pipe arranged to direct a current of air to mingle with and force the vapors from the water-vessel into the fire, all substantially as and for the purposes specified.



6. A furnace, substantially as herein described and shown, consisting of the casing, the grate, the partitions or plates C, the trough-like bottoms E, the catches for securing said bottoms, the main bridge-wall, the tank located in rear thereof, a cover for said tank, vents or openings being provided leading from the tank, the hollow auxiliary bridge-wall having vents or openings, and the air-pipes I, F, and K, all substantially as and for the purposes specified.

7. In a furnace, the combination of the bridge-wall, the tank located in rear thereof, a cover for said tank, vents or openings being provided leading from the tank, and the air-blast pipe opening into said tank, all substantially as and for the purposes specified.

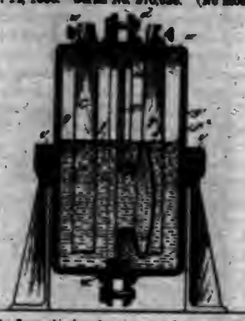
8. The combination, substantially as herein described and shown, of the bridge-wall, the tank located in rear of said wall, a cover for the tank, openings being provided leading upward through said cover, forward through the bridge-wall, and rearwardly through the back wall of the tank, the blast-pipe opening into the tank, and the auxiliary bridge-wall forming a second combustion-chamber in rear of the main bridge-wall, the combustion in said second chamber operating to heat the water in the tank, substantially as set forth.

9. The combination, in a furnace, of the main bridge-wall, the second or auxiliary bridge-wall arranged in rear of the main bridge-wall, forming a second combustion-chamber, said second bridge-wall being made hollow and having vents leading outward from its interior, the air-blast pipe leading into said second bridge-wall, the water-tank arranged in the rear of the main bridge-wall, a cover for said tank openings being formed through the said cover and through the bridge-wall leading forward from said tank, and perforations being formed in the rear wall of such tank, an air-blast pipe leading into the tank, the grate, the troughs arranged below the grate, and the air-blast pipes arranged to discharge adjacent to said troughs, substantially as set forth.

396,870. ELECTRIC BATTERY. CHARLES F. HEINRICHS, New York, N. Y., assignor of one-half to William F. Whitmayer, same place. Filed Apr. 14, 1888. Serial No. 270,635. (No model.)

Claim.—1. In an electric battery, a flexible and expansible compartment connected with a porous diaphragm, by means of which the fluids may be stored, separated from each other, from the electrodes, and from the porous diaphragm, in combination with the second fluid, by means of which the fluid contained in the expansible compartment is replaced into the porous cup, all substantially as described.

2. In an electric battery, a porous cup (containing one electrode) to which is connected a flexible and expanding non-porous chamber, in combination with the cup and electrode-holder and means by which the cup and the electrode may be lowered in the battery or raised out of the same, all substantially as described.



3. In an electric battery, the combination, with the porous cup *p*, of soft-rubber ring and clamp with locking-piece K, electrode-holder extension *t*, studs *i i*, and lifting-bands *b b*, all substantially as described.

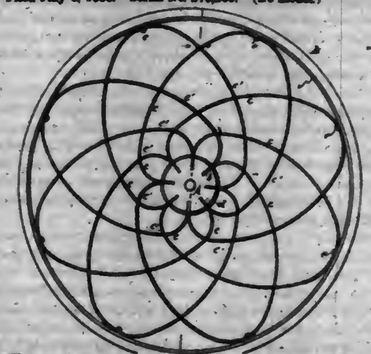
4. In combination with the jar of a liquid battery, an interior porous cup containing one electrode and connected with another electrode arranged to dip in the fluid of the cup, and a flexible or expanding non-porous chamber in connection with the porous cup, all substantially as described.

5. In combination, in a liquid battery, a porous cup with connections for raising and lowering it in the cell, an electrode fixed in place in the porous cup, an electrode on the outside thereof, and a flexible non-porous pouch attached to the lower part of the cup and in communication therewith, all substantially as described.

6. In combination, the jar *g*, the porous cup *p*, having a perforated bottom, the non-porous pouch *o*, fixed to its lower end, the holder *r*, having an extension, *t*, carrying an electrode, and an electrode in the porous cup, all substantially as described.

396,871. ELECTRIC BATTERY. CHARLES F. HEINRICHS, New York, N. Y., assignor of one-half to William F. Whitmayer, same place. Filed Apr. 14, 1888. Serial No. 270,636. (No model.)

Claim.—1. In a tipping battery, and in combination, a partition partly porous and partly non-porous, the electrodes arranged in the described relation thereto, and a supplemental chamber connected to an opening in the non-porous part of the partition, all substantially as described.

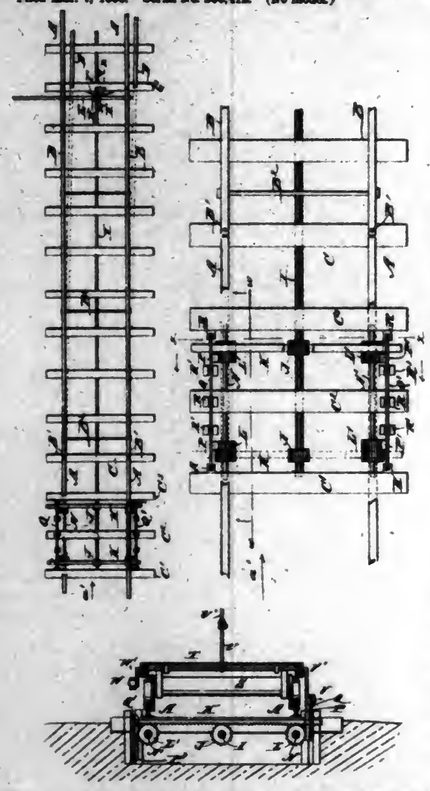


2. In a tipping battery having a partition, *p*, partly porous and partly non-porous, an opening in the non-porous part with an extensible non-porous pouch connected therewith, all in the described relation to the electrodes and substantially as set forth.

3. In an electric tip-battery, the combination of the double cell-inclosures, the two fluids with a partition-plate partly porous and partly non-porous, and the flexible packing-ring, all arranged substantially as described.

4. In an electric tip-battery, the combination of the two cell-inclosures *g* and *g'*, the grooved packing-ring *u*, the partition-plate *p* being partly porous and partly non-porous, with the fluids *f''* and *f'''*, and the two electrodes C and *z*, all substantially as described.

5. In an electric tip-battery, a partition-plate being partly porous and partly non-porous, and a supplemental non-porous expansion-chamber connected to an opening in the partition-plate, all substantially as described.



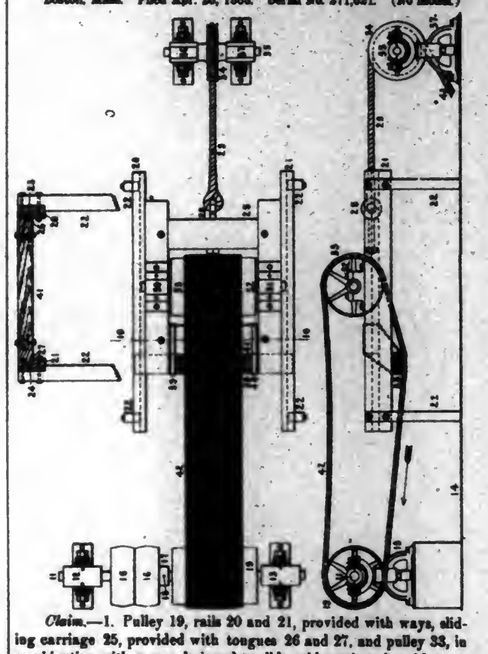
396,872. VEHICLE-WHEEL. HORATIO F. HICKS, Ashland, Oreg. Filed July 6, 1888. Serial No. 279,209. (No model.)

Claim.—1. In a wagon-wheel, the combination, with the hub and rim, of two series of curved spring-spokes, the curves of the spokes of one series being arranged oppositely with reference to the curves of the spokes of the other series, substantially as specified.

2. In a wagon-wheel, the combination of a hub having end flanges and curved spokes inserted in the flanges of the hub and secured to the rim, the curves of one series of spokes being oppositely arranged with reference to the curves of the spokes of the other series, substantially as specified.

396,878. RAILROAD-SWITCH. JOHN HUNTER, Maple Bay, Minn.
Filed Mar. 7, 1888. Serial No. 266,412. (No model.)

Claim.—1. In a railroad-switch, the combination, with the switch-rails pivoted at one end and having a rack connecting their free ends, of a longitudinally-extending rock-shaft having a gear engaging said rack, inclined vertically-movable plates mounted outside of the main rails and connected with said operating-shaft for rocking it in opposite directions, a link pivotally connected with the said rack, a fixed bracket having a slot receiving said link and a spring bearing against the front end of said link.

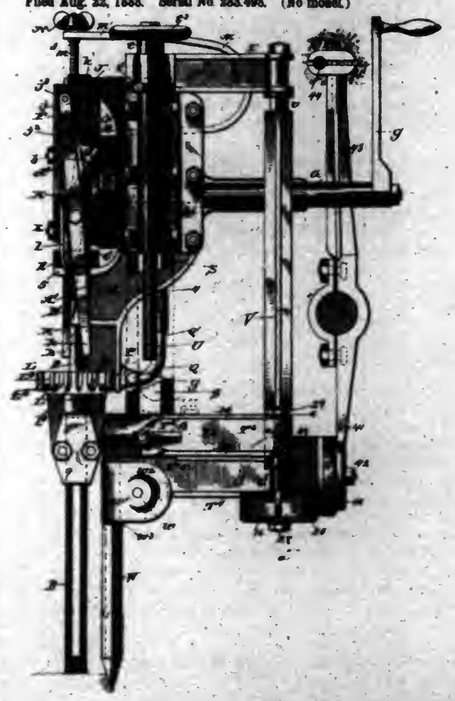


2. In a railroad-switch, the combination, with two plates having inclined top edges and arranged to slide vertically in opposite directions, of vertical racks formed on the said plates, gear-wheels meshing into the said vertical racks, and horizontal transverse racks meshing into the said gear-wheels, so that when one plate is depressed the other rises, substantially as shown and described.

3. In a railroad-switch, the combination, with two plates having inclined top edges and adapted to slide vertically in opposite directions, of vertical racks formed on the said plates, gear-wheels meshing into the said vertical racks, horizontal transverse racks meshing into the said gear-wheels, a second set of gear-wheels meshing into the said horizontal racks, and a shaft carrying the said second set of gear-wheels and connected with the free ends of the pivoted switch-rails, substantially as shown and described.

4. In a railroad-switch, the combination, with two plates having inclined top edges and adapted to slide vertically in opposite directions, being operated from the cab of the locomotive, of vertical racks formed on the said plates, gear-wheels meshing into the said vertical racks, horizontal transverse racks meshing into the said gear-wheels, and a second set of gear-wheels meshing into the said horizontal racks, a shaft carrying the second set of gear-wheels and also provided at its opposite end with a gear-wheel, a rod having a rack meshing into the gear-wheel at the end of the said shaft, and pivoted switch-rails carrying at their free ends said rod having a rack, substantially as shown and described.

5. In a railroad-switch, the combination, with pivoted switch-rails, of a rod secured to the free end of the said pivoted switch-rails, a link connected with the said rod, a keeper in which the said link is pivoted, and a spring for holding the said link in position, substantially as shown and described.



396,874. BELT-STRETCHING MACHINE. CHARLES L. IRESON, Boston, Mass.
Filed Apr. 23, 1888. Serial No. 271,631. (No model.)

Claim.—1. Pulley 19, rails 20 and 21, provided with ways, sliding carriage 25, provided with tongues 26 and 27, and pulley 33, in combination with means designed to slide said carriage in said ways, substantially as described.

2. Pulley 19, rails 20 and 21, provided with ways, sliding carriage 25, provided with tongues 26 and 27, pulley 33, and surfacing-stick 38, in combination with means designed to slide said carriage in said ways, substantially as described.

396,875. MINING-DRILL. WILLIAM H. JENKINS, Philadelphia, Pa.
Filed Aug. 22, 1888. Serial No. 283,498. (No model.)

Claim.—1. The combination, with a drill-rod having a lifting-pin, of a cam for operating the same, said cam consisting of a disk provided with groove or cut-away portion I', having a radial side arranged at one side of the center line of said cam-disk, said radial portion ending short of the center of the disk, and a curved side beginning with its point at the opposite side of the said center line, extending from the periphery toward the center, having a gradually-decreasing radius, said curvature extending over and past the center of said cam-disk and ending at the inner end of the radial portion, substantially as and for the purpose described.

2. The combination, with a cam provided with a cam-groove, I, substantially as shown, one edge of which is formed of a radial straight portion arranged to one side of the center of the cam, of a spring-actuated drill-rod having a lifting-pin formed with an approximately semicircular bearing-face for operation in said groove, and its opposite face formed straight and extended beyond the center of the cam, whereby the pin shall be instantly released by the cam when the said straight portion of the pin and the radial straight side of the groove shall be in coincident planes, substantially as and for the purpose set forth.

3. In a mining-drill, the combination of the drill-supporting frame and the column Z, for supporting said frame, of a series of adjustable friction-disks connecting said frame to the column, said disks consisting of a horizontal disk, 20, adjustably secured to the drill-supporting frame, provided with a vertical portion, 30, having a central pivot bolt, an angle-plate, 33, adjustably secured upon said plate in frictional contact with the portion 30, said plate provided with vertical portion 34 at right angles to the part 33, a disk, 38, secured upon an arm connected with the column Z, and a pivotal bolt passing centrally through said portion 34 and the disk 38, each of said disk portions having independent adjustments, substantially as shown and described.

4. In a mining-drill, the combination, with the main frame, a series of adjustable disks formed thereon, as shown and described, and the column Z, of the bar 41, mounted on the column Z and connected at one end with the adjustable disks, provided with an extended portion, 43, an adjustable brace-bar, 44, journaled in the portion 43, and the adjustable brace-bar W, connected to the front end of the main frame, whereby said frame is securely adjusted to the main walls, substantially as shown and described.

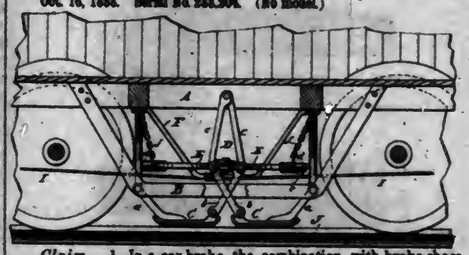
5. In a mining-drill, the combination with the cam I, journaled in the frame A, fixed guides C C', secured in said frame, provided with V-shaped grooves, the cross-head having V-shaped tongues entered in said grooves, and a lifting-pin connecting said cross-head and cam, of the U-shaped spring resting against the upper edge of the cross-head, and its opposite end connected with the frame A, substantially as and for the purpose described.

6. The combination, with the cross-head and the U-shaped spring M, for operating the forward throw of said cross-head, one leaf of said spring connected with and adjustably secured to the frame, the other leaf extending over the cross-head, of the central bearing-plate secured in the upper end of the cross-head and provided with a knife-bearing edge adapted to support the leaf *m* of the spring M, substantially as and for the purpose described.

7. The combination, with the cross-head D, the drill-rod B, secured thereto, a chuck, L, provided with radial projections secured to said drill-rod, and the cam for operating the drill-rod and cross-head, said cross-head formed with cam-recesses in its opposite ends, of the arms K, pivoted to the frame and disposed one to each end of the cross-head D, the upper ends thereof engaging the said cam-recesses, their lower ends engaging the radial projections on the chuck L, said arms adapted to oscillate by the travel of the cross-head, whereby a rotary motion is imparted to the chuck, substantially as and for the purposes shown and described.

8. In a mining-drill, the combination, with the cross-head D, the frame E, secured thereto, having lateral arms d^3 d^3 formed thereon, said arms provided with cam-shaped openings J, arranged in contra-relation to each other, the drill-rod B, connected with the cross-head, and the chuck L, connected to the drill-rod, said chuck provided with radial projections, of the swinging arms K, centrally pivoted to the frame A, and disposed one to the outer face of each of the said arms d^3, connected at their upper ends with the cam-openings J, their lower ends, K, arranged to engage the radial projections on the chuck, said arms adapted to be oscillated by the travel of the cross-head and the cam mechanism for operating the cross-head, substantially as shown and described, as and for the purpose set forth.

9. In a mining-drill, the combination, with the cross-head, the frame F, secured thereto, having arms d^3 d^3 projecting therefrom over the sides of the cross-head, said arms provided with cam-shaped openings arranged in contra-relation to each other, the drill-rod B, secured to the cross-head, and the chuck L, secured to the drill-rod, provided with radial projections, of the arms K, centrally pivoted upon the sides of the frame, said arms provided at their upper ends with roller-bearings engaging the cam-openings J in the arms d^3, their lower ends, *k*, arranged to engage the radial projections, the chuck-springs Z Z', for automatically throwing said arms back to their normal positions, and the cam mechanism, substantially as described and shown, for operating the cross-head, all arranged as and for the purpose described.



10. The combination, with the cross-head carrying the drill-rod, the chuck attached to the said drill-rod, the cam mechanism I, substantially as shown and described, for operating the upward movement of the cross-head, and the spring for forcing said cross-head down, of the arms centrally pivoted, said arms arranged to oscillate by contact at their upper ends with cam-faces of the cross-head, their lower ends adapted to engage the chuck and revolve the same when said arms are oscillated, substantially as shown and described.

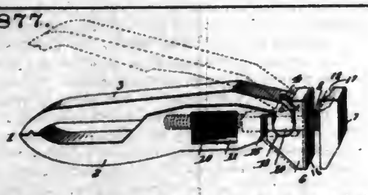
11. In a mining-drill, the combination, with the drill-rod and the chuck secured thereto, provided with radial projections, of the pivotal stop P, said stop adapted to engage the said radial projections, said stop having an extension, Q', provided with a bayonet or other lock joint engaging a stud upon the frame, whereby said stop may be swung out of engagement with said stud and permit of the rotation of said drill-chuck, substantially as and for the purpose specified.

12. In a mining-drill, the combination of the main frame provided with a U-shaped arm, V, forward-extended arms T' and T², and a supplemental arm, T³, the arms T² and T³ supporting the drill-frame, said arm T' pivoted to the outer end of the arm V, and the arm T² pivoted upon the bolt connecting said arm V with the arm T³, said connections of arms T' T² permitting the swinging of the frame T and the drill mechanism away from its working position, substantially as shown and described.

13. In a mining-drill, the combination, with the main frame T, said frame consisting of the arms T' T² and U-shaped arm V, and the supplemental portion T³, said arms having hinged connections at their outer ends to the arm V and part T, respectively, the forward end of the arm T² formed with a reduced portion dovetailed in cross-section, and the arm T³ having an enlarged portion arranged to fit the reduced part of the arm T², said arm provided with an elongated slot, of the U-spring embracing the arm T², its forward end adapted to embrace the ends of the arms T² T³, and an adjusting-bolt passed through the spring-arms and the slot, by the adjustment of which the said spring may be slid back and permit the arms T² and T³ to become disconnected, thereby allowing the frame to be swung upon its pivots, substantially as shown and described.

396,876. CAR-BRAKE. GEORGE O. KANE, Providence, R. I. Filed Oct. 16, 1888. Serial No. 288,204. (No model.)

Claim.—1. In a car-brake, the combination, with brake-shoes pivotally connected at their opposite ends with the frames or supports depending from the car, of the toggle-levers D, the lower bars, *b b*, of which cross each other and are pivotally connected to the adjacent ends of the shoes, brake-beams to the ends of which said toggles pivot at the joints between their upper and lower members, a centrally-pivoted lever between the two bars, rods connected at their inner ends to opposite sides of the lever, and at their outer ends to the centers of said beams, and brake-rods connected with the said lever beyond first-named rods, substantially as set forth.



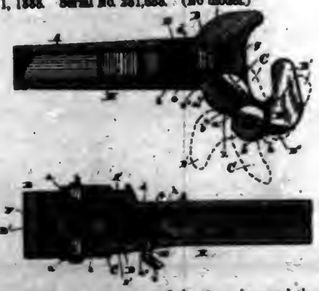
2. The combination, in a car-brake, of the frames B, secured to the car-frame A, arms *a*, pivoted to the frames B, brake-shoes C, secured to the arms *a*, toggle-joints D, connected with the brake-shoes and car-frame, the brake-beams E, and mechanism for moving the beams toward each other for straightening the toggle-joints, substantially as specified.

3. In a car-brake, the combination, with the pivoted brake-shoes C, of the toggle-joints D, brake-beams E, springs *d*, rods H, the lever G, and mechanism for operating the said lever, substantially as specified.

396,877. WRENCH. CHARLES H. KENNEDY, Greenburg, N. Y. Filed Apr. 9, 1888. Serial No. 270,062. (No model.)

Claim.—1. A wrench consisting in a longitudinally-bored stock, 2, the outer part of the bore being squared, the sliding inner jaw, 6, upon the outer side of the upper end of the stock at right angles thereto, a lever pivoted to said stock, and also pivotally connected to the jaw for throwing it positively in opposite directions, the outer jaw,

896,877.



7, having a shank, 8, extended into the bore, the lower end of the shank being threaded and the upper part being squared to fit the squared portion or socket of the bore, and an exposed nut on the said threaded portion, substantially as set forth.

2. A wrench consisting in a longitudinally-bored stock having an opening, 11, communicating with said bore, the inner jaw, 6, sliding on the outer end of the stock and having an aperture in line with said bore and a recess forming a bearing, a lever pivoted to the outer end of the body and having a cam-shaped outer end entering said recess, and the outer jaw having a shank extending through the aperture in the inner jaw into the bore of the body and provided with an adjusting-nut working in the opening 11, substantially as set forth.

3. The combination, with the stock and the outer jaw projecting in front and rear thereof, of an inner sliding jaw also projecting in front and rear of the stock and a lever for forcing it toward the outer jaw, the inner or contacting face of one of said jaws at its rear end being cut away or recessed to form a cutting-edge flush with said inner or contacting face, substantially as set forth, whereby the forward ends of the jaws serve the usual purposes of a wrench and their rear ends form wire-cutting jaws, as described.

4. A wrench constructed with handle 1, consisting of the part 2, formed with square socket 9, opening 11, shoulder 15, and projections 4 5, the jaw 6, with oval recess 13, the lever 3, forming the other part of handle 1 and having cam-shaped forked end 14, pivoted to projection 4 and located in recess 13, and the adjustable jaw 7, formed with recess 17, cutting-edge 18, and shank 8, with screw-threaded portion 12, engaging thumb-nut 10 in opening 11, substantially as shown and described.

896,878. CAR-COUPLING. ISAAC KLINE, Louisville, Ky. Filed Aug. 1, 1888. Serial No. 281,688. (No model.)

Claim.—1. The combination of the draw-bar and the adjustable horizontally-swinging hook thereon with the pivoted oscillating locking-tumbler pivoted in the draw-bar and the depending link for oscillating the same, substantially as set forth.

2. The combination of the draw-bar and swinging hook hinged thereto, and having a locking bevel-faced arm, with a tumbler pivoted in the draw-bar, having a beveled shoulder engaging said arm when locked, and the depending link pivotally connected to said tumbler, substantially as described.

3. In a car-coupler, the combination of the draw-bar, having pin-openings and a slot, a'', in its bottom, with the oscillating tumbler D, pivoted on a rod, d, in rear of the pin-openings and having a rounded front face, and the link E, pivotally connected with the rear end of tumbler D and depending through the slot a'', substantially as described.

4. The combination of the draw-bar, the oscillating tumbler D thereto, and the devices for operating said tumbler with the swinging hook B, having a shank, b', pivoted between lugs a of the draw-bar, and also a locking-arm, C, provided with an inclined guide, F, formed on the lower face of the arm at the junction of the arm and shank, substantially as and for the purpose described.

5. The combination of the draw-bar having pairs of hinge-lugs, the lower one having notches f' f'' in its upper surface, with a swinging hook hinged between said lugs, and having an incline, F, at the junction of its arm and shank, adapted to lift the hook when the latter is locked and to cause it to swing open when released, and also having a depending lug adapted to engage the notch f' when the hook is partially opened, or to engage notch f'' when the hook is thrown back out of engaging position, substantially as and for the purpose described.

6. The combination of the draw-bar and the swinging hook pivoted thereon, having a bevel-faced locking-arm, with a tumbler having an oppositely-beveled shoulder engaging said arm when the hook is locked and a lever-block engaging said tumbler, substantially as set forth.

7. In a coupling, the combination of the draw-bar having hinge-lugs, the lower one of which has notches in its upper surface, and a swinging hook hinged to said lugs and having an incline, F, at the junction of its arm and shank, and a stop-lug adapted to engage said notches, and also having a bevel-faced locking-arm, with a bevel-shouldered oscillating locking-tumbler engaging said arm, and the link-connections for oscillating said tumbler, substantially as set forth.

8. The combination of the draw-bar, its swinging hook, and the oscillating tumbler engaging the same with a depending link pivotally connected to said tumbler and the crank-rods and connections for depressing said link, substantially as set forth.

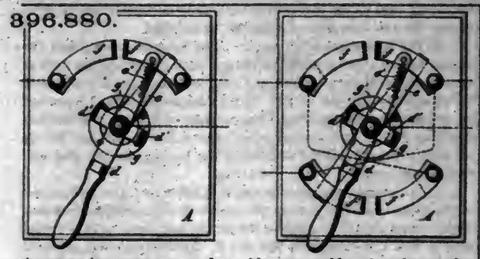
9. The combination of the draw-bar and the automatically-swinging hook pivoted thereto, having a bevel-faced locking-arm, with the tumbler pivoted in said draw-bar, having a rounded front edge and a bevel shoulder engaging said arm, the pivoted lever-block engaging said tumbler, and the depending link for operating the same, substantially as described.

10. The combination of the draw-bar, the swinging hook pivoted thereto, having an incline, F, and a rounded and bevel-faced locking-arm, with a slotted tumbler pivoted in the draw-bar having a rounded front face and a beveled shoulder for engaging the arm, the depending link passing through a slot in the floor of the draw-bar and pivoted in the slot of the tumbler, and the slotted lever-block engaging the tumbler, substantially as specified.

11. The combination of the draw-bar, its swinging hook, the oscillating tumbler for locking the same, and the depending link connected to said tumbler with the cranked rod below the draw-bar connected to said link and the cranked rod above the draw-bar connected to and operating the lower rod, substantially as set forth.

12. In a car-coupling, the combination of the draw-bar having hinge-lugs at one side, one of which is notched, as described, and the horizontally-swinging block hinged to said lugs and having an incline, F, and a lug, f, substantially as described, and a locking-arm having a rounded and beveled end, with an oscillating locking-tumbler pivoted in the draw-bar beneath a chamber in the upper wall thereof, and having a rounded front end and an inclined side shoulder for engaging and locking the arm of the hook, a depending link passing through an opening in the bottom of the draw-bar and pivotally connected to said tumbler, and a pivoted lever-block engaging said tumbler, all substantially as specified.

896,879. CAR-COUPLING. ISAAC KLINE, Louisville, Ky. Filed Oct. 3, 1888. Serial No. 287,054. (No model.)

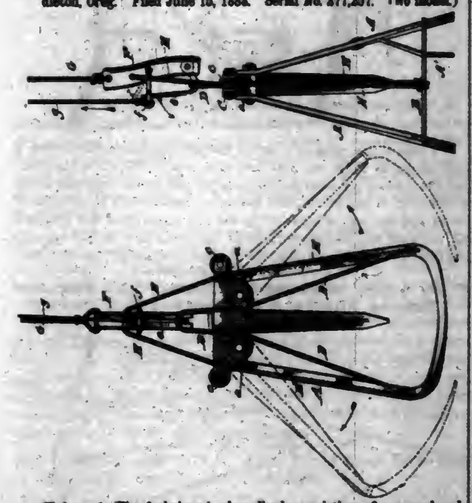


Claim.—1. In a car-coupling, the combination of a tumbler having an angular front face, with a swinging hook having an arm adapted to enter the mouth of the draw-bar when closed, and also having an incline at the junction of the arm and shank of the hook adapted to cause the hook and arm to rise vertically when the hook is closed or the arm swung inward, whereby the end of the arm as it moves under the angular face of the tumbler lifts the tumbler solely by its vertical movement alone, and the use of and necessity for inclined faces on the end of the arm and face of the tumbler are obviated, all substantially as specified.

2. The combination, in a coupler of the character described, of a tumbler pivoted in the throat of the draw-bar and having an angular front face, with the swinging hook B, its arm C, adapted to enter the mouth of the draw-bar, having a shoulder, c, at its end to engage the tumbler, and the incline b at the junction of the arm with the shank of the hook, adapted to engage the mouth of the draw-bar and lift the hook and arm vertically as the latter is swung inward, whereby the lifting of the tumbler is effected without the employment of coacting inclined faces on the tumbler or arm, substantially as described.

896,880. ELECTRIC SWITCH OR CUT-OUT. EDWARD B. KNOWLES, Brooklyn, N. Y. Filed Sept. 14, 1888. Serial No. 285,389. (No model.)

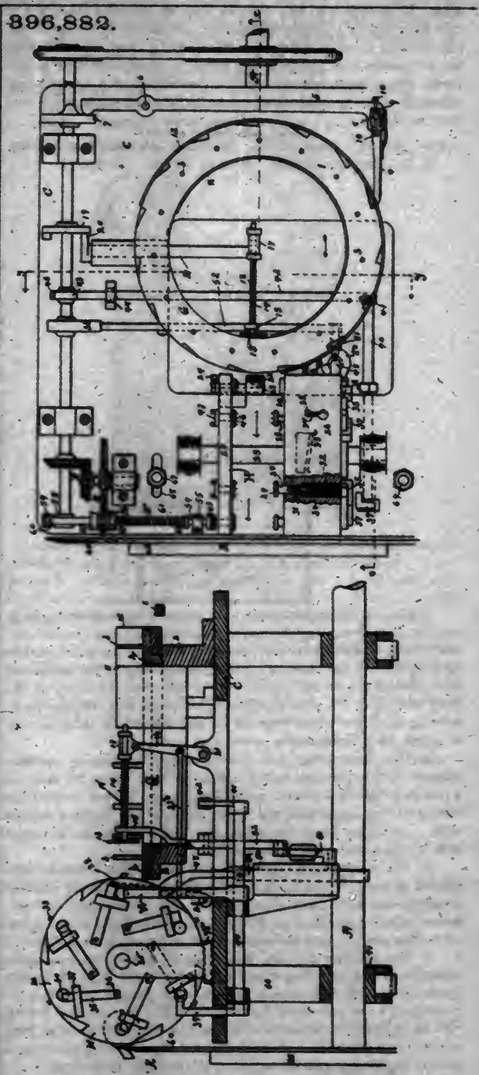
Claim.—1. The manually-operated lever and the circuit-controlling bar pivoted loosely, a circular spring-plate placed concentrically with the pivot of the operating-lever, a pair of lugs attached to



896,880.

the operating-lever, arranged to ride upon said spring-plate, and a latch secured to the spring-plate for the circuit-controlling bar.

2. The manually-operated lever and the circuit-controlling bar pivoted loosely and connected by a spring, a circular spring-plate placed concentrically with the pivot of the operated lever, a pair of lugs attached to the operating-lever, arranged to ride upon said spring-plate, and a latch secured to the spring-plate for the circuit-controlling bar.



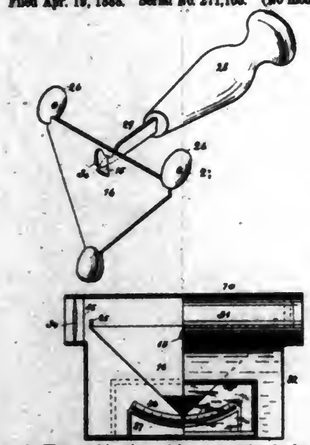
896,881. HAY OR GRAIN FORK. WILLIAM H. LANDER, Pendleton, Oreg. Filed June 15, 1888. Serial No. 277,257. (No model.)

Claim.—1. The fork herein described, consisting of a cross-head with clutch-hooks pivoted to each end, a trip-block above provided with a hook-catch and trigger with trigger-rope, an inner rope extending from the lower portion of the clutch-hooks through the cross-head and adapted to be caught by the hook-catch, and an outer rope extending through the cross-head from the trip-block to the lower portions of the clutch-hooks, substantially as and for the purpose described.

2. The combination of the clutch-hooks A A, with cross-bars B, cross-head C, with prong H and pulleys b b and c c, the trip-block F, with hook-catch e and trigger f, the outer rope, E, extending from the lower part of the clutch-hooks to the trip-block, and the inner rope, D, extending from the lower part of the clutch-hooks through the cross-head and adapted to be caught by the hook-catch on the trip-block, substantially as and for the purpose described.

896,882. CORK-CUTTING MACHINE. HAKON S. LARSEN, Christiania, Norway. Filed June 21, 1888. Serial No. 277,785. (No model.) Patented in Norway Aug. 27, 1887.

Claim.—1. In an automatic cork-machine, the combination, with a turning apparatus, F, consisting of an axially-movable spindle, 54, constantly rotated by suitable gearing, of a carrier-wheel, H, consisting, essentially, of two disks, between which the cork blocks are held, and one of which disks, 27, is provided with a number of spindles provided on one side with a prong-chuck and on the other with a coupling-clutch, said turning spindle 54 being also provided with a coupling-clutch, which coupling-clutches are engaged with each other at intervals by means of the axial movement of the turning spindle, and said disk being mounted on an axle having an intermittent rotary motion at intervals corresponding with the number of spindles in the disk, substantially as herein described.



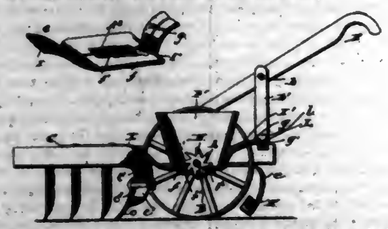
2. In an automatic cork-machine, a carrier-wheel, H, composed of two disks mounted on the same shaft, one of said disks, 27, having a number of spindles at equal distances from each other near the periphery of the disk, the axes of which spindles are parallel to the axis of the disks, said spindles running through the disk, and having on the inside a prong-chuck and on the outside a coupling-clutch, and the other disk, 26, having also near its periphery, opposite to the aforesaid spindles, a corresponding number of spindles with prong-chucks, in combination with spring-boxes inserted from the outer side of said disk, a spring in said spring-boxes acting upon the end of the spindles, and the spring-boxes being at intervals pushed to their inmost position and held there by means of stopper-arms 35 on the outside of the disk, being allowed at intervals to issue from the holes in which they are fitted, and thereby releasing the spring, said intervals being fixed by the movements of two arms, 38 and 39, periodically touching the ends of the spring-boxes, and both disks having at intervals an intermittent rotary movement imparted in one direction, according to the number of spindles at the periphery, substantially as herein described.

3. In combination with the carrier-wheel of an automatic cork-machine, as specified in claim 2, the pin 33 on the spring-box 30, working in a slot, 34, in the periphery of the disk 26, in combination with an angle-piece, 39*, acting as a wedge against the pin 33 under the revolution of the carrier-wheel, substantially as herein described.

4. In an automatic cork-cutting machine provided with a carrier-

wheel, H, composed of two disks mounted on the same shaft, one of said disks having a number of spindles provided with prong-chucks and coupling-clutches and the other disk having a corresponding number of spindles with prong-chucks acting in connection with spring-boxes, the combination, with said carrier-wheel, of a transporting-wheel, G, and devices connected therewith for pushing the cork blocks into the carrier-wheel, substantially as herein described.

396,883. HAND-LEVEL. CHARLES E. LAWRENCE, New Brighton, N. Y. Filed Apr. 19, 1888. Serial No. 271,163. (No model.)



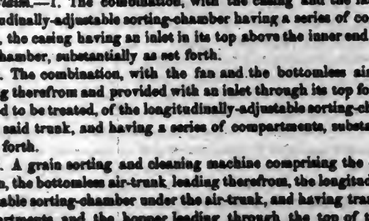
Claim.—1. The combination, with a supporting-body having horizontally-aligned sighting devices, of a counterbalanced pendant pivotally connected at its vertical center to the said support between its sighting devices, the extreme upper surface or edge of the pendant at both sides of the pivotal point being in line with the sights on the body when they are in a true horizontal plane, but interrupting or crossing the line of vision between the sights when the latter are not in such a plane, substantially as set forth.

2. The combination, with the supporting-body having opposite aligned sighting devices, and a segmental scale below the same, of a triangular pendant pivoted to the support on a central vertical line having its base uppermost and in the plane of the sighting devices when they are on a true horizontal line, and provided at its vertex with a pointer, substantially as set forth.

3. The combination, with the open-ended tube provided with aligned sighting devices in its ends, of the counterbalanced pendant pivoted between the said sighting devices, with its extreme upper surface or edge at opposite sides of its pivotal point in line with said sights when they are in a true horizontal plane, substantially as set forth.

4. The combination, with the casing 32, having the graduated segment 36 and glazed aperture therefor, and the tube 31, having lenses and crossed sight-wires in its ends, of the triangular pendant 16, pivoted on a vertical central line near its base in the tube, and having pins 25 in line with the points of intersection of said wires when they are in a true horizontal plane, the vertex of said triangle having a pointer registering with the segment, substantially as set forth.

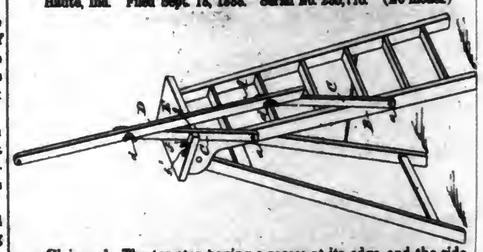
396,884. PLANTER. STEPHEN A. LOWE, Marion Station, Miss. Filed June 30, 1888. Serial No. 278,068. (No model.)



Claim.—1. In a planter, the combination, with the main frame and tongue secured between the front side rails thereof, of the hopper, the spring-plate G, connecting the bottom of the hopper and the tongue, the spring-plate g', connecting the rear ends of the side rails o the main frame, and the spring-plate g, connecting the middle of the plate g' and the bottom of the hopper, substantially as specified.

2. In a planter, the combination, with the main frame having bearing-notches in its side-rails, of the axle resting in said notches, and the spring-arms of the coverer-bar secured to said side rails and completing the axle-bearings, substantially as specified.

3. The herein-described planter comprising the main frame, the tongue having a downwardly-curved and slotted rear end, the furrow-opener adjustably attached to said rear end, the axle, the wheels on the inner side of the side rails of the main frame, the hopper supported by springs upon the main frame and provided with a longitudinal feed-slot in its bottom, and the feed-wheel secured to the axle and having the spring-arms of said bar completing the bearings for the axle, substantially as specified.



4. In a planter, the combination, with the main frame and tongue, of the hopper having a bottom provided with a longitudinal feed-slot, I', the spring-plate G, connecting the tongue and hopper and provided with a slot, I, running into the slot f', the spring-plate g, provided with a slot, I', running from the slot f' to and out of the rear end of the said spring-plate, the transverse spring-plate g', provided with the slot L, and the set-screw l, engaging a nut below said spring-plate g.

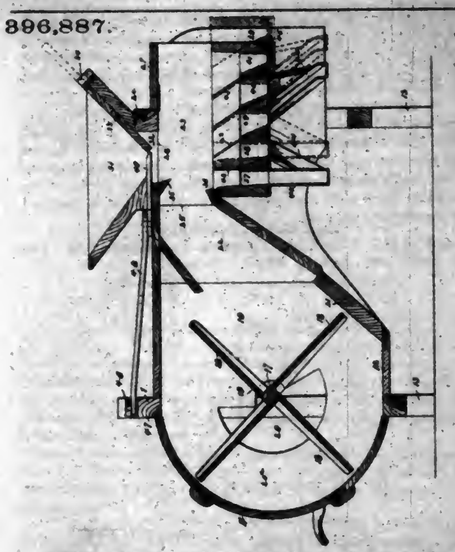
396,885. STOPPER-FASTENER. CHARLES P. MAHER, Allegheny, Pa. Filed June 23, 1888. Serial No. 277,944. (No model.)

Claim.—In a stopper or cover fastener, the combination, with a bail having its upper end provided with eyes or loops and its cross-bar constructed and arranged to surround and protect one side of the bottle-neck or jar, of the lever having connection with the stopper or cover and the eyes or loops of the bail and constructed and arranged to surround and protect the side of the bottle-neck or jar opposite that occupied by the cross-bar of the bail, substantially as set forth.

396,886. GUARD FOR STEP-LADDERS. OTTO J. MEISEL, Terre Haute, Ind. Filed Sept. 18, 1888. Serial No. 285,710. (No model.)

Claim.—1. The top step having a recess at its edge, and the side piece or upright of the ladder having arms pivoted thereto, in combination with a guard-rail pivoted to the said arms and a fastening device for locking the upper arm in the said recess, substantially as and for the purposes set forth.

2. The top step, E, having a recess, g, at its edge, and the side piece, B, of the ladder, having the arms C C pivoted thereto, in combination with the guard-rail D, pivoted to the arms C by set-screws d, and a fastening device or hook, f, for locking the upper arm C in the recess g, substantially as described.

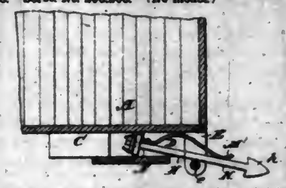


396,887. SEED GRADER AND CLEANER. WILLIAM MERRIS, Bradleytown, Pa. Filed Apr. 24, 1888. Serial No. 271,672. (No model.)

Claim.—1. The combination, with the casing and the fan, of a longitudinally-adjustable sorting-chamber having a series of compartments, the casing having an inlet in its top above the inner end of the said chamber, substantially as set forth.

2. The combination, with the fan and the bottomless air-trunk leading therefrom and provided with an inlet through its top for grain or seed to be treated, of the longitudinally-adjustable sorting-chamber under said trunk, and having a series of compartments, substantially as set forth.

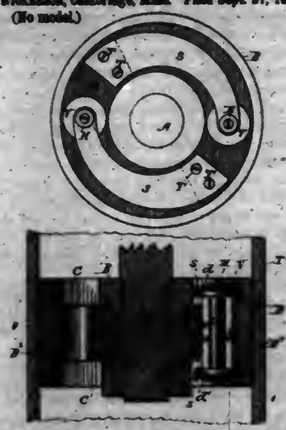
3. A grain sorting and cleaning machine comprising the casing, the fan, the bottomless air-trunk leading therefrom, the longitudinally-adjustable sorting-chamber under the air-trunk, and having transverse compartments, and the hopper leading through the top of the air-trunk over the inner or front end of said chamber, the horizontal sliding gate 49 and the inclined sliding gate 33 meeting at their inner ends in the hopper-outlet, substantially as set forth.



396,887.

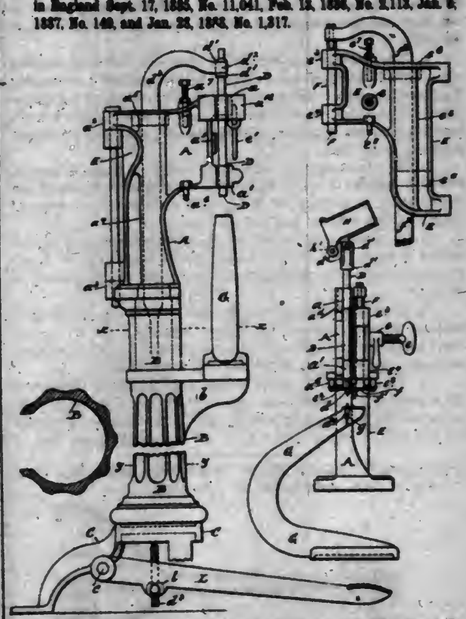
4. The combination, with a blast-trunk, a grading-receptacle adjustably supported from said trunk, a vertical transverse partition in said receptacle at the inner end, and a series of spaced essentially-inclined partitions adjacent to the vertical partition, and a hopper supported upon said trunk near the inner end, of a fan and a funnel-shaped conductor uniting the fan-chamber and trunk, substantially as shown and described.

5. The combination, with a blast-trunk, a grading-receptacle adjustably supported from said trunk, a vertical transverse partition in the receptacle at the inner end, and a series of adjacent essentially-inclined partitions, a hopper supported upon the trunk, and gates sliding upon the hopper at an angle to each other, of a vertical metal extension secured to the said vertical partition, similar extensions secured to the remaining partitions inclined in direction of the hopper-opening, a fan, a funnel-shaped conductor connecting the fan-chamber and trunk, a rearwardly-inclined baffle-plate secured to the upper inner surface of the trunk-entrance, and a forwardly-inclined guide-plate attached to the inner bottom surface of trunk below the baffle-plate, substantially as and for the purpose specified.



396,888. CAR-COUPLING. JAMES MUTTON, Frisco, Utah. Filed Nov. 3, 1888. Serial No. 290,266. (No model.)

Claim.—1. In a car-coupler, the combination, with the sills of the car, of opposing blocks attached to the said sills a distance from the end of the said car, and equivalent blocks secured to the said sills at the end of the car, of downwardly-extending perpendicular bars or arms secured to the forward end of the forward blocks, a friction-roller journaled in said bars, a link provided with an arrow-shaped head reciprocating between the forward blocks and upon the roller, a guide-plate secured to the inner end of the link reciprocating between the forward and rear blocks, and a base-plate covering the space intervening the said forward and rear blocks, as and for the purpose specified.



2. In a car-coupler, the combination, with the car-body and longitudinal sills secured to the under surface of the same, opposing blocks secured to the sills a distance from the end of the body, spaced opposing blocks attached to the said sills at the end of the said body, provided with recesses in their forward contiguous faces, downwardly-extending perpendicular bars or arms secured to the recessed surfaces of the forward blocks, and a friction-roller journaled in said bars, of a link reciprocating between the forward blocks, bearing upon the roller, provided with an arrow-like head, a transverse guide-plate attached to the inner end of the link reciprocating in the space intervening the forward and rear blocks, a spring secured to the upper surface of said link, having a bearing against the under surface of the car, and a guide-plate secured to the said blocks and covering the space intervening the same, all combined to operate substantially as shown and described.

396,889. FLUID SPEED-REGULATOR FOR ELEVATORS. WILLIAM H. HINKEMEYER, Cambridge, Mass. Filed Sept. 27, 1888. Serial No. 286,021. (No model.)

Claim.—In a fluid speed-regulator device, the combination of the cylinder T, piston-rod A, and piston B, with a two-seated valve, Y, and springs S S, adapted to hold the valve open and to yield sufficiently to allow the valve to close when the velocity of the fluid in its valve-passage in either direction generates a certain amount of pressure.

396,890. PUNCHING AND EYELETING MACHINE. MARSHALL H. PEARSON and CHARLES BENNER, Leicester, County of Leicester, England. Filed Apr. 24, 1888. Serial No. 271,711. (No model.) Patented in England Sept. 17, 1885, No. 11,041, Feb. 13, 1886, No. 2,113, Jan. 8, 1887, No. 149, and Jan. 28, 1888, No. 1,317.

Claim.—1. The combination of the standard A, the frame E, hinged thereto, the punching-tool and eyelet-clinching die mounted on shafts or spindles reciprocating in the standard A and hinged frame E, the spring for holding together the standard A and frame E, and means for opening and adjusting the distance between the standard A and frame E, substantially as set forth.

2. In a punching and eyeleting machine, the combination of a standard, A, having a vertical eyelet-clinching spindle sliding in bearings on said standard, mechanism, substantially as described, for actuating said spindle, and a work-supporting horn, G, with a pillar, B,

(mounted on legs C,) adapted to connect the said standards together and retain them in their respective positions to each other, substantially as set forth.

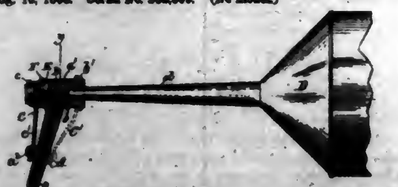
3. In a punching and eyeleting machine, the combination of a standard, A, secured to pillar B, a vertical sliding spindle, D, adapted to slide in bearings on said standard and operated by mechanism, as described, with a flat-bottomed radial reciprocating eyelet-box divided into two compartments and hinged to a supporting-bracket secured to said standard, a vertical hopper-ended conducting-chute hinged to said supporting-bracket and box, and mechanism, substantially as described, adapted to actuate and reciprocate the box and chute simultaneously or separately, as set forth.

4. In a punching and eyeleting machine, the combination of the standard A, secured to the pillar B, the vertical spindle adapted to slide in bearings on said standard, the self-feeding eyelet-box and chute, operating mechanism, substantially as described, and work-supporting horn, with an adjustable framing, E, having bearings at one end adapted to receive a vertical sliding spindle carrying the punching-tool and hinged at the other end to the said standard, and the mechanism, substantially as set forth, for adjusting and increasing the distance between the spindles carrying the eyelet-clinching and punching tools, as set forth.

5. In a punching and eyeleting machine, the combination of the standard A, secured to the pillar B, mounted on legs C, the vertical spindle D, carrying the upper clinching-die, adapted to slide in bearings on said standard, the work-supporting horn G, the self-feeding eyelet-box H, chute I, and frame E, hinged at one end to said standard and provided at the other end with bearings to receive the vertically-sliding spindle F, carrying the punching-tool *f*, with the treadles L L', pivoted to the legs C, and intermediate mechanism, substantially as described, connecting said parts to the spindles D and F, whereby the latter may be operated, as set forth.

6. In a punching and eyeleting machine, the combination of the pillar mounted on legs adapted to receive the treadles, the standard adapted to be secured to said pillar and to receive the sliding spindle carrying the upper eyelet-die, and the framing adapted to be hinged at one end to said standard and at the other to receive the vertical sliding spindle carrying the punching-tool, and intermediate mechanism, as described, connecting said spindles to the treadles, whereby either spindle may be operated by its respective treadle, the other at the same time being inoperative, or both operated simultaneously, as set forth.

7. The combination of spindle D, eyelet-box H, divided into two compartments and hinged to a support, A, guiding-shield J, angle-plate K, chute I, hinged to said support and eyelet-box, hopper i^7, guiding-plates i^8 i^9, covering-plate i^2, spring i^3, cam-lever d^{10}, projection a^{10}, against which said cam-lever operates, cam d^9, and roller d^8, all substantially as set forth.



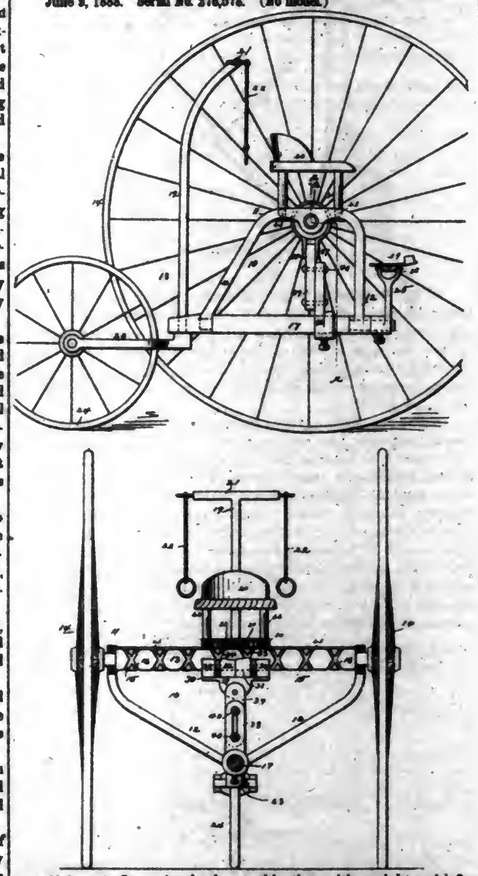
8. The combination of standard A, pillar B, frame E, lever d', screw a^{11}, spindles D and F, nipple d^{11}, adjusting-screw e, pins a^4 and e^4, and spring e^3, whereby the said spindles are adjusted and retained at the required distance apart, as set forth.

9. The combination of the standard A, bearings a a', slotted spindle D, upper die, d, secured in said spindle, headed and slit nipple d^{11}, and pin d^{10}, with which said nipple engages, all substantially as set forth.

10. The combination of standard A, slotted spindle D, sliding in bearings on said standard, upper die, d, nipple d^{11}, pin d^{10}, hinged chute I, spring d^{12}, cam d^9, secured to the chute, and roller d^8, adapted to engage with said cam, all substantially as set forth.

11. The combination, with a punching and eyeleting machine, of the treadles L L', pivoted to the legs C, said treadle L' being partially composed of a flat spring, l^3, rods d^{13} and f^9, trunnion-nuts l l', springs d^{11}, d^{12}, and f^{10}, and spindles D and F, all substantially as set forth.

396,891. OIL-CAN NOZZLE. JOHN S. PEPPER, Lincoln, Nebr. Filed Aug. 16, 1888. Serial No. 282,899. (No model.)



Claim.—1. The combination, with a can-nozzle, of a rotatable discharge-tube fitted thereto and projecting laterally and a spring automatically holding the tube in position to normally cut off the flow of oil or other fluid from the nozzle, substantially as herein set forth.

2. The combination, in a can-nozzle, of a head-piece adapted for attachment to an oil or fluid can or vessel and having an angular or curved interior passage or bore, a rotatable laterally-projecting discharge-tube fitted to the head-piece and having a passage adapted to register with the head-piece passage, and a spring automatically holding the discharge-tube in position to cut off the oil or fluid flow from the nozzle, substantially as herein set forth.

3. The combination, in a can-nozzle, of a tube, A, having a passage, *a*, a head-piece, B, provided with an angular or curved passage, *b*, and fitted to the tube so as to prevent backward movement thereof, said tube projecting laterally from the head-piece, a spring connected to the head-piece and normally throwing the passages *a b* out of line, and a stop device on the head-piece and tube, substantially as described, for the purposes set forth.

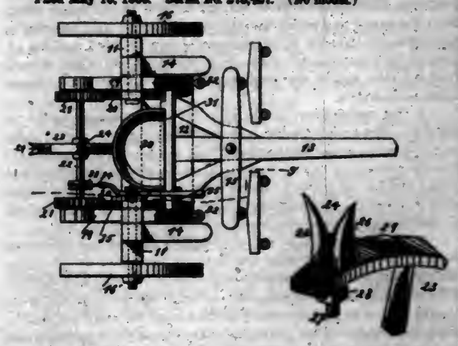
396,892. TRICYCLE. FRANCIS W. POST, Norwich, Conn. Filed June 9, 1888. Serial No. 276,578. (No model.)

Claim.—1. In a tricycle, the combination, with a right and left hand spirally-grooved axle, of a rock-shaft at right angles to said axle, a sleeve traveling upon said axle, rings loosely held in the sleeve provided with lugs entering the grooves, and a link connecting the rock-shaft and sleeve, substantially as shown and described.

2. In a tricycle, the combination, with a right and left hand spirally-grooved axle, drive-wheels rigidly secured to the same, and a rock-shaft at right angles to the axle, of a sleeve reciprocating upon the axle, rings loosely held in said sleeve, provided with lugs entering the grooves, a link connecting the rock-shaft and sleeve, and pedal-arms secured upon the rock-shaft, all as shown and described.

3. In a tricycle, the combination, with a right and left hand spirally-grooved axle, drive-wheels rigidly secured to the same, and a rock-shaft at right angles to the axle, of a clutch-carrying sleeve reciprocating upon the axle, rings loosely held in said sleeve, having lugs entering the axle-grooves, a compensating link uniting the rock-shaft and sleeve, and an essentially V-shaped pedal-carrier vertically secured to the said rock-shaft, substantially as shown and described.

4. In a tricycle, the combination, with a right and left hand spirally-grooved axle, drive-wheels fixed upon the same, and a rock-shaft at right angles to the axle, of a sleeve reciprocating upon the axle, toothed rings centrally and loosely held in said sleeve, having lugs entering the axle-grooves, toothed rings secured to the sleeve, compensating links uniting the rock-shaft and sleeve, and an essentially V-shaped pedal-carrier vertically secured upon said rock-shaft, substantially as shown and described.

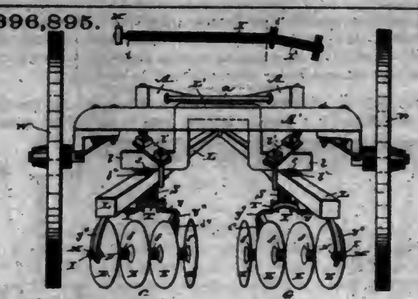


396,893. APPARATUS FOR MAKING MOLDS. EDWARD REMOT, Little Falls, N. Y. Filed Nov. 8, 1888. Serial No. 290,265. (No model.)

Claim.—1. The apparatus for making molds herein shown and described, consisting of inner and top and bottom frames adapted to be placed together, in combination with pattern-plates adapted to hold the patterns and to be held between the frames for forming the mold, and to be removed from the frames for drawing the patterns, substantially as described.

2. The removable and oppositely-placed plates C D, having patterns E F, secured to the plates, formed with coinciding gates E' F', in combination with the separate frames of the flask, substantially as described.

396,894. STALK-PULLER. GEORGE W. ROGERS, Baltimore, Md. Filed May 10, 1888. Serial No. 273,427. (No model.)



Claim.—1. A stalk-puller comprising a frame having opposite axles carrying drive-wheels and gears, a shaft journaled in rear of said axles and provided with end gears meshing into said axle-gears, a wheel, 23, also on said shaft, and the teeth 24, having threaded shanks 27 extending through the rim of the wheel and provided with nuts, and said teeth being bifurcated to form two outwardly-curved members, 25 26, substantially as set forth.

2. The combination, with the stalk-pulling wheel 23, of the teeth 24, having threaded shanks 27 extending through the rim of the wheel, provided with nuts 26, and the braces 29, secured to the rim and bearing against the rear sides of the teeth, substantially as set forth.

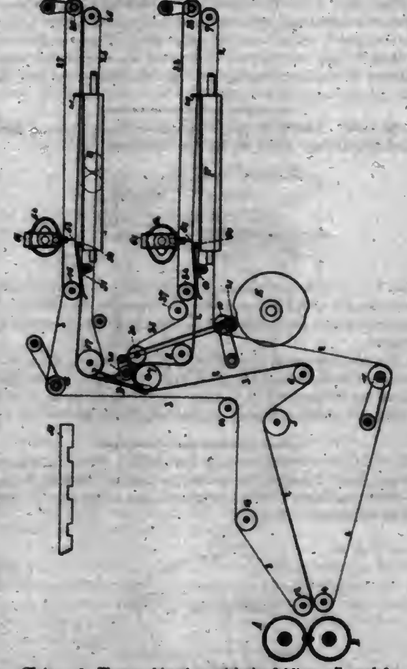
3. In a stalk-puller, the bifurcated tooth 24, formed with outwardly-curved members 25 26 and with a threaded shank at its base, substantially as set forth.

4. The combination, with the main frame having transversely-apertured front bar, 12, and drive-wheels, of the inner frame, having side bars, 19, mounted on the axles to swing vertically independent of the main frame, and connected at their front ends by a cross-bar, 19, having apertures in line with those in bar 12, the shaft 22, mounted in the rear ends of bars 19, the wheel 23 on said shaft and provided with bifurcated teeth 24, having outwardly-curved members 25 26, gearing connecting said shaft with the drive-wheels, pins 32, connecting the bars 12 31, and mechanism for raising the rear end of the inner frame upon the removal of said pins, substantially as set forth.

396,895. DISK CULTIVATOR. HENRY M. ROSE, Watertown, Ill. Filed Sept. 7, 1888. Serial No. 284,908. (No model.)

Claim.—1. A disk cultivator having the inner disks of the gangs set at a different angle to the line of advance from that of the other disks of the gangs, substantially as set forth.

2. In a disk cultivator, the gangs G, having the disks E of the outer or main portion set at an angle to the line of advance and the disk E' at the inner end of the gang set at a less angle to the line of advance, substantially as set forth.



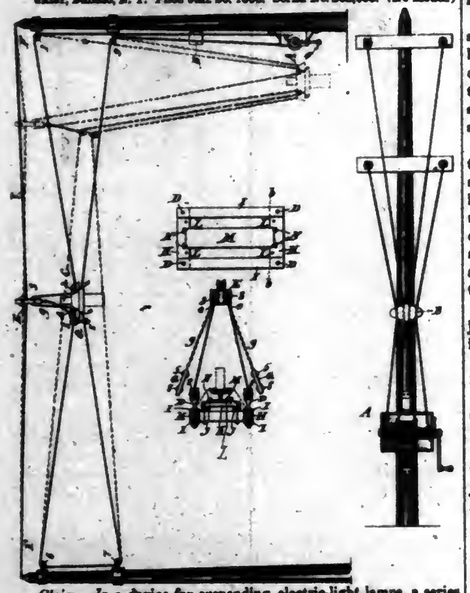
3. The combination, with the gang-yoke or support, of a shaft or journal mounted therein for the outer portion of the gang, a second journal at an angle to the first for the inner disk of the gang, and the disks mounted on said journals, substantially as set forth.

4. In a gang for disk cultivators, the combination, with the other disks, E, and the inner disk, E', of the part I I', forming two journals at an angle to each other for said disks, substantially as set forth.

5. The combination, with the gang, of the arched gang yoke or support and the arch T, supported by the main frame, and clamps for adjusting the gang and securing it in vertical planes, substantially as set forth.

6. The combination, with the gang, of the arched gang yoke or support, the arch T, carried by the main frame, and clamps for securing said arches together, said clamps being also constructed to permit of the swinging of the gang-yoke for adjustment in horizontal planes and to secure said yoke to the arch T with the gang at the desired angle to the line of draft, substantially as set forth.

396,896. SHEET-DELIVERY APPARATUS FOR PRINTING-MACHINES. WALTER SCOTT, Plainfield, N. J. Filed Mar. 2, 1888. Serial No. 265,921. (No model.)



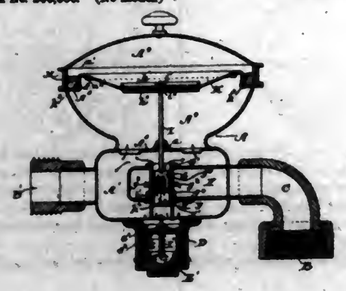
Claim.—1. The combination, with the folding-rolls and fence and the tapes or belts for conveying the sheets to such folding-rolls, of the cross-bar or roller, the stationary guides or rods over which the sheets are passed, the fingers acting adjacent to the cross-bar, and the cams for giving the proper movements to such fingers, substantially as set forth.

2. The combination, with the folding-rolls and the fence for stop-

ping the sheets, and the tapes for conveying such sheets to the folding-rolls, of the cross-bar or roll and the inclined rods or guides, over which one set of the tapes pass for moving along and delivering the sheets over the cross-bar or roller, substantially as set forth.

396,897. SUSPENDING ELECTRIC-LIGHT LAMPS. AUGUST SIEGERT, Buffalo, N. Y. Filed Jan. 26, 1888. Serial No. 262,085. (No model.)

Claim.—In a device for suspending electric-light lamps, a series of cables, in combination with baskets C, carriage E, pulleys 1, 2, 3, 4, 5, 6, 7, 8, and 9, yokes B and G, and windlass A, provided with a single drum divided into parts of which some are, in diameter, many times larger than others, substantially and identically as shown, described, and for purposes set forth.



396,898. TOOTH-BRUSH. WILLIAM H. SMITH, Florence, Mass. Filed June 4, 1888. Serial No. 275,948. (No model.)

Claim.—1. The combination, with the brush A, provided with the short shank *c*, of the hollow handle B, formed of the halves *d d'*, connected by hinges and adapted to receive the brush, substantially as described.

2. The combination of the hollow handle B, formed of the similar halves *d d'*, having semicircular grooves *i*, the hinges *s*, connecting the halves, the spring-catch *f*, the push-pin *h*, and the brush A, provided with the shank *c*, pivoted in the half *d'*, substantially as described.

396,899. AUTOMATIC GAS-GOVERNOR. REUBEN H. SPEAKE, Washington, D. C., assignor of two-thirds to Charles A. Mellhuish, Charles R. Eberle, and Henry C. Borden, all of same place. Filed Mar. 10, 1888. Serial No. 266,880. (No model.)

Claim.—1. In a gas-governor, substantially as described, the combination, with the shell, of the inlet-pipe, the cylindrical valve-casing, and a cylindrical valve actuated by the pressure of gas within the pipes leading from the shell to the burners, having circumferential ports to register with similar ports in the casing, and having discharge-openings at both of its ends leading to the service-pipe, substantially as described, for the purpose specified.

2. A gas-governor comprising a shell, a valve-casing located within said shell, having ports to surround the valve, the cylindrical valve having peripheral ports and also having discharge-openings at both of its ends leading to the service-pipe secured in said seat to control the admission of gas to the shell, and the diaphragm for supporting said valve, actuated by the gas within the shell, substantially as described.

3. The combination, with the inlet-pipe and its exterior shell, of the open-ended cylindrical valve-casing passing transversely through said inlet-pipe and opening at both of its ends into the shell, and having peripheral ports opening therein, the cylindrical valve fitted to move longitudinally within said casing, having circumferential induction-ports to register with the ports of the valve-casing and open at both of its ends to discharge into the exterior shell and service-pipe, and a diaphragm arranged within said exterior shell for actuating the valve, substantially as described.

4. The combination, with the exterior shell and inlet-pipe projecting into said shell, of an open-ended cylindrical valve-casing passing transversely through said inlet-pipe, and a cylindrical valve having peripheral ports and discharge-openings at both of its ends leading to the service-pipe, substantially as described.

5. The combination, with the shell, of the inlet-pipe passing into said shell, the cylindrical valve-casing fitted transversely through the inlet-pipe, the cylindrical valve adapted to move longitudinally within the valve-casing and across the inlet-pipe, the diaphragm attached to the valve and actuated by the pressure within the shell, and the adjustable spring-actuated rod secured to the lower end of the valve to hold the valve against the pressure beneath the diaphragm, substantially as described.

6. The combination, within the inlet-pipe, of the open-ended cylindrical valve-casing having a circumferential port or ports and inwardly-projecting valve-seats respectively above and below said ports, and the cylindrical valve fitted to move longitudinally within said casing and having ports to register with those of the casing, and outwardly-projecting circumferential shoulders to fit upon the valve-seat of said casing, substantially as described.

7. The combination of the shell having an inlet-pipe projecting therein, the cylindrical valve and its casing fitted into the inlet-pipe, the diaphragm located in the upper portion of the shell, and the perforated crown-sheet overlying the valve, having the inner rim of its central portion to project outside of the rim of the valve and seat to allow free passage of the gas to the under side of the diaphragm and protect the valve and its seat from tar drip, substantially as described.

396,900. METALLIC FASTENING DEVICE. FERDINAND W. STARR, Springfield, Ohio. Filed Jan. 17, 1888. Serial No. 260,967. (No model.)

Claim.—1. A fastening device having substantially parallel sides, a corrugated body, and parallel zigzag driving and entering edges, substantially as specified.

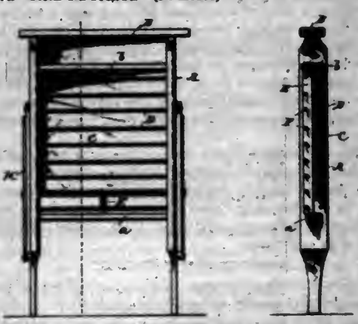
2. A strip adapted to be cut into fastening devices, the latter having opposite zigzag parallel edges, one of which is beveled, and a series of corrugations extending from one edge to the other, substantially as specified.

3. A fastening device having a corrugated body and zigzag entering edge, substantially as specified.

396,901. WINDOW-VENTILATION. ALFRED C. STEVENSON, Oakdale Station, Pa. Filed June 23, 1888. Serial No. 278,495. (No model.)

Claim.—1. The combination, with a window-frame, of journal-plates set in the upper portion of the grooves for the lower sash, side guides formed in the bead between the two sash-grooves, a spring-roller journaled in the plates in the upper portion of the lower sash-groove, a foraminous diaphragm wound upon the roller and provided with a heavy bar on each side extending beyond the ends of the roller and traveling in the guides, and a rigid strip attached to the lower end of the foraminous diaphragm and connected to the upper end of the upper sash, substantially as and for the purpose described.

2. The combination, with a window-frame, of two spring-rollers arranged side by side, provided with foraminous diaphragms arranged

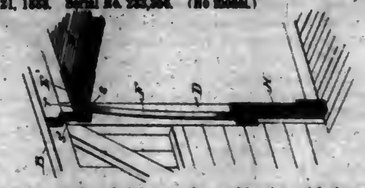


396,901.

to be pulled down across the opening of the window-sash to form a space between, and a support attached to the window-frame and arranged between the diaphragms for the reception of volatile substances for modifying the character of the air admitted to the room through the same, substantially as described.

3. The combination, with a window-frame, of two spring-rollers arranged side by side and provided with foraminous diaphragms arranged to be pulled down across the opening of the sash, supports arranged upon the window-frame between the diaphragms, and a box-frame consisting of top, bottom, and ends held upon said supports and having their edges fitting closely against the two diaphragms to form a receptacle for disinfectants, inhalents, &c., as described.

396,902. COMBINED CORN-SHELLER AND WASH-BOARD. JOHN M. STOKES and OLIVER P. REED, Agnilasco, Tex. Filed July 31, 1888. Serial No. 281,631. (No model.)

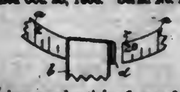


Claim.—1. The combination, with the frame, the backing, and the rods D upon one side of said backing, of the vertical strip E and the rods F, secured thereto near the outer face thereof upon the opposite side of said backing, substantially as and for the purpose specified.

2. The device described, consisting of the frame, the backing, the transverse rods secured to said backing upon one side thereof, the vertical strip upon the opposite side of said strip, and the transverse rods F, secured to the outer edge of said strip, the pivoted legs, and the bars H, pivoted at one end to the side bars of the frame and at the other provided with elongated slots engaging pins on the legs, substantially as shown and described, and for the purpose specified.

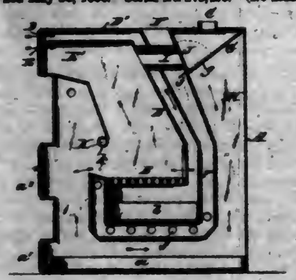
3. As an improved article of manufacture, a corn-sheller consisting of a suitable frame and a backing, a strip secured centrally between the side bars of the frame parallel therewith, and the transverse rods F, held in said side bars and strip E at a distance from said backing, substantially as shown and described, and for the purpose specified.

396,903. CAR-DOOR. CONRAD THIES, Chicago, Ill. Filed Aug. 21, 1888. Serial No. 283,366. (No model.)



Claim.—1. In a freight-car, the combination, with the grain-door E, of guide-loop hangers E' upon the door and guides F upon the door-casing, provided toward their upper extremities with shoulders *r* and depressed seats *s* on the outer sides of the guides, substantially as described.

2. In a freight-car, the combination, with the grain-door E, of guide-loop hangers E' upon the door, guides F upon the door-casing, provided toward their upper extremities with shoulders *r* and depressed seats *s* on the outer sides of the guides, and catches G, depending from the ceiling of the car in the path of the lateral edges of the door E, substantially as described.

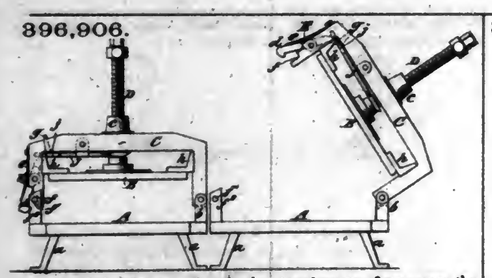


3. In a freight-car, the combination, with the door E, of guide-loop hangers E' upon the door, guides F, provided toward their upper extremities with shoulders *r*, depressed seats *s* on their outer sides to receive the loops E', which slide upon the guides, and recesses *s'* on the inner sides of the latter, catches G, depending from the ceiling of the car in the path of the lateral edges of the door E, and vertical shields H along the lower portions of the sides of the door-casing, provided with retaining-flanges for the door in its lowered position, substantially as described.

396,904. LOT-TICKET AND SIZER. SOLOMON J. WALLACH, New York, N. Y. Filed Oct. 26, 1888. Serial No. 289,160. (No model.)

Claim.—As an improved article of manufacture, a lot-ticket provided with an extension, *k*, and a sizer, *a*, the extension *k* being doubled over the end *p* of the sizer, forming thereby an opening, *d*, on the back of the lot-ticket adapted to allow the sizer to be run through and held therein, and thus to mark the correct size, all constructed as and for the purpose substantially as described.

396,905. HOT-AIR FURNACE. EDWARD W. WELLS, Oskaloosa, Iowa. Filed May 30, 1888. Serial No. 275,469. (No model.)

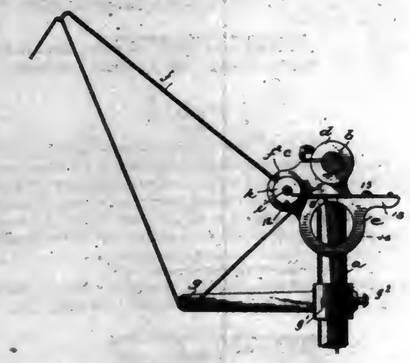


Claim.—1. In a hot-air furnace, the combination, with the shell, the magazine with draft-slide E, and the grate, of the interior flue, D', with draft-slide extended beneath the grate and the flue F, around the flue D', and beneath and up the front side of the grate, and provided with apertures *f*, communicating with the exterior of the shell, substantially as and for the purpose specified.

2. In a hot-air furnace, the combination, with the shell provided with flues D', F, and H, of the inclined plate G, dividing the flue H into two parts and provided with opening *g*, the direct-draft flue I, and the damper J, pivoted at *j*, arranged to alternately close or disclose the opening *g* or the rear end of the flue I, substantially as and for the purpose specified.

396,906. PRESS. FREDERICK F. WHITTAL, Jersey City, N. J., assignor of one-half to John J. Ginger, same place. Filed Aug. 31, 1888. Serial No. 284,342. (No model.)

Claim.—1. In a press, the combination, with a bed-piece, of a frame pivotally connected thereto, a platen, a screw for raising and lowering the platen, a spring-actuated dog for securing the frame and bed-piece, and a lever fulcrumed on the frame and engaging said



396,906.

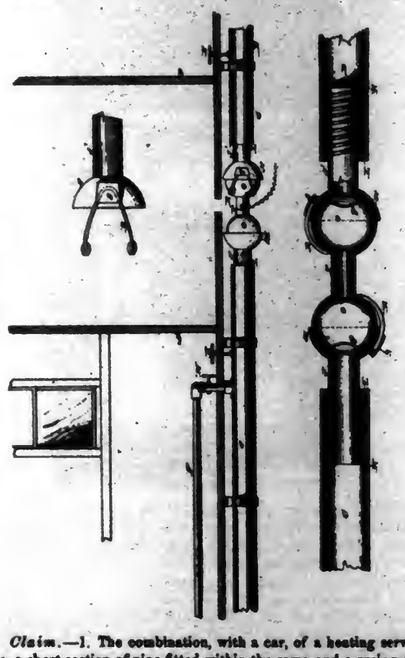
screw and dog for operating the dog to release the frame upon the raising of the screw, substantially as specified.

2. In a press, the combination, with a bed-piece, of a frame pivotally connected thereto, a platen, a screw for raising and lowering the platen, a spring-actuated locking device for locking the frame to the bed-piece, a lever pivoted on said frame and having a loose connection with said screw, and also a loose connection with said locking device, whereby, as the said screw is rotated, the lever will be rocked to operate said locking device, and a stop for preventing a too extended upward movement of the platen, substantially as specified.

396,907. TAKE-UP AND TENSION DEVICE FOR KNITTING-MACHINES. FRANK WILCOMB, Providence, R. I., assignor to the Wilcomb Manufacturing Company, same place. Filed Apr. 15, 1887. Serial No. 234,943. (No model.)

Claim.—1. In combination, the take-up sweep pivotally supported, and a spring-pressure plate supported so as to engage with the yarn at all times for applying a tension thereto, said plate being arranged independent of the sweep and adapted to be automatically operated by engagement with a portion thereof for lessening the pressure of said plate on the yarn, substantially as described.

2. In combination, the take-up sweep pivotally supported, a spring-pressure plate for applying at all times a tension to the yarn, arranged independent of the sweep and adapted to be operated thereby to lessen the friction on the yarn, and an adjustable power device for returning the sweep to normal position, substantially as described.



3. In combination, the sweep having a suitable bearing at its end, the spring-plate 5, automatically operated by engagement with a portion of the sweep, the shaft i, for pivotally supporting the sweep, and the spring coiled about said shaft having one end engaging therewith and the other end fixed, substantially as described.

4. In combination, the take-up sweep, an independent tension-plate, an independent spring for giving movement to the sweep, the pull upon the said spring being in the direction of its coils, and means for adjusting the tension thereof in its relation to the sweep, substantially as described.

5. In combination, the sweep, pivotally supported, a shaft, i, for supporting the sweep, and a spring for applying a tension to said shaft, the sweep being loosely fitted to the shaft and held thereto adjustably by a jam-nut, 9, whereby the relative positions of the sweep and shaft may be changed, substantially as described.

6. In combination, the sweep, a support, i, for the sweep, said sweep having a bearing at its end loosely fitted to the support i, and a spring coiled about the support for applying a tension to the parts, said support having a suitable thumb-piece, by which it may be turned to change its position in relation to the sweep, and a jam-nut, 9, substantially as described.

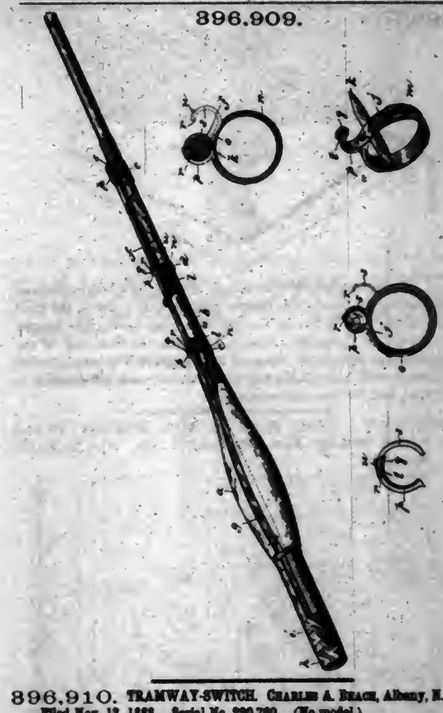
396,908. PIPE-COUPLING FOR RAILWAY-CARS. PHILIP S. WHEMAN, Springfield, Ohio. Filed Dec. 15, 1887. Serial No. 257,968. (No model.)

Claim.—1. The combination, with a car, of a heating service-pipe, a short section of pipe fitted within the same, and a spring connected to the service-pipe and to said section of pipe, and tending to project the latter from the former, the said section of pipe having a hemispherical hollow head, two hollow spheres connected by an intervening neck, one of which fits said head and each of which has an opening opposite the intervening neck, and a spring-clamp secured to the head and embracing the sphere within it.

2. The combination, with a central service-pipe and a tubular section slidingly fitted within it and provided with a hollow hemispherical head, a packing between the service-pipe and said tubular section, and a spiral spring connected with the service-pipe and section, and tending to project the latter from the former, of two hollow spheres connected together by an intervening hollow neck and having openings opposite the ends of said neck, and a spring-clamp connected to each head and composed of two prongs which engage the respective spheres.

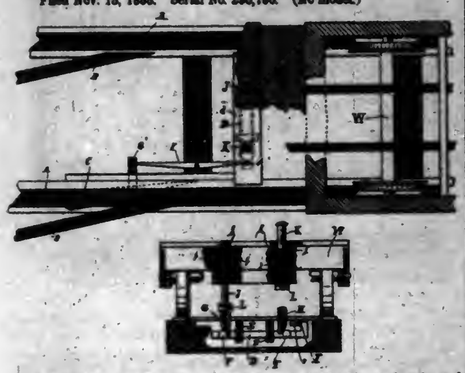
3. The combination, with a tubular section having a hollow approximately hemispherical head, and a spring-clamp secured to the head and divided into two prongs, of two hollow spheres connected together by an intervening hollow neck and each having an opening in the end opposite the said neck, one of which is fitted into said head and is held by said clamp.

396,909. FISHING-ROD. JAMES ANNIS, Le Roy, N. Y. Filed May 24, 1888. Serial No. 274,919. (No model.)



Claim.—1. In a fishing-rod handle or stock having a longitudinal recess therein for the reception of a rod-section, the combination of concentric clasping bands or rings for encircling the rod at intervals, provided with overlapping spring-clasps for engaging the rod-sections, substantially as described.

2. In a fishing-rod, a stock provided with a longitudinal recess for the reception of an extra tip, in combination with one or more eyes or clasps placed in alignment with said recess, in the manner and for the purpose set forth.



3. In a fishing-rod, one or more double rings arranged to slide within each other and provided with curved arms, the free ends of which lock one with the other by frictional contact, in the manner and for the purpose substantially as described.

4. A clasping-band for fishing-rods, comprising two concentric rings, one of which is fitted to slide within or upon the other, each being provided on its circumference with a reversely-curved spring projection to overlap and clasp a rod-section, substantially as described.

396,909.

396,910. TRAMWAY-SWITCH. CHARLES A. BEACH, Albany, N. Y. Filed Nov. 13, 1883. Serial No. 290,760. (No model.)

Claim.—1. The combination of the switch-block and the pivoted bar connected therewith with the longitudinally-movable frame located in front of the switch-block and connected to said bar, and the vertically-movable blocks having oppositely-inclined faces engaging and operating said frame, and the devices, substantially as described, on the car for depressing either of said blocks, substantially as and for the purpose specified.

2. The combination of the movable frame, the friction-rollers mounted thereon, and the vertical blocks having oppositely-beveled faces engaging the opposite friction-rollers of said frame with the switch-block in rear of said frame and the horizontal pivoted bar having one end pivotally connected with said block and its other end pivotally connected to said frame, substantially as described.

3. The combination of the switch-block, the longitudinally-movable frame located transversely in the main track, and the vertically-movable blocks for shifting said frame with spring-controlled standards mounted on a car and provided with inclined shoes adapted to be brought into contact with the blocks to depress the latter during the passage of a car thereover, and thus shift the switch, all substantially as specified.

4. The combination of the longitudinally-movable frame and its casing, its supports and friction-rollers, and the vertically-movable blocks having oppositely-beveled faces engaging the said rollers and adapted to shift the frame when depressed, with the pivoted bar connected to said frame and actuated thereby, and the switch-block in rear of the frame and connected to the opposite end of said bar, and the devices, substantially as described, for operating either block from a car, substantially as and for the purpose described.

5. The combination of the longitudinally-movable frame and the friction-rollers in the opposite ends thereof, the opposite blocks having beveled faces engaging said rollers and adapted to shift the frame when depressed, with the pivoted bar connected to one end of said frame, the switch-block, the link connecting said bar and switch-block, and the spring-supported standards carrying inclined shoes on their lower ends adapted to engage said blocks when depressed and cause the shifting of the switch, substantially as and in the manner specified.

396,911. PROCESS OF MAKING MOSAICS OF GLASS. HENRY F. BELOMER, Irvington, N. J. Filed May 11, 1887. Serial No. 237,790. (No model.)

Claim.—The process of manufacturing mosaics herein described, to wit: arranging glass or mineral plates in a separated relation to one another, casting a metal frame in the interstices between said plates or pieces, covering the surface edges of said plates with a thin coating of plumbago or other conducting material, and then electro-depositing a film of metal upon said covered edges and the metal frame, so as to form an overlapping flange to hold said plates or pieces in position, as and for the purposes set forth.

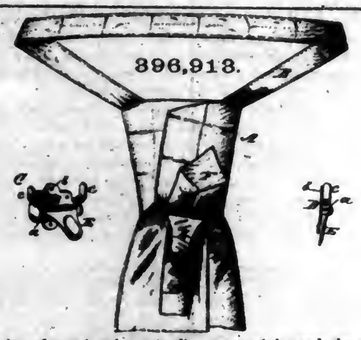
396,912. MOLD FOR MAKING MOSAICS. HENRY F. BELOMER, Irvington, N. J. Filed May 11, 1887. Serial No. 237,791. (No model.)

Claim.—1. The mold for casting frame-works for mosaics, which consists of sheets I F, having turned edges to form a top-metal receptacle, and having interposed mosaic plates or pieces arranged in a separated relation to receive the frame-work metal, substantially as and for the purposes set forth.

2. The improved mold for casting frame-works for mosaic plates or pieces, substantially as described, which consists of sheets of uninflammable asbestus having mosaic pieces interposed therebetween, the said sheets having a back-metal receptacle formed on the upper side, and on said upper side having vents and feeds K, projecting up through said receptacle, substantially as and for the purposes set forth.

3. In a mold for casting frames around mosaic plates or pieces, the combination of sheets F I, adapted to receive mosaic pieces, vertical flanges J, forming a back or top metal receptacle, and back or top metal pressing down on said sheets, substantially as and for the purposes set forth.

4. In a mold for casting mosaics of glass, the combination of flexible sheets F I, bent at the edges, as at J, and feeds or vents K, substantially as set forth.

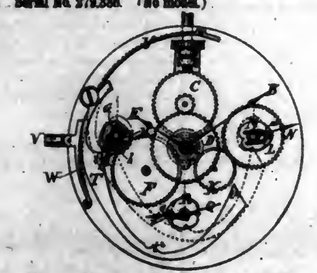


5. In a mold, the combination of flexible sheets F I, having flanges J and partitions L, substantially as and for the purposes set forth.

6. In a mold, the combination of sheets F I with interposed pieces separated from one another, back or top metal, O, perforated pieces G, and vents or feeds K, all said parts being arranged and combined substantially as and for the purposes set forth.

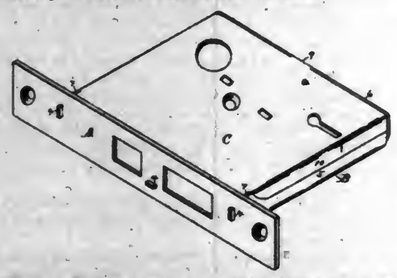
7. In a mold, the combination of the sheet F, wire C, mineral pieces arranged on said sheet F in separated relation to one another and to the said wire, a sheet, I, holding said wire and pieces in proper relation, flanges J, and vents and feeds, substantially as and for the purposes set forth.

396,913. BUCKLE-FASTENER. GEORGE BOMER, Rochester, N. Y., assignor of one-half to Bernhardt R. Kolloski, same place. Filed Oct. 23, 1888. Serial No. 288,947. (No model.)



Claim.—1. The combination, with a neck tie or scarf, of a buckle having a pivoted lever, E, with jaw *a*, and the plate D, having guides

c, consisting of metal strips extending outward beyond the pivotal point of the jaw of the lever and edges of the plate and extending upward above said pivotal point, substantially as and for the purpose set forth.

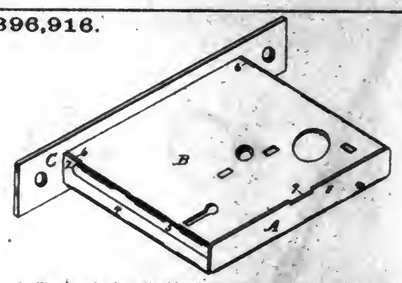


2. The combination, with a neck tie or scarf provided with a neckband and a buckle consisting of the plate D and pivoted lever E, with jaw *a*, of the independent protecting-flap F, substantially as and for the purpose specified.

396,914. STOP-WATCH. FRITZ BOVET and ALBIN R. BESSIRE, Bienne, Switzerland, assignors to H. Bovet, same place. Filed July 9, 1888. Serial No. 279,386. (No model.)

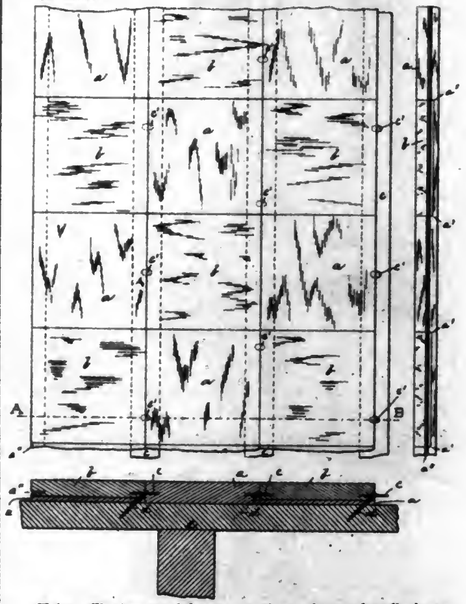
Claim.—The combination of the heart-cams R, H, and M, with a lever, T, having three projections, *f*, *f*², and *f*³, and with a spring, U, a pusher, V, and a lever, W, substantially as shown and described, and for the purpose specified.

396,915. LOCK-CASE. CHARLES M. BURGESS, New Britain, Conn., assignor to the Russell & Erwin Manufacturing Company, same place. Filed Sept. 27, 1888. Serial No. 286,531. (No model.)



Claim.—The improved lock-case herein shown and described, consisting of the face-plate A and two side plates, B and C, each of the latter having the side flanges, whose edges abut against each other for a part of the length of the case, while the flanges upon one part are widened at the front end, substantially as described, and for the purpose specified.

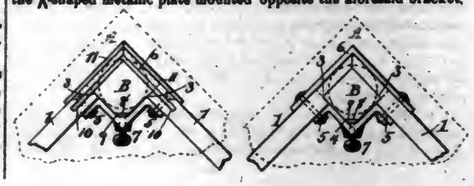
396,916. LATCH-CASE. CHARLES M. BURGESS, New Britain, Conn., assignor to the Russell & Erwin Manufacturing Company, same place. Filed Oct. 15, 1888. Serial No. 288,070. (No model.)



Claim.—1. The herein-described latch-case, the body of which is composed of the main part having side flanges and wings and a cap having side flanges, the front ends of the flanges on the cap and the wings of the flanges on the main part being formed with interlocking projections and recesses, substantially as described, and for the purpose specified.

396,916.

2. The herein-described latch-case, the body of which is composed of the main part having side flanges widened into wings at the front end, and the back 8, having a recess, and a cap having side flanges, and a tenon, 9, to fit the recess in the back, the front ends of the flanges on the cap and the wings of the flanges on the main part being formed with interlocking projections and recesses, substantially as described, and for the purpose specified.

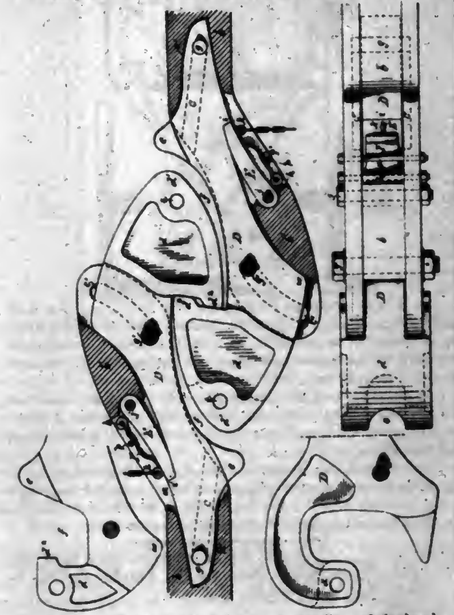


396,917. INLAID FLOOR OR WOOD COVERING. CHARLES BUTCHER, Cambridge, Mass. Filed Aug. 10, 1888. Serial No. 282,437. (No model.)

Claim.—The improved floor or wood covering, as described, consisting of the boards *a a*, having lateral or equivalent recesses *a' a'*, and the blocks *b b*, inserted in said recesses, in combination with the metal tongues *c c* and grooves *a' a'* in the sides of said boards, said grooves passing alternately through the edges of the boards and the blocks *b b*, substantially as and for the purpose set forth.

396,918. KNOCKDOWN TABLE. HENRY A. BUTLER, Syracuse, N. Y., assignor of one-half to William P. Shepard, same place. Filed May 21, 1888. Serial No. 274,392. (No model.)

Claim.—In a knockdown table, in combination, the side rails rigidly secured together at their meeting angles by a metallic bracket of V-shaped form, and having slight projections at right angles thereto, all integral, slots at said extremities for the reception of fastening-bolts that pass through perforations in the side rails into and through the A-shaped metallic plate mounted opposite the aforesaid bracket,



396,918.

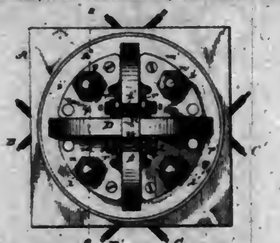
and the table-leg, squared at its top portion, with a corner thereof faced off, and provided with a flat metallic plate secured thereto, against which the set-screw passing through the bracket is adapted to bear when said leg is inserted in its seat, substantially as shown and described.

396,919. CAR-COUPLING. JOSEPH D. CARL and GRAHAM L. OBLE, Wilmington, Del. Filed Oct. 12, 1888. Serial No. 287,894. (No model.)

Claim.—1. The combination, in a car-coupling, of the head, a coupling-hook, and a retainer therefor, with longitudinal and transverse guides for said hook, by which the hook will have a combined longitudinal and transverse movement on its release from the retainer, substantially as described.

2. The combination, in a car-coupling, of the recessed head having slots therein, as described, with a coupling-hook having pins adapted to said slots, and a spring-dog engaging with the outer face of said coupling-hook, substantially as described.

3. The combination, in a car-coupling, of the coupling-head, the sliding hook having a head, *d*, and an extension or projection, *e*, forming with the head a recess, *f*, for receiving the hook of the opposing head and a retainer for said hook, substantially as specified.



4. The combination, in a car-coupling, of the head, with a hook, and longitudinal and transverse guides for said hook, with a projecting lug, *d*², on the engaging-head of said hook, substantially as and for the purpose set forth.

5. The combination, in a car-coupling, of the recessed head having longitudinal slots *c* at the rear and transverse curved slots *c'* at the outer end, with a coupling-hook having pins working in said slots, substantially as described.

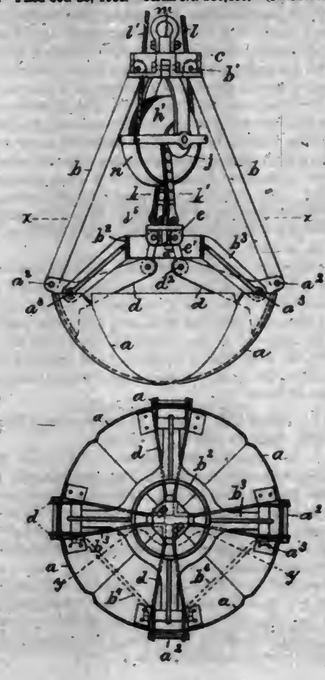
6. The combination of the slotted coupling-head, the locking-dog, and the coupling-hook having pins adapted to the slots in the head, and having a heel bearing against an abutment in the head and serving to relieve the pins from strain, all substantially as specified.

7. The combination of the coupling-head, its hook, the swinging locking-dog, the spring acting thereon, and a pin acting as a backing for the spring and as a stop for the outward movement of the dog, all substantially as specified.

396,920. ELECTRIC CUT-OUT DEVICE. J. CHESTER CHAMBERLAIN, New York, N. Y. Filed June 29, 1887. Serial No. 242,930. (No model.)

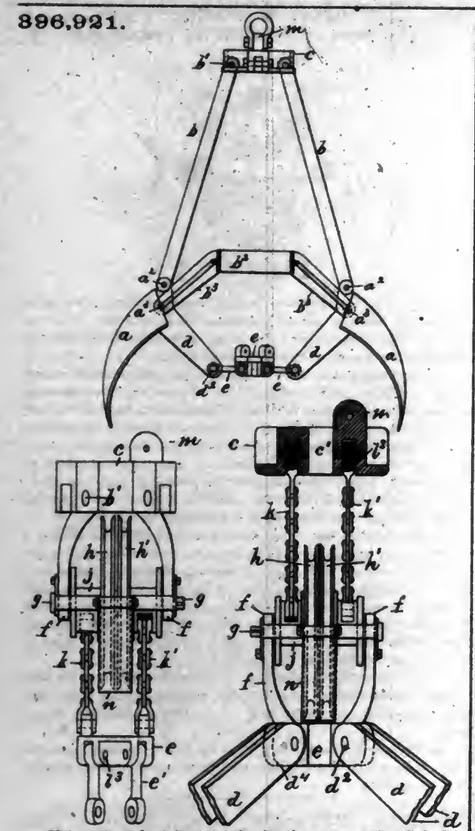
Claim.—1. The combination of an insulating-block, safety-catch terminals on one side thereof, and metal hooks extending from said terminals through said block for engagement with circuit-wires on the other side thereof, substantially as set forth.

2. The combination of an insulating-block, safety-catch terminals on one side thereof, metal hooks extending from said terminals through said block for engagement with circuit-wires on the other side thereof, and means for locking said hooks in place, substantially as set forth.



3. The combination of an insulating-block having slots on its lower side for receiving circuit-wires, and safety-catch terminals on its upper side, and the connecting devices passing through said block, having oblique slots at their lower ends for receiving the wires, and clamping-nuts on their upper ends, substantially as set forth.

4. The combination of two blocks placed together, the wires of a circuit passing beneath said blocks, the wires of a crossing or branching circuit between said blocks, connecting devices extending from the wires beneath the blocks through both blocks to safety-catch terminals, connecting devices extending from the wires between said blocks through the upper block to other safety-catch terminals, and safety-catches joining the wires of one pair, respectively, to those of the other pair, substantially as set forth.



5. The combination, with the safety-catch block and the four terminal plates thereon, of the double insulating-bridge upon said block separating said plates from one another, substantially as set forth.

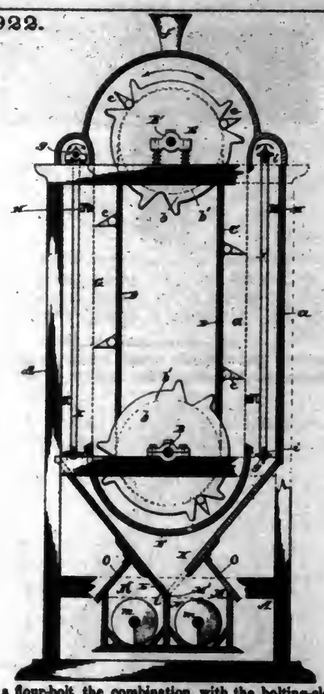
6. The combination of the block, the four safety-catch terminal plates thereon, the double insulating-bridge, and the cover, substantially as set forth.

396,921. DREDGING-SCOOP. NICHOLS B. CORBIN, Jersey City, N. J. Filed Oct. 25, 1888. Serial No. 289,109. (No model.)

396,921.

Claim.—1. A dredging-scoop having the scoop-sections linked to a head-block and provided with lever-arms, a foot-block jointed to the said arms, a pulley-shaft fitted to bearings upon one of the blocks, the pulleys *h h'*, fitted to the said shaft, and the chains *k k'*, attached to the hubs of the pulleys and to the other block, the whole being suspended and operated substantially as herein set forth.

2. In a dredging-scoop, the combination, with the scoop-sections linked to a head-block and provided with lever-arms, of a foot-block jointed by links to the said arms, bearings projected downward from the top block, a shaft fitted to such bearings across the center line of the scoop, two pulleys side by side upon such shaft, provided each with a hub and a chain attached thereto and to the foot-block, and two ropes or chains attached to the opposite sides of the pulley-rims and extended upward through an opening in the head-block, as and for the purpose set forth.



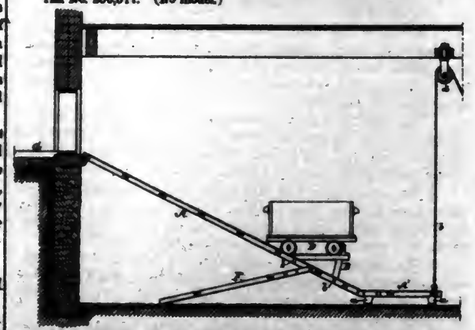
3. In a dredging-scoop, the combination, with the scoop-sections *a*, head-block *c*, links *b*, and lever-arms *d*, of the foot-block *c*, jointed by links to the arms *d*, bearings *f*, attached to the top block, the shaft *g*, the pulleys *h h'*, provided each with hub *j*, the chains *k k'*, attached to the hubs and to the foot-block *e*, and a brace pivotally connected with the arms *d*, as by the bolts a^3, and operating with the bolts to form fulcra for the movements of the scoop-sections, substantially as herein set forth.

396,922. FLOUR-BOLT. JAMES J. FAULKNER, Jackson, Mich. Filed Sept. 1, 1886. Serial No. 212,375. (No model.)

Claim.—1. In a flour-bolt, the combination, with a pair of opposite bolting-cloth walls and an endless belt or chain carrying a set of buckets or lifts, the end of which projects beyond the edges of the belt or chain, of upper and lower shafts on which the endless belt or chain is mounted, said shafts being provided with sprocket-wheels, the notches of which are adapted to receive the projecting ends of the buckets or lifts, substantially as set forth.

2. In a flour-bolt, the combination, with the pair of opposite bolting-cloth walls and the endless-belt flour-elevator, of the endless belts or chains and the adjustable clearing-brushes carried by these belts or chains and adapted to sweep the entire outer surface of the bolting-cloth in their descent, substantially as set forth.

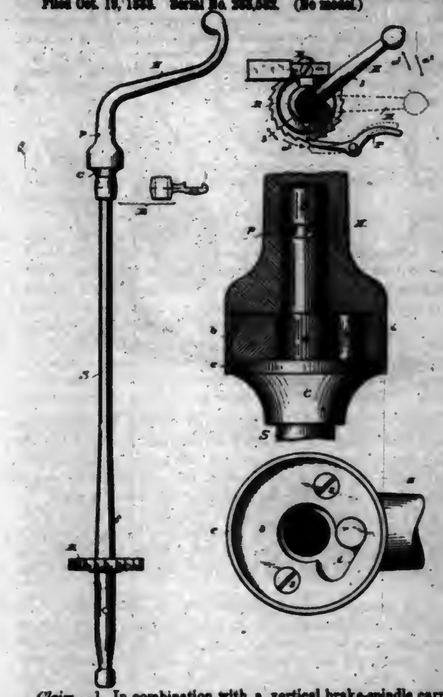
396,922.



3. In a flour-bolt, the combination, with the bolting-cloth walls and the flour-elevator, of the endless chains or belts adapted to travel up and down on the outside of the bolting-cloth walls, cross-bars attached to the endless belts or chains, and brushes adjustably secured to one of the cross-bars, substantially as set forth.

4. In a flour-bolt, the combination, with the endless chains and bars secured thereto, of metallic strips secured to the bars, brushes, and set-screws for adjustably securing the brushes to the metallic strips, substantially as set forth.

5. In a flour-bolt, the combination of the bolting-cloth walls and the flour-elevator mounted on upper and lower shafts, the lower shaft being provided with a screw-flange adapted to prevent the uneven accumulation of unbolted flour, substantially as set forth.



396,923. APPARATUS FOR DELIVERING ASHES FROM CELLARS. MILTON FOREMAN, Philadelphia, Pa. Filed Nov. 30, 1887. Serial No. 256,517. (No model.)

Claim.—1. The combination of a wheeled delivery-truck, a pair of skids pivoted adjacent to the window-opening of a cellar and having horizontal portions providing a support for said truck when the skids are down, and a flexible hoisting device attached at the inner ends of the skids, all substantially as specified.

2. The combination of a pair of skids pivoted adjacent to the window-opening of a cellar and having their inner ends at such an angle that they lie horizontally when the skids are down, angular frames detachably secured to the skids above the inner ends of the same, and a hoisting device attached to the inner ends of the skids, all substantially as specified.

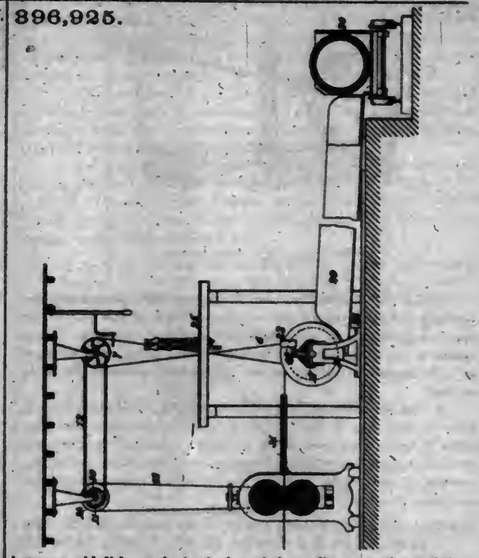
396,924. BRAKE-HANDLE. JOHN W. FOWLER, Brooklyn, N. Y. Filed Oct. 19, 1888. Serial No. 288,582. (No model.)

Claim.—1. In combination with a vertical brake-spindle carrying a collar near its upper end, and having a smooth cylindrical portion immediately above said collar, a handle inclosing a clutch-roller in contact with said cylindrical portion of the spindle and which rests endwise upon said collar, and means, substantially as hereinbefore specified, for wedging the roller against the spindle when the handle is turned in a given direction, whereby the handle is adapted to be moved independently of the spindle to an effective position and the unlocked spindle is rendered free to turn independently of the handle to instantaneously release the brake.

2. In combination with a brake-spindle having at or near its upper end a cylindrical portion, a recessed handle provided with a bored and recessed bushing which encircles said spindle portion, and a clutch-roller confined between an incline in said bushing-recess and the periphery of said spindle portion, substantially as hereinbefore specified.

3. The combination of a brake-spindle having a circular collar fast thereon near its upper end and a short clutch portion immediately above the same, and a handle having its lower end axially bored and concentrically recessed, and provided with a bored and recessed bushing, and a clutch-roller within it, below which the lower edge of the handle-casting encircles said collar to exclude dust, substantially as hereinbefore specified.

4. The combination of a brake-spindle of iron or steel having its upper end lathe-finished and hardened, a recessed handle, which may be of brass, provided internally with a bushing of hardened steel, which encircles a cylindrical portion of said upper end of the spindle, and a clutch-roller within the bushing, substantially as hereinbefore specified.



396,925. REEL FOR WIRE RODS. WILLIAM GARRETT, Joliet, Ill. Filed June 25, 1888. Serial No. 278,115. (No model.)

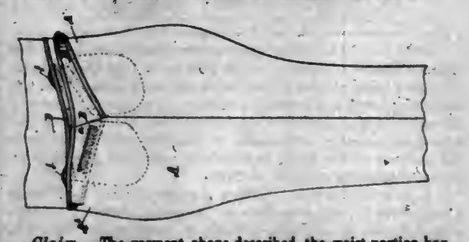
Claim.—1. In an apparatus for reeling wire rods, the combination of two disks mounted in independent shafts, one of said disks being movable toward or from the other for the purpose of discharging the coil of long rod therefrom, substantially as set forth.

2. In an apparatus for reeling wire rods, the combination of two disks mounted upon independent shafts, one of said disks being movable toward or from the other, and flanges or other retaining devices on the outer edges of the disks to prevent lateral displacement of the wire rod, substantially as set forth.

3. In an apparatus for reeling wire rods, the combination of two disks mounted on independent shafts, one of said disks being movable toward and from the other, whereby the rod may be grasped between said disks at the beginning of the reeling operation and the bundle automatically discharged therefrom, substantially as set forth.

396,925.

4. In a reeling apparatus, the combination of a continuously-rotating disk and a loosely-mounted disk movable toward and from the rotating disk, said disks having their contiguous faces constructed, as regards their peripheral edges, to receive and hold a length of wire rod, substantially as set forth.

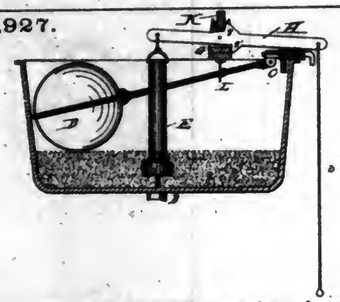


5. In a reeling apparatus, the combination of a continuously-rotating disk and a loosely-mounted disk movable toward and from the rotating disk, said disks having their contiguous faces constructed, as regards their peripheral edges, to receive and hold a length of wire rod, and provided with jaws or other devices for grasping the rod, substantially as set forth.

6. In an apparatus for reeling wire rods, the combination of two disks separable from each other for the purpose of discharging a bundle of rod wrapped around the peripheries of said disks, and a trough for receiving such bundle and conducting the same away from the disks, substantially as set forth.

7. In an apparatus for reeling wire rods, the combination of two disks, one of which is movable toward and away from the other, said disks being provided on the inner faces with a groove and projection, respectively, substantially as set forth.

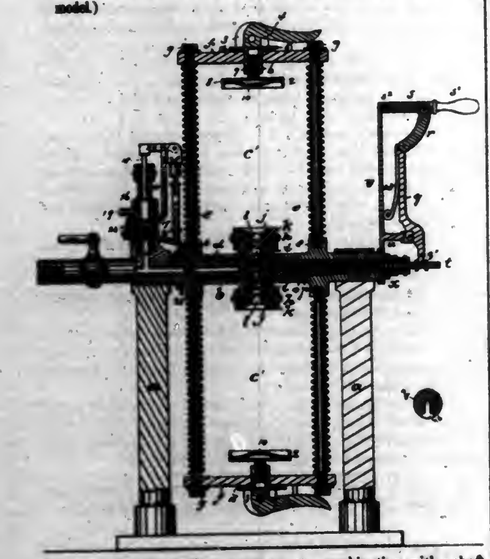
8. The combination of the delivery-rolls of a rod-train, a pair of separable disks forming a reel, a guide for conducting the rod from the rolls to said disks, and a trough for receiving and conducting away a bundle of rod from the reel, substantially as set forth.



396,926. TROUSERS, OVERALLS, &c. BENJAMIN J. GRESLY, Boston, Mass. Filed July 21, 1888. Serial No. 280,594. (No model.)

Claim.—The garment above described, the waist portion having the front and rear flaps, A' A^2, with their edges *a b c d* forming a placket over each hip and connected by the straps B B', secured to the edges *a b* of the front flap, A^2, from the top of such edges to the bottom of the placket, and by the straps D D', secured to the edges *c d* of the rear flap, A', from the top of such edges to the bottom of the placket, the straps D D' uniting at the front and the straps B B' at the rear, all substantially as described.

396,927. FLUSHING-TANK FOR WATER-CLOSETS. ADOLPH HAARLANDER, Allegheny, Pa. Filed Aug. 3, 1887. Serial No. 246,418. (No model.)

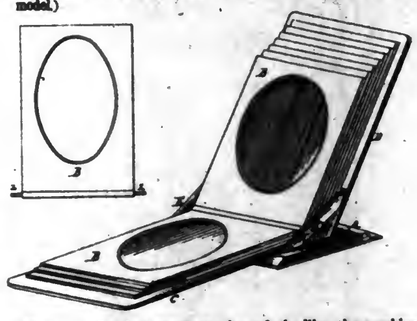


396,927.

Claim.—1. In a flushing-tank for water-closets, the combination, with the induction-valve C and eduction-valve E, of the float D, stirrup L, trigger-lever K, connected to said stirrup, and lever H, connected to the eduction-valve, and chain *b*, said levers being arranged at right angles to each other and interlocking, substantially as described.

2. The combination, with a flushing-cistern, of induction-valve C, lever *m*, and float D, for operating the induction-valve, eduction-valve E, and pivoted lever H, for operating it, having shoulder *g*, and pivoted trigger K, arranged to engage said shoulders, and stirrup connecting said trigger to lever *m*, all combined and arranged substantially as shown and described.

396,928. APPARATUS FOR BOTTLING SODA-WATER, &c. CHAS. C. HALEY, Newark, N. J. Filed Dec. 22, 1887. Serial No. 258,654. (No model.)



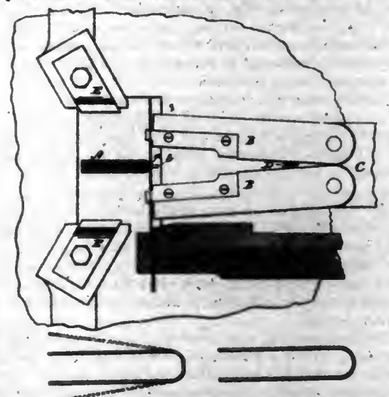
Claim.—1. In a bottling apparatus, the combination, with a shaft having a duct, *n*, a sleeve, *d*, having passages to coincide therewith, said sleeve being adapted to revolve on said shaft, a plurality of bottle-holding frames, and a secondary passage, *r*, across the shaft between the mouth-holding portions of the bottle-frames, and a valve for controlling said passage, substantially as described, whereby the water and gas from a bottle in one frame may be sniffed into a bottle in another, substantially as herein set forth.

2. In combination, in a bottling apparatus, with a shaft having a duct, *n*, heads *h h*, having ducts or passages *l*, adapted to coincide with said ducts *n*, and revolving frames or bottle-holders adapted to hold the heads of the bottles into impervious engagement with said heads *h*, and passages or ducts *r r*, providing open communication between the said heads *h h*, and means, substantially as described, for closing such communication, substantially as set forth.

3. In combination, in a bottling apparatus, posts *a a*, a shaft, *b*, having a duct, *n*, a sleeve, *d*, bottle-holders revolving with said sleeve, heads *h h*, having passages *l l*, ducts or passages *r r*, a valve for closing communication between the same, and means *v* for revolving the sleeve, substantially as set forth.

4. In a bottling apparatus, the shaft having ducts or passage *n*, a rest adapted to be opened to allow the escape of air from the duct or passage *n*, frames revolving on said shaft and adapted to hold two independent bottles, a duct leading from one to the other of said bottles, and a valve for opening closed communication through said ducts, and means for revolving said frames, substantially as set forth.

396,929. PHOTOGRAPH-ALBUM. CARL H. HAMMANN, Offenbach-on-the-Main, Germany. Filed Jan. 11, 1888. Serial No. 260,427. (No model.)



Claim.—1. In photograph-stands and the like, the combination of the leaves having the projecting journals and the stand therefor having slotted bearings for said journals with a movable locking-piece which covers the slots in the bearings, whereby the leaves may be readily inserted or removed from the stand and locked in place.

2. In photograph-stands and the like, the combination of the leaves having journals, and the stand therefor having bearings in which said journals may be inserted with a single movable locking-piece engaging with each leaf and preventing its removal from the stand.

3. In photograph-stands and the like, the combination of the leaves having two projecting journals and the stand having bearings for the same, one set of bearings being slotted, so that the journals may be readily put into place through the slots with a locking-slide similarly slotted and movable over the slotted frame, and thereby opening or closing the journals according to the position of the slide.

396,930. MACHINE FOR BENDING WIRE. ELI HARRIS, New York, N. Y., assignor to the Self Retaining Hair Pin Company, same place. Filed June 11, 1888. Serial No. 276,723. (No model.)

Claim.—In an apparatus for making articles from wire, in which the wire is bent to shape, the combination of a former, corresponding in shape to the shape required for the bent wire except that a portion of the surface of the former is recessed to permit an extra inward bend of the wire, and an auxiliary bender arranged to operate within the bend so made by the principal bender and at the point where the said recess in the former occurs, substantially as described, said supplemental bender being adapted to give to the said inward bend an outward bend into the required shape.

396,931. HORSE-POWER REGULATOR. FREDERICK HART, Poughkeepsie, N. Y. Filed Jan. 21, 1888. Serial No. 261,483. (No model.)

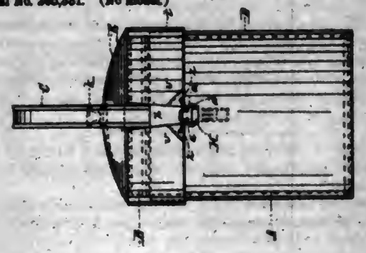
Claim.—1. The combination, with the vertically-movable horse-power tread, of a stationary frame on which the tread can be raised and lowered to change its inclination, and a centrifugal regulator attached to the tread and moving vertically therewith, whereby the vertical movement of the tread on said frame is automatically controlled, substantially as set forth.

396,931.

2. The combination, with the vertically-movable horse-power tread, of a stationary frame on which the tread can be raised and lowered to change its inclination, a worm or screw interposed between the movable tread and the stationary frame, whereby the tread is frictionally held in position on the frame, and a centrifugal regulator whereby the vertical movement of the tread on the frame is automatically controlled, substantially as set forth.

3. The combination, with the regulator-frame provided with gear-racks, of a pinion-shaft provided with pinions meshing with said gear-racks and adapted to be attached to the tread of the horse-power, a governor-shaft which is driven from the horse-power, a governor mounted on said shaft, and a ratchet mechanism controlled by said governor and connected with said pinion-shaft, substantially as set forth.

4. The combination, with the regulator-frame provided with gear-racks, of bearing-frames adapted to be attached to the horse-power tread, a pinion-shaft journaled in said bearing-frames and provided with pinions which mesh with said racks, a governor-shaft journaled in said bearing-frames, a governor attached to said shaft, and a ratchet mechanism mounted on one of said bearing-frames which is geared with the pinion-shaft, controlled by the governor, and actuated from the governor-shaft, substantially as set forth.

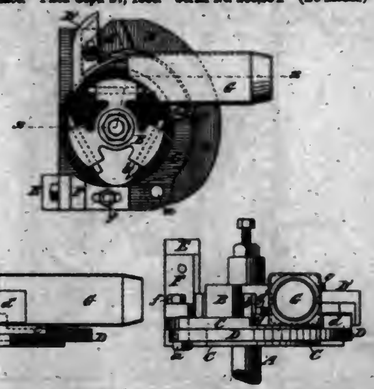


5. The combination, with the regulator-frame C, provided with gear-racks c^4, of the pinion-shaft D, provided with pinions *d d*, meshing with said gear-racks, bearing-frames E E', provided with plates *e e*, a governor-shaft, F, provided with a worm, *g*, a centrifugal governor mounted on said shaft, a worm-wheel, G, mounted on the bearing-frame E, a ratchet-shaft, J, journaled in the bearing-frame E', a ratchet-wheel, J', secured to the shaft J, a shield, L, controlled by the centrifugal governor, a pawl-arm, *j*, connected with the worm-wheel G, a worm, *m*, secured to the ratchet-shaft J, and a worm-wheel, M, secured to the pinion-shaft D and meshing with the worm *m*, substantially as set forth.

396,932. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. ARTHUR J. HOLT, Grand Rapids, Mich.; Frances S. Holt administratrix of said Arthur J. Holt, deceased. Filed May 13, 1884. Serial No. 131,901. (No model.)

Claim.—In a compound-wound dynamo-electric machine, the combination, with the commutator, of commutator-brushes connected to the field-coils included in series with the armature and external circuit, and independently-adjustable commutator-brushes connected with the field-coils in derived circuit and located on the commutator at points intermediate between the points of maximum and minimum potential of the armature, substantially as set forth.

396,933. INSULATING JACKET OR COVERING. WILLIAM J. HOLFORD, Lawrence, Mass., assignor of two-thirds to Daniel F. Fitzgerald and Evan R. Williams, both of same place. Filed Feb. 27, 1888. Serial No. 265,381. (No model.)

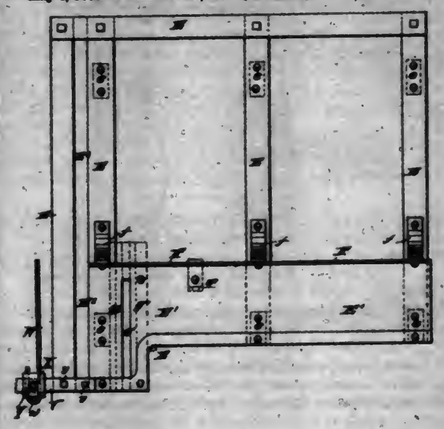


Claim.—1. In a jacket or covering of the character described, the insulating cover E, having the flaps *v v*, provided with the hooks *z*, in combination with the insulating-body A, provided with the loops *d*, and means, substantially as described, for exerting a strain on said loops when engaged with said hooks, substantially as set forth.

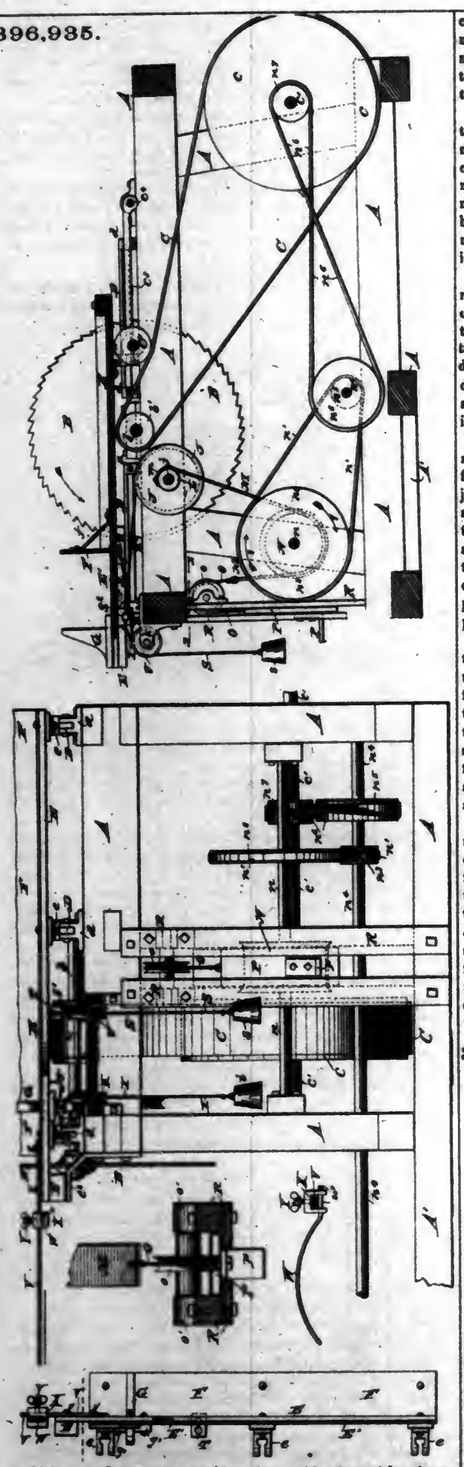
2. The insulating-body A, having the elastic straps H, provided with triangular loops *d*, in combination with the insulating-cover E, having the side slots or recesses, *x*, forming flaps *v*, said cover being provided with hooks *z*, substantially as described.

3. In a jacket of the character described, the insulating-cover E, having side slots or recesses forming flaps *v*, said flaps being provided with hooks, in combination with the insulating-body A, provided with a loop for receiving said hooks, whereby the flaps may be drawn together, substantially as described.

396,934. WOOD-PLANING MACHINE. ALFRED B. HUTCHINSON, Brooklyn, N. Y., assignor to the Glen Cove Machine Company, (Limited,) same place. Filed Sept. 27, 1883. Serial No. 288,594. (No model.)



Claim.—1. The combination, in a wood-planing machine, with a side cutter-head, a fixed head-plate below said cutter-head, and a chip-breaker a portion of which is below the level of the upper surface of said plate, of a shaving-hood secured to said plate and lying over the said portion of the chip-breaker, substantially as herein described.



2. The combination, in a wood-planing machine, with the side cutter-head and its cutters, and a shaving-hood opposite the said cutters, of a chip-breaker provided with a tongue which enters the mouth of the said hood for the purpose of guiding thereinto the shavings or chips produced by the said cutters, substantially as herein described.

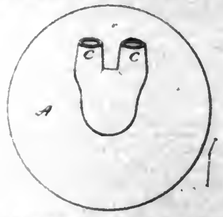
3. The combination, in a wood-planing machine, with the side cutter-head and its cutters and a fixed head-plate below the said cutter-head, of a chip-breaker a portion of which is below the level of the said head-plate, but the nose of which is above the said head-plate, a shaving-hood which is attached to the head-plate and which overlies the portion of the chip-breaker below the said plate, and a tongue attached to the chip-breaker and entering the mouth of the shaving-hood, substantially as and for the purpose herein set forth.

396,935. SAWING-MACHINE. JAMES R. IVEY, Macon, Ga. Filed May 1, 1883. Serial No. 272,495. (No model.)

396,935.

Claim.—1. In a sawing-machine, the combination, with a frame and a table or support thereon provided with a fixed jaw or fence, of a movable jaw fitted to the table, a pulley journaled on the frame, a cord connecting said pulley with the movable jaw, a friction-band connected for turning the cord-pulley, a treadle or operating device connected to the other end of the band, and a friction-drum onto which the band may be tightened to receive motion therefrom for actuating the movable jaw, substantially as described, for the purposes set forth.

2. In a sawing-machine, the combination, with a frame and a table or support thereon provided with a fixed jaw or fence, of a movable jaw fitted to the table, a pulley journaled on the frame, a cord connecting said pulley with the movable jaw, a friction-band connected for turning the cord-pulley, a treadle or operating device connected to the other end of the band, a friction-drum onto which the band may be tightened to receive motion therefrom for actuating the movable jaw, and a weighted cord connected to said jaw for retracting it, substantially as described, for the purposes set forth.



3. In a sawing-machine, the combination, with a frame and a carriage fitted for reciprocation thereon and provided with a fixed jaw or fence, of a movable jaw fitted to the carriage, a pulley journaled on the frame, a cord connecting said pulley with the movable jaw, a friction-band connected for turning the cord-pulley, a treadle or operating device connected to the other end of the band, a rotating friction-drum onto which the band may be tightened for actuating the movable jaw, and a weighted cord connected to the carriage to retract it, substantially as described, for the purposes set forth.

4. In a sawing-machine, the combination, with a supporting-frame and a carriage fitted for reciprocation thereon and provided with a fixed jaw or fence, of a movable jaw fitted to the carriage, a pulley journaled on the frame, a cord connecting said pulley with the movable jaw, a friction-band connected for turning the cord-pulley, a treadle or operating device connected to the other end of the band, a friction-drum onto which the band may be tightened for actuating the movable jaw, and weighted cords connected to both the movable clamping-jaw and reciprocating carriage for retracting either independently or both simultaneously, substantially as described, for the purposes set forth.

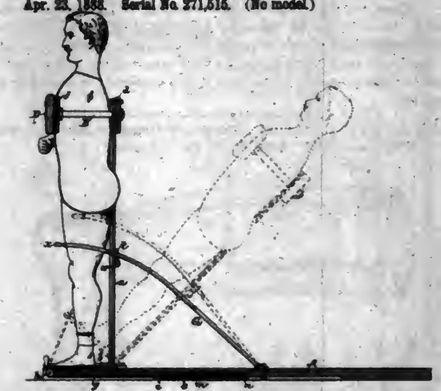
5. In a sawing-machine, the combination, with a frame and a table or support thereon provided with a fixed jaw or fence, F, of a movable jaw, G, fitted in the carriage, a shaft, *j*, journaled on the frame, a pulley, J, and drum L on said shaft, a cord, H, connecting the pulley J with the jaw G, a weighted retracting-cord, I, connected to the jaw G, a shaft, *n*, journaled in the frame, gearing operating said shaft, a friction-drum, N, on said shaft, a treadle device, P *p*, fitted to the frame, and a friction-band, M, connected to the drum L and to the treadle and receiving the drum N in its bight, substantially as described, for the purposes set forth.

6. In a sawing-machine, the combination, with a frame and a reciprocating carriage thereon provided with a fixed jaw or fence, of a movable jaw, G, fitted in the carriage, a shaft, *j*, journaled in the frame, a pulley, J, and drum L on said shaft, a cord, H, connecting the wheel *j* with the jaw G, a weighted retracting-cord, I, connected to the movable jaw G, a weighted retracting-cord, S, connected to the carriage, a shaft, *n*, journaled on the frame, gearing for operating said shaft, a friction-drum, N, on said shaft, a treadle device, P *p*, fitted in the frame, and a friction-band, M, connected to the drum L and to the treadle and receiving the drum N in its bight, all constructed and arranged for operation substantially as described, for the purposes set forth.

396,936. FACE-SHIELD FOR ATOMIZERS. SIMEON H. JENNINGS, Deep River, Conn. Filed June 11, 1888. Serial No. 276,722. (No model.)

Claim.—The herein-described face-shield for steam-atomizers, consisting of the shield A, the receiving-tube B, leading therefrom and contracted into flattened shape toward the delivery end, the delivery end terminating in two nipples, C C, the said nipples forming two independent tubular openings at the delivery end of the tube, substantially as and for the purpose described.

396,937. TOP-PROP FOR VEHICLES. JOHN A. KASPAR and WALLACE R. CURTIS, Pomeroy, Ohio. Filed May 7, 1888. Serial No. 273,145. (No model.)



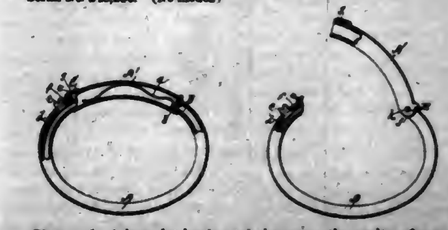
Claim.—In a vehicle-top prop, the combination, with a sleeve, C, adapted to be made to inclose the metal top-prop of a vehicle, said

396,937.

sleeve having an external longitudinal groove, *c*, and external shoulders near each end, of the wire support *f*, having its ends coiled about the said sleeve and terminating in the groove *c*, and having its outer supporting portion bent downwardly, substantially as and for the purpose specified.

396,938. EXERCISING-MACHINE. JOHN A. KEMMLER, Philadelphia, Pa., assignor of one-half to Werner Steinmann, same place. Filed Apr. 23, 1888. Serial No. 271,515. (No model.)

Claim.—1. The combination of the base, a yielding frame thereon carrying a representation of a human figure, and a striking-pad connected to said frame, all substantially as specified.



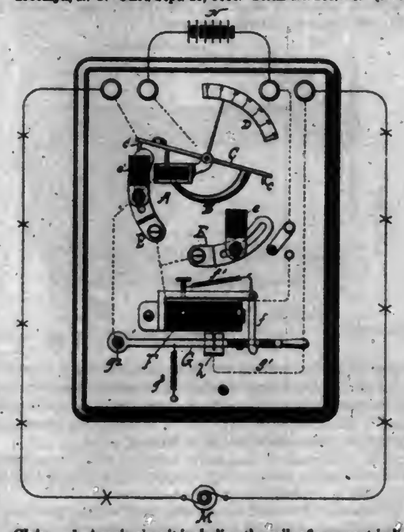
2. The combination of the base, a representation of a human figure mounted thereon, but free to yield in respect thereto, a strike-pad carried by said figure, and a spring acting to maintain the figure in an upright position, substantially as set forth.

3. The combination of the base, the frame pivoted thereto and carrying a representation of a human figure, a spring acting upon said frame and tending to maintain it in the upright position, and a detent-arm engaging with a catch on the frame and serving to retain the latter when thrown back from the upright position, all substantially as specified.

4. The combination of the base, the frame pivoted thereto and carrying a representation of a human figure, a draft cord or chain connected to the frame and passing around a pulley on the base, and a spring acting upon said draft cord or chain, all substantially as specified.

5. The combination of the base, the yielding frame thereon, a representation of a human figure carried by said frame, and a striking-pad occupying a position upon the breast of said figure, but having a rigid connection with the frame, whereby blows upon the pad are transmitted directly to the frame without straining the material of which the figure is composed, all substantially as specified.

396,939. BRACELET. THOMAS KING, Providence, R. I., assignor to himself and William C. Greene & Co., same place. Filed Aug. 20, 1887. Serial No. 248,228. (No model.)



Claim.—1. A bracelet having tubular arms, the cavity of one of which is sufficiently large to receive the end of the opposite arm, and having one end of the smaller arm pivoted within the cavity of the larger and the other end of the smaller arm held within the said cavity, and also in locked engagement by means of the spring-catch and the internal notch, substantially as described.

2. A bracelet having tubular arms which are pivoted to each other, one of the said arms being provided at its free end with an internal notch, and also with a holding-socket adapted to receive the end of the opposite arm, which arm is provided with a projecting spring-catch, which is adapted for engagement with the internal notch upon the entrance of the end of the said arm into its holding-socket, substantially as described.

3. In a bracelet, the combination, with the pivoted arm A, provided with the spring-catch C, having the spring *d*, nail-piece *e*, and catch-hook *c* in one piece, of the arm A', which provides a holding-socket, *i*, for the free end of the arm A, and also has an interior notch or shoulder, *g*, adapted to receive the catch-hook *c* upon the entrance of the end of the arm A into the holding-socket *i*, substantially as described.

396,940. AUTOMATIC ELECTRIC CUT-OUT. EDWARD B. KNOWLES, Brooklyn, N. Y. Filed Sept. 25, 1888. Serial No. 286,238. (No model.)

Claim.—1. A main circuit including the coils of a current-indicator, the movable element of said current-indicator provided with a pair of contacts, both of which connect with the same side of a local generator, a pair of adjustable contacts adapted to connect with said pair of contacts upon the said moving element, said adjustable contacts being connected with the opposite side of said local generator.

2. The combination, with a main circuit and a local circuit, the main circuit including the coils of a current-indicator, and the local circuit including a magnet adapted to open the main circuit, the movable element of the current-indicator carrying two contact-points, forming one terminal of the local circuit, and two adjustable corresponding contacts forming the other terminal of said local circuit.

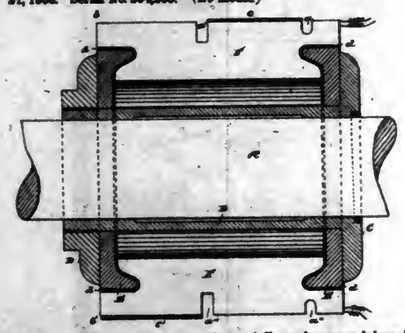
3. In an automatic cut-out, a pivoted arm carrying a contact on each side of its pivot, a curved support carrying corresponding adjustable contacts, an electro-magnetic device causing movement of the pivoted arm, a main circuit including said electro-magnetic device, and a local circuit including a magnet adapted to open the main circuit, the terminals of said local circuits being the pivoted arm and the curved support, substantially as described.

4. In combination with an electrical indicator carrying a pair of contacts, the said contacts adapted to move in a circular path, a curved track or guide, and a pair of contacts adjustable thereon.

396,941. ARMATURE-WINDING FOR DYNAMO-ELECTRIC MACHINES. EDWARD B. KNOWLES, Brooklyn, N. Y., assignor to the Mutual Electric Manufacturing Company, of New York. Filed Dec. 3, 1886. Renewed Dec. 21, 1888. Serial No. 294,284. (No model.)

Claim.—1. An armature having its coils divided into a number groups, each group consisting of a number of separate bobbins or wires, and one-half of the bobbins in each group wound parallel to each other and parallel to and on one side of a given diameter, alternate bobbins in the several groups starting from opposite sides of the same end of the armature, substantially as described.

2. An armature having its coils disposed around it in groups of parallel wires starting in alternation from opposite sides of the same end of the armature and similarly ending at the same end of the arma-

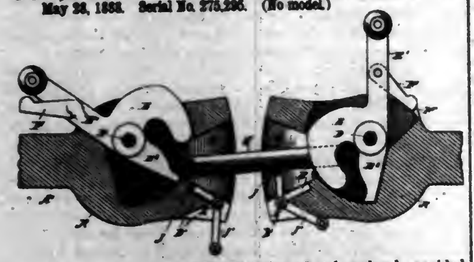


396,941.

ture, the ends of the said coils or bobbins of the several groups being connected in alternation, substantially as set forth.

396,942. COMMUTATOR FOR DYNAMO-ELECTRIC MACHINES.

EDWARD R. KNOWLES, Brooklyn, assignor to the Mutual Electric Manufacturing Company, of New York. Filed Aug. 5, 1885. Renewed Dec. 21, 1888. Serial No. 294,285. (No model.)

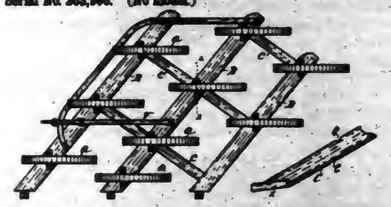


Claim.—1. The combination, substantially as shown and described, of the shaft A, the leaves provided with circumferential grooves dividing the surface of the commutator into brush-segments, and the sleeve B, head C, nut D, and insulating-disks for securing such leaves to and insulating them from the shaft, as set forth.

2. In a commutator, the leaves provided with circumferential grooves dividing the surface of the commutator into brush-segments, substantially as described.

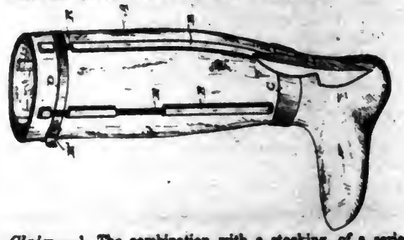
3. In a commutator of the general construction described, the grooves *a a'* in and around the face, as shown, for the purposes specified.

396,943. CAR-COUPLING. JOHN B. MAAS, Negaunee, Mich. Filed May 28, 1888. Serial No. 275,295. (No model.)



Claim.—1. A car-coupler consisting of a draw-head provided with a jaw for the reception of a link and an inner chamber communicating therewith, and a hook and arm, E', pivotally mounted within said chamber, said arm being provided with the dog F, the draw-head being notched to receive said dog, substantially as described, and for the purposes set forth.

2. A car-coupler consisting of a draw-head provided with a jaw for the reception of a link and an inner chamber communicating therewith, a hook and arm, E', pivotally mounted within said chamber, and the dog F, pivotally attached to said arm, the draw-head being notched for said dog, in combination with the rod H, having arms H', bell-crank L, and the chains *l l'*, connected to the respective arms of said bell-crank, the outer ends of said chains being engaged, respectively, to the dog and arm E' aforesaid, substantially as set forth.



3. A car-coupler consisting of a draw-head provided with a jaw for the reception of a link and an inner chamber communicating therewith, a hook and arm, E', pivotally mounted within said chamber, and the dog F, pivotally attached to said arm, the draw-head being notched for said dog, in combination with the rod H, bell-crank L, and the chains *l l'*, connected to the respective arms of said bell-crank, the outer ends of said chains being engaged, respectively, to the dog and arm E' aforesaid, and the rod M, connected to an arm of the bell-crank, as specified, substantially as described.

396,944. HARROW-FRAME. JAMES MCMAHON, Kalamazoo, Mich., assignor to D. C. & H. G. Reed & Co., same place. Filed Feb. 14, 1888. Serial No. 263,966. (No model.)

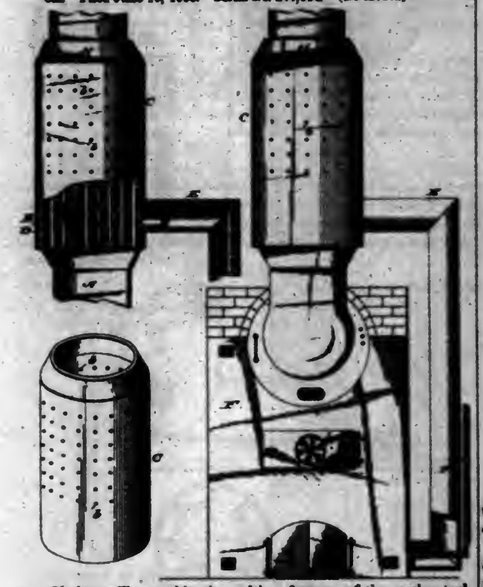
Claim.—A float harrow-frame consisting of the wooden draft-beams, the straight solid thin metal cross-bars on the under side of the draft-beams, said cross-bars having the side gains and the upwardly-turned ends projecting beyond the draft-beams at the forward ends, and the clamping-bolts in the gains of said cross-bars, substantially as set forth.

396,945. STOCKING. SIGMUND M. MICHELSON, Milwaukee, Wis. Filed June 8, 1888. Serial No. 276,495. (No model.)

Claim.—1. The combination, with a stocking, of a series of removable strips of stiffening material held against the outside of the leg thereof, and a calf-strap surrounding the upper part of the said stocking-leg and held in place by said removable strips, substantially as set forth.

2. The combination of a stocking and short and long pockets stitched to the outside of the leg thereof in vertical line with each other and separated a short distance with the removable vertical stiffening-strips, a calf-strap held in place thereby, and a continuous counter-strap secured only to the back of the stocking and passing around the ankle portion thereof, substantially as set forth.

3. The combination of a stocking and short and long pockets stitched thereto in vertical line with each other and separated a short distance, the former being adjacent to the top of the stocking, with removable vertical stiffening-strips located in said pockets, and a calf-strap passing around the upper part of the stocking beneath the stiffening-strips, and occupying the space between the adjacent ends of the short and long pockets, substantially as described.



396,946. LAMP-STANDARD. JOHN C. MILLER and AUGUSTUS H. JOHNS, Meriden, Conn., assignors to the Meriden Bronze Company, same place. Filed Aug. 13, 1888. Serial No. 282,622. (No model.)

Claim.—1. In a lamp-standard composed of a stationary tube, with an inner tube or rod working telescopically therein, the said inner tube carrying the lamp, the combination therewith of a sleeve surrounding the inner tube and vertically movable, with a spring arranged to yieldingly support said sleeve, substantially as described, and whereby said sleeve forms an elastic cushion upon which the force of the descending lamp will be met.

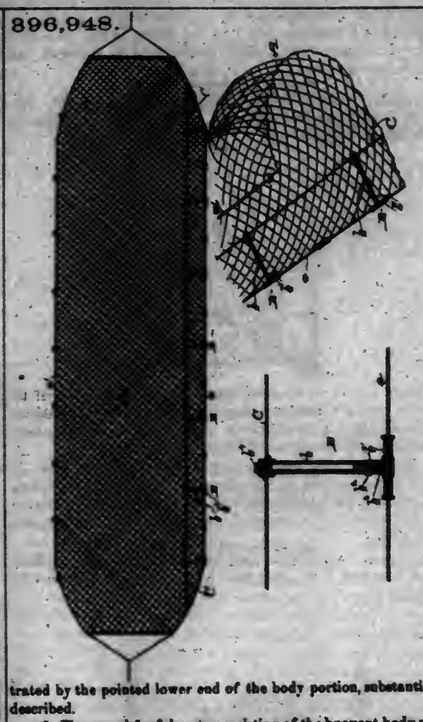
2. In a lamp-standard composed of an outer tube, A, and a rod or inner tube, B, telescopically adjustable therein, the said rod or tube B carrying the lamp, a collar, D, fixed to the upper end of the said stationary tube, said collar constructed with an annular spring-chamber upon its inner surface, and a sleeve, E, in said collar surrounding the adjustable rod or tube and projecting above said collar, with a spring in the chamber of the collar below said sleeve, substantially as and for the purpose described.

396,947. HOT-AIR BLAST. WILLIAM G. MILLS, San Francisco, Cal. Filed June 19, 1888. Serial No. 277,004. (No model.)

Claim.—The combination, with a furnace, of the smoke-stack composed of tubes B, for the passage of smoke and particles of combustion, the casing C, surrounding the said tubes and having perforations *b* entirely around the same at its upper portion for the inlet of cold air, which passes around the smoke-tubes, and also having its upper end contracted to approximately bear against the outer surface of the stack, the pipe E, leading from the lower portion of the said casing below the perforations to the ash-pit of the furnace, and the steam-pipe F, entering the said pipe E at its point of connection with the ash-pit, whereby a jet of steam may be thrown to draw the heated air in the smoke-stack or its casing into the ash-pit beneath the fire, substantially as specified.

396,948. GUARD FOR FISH-NETS. JACOB MYERS, Eureka, Cal. Filed Nov. 30, 1888. Serial No. 292,316. (No model.)

Claim.—1. In a fish-net, and in combination with the lead-line at its foot, the guard-line secured to the net at a point above and parallel with the lead-line, and the stiff or rigid guards extending between said lines and attached to both, said guards having a tubular foot portion, through which the lead-line passes, substantially as and for the purpose herein described.

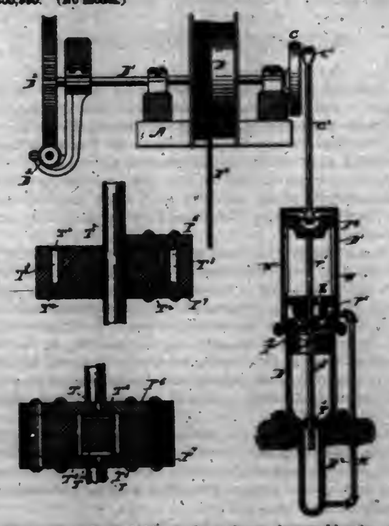


2. In a fish-net, and in combination with the lead-line at its foot, the guards B, having a body portion secured to the net and a tubular T-shaped foot portion secured to said body portion and receiving the lead-line, substantially as described.

3. In a fish-net, and in combination with its lead-line at its foot, the guard-line extending parallel with the lead-line and secured to the net, and the guards consisting of the body portion secured at its upper end to the guard-line, and a T-shaped tubular foot portion secured to the lower end of the body portion and receiving the lead-line in its horizontal portion, substantially as described.

4. The guards for the base or foot of a fish-net, consisting of the buoyant body portion *b* and heavy foot portion *b'*, made of a T shape and tubular to receive the body portion and the lead-line of the net, substantially as herein described.

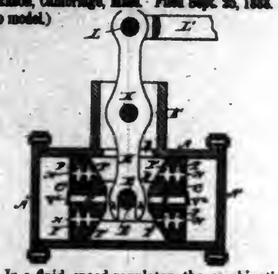
5. In a fish-net, and in combination with its lead-line and the guard-line attached to the net and running parallel with the lead-line, the guards B, consisting of a body portion, *b*, secured at its top to the guard-line and having a pointed lower end, and the tubular T-shaped foot portion *b'*, into which the pointed lower end of the body portion fits, said foot portion receiving the lead-line of the net, which is penetrated by the pointed lower end of the body portion, substantially as described.



396,948.

6. The guard for fish-nets, consisting of the buoyant body portion *b*, having a pointed lower end, and the heavy tubular T-shaped foot portion *b'*, in which the lower end of the body portion is secured, substantially as described.

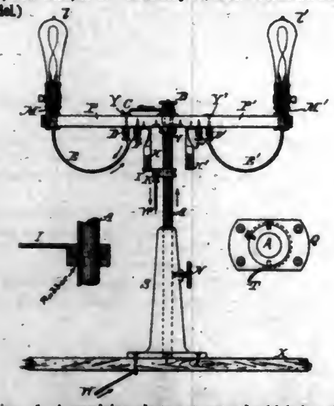
7. The guard for fish-nets, consisting of the hollow buoyant body portion *b* and the heavy tubular T-shaped foot portion *b'*, secured to said body portion, substantially as herein described.



396,949. FLUID SPEED-REGULATOR FOR ELEVATORS. WILLIAM R. MCKERNON, Cambridge, Mass. Filed Sept. 21, 1888. Serial No. 285,995. (No model.)

Claim.—1. In a fluid speed-regulator, the combination of the cylinder D, the piston-rod P' P², and the piston P, having openings whereby the fluid may pass from one side to the other, with the auxiliary chambers D² and P² and reservoir-pipe H, substantially as described, and for the purpose set forth.

2. In a fluid speed-regulator, the combination of the cap P^2, having openings T T, with the body P of the piston, having grooves T^2 T^2 and intermediate openings, T^3 T^3, substantially as described, and for the purpose set forth.

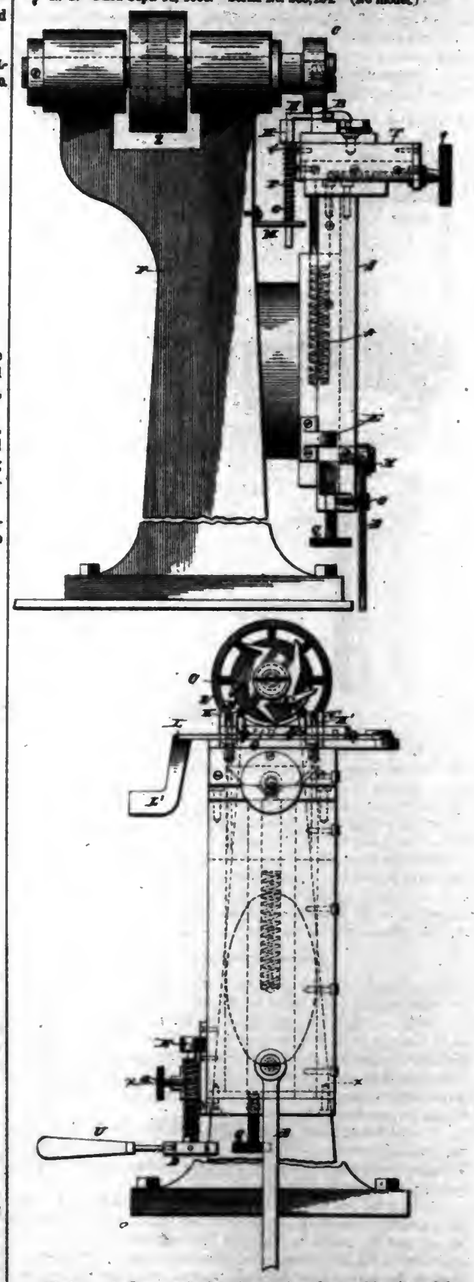


396,950. FLUID SPEED-REGULATOR FOR ELEVATORS. WILLIAM B. HOKENSON, Cambridge, Mass. Filed Sept. 25, 1886. Serial No. 214,322. (No model.)

Claim.—1. In a fluid speed-regulator, the combination of the cylinder A, having a lateral opening, B, with the piston C C', adapted to admit through it a restricted flow of fluid, and an actuating-arm, substantially as described, and for the purpose set forth.

2. In a fluid speed-regulator, the combination of the cylinder A, having a lateral opening, B, with passages for conducting the fluid from one side of the piston to the other, and the piston C C', having automatic valves $V' V^2$, substantially as described, and for the purpose set forth.

396,951. REVOLVING PHOTOMETER-STAND. JAMES W. PACKARD, New York, N. Y. Filed May 19, 1888. Serial No. 274,435. (No model.)



Claim.—1. A revolving photometer-stand which has the following parts in combination: two revolving arms, each of which carries a socket for an electric lamp, a set of two contact-pieces on each arm and connections between the contact-pieces and the electrodes of the lamp-socket, together with a standard which has two stationary contact-pieces insulated one from the other and corresponding to the sets of contact-pieces on the revolving arms, which stationary contact-pieces form the terminals of an external electric circuit, substantially as described.

2. A revolving photometer-stand which has the following parts in combination: two revolving arms, each of which carries a socket for an electric lamp, a set of two contact-pieces on each arm, and connections between these contact-pieces and the electrodes of the lamp-socket, together with a standard which has two stationary contact-pieces insulated one from the other and corresponding to the sets of the contact-pieces on the revolving arms, and a spring-clip for locking the revolving arms in one position when the stationary contact-pieces touch any one of the revolving sets of contact-pieces, substantially as described.

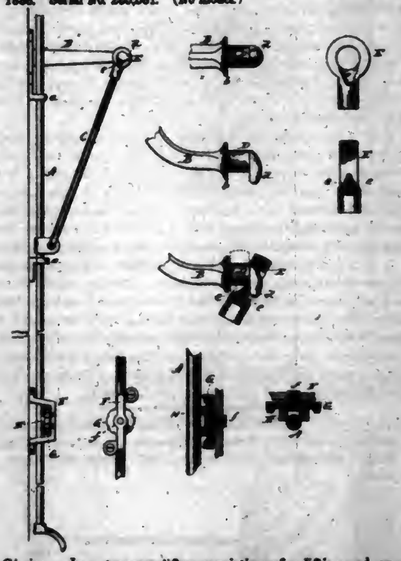
3. The combination, in a photometer, of the stationary standard lamp, the sliding gage, and the revolving photometer-stand, which has sockets for two lamps, whereby while one lamp is being calibrated a second lamp may be removed and a third substituted in its place, substantially as described.

4. The combination, in a photometer, of the stationary standard lamp, the sliding gage, and the revolving photometer-stand, which has sockets for two lamps and electric connections for the same, whereby while one lamp is being calibrated a second lamp may be removed and a third substituted in its place, substantially as described.

396,952. MILLING-MACHINE. JAMES W. PACKARD, New York, N. Y. Filed Sept. 11, 1886. Serial No. 213,124. (No model.)

Claim.—1. In a work-clamping device, the combination of the main frame, the reciprocating table, and the L-shaped clamps, which operate in conjunction with the table and are attached to the main frame by a spring-connection, substantially as described.

2. In a work-clamping device, the combination of the main frame, the vertically-reciprocating table, the vertically-acting clamp, which operates in conjunction with the table and has a restricted movement within guides upon said table, and the spring, one end of which is attached to the clamp, while the other is attached to the main frame, substantially as described.



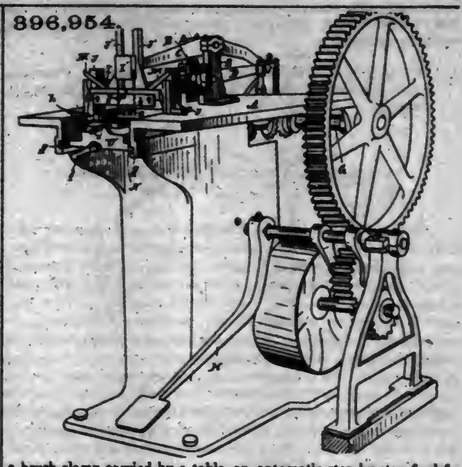
3. In a work-clamping device, the combination of the table with a raised ledge, the lever pivoted to the table, the two-pronged clamp, which is pivoted on the lever and acts in conjunction with the raised ledge, and the spring which is mounted upon the lever and holds the pivoted two-pronged clamp flexibly in its position, substantially as described.

4. In a work clamping device, the combination of the table with a raised ledge, the lever pivoted to the table, a spring which throws the lever away from the raised ledge, the two-pronged clamp, which is pivoted on the lever and acts in conjunction with the raised ledge, and a second spring, which is mounted upon the lever and holds the pivoted two-pronged clamp flexibly in its position, substantially as described.

5. In a work-clamping device, the combination of the main frame, the reciprocating table, and the clamps which slide in guides upon the table and are spring-pressed against the table when it is at or near one extreme of its adjustment, while they are automatically raised from the table when it is at other positions of its adjustment, substantially as described.

6. The combination, with a reciprocating slide and a main frame, of a fine-threaded adjusting-screw, which is attached to the slide and which abuts against a suitable portion of the main frame, together with a coarse-threaded adjusting-screw, which is attached to the slide only and also abuts against a suitable portion of the main frame, substantially as described.

396,953. TRANSOM-LIFTER. ALBERT A. PAGE, New Haven, Conn., assignor to Sargent & Company, same place. Filed Sept. 17, 1888. Serial No. 285,561. (No model.)



Claim.—In a transom-lifter consisting of a lifting-rod, an arm attached to the transom, and a connecting-rod hung to said lifting-rod and to the outer end of the said arm, the said arm constructed with a trunnion, D, projecting from a shoulder on the arm, and the trunnion constructed with a lateral projection, *d*, upon one side, distant from said shoulder corresponding to the thickness of the head of the rod, with the head of the rod constructed with an opening through it corresponding in diameter to the said trunnion, the face of the head recessed from its opening outward to a point out of line with the said projection *d* on the trunnion when the two parts are set together, substantially as specified, and whereby because of said recess in the head and the said lateral projection on the trunnion the said head may be removably set onto the trunnion over said projection.

396,954. BRUSH-MACHINE. EDWARDS W. PORTER, Detroit, Mich., assignor to the Detroit Patent Brush Company, same place. Filed Dec. 1, 1886. Serial No. 220,264. (No model.)

Claim.—1. In a brush-machine, the combination of the following elements: a clamp for holding and supporting the brush-block in operation, vertically-actuated staple-drivers, horizontally-actuated staple-drivers, automatic staple-feeds for the staple-drivers, and a reciprocating cross-head adapted to carry a detachable follower, all arranged to set and staple-fasten by their joint intermittent action a row of bristles, together with a longitudinal wire, into a longitudinal groove of the brush-block, substantially as described.

2. In a brush-machine, the combination of the following elements:

a brush-clamp carried by a table, an automatic step-by-step feed for said table, vertical staple-drivers, horizontal staple-drivers, automatic staple-feeds for the staple-drivers, and a vertically-reciprocating cross-head adapted to carry a detachable follower, all arranged to set a row of bristles, together with a longitudinal wire which holds said bristles, into each longitudinal groove of the brush-block and staple-fasten the wire, substantially as described.

3. In a brush-machine, the combination of a sliding table secured in a recess of the frame of the machine, of an automatic step-by-step feed for said table, of a clamp for clamping a brush-block upon said table, of two staple-drivers arranged to operate laterally against the opposite ends of the brush-block, of a cross-head carrying a detachable follower and arranged to operate vertically against the top of the brush-block, and of two staple-drivers carried by a second cross-head and arranged to operate vertically against the top of the brush-block through passages provided for the follower and in the cross-head which carries the follower, substantially as and for the purposes described.

4. In a brush-machine, the combination of the sliding table U, which carries the brush-block, the hinged stop *z*, secured to said table, the shaft *t*, the circular stops *u*, having notches *v* and guard-fingers *w*, and the tension-springs *s*, all arranged and operated to form a step-by-step feed, substantially as described.

5. In a brush-machine, the sliding table U, carrying the stationary jaw *h*, with adjusting-screw *i*, the hinged jaw *h'*, the removable bottom plate, *h''*, and the cam-lever *j*, for operating the movable jaw, all arranged to form an adjustable clamp for the brush-block, substantially as described.

6. In a brush-machine, the combination, with the staple-drivers *a* and the cross-head I, having the passages *a'*, of the follower L, having the passages *d*, substantially as described.

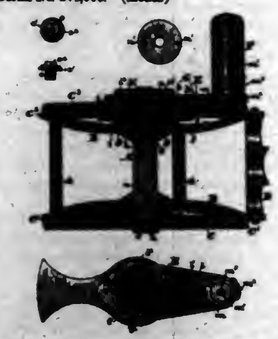
7. The staple-holder T, consisting of an outer and inner shell formed with cross-bars and hooks and detachably secured together thereby, and forming a space, *n*, between their respective walls to hold the staples, substantially as described.

8. The combination of the guide-block P, having the horizontal aperture *k*, T-shaped in cross-section, the staple-holder T, detachably secured to the said guide-block and having the vertical space *n*, for holding the staples, and the staple-driver Q, of corresponding cross-section with the aperture *k* in the guide-block and adapted to work therein, substantially as described.

9. In a brush-machine, the combination of the stationary table or frame, a movable table supported in a recess of the frame and adapted to carry the brush-head, horizontally-apertured guide-blocks secured in lateral recesses in the frame upon opposite sides of the movable table, horizontally-movable staple-drivers adapted to work through apertures in the guide-blocks, staple-holders adapted to feed the staples by gravity into the apertures of the guide-blocks, a cross-head movably secured in vertical guides above the movable table, vertical staple-drivers arranged to work through vertical apertures in the cross-head, inclined rails carried by the cross-head and arranged to hold and feed staples by gravity into the vertical apertures of the cross-head, a follower and means for detachably securing it to the cross-head, passages through the follower through which the vertical staple-drivers work, and means for imparting a concerted intermittent movement to the staple-drivers and to the follower, substantially as described.

10. The combination of the apertured guide-blocks P, having the vertical notches *r*, and the staple-drivers Q, T-shaped in cross-section

and adapted to work through the apertures of the guide-blocks, substantially as described.



396,955. PNEUMATIC ACTION FOR ORGANS. FREDERICK PETTINARD, Meriden, Conn. Filed Apr. 30, 1888. Serial No. 272,265. (No model.)

Claim.—1. In an orguinette, the combination of pneumatic operators corresponding to each sound-producing device, the said operator consisting of a plate, *d*, hinged at one end, a flexible connection around said plate, with the adjacent surface on which said plate is supported, so as to form a bellows-like chamber, air-inlet passages G, opening to the said operators, each passage terminating in an aperture, *h*, opening to the atmosphere, an exhaust-chamber, a passage, *l*, between said exhaust-chamber and operator, the opening to said passage *l* into the operator being of no greater area than the area of the aperture *h*, a connection from said operators with the respective sound-producing devices, and a flexible strip adapted to move over said apertures *h*, the said strip having series of openings in line with said apertures, the closed spaces between said openings corresponding to the length of the note or sound to be produced, the openings between the said closed spaces corresponding to the time required between the sounding of corresponding notes, substantially as described.

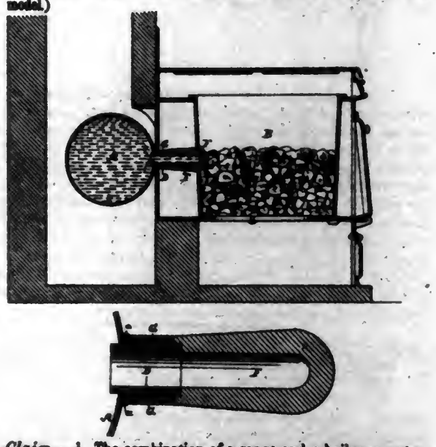
2. In an orguinette having a series of openings corresponding to the respective reeds of the instrument, and having pneumatic operators between the said openings and the said reeds adapted to operate said reeds when said openings are closed, the combination therewith of an operating-strip adapted to be moved over said openings, and the said strip constructed with lines of perforations corresponding to the respective openings over which the strip is adapted to run, the said lines consisting of a series of perforations alternating with closed or solid spaces, the length of the said solid spaces corresponding to the length of note required, and the length of the series of perforations between said solid spaces corresponding to the length of time required between such notes, substantially as and for the purpose described.

396,956. FISHING-REEL. GEORGE W. PROUTY, Boston, Mass., assignor of one-half to Richard O. Harding, same place. Filed Apr. 26, 1888. Serial No. 271,906. (Model.)

Claim.—1. In a fishing-reel, the combination of the supporting-frame, a spool provided with journals revoluble in bearings in said frame, a handle so mounted upon one of said journals as to be revoluble thereon, and a washer so interposed between said handle and said spool as to create a friction between the same, in order that said spool may be rotated in one direction by said handle for the purpose of winding up the line, while it may be rotated in the opposite direction without turning said handle when the strain upon the line overcomes the friction between said washer and said handle and spool.

2. In a fishing-reel, the combination of the supporting-frame, a spool provided with journals revoluble in bearings in said frame, a handle so mounted upon one of said journals as to be revoluble thereon, a washer so interposed between said handle and said spool as to create a friction between the same, in order that said spool may be rotated in one direction by said handle for the purpose of winding up the line, while it may be rotated in the opposite direction without turning said handle when the strain upon the line overcomes the friction between said washer and said handle and spool, and a sliding bolt for positively locking said spool and handle when desired to prevent either from being revolved independently of the other.

3. In a fishing-reel, the combination of the supporting-frame, a spool provided with journals revoluble in bearings in said frame, a handle so mounted upon one of said journals as to be revoluble thereon, a washer interposed between said handle and said spool for the purpose of creating a friction between the same, a sliding bolt located in a recess in said handle, a slot or notch in the hub of said spool, with which said bolt is adapted to engage to positively lock said spool and handle together, a spring for moving said bolt in one direction, a bell-crank lever one arm of which engages with said bolt, and a milled thumb-piece for operating said lever to move said bolt in the opposite direction, which thumb-piece is so located that it may readily be operated by the angler's hand while turning the handle.



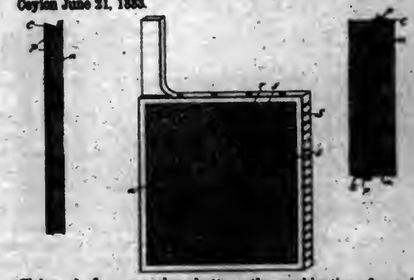
4. In a fishing-reel, the combination of the supporting-frame, a spool provided with journals revoluble in bearings in said frame, a handle so mounted upon one of said journals as to be revoluble thereon, a washer interposed between said handle and said spool for the purpose of creating a friction between the same, a sliding bolt secured to said handle, a slot or notch in the hub of said spool, with which said bolt is adapted to engage to positively lock said handle and spool together, a bell-crank lever one arm of which engages with said bolt, a disk secured to said handle and provided with a lateral projection, which engages with said lever to release said bolt from said slot or notch in the hub of the spool, and a spring adapted to press said bolt into engagement with said slot when it has been released from engagement with said lateral projection.

5. In a fishing-reel, the combination of the supporting-frame, a spool provided with journals revoluble in bearings in said frame, a cup-shaped piece secured to the end of one of said journals, a washer located within said cup-shaped piece, and a handle for rotating said spool, so mounted that a portion of its inner side will be pressed or held in close contact with said washer, thus creating a friction between the same, so that said spool will be rotated when said handle is turned in order to wind up the line, but will be revolved in the opposite direction when the strain upon the line is sufficient to overcome the friction between said handle and washer.

6. In a fishing-reel, the combination of the supporting-frame, a spool provided with journals revoluble in bearings in said frame, a cup-shaped piece secured to the end of one of said journals, a washer located within said cup-shaped piece, a handle for operating said spool, a disk secured to the axis of said handle and rotating therewith with one surface in contact with said washer, and a screw for adjusting said disk toward or from said washer to regulate the friction.

7. In a fishing-reel, the combination of the supporting-frame, a spool provided with journals revoluble in bearings in said frame, a cup-shaped piece secured to the end of one of said journals, a washer located within said cup-shaped piece, a handle for operating said spool and provided with an inwardly-projecting hollow hub which incloses said cup-shaped piece, an inwardly-projecting flange to said hub, and a washer located between said inwardly-projecting flange of the handle and the under side of said cup-shaped end piece.

396,957. RANGE-BOILER. THOMAS W. REES, Philadelphia, Pa., assignor of one-half to Thomas W. Snowden and Richard T. Stockman, both of same place. Filed Dec. 12, 1887. Serial No. 257,649. (No model.)



Claim.—1. The combination of a range and a boiler or water-heater located within the structure of the range and fixedly set in respect to the fire-pot of the same, with a plug having a screw-connection with the shell of the boiler and having a closed outer end which projects to or into the fire-pot of the range, all substantially as specified.

2. The combination of a range and a boiler or water-heater located within the structure of the range and fixedly set in respect to the fire-pot of the same, with a nipple screwed directly into the shell of the boiler and projecting therefrom, a hollow plug screwed onto said nipple and projecting into the fire-pot of the range, and a packing-ring for preventing leakage at the shell of the boiler, all substantially as specified.

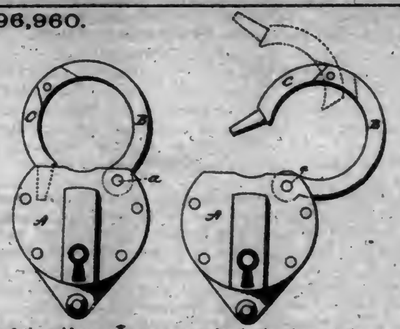
3. The combination of a range and a boiler or water-heater located within the structure of the range and fixedly set in respect to the fire-pot of the same, with a nipple screwed into and projecting from the shell of the boiler, a hollow plug screwed onto the outer end of the nipple and projecting into the fire-pot of the range, and a collar and packing interposed between the said plug and the shell of the boiler, all substantially as specified.

396,958. SECONDARY BATTERY. JOHN S. SELLON, Hatton Garden, County of Middlesex, England, assignor to the Electrical Accumulator Company, of New York. Filed Apr. 26, 1887. Serial No. 236,206. (No model.) Patented in England Sept. 15, 1881, No. 3,967; in India Aug. 23, 1883, No. 963; in Argentine Republic Nov. 21, 1883, No. 354; in British Guiana Dec. 11, 1883, No. 197/3,155; in Mexico Jan. 27, 1883; in Canada Mar. 15, 1883, No. 16,490; in Straits Settlements Apr. 26, 1883, No. 25; in Chili June 8, 1883; in Brazil June 15, 1883, No. 53, and in Ceylon June 21, 1883.

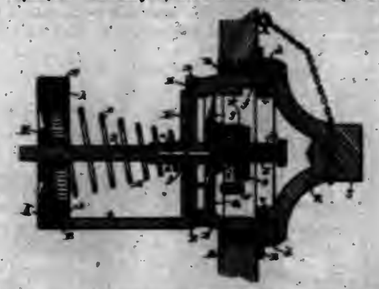
Claim.—1. In a secondary battery, the combination of a positive element containing lead and antimony combined with an oxide of lead, and a negative element containing lead and antimony combined with an oxide of lead, substantially as described.

2. In a secondary battery, a plate, element, or support containing lead and antimony, in combination with an active material.

3. In a secondary battery, a perforated plate, element, or support composed of lead and antimony, to, in, or upon which is applied an active material.



396,959. WATER-CLOSET BASIN. JOHN SHANKS, Barrhead, County of Renfrew, Scotland. Filed May 15, 1888. Serial No. 273,977. (No model.) Patented in England Dec. 12, 1885, No. 15,255.



Claim.—A water-closet basin having combined in it a main discharge-outlet at the side leading down into a trap-bend passage below the basin, a concave basin-bottom dipping a little lower than the bottom edge of the main outlet, an upper water-flushing inlet, a hollow slit distributing-rim; a lower water-flushing inlet facing the main discharge-outlet and at the level of the water retained in the basin-bottom, a passage leading to the lower flushing-inlet directly from the horn to which the water-supply pipe is connected, and an after-service pocket with a top opening to receive water from the flushing-stream and with a small bottom orifice or inlet into the basin, the said several parts being all made in one piece, and substantially as herein set forth.

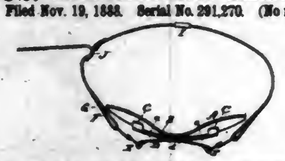
396,960. PADLOCK. HORACE P. SIMS, New York, N. Y., assignor to the Burnes Manufacturing Company, New Haven, Conn. Filed Oct. 15, 1888. Serial No. 288,122. (No model.)

Claim.—In a padlock, a shackle made in two parts, one part hinged by one end to the case, and the second part hinged to the other end of the said one part, so as to swing in the plane of the shackle, the free end of the said second part constructed to engage the mechanism of the lock, substantially as described.

396,961. AUTOMATIC STOP-VALVE BUNG. LEVI F. SMITH, Philadelphia, Pa. Filed May 21, 1888. Serial No. 274,484. (No model.)

Claim.—1. In a stop-valve bung, the combination of the cylindrical shell screw-threaded exteriorly at one end and screw-threaded interiorly at both ends, and having a semi-annular partition, an annular valve-seat at one end, with a valve and a valve-stem carrying said valve and having one end playing through an opening in said partition and screw-threaded, and having its other end playing through a screw-threaded disk in the lower end of the shell, a coiled spring for operating said valve, and the nut on the threaded end of the stem, all constructed and arranged substantially in the manner and for the purpose described.

2. The combination of the shell, its valve-seat, and valve having a valve-stem bored longitudinally to establish communication through the bung when the valve is closed, and having lateral openings communicating with the bore at opposite sides of the valve, with a screw-plug, M, for closing said bore and cutting off communication therethrough, substantially in the manner and for the purpose described.

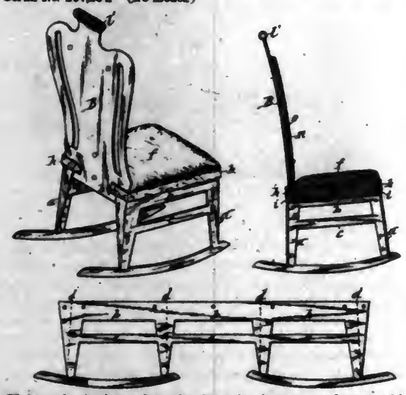


3. The combination of a shell having an annular valve-seat, and a spring-actuated valve, with a valve-stem carrying said valve, having a central bore and openings communicating therewith on opposite sides of the valve, a screw-plug in the outer end of said stem for closing communication through its bore, and a nut on said stem for regulating the movement of the valve, all constructed and arranged substantially in the manner and for the purpose described.

4. In a stop-valve bung, the combination of the shell D, having internal partitions, G, an annular valve-seat below said partition, and an interiorly screw-threaded ring, E, at its opposite end, with the valve I, valve-stem J, nut O, disk K, exteriorly screw-threaded, and spring L, all constructed and arranged substantially in the manner and for the purpose described.

5. The herein-described stop-valve bung, consisting of a cylindrical exteriorly-screw-threaded shell formed with a transverse perforated partition near its outer end, and an annular valve-seat at the inner side of said partition, in combination with a valve-stem, J, carrying a valve, I, and playing through a central opening in said partition and through an opening in a disk, K, secured in the inner end of the shell, the conical spring controlling said valve, and the setting-nut O on the end of the valve-stem outside the said partition, substantially as and for the purpose set forth.

6. The combination of the flanged exteriorly and interiorly screw-threaded bushing B with the stop-valve bung having an exteriorly-threaded portion engaging said bushing, and a perforated partition, G, valve-seat H, a spring-actuated valve, I, its stem J, having bore *j* and openings N *n*, the nut O, and plug M, and key Q, all constructed and arranged to operate as and for the purpose described.



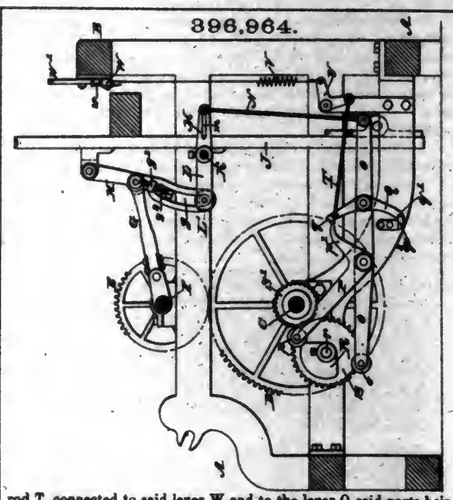
396,962. ABDOMINAL SUPPORTER. BELA ST. JOHN, Torrington, Conn. Filed Nov. 19, 1888. Serial No. 291,270. (No model.)

Claim.—1. In an abdominal supporter, the combination of the pad A, made from leather or other flexible material, combined with the horizontal elastic metal bar B, secured to the pad and provided with vertical springs C, pivoted to its respective ends, the horizontal spring D, fixed to the bar B, and straps adjustably connected to the respective ends of said spring D and adapted to pass around the body, whereby the said pad is secured, substantially as described.

2. The combination of the perforated flexible pad A, the horizontal metal bar B, secured to the pad, vertical springs C at each end of the said bar B, the horizontal springs D, fixed to the said bar B, the straps F G, formed from a single strap, adjustably connected to the respective ends of the said spring D, the said straps connected with a vertical stay, I, at the back, substantially as described.

396,963. TOY FURNITURE. GARDNER H. STONE, Syracuse, N. Y., assignor of one-half to Frank A. Hale, same place. Filed Mar. 15, 1888. Serial No. 267,234. (No model.)

Claim.—1. A piece of toy furniture having its top frame and legs formed of a sheet-metal blank consisting of the elongated straight strip *b b b*, the branches *a a a a*, extending from one of the longitudinal edges of said strip, and bars *c c c* between said branches, said blank being bent approximately at right angles to the plane of the blank on the lines *d d* through the branches *a a a a*, substantially as described and shown.



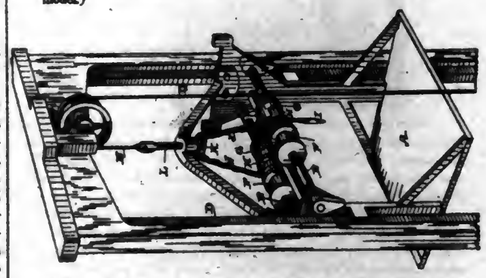
2. A piece of toy furniture composed of a wooden top plate, a frame formed of a blank of sheet metal encompassing the said top plate, cloth covering the wooden top plate and lapping over the exterior of the top portion of the metallic frame, a binding along the marginal portion of the cloth cover, and tacks or brads passing through the binding, underlying cloth, and metallic frame and into the wooden plate, substantially as described.

396,964. LOOM FOR WEAVING TERRY FABRICS. CHARLES STROBEL, Philadelphia, Pa. Filed Apr. 17, 1888. Serial No. 271,000. (No model.)

Claim.—1. The combination of a frame, a driving-shaft journaled therein and having the gear-wheels D and S thereon, a crank-shaft with a gear-wheel meshing with said gear-wheel D, a pitman connected to the said crank-shaft, a lay with a pivoted link having a slotted lower end, the said pitman being pivotally connected to said link, a rock-shaft on the lay having an arm with a roller at one end working in the slot of said link, a second arm secured to the said rock-shaft, a terry-lever pivoted to the frame, a rod connecting said second arm and said terry-lever, the lever P, pivoted to the same stud as the terry-lever, the lever Q, pivoted to the terry-lever and adapted to engage the lever P, and a rotary shaft with a cam adapted to operate the said levers O and P, substantially as described.

2. The pivoted terry-lever O, the lever Q, pivoted to said lever O and having a notched end, the lever P, pivoted on the same stud with the terry-lever and having the nose *p'*, the cam R, adapted to operate the said lever P, the frame A, with the breast-beam B, the levers W W', pivoted to the said beam, the spring V, the elbow-lever U, and

396,964.

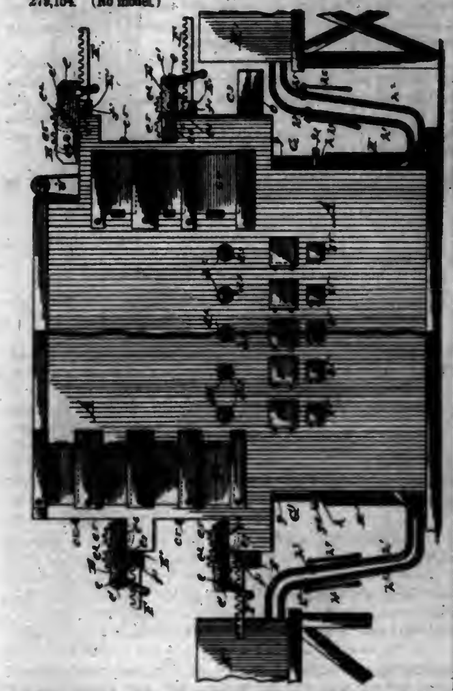


rod T, connected to said lever W and to the lever Q, said parts being combined substantially as described.

3. A loom having a breast-beam and a lay, the lever W, with recessed end, and lever W', with nose or hook end, said levers being pivoted to said beam, a slotted link pivotally connected to said lay, a crank-shaft with pitman connected to said link, a rock-shaft with an arm having a roller working in said slotted link, a terry-lever pivotally secured to the frame of the loom, a rod and arm connecting said terry-lever with the said rock-shaft, a lever pivoted on said terry-lever having a notched lower, a rod, elbow-lever, and spring connecting said lever W with said arm on the terry-lever, a rotary shaft with cam thereon, and a lug secured to the frame adapted to engage the notched lower end of said arm on terry-lever, said parts being combined substantially as and for the purpose described.

4. A loom with a driving-shaft and having the terry-lever O pivotally attached to the frame thereof, the lever P, having the same pivotal stud as the said terry-lever, the lever Q, pivoted to the terry-lever and having an end adapted to engage the end of the lever P, a rotary shaft having the cam R, a lay having the pivoted slotted link H, a crank-shaft with pitman connected with said link, a rock-shaft with an arm having a roller working in said slot, and an arm connected by a rod to said terry-lever.

5. A loom having a driving-shaft, a lay with the slotted pivoted link H, a crank-shaft with pitman connected to said link, the pivoted terry-lever O, a rock-shaft having an arm with a roller working in the slot of said link, and an arm connected by a rod to the said terry-lever, the lever P, with nose *p'*, the shaft *r*, with cam R thereon, the lever Q, with notched end *q*, the breast-beam B, with cossting levers W W', and a spring, elbow-lever, and rod connecting said lever W with the upper part of arm Q, said parts being combined substantially as and for the purpose described.



396,965. ELEVATOR SAFETY ATTACHMENT. PHILIP R. SULLIVAN, Tuscarora, Nev. Filed Sept. 5, 1888. Serial No. 284,674. (No model.)

Claim.—The horizontal shafts journaled upon the hoisting or elevator cage, having the cams fixed to the outer ends, so as to engage the guides within which the cage travels, springs acting to rotate the shafts, so as to force the cams into engagement with the guides, and pulleys around which suspending ropes or chains pass and connect with the cable to produce a tension in the opposite direction from that of the springs, in combination with clutch-sections sliding upon feath-

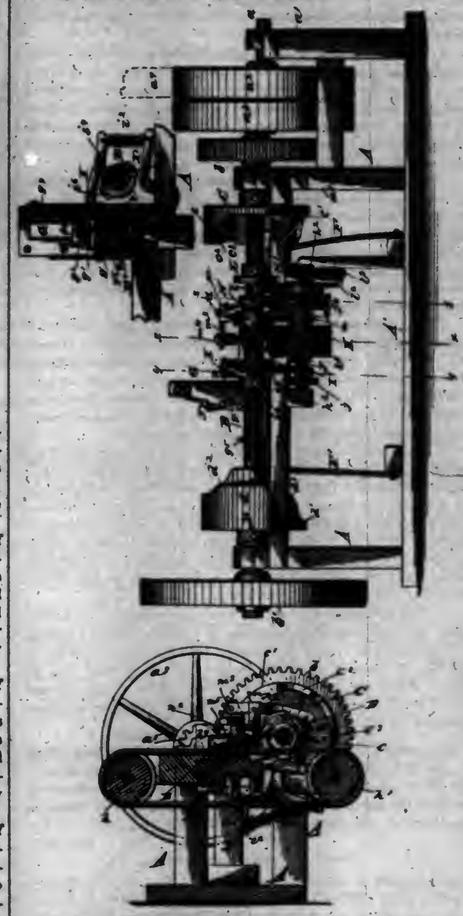
ers upon the shafts and engaging the suspending-pulleys, and a lever by which the clutch is disengaged, so as to allow the springs to act and throw the cams into engagement with the guides, substantially as and for the purpose herein described.

396,966. BRICK-KILN. JOHN TABER, South Wolfborough, N. H., assignor to himself, William Emery, Alfred, Me., and George M. Stearns, Boston, Mass. Filed May 11, 1886. Renewed July 5, 1888. Serial No. 279,154. (No model.)

Claim.—1. In a kiln to burn brick or other articles, the combination of the fire-boxes, the parallel heating-chambers successively approximating the same, but not receiving any of the flame or products of combustion therefrom, and mechanism, substantially as described, whereby the bricks are brought continuously nearer and nearer the fire-boxes and then discharged from the kiln.

2. In a kiln to burn brick or other articles, the combination of the fire-boxes, the parallel heating-chambers successively approximating the same, the racks, gearing, and crank-axles by which the pans bearing the brick are successively moved into the chambers, and mechanism, substantially as described, whereby the pans are lowered from the alternate ends of the heating-chamber to the next lower chamber and brought continuously near the fire-boxes, substantially as specified.

3. In a kiln to burn brick or other articles, the combination of the fire-boxes, the parallel heating-chambers successively approximating the same, the racks, gearing, and crank-axles by which the pans bearing the brick are successively moved into the chambers, the frames reciprocating between the end walls of the kiln and the end walls of the heating-chambers and lowering the pans from one chamber to another, and mechanism, substantially as described, whereby said frames are actuated.



4. In a kiln to burn bricks or other articles, the combination of the fire-boxes, the parallel heating-chambers successively approximating the same, the racks, gearing, and crank-axles to move the brick-carrying pans into the chambers, the vertical reciprocating frames to lower said pans from each chamber to the next lower one, the vertical water-cylinders below said frames, the plungers or pistons moving therein and supporting the reciprocating frames, the reservoir situated sufficiently high above the cylinder, and the pipes k' k^9, connecting the reservoir and cylinders and controlled, respectively, by the valves k^3 k^9, substantially as specified.

5. In a brick-kiln, the combination of the fire-boxes, the parallel heating-chambers C C' C^3 C^9, successively approximating the same, the mechanism, substantially as described, to move the brick continuously through the chambers, and a casing, D, within the chamber C^9 and having around it the fire space or flue *d*, in which the flame and products of combustion of the fire-box penetrate, but not within the casing D, substantially as specified.

6. In a brick-kiln, the combination of the fire-boxes, the parallel heating-chambers successively approximating the same, the fire space or flue *d* in the lower chamber, C^9, the drying-chamber separated by the vertical wall A' from the kiln proper and the flues L, running through said wall A', and the valves *l*, by means of which heat can be admitted into the drying-chambers when the kiln is too hot, substantially as specified.

7. In a kiln for bricks or other articles, the combination of the fire-boxes, the parallel heating-chambers C C' C^3 C^9, all provided with the ways *c*, the pans *c'*, moving on said ways, the pans constructed, substantially as described, to cover the brick on said pans, the crank-axles, the gearing, and racks to move the pans into the chambers, and platforms *f*, on which the racks move, the vertically-reciprocating lowering-frames having upon them the sections of ways c^8 to receive the pans from the ways *c* of the heating-chambers, and mechanisms, substantially as described, to actuate said frames.

396,967. TILE OR BRICK PRESSING MACHINE. JOHN TABER, Wolfborough, N. H., assignor to himself, William Emery, Alfred, Me., and George M. Stearns, Boston, Mass. Filed Feb. 20, 1886. Renewed July 5, 1888. Serial No. 279,155. (No model.)

Claim.—1. The combination of the cam-shaft, the disks secured thereon and provided with cam-flanges, substantially as described, the feeding-frame, the plungers moving in ways on the main frame and actuated by the cam-flanges, the blank-delivering mechanism attached to the feeding-frame, constructed substantially as described and operated by a pin or lug on one of said plungers, the springs to retract the plungers, and mechanism, substantially as described, to rotate the cam-shaft.

2. The combination of the rotating cam-shaft, the disks secured thereon and provided with the cam-flanges, shaped as described, the

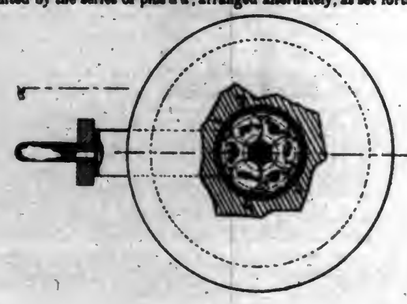
feeding-frame, the plungers moving in ways on the main frame and actuated by the cam-flanges, the blank-delivering mechanism attached to the feeding-frame, constructed substantially as described and actuated by a pin or lug on one of said plungers, the springs to retract the plungers, the belt running through the discharge-opening and carried by the end pulleys, and mechanism, substantially as described, whereby the belt is moved at proper intervals of time.

3. The combination of the rotating cam-shaft, the disks thereon provided with the cam-flanges shaped as described, the feeding-frame, the plungers moving in ways on the main frame and actuated by the cam-flanges, the springs to retract the plungers, the belt moving through the discharge-opening, the block m^4 and bar m^7, connected, respectively, with the pivoted levers M M', the spring m^3, connecting the rear ends of said levers, the collar N, secured to the cam-shaft and provided with the cam-lugs n' n, and mechanism, substantially as described, whereby the belt is moved at proper intervals of time.

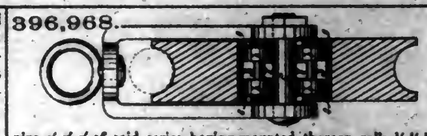
4. The combination of the rotating cam-shaft, the disks thereon provided with cam-flanges shaped substantially as described, the feeding-frame, the plungers moving in ways on the main frame and actuated by the cam-flanges, the springs to retract the plungers, the belt moving through the discharge-opening, the blocks i^7, provided with the pins i^3, the levers I I', the spring i^3, connecting the rear ends of said levers, the collar i^4 on the cam-shaft, provided with the cam-lugs i^5 i^6, and mechanism, substantially as described, whereby the belt is moved at proper intervals of time.

5. The combination of the rotating cam-shaft, the disk thereon provided with cam-flanges shaped substantially as described, the plungers actuated by said cam-flanges, the feeding-frame, the oscillating shaft g, the rod g', passing therethrough, the pin g^2, entering the feeding-frame to support a brick therein, and the lug g^3 on the plunger E, adapted to strike against the rod g' when the plunger moves inward and draw the pin g^2 outward, substantially as specified.

6. The combination, with the rotating cam-shaft, the cam-disk, the plungers actuated thereby, and the belt H, passing over the pulleys h h', of the shaft J, ratchet j, controlled by the spring-pawl j', the disk j^3, turning loosely on said shaft, the ratchet-wheel j^2, controlled by the spring-pawl j^3, the pivoted T-shaped lever K, link-bar k, the spring j^5, the collar L, secured to the cam-shaft, and the roller l', attached to said collar and acting on the lever K, all constructed substantially as and for the purpose specified.



7. The combination of the rotating cam-shaft, the disks secured thereon and provided with cam-flanges shaped substantially as specified, the feeding-frame, the blank-delivering mechanism attached thereto, constructed substantially as described, and actuated by a pin or lug on one of the plungers, and the plungers actuated by the cam-flanges and having their ends adapted to have secured to them removable and interchangeable dies, substantially as specified.

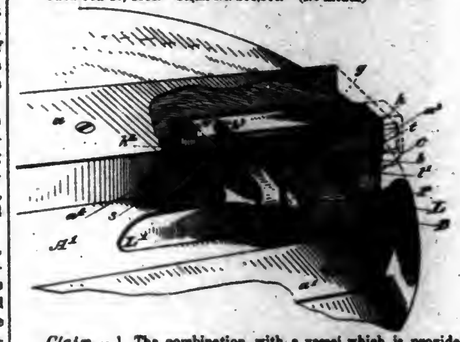


8. The combination of the shaft a, carrying the pulleys a^3 a^5 and the pinion a^6, the cam-shaft B, having upon it the cam-disks C and D, shaped substantially as specified, and the gear-wheel b, meshing with the pinion a^6, the plungers moving in ways on the main frame and actuated by the cam-disks, the belt moving at regular intervals of time through the discharge-opening of the machine, the blank-delivering mechanism, constructed substantially as described, attached to the feeding-frame and actuated by a pin or lug on the plunger E, and mechanism, substantially as described, to actuate said belt.

9. The combination of the reciprocating plungers, the feeding-frame, the automatic blank-delivering mechanism attached thereto, the belt moving at regular intervals of time through the discharge-opening, the rotating cam-shaft, the cam-disk C, provided with the flange c, having the inclined portion c^2 and notches c^3, and the cam-disk D, provided with the flange d, having the inclined portion d^2 and notches d^2, substantially as specified.

396,968. ANTI-FRICTION BEARING. ALFRED W. TERRY, Brooklyn, N. Y. Filed Nov. 3, 1888. Serial No. 289,869. (No model.)

Claim.—1. An anti-friction bearing consisting of the rings A A', united by the series of pins a a', arranged alternately, as set forth, the



pins a' a' a' of said series having mounted thereon rolls b' b' b', and the remaining pins a a a having mounted thereon rolls b b, each roll b' passing between two of the rolls b b on either side of the same, substantially as and for the purpose described.

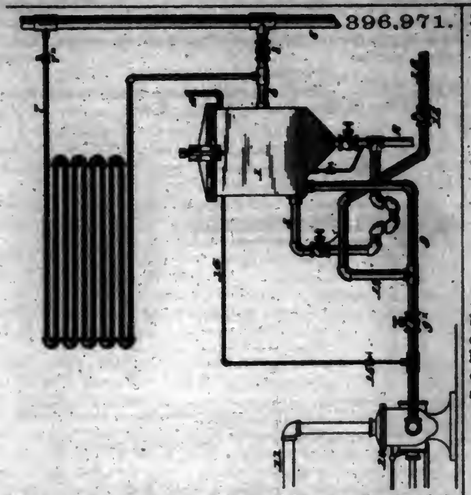
2. In an anti-friction bearing, the combination of the rings A A', the series of pins a a', arranged alternately, as set forth, the rolls b b, arranged in pairs, one pair on each of the pins a a a, and the rolls b' b' b', one on each of the pins a' a' a', each roll b' passing between the rolls b b of each of the two pairs on each side of the same, substantially as and for the purpose described.

396,969. BUTTER-TUB. LYMAN K. TEWKSBURY, Brooklyn, Pa. Filed Oct. 17, 1888. Serial No. 288,300. (No model.)

Claim.—1. The combination, with a vessel which is provided with a catch or recess, of a lid which rests upon such vessel, and which is provided with a slidable hook and with a pivoted spring-actuated lever which is in engagement with the slidable hook, the spring operating through the lever to move the hook inwardly into engagement with the recess in the vessel and to maintain it in such engagement.

2. The combination, with a vessel which is provided with two oppositely-placed catches or recesses, of a lid which rests upon such vessel, and which is provided upon one side with a fixed engaging-hook, and which is provided upon the opposite side with a slidable hook and with a pivoted spring-actuated lever which is in engagement with the slidable hook, the spring operating through the lever to move the hook from without inwardly into engagement with the recess in the vessel and to maintain it in such engagement.

396,970. WRENCH. JOHN VAN AUSDALL, Keokuk, Iowa. Filed Nov. 8, 1886. Serial No. 218,341. (Model.)



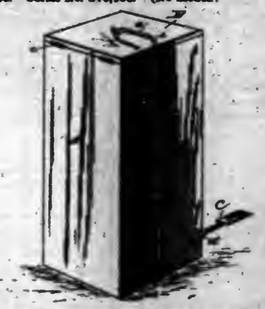
Claim.—The improved wrench herein described, consisting of the single bar of metal bent at one end to form the diverging jaws B C, the portion C being prolonged to form the lever-handle A, and the portion B carrying the movable serrated plate E, all substantially as shown and set forth.

396,971. FEED-WATER HEATER AND PURIFIER. WARREN WEBSTER, Philadelphia, Pa. Filed Sept. 13, 1888. Serial No. 285,227. (No model.)

Claim.—1. In a feed-water heater and purifier, the combination of a tank or receiver, a steam-supply pipe, a supply-pipe leading from the tank or receiver to a pump, and an air-outlet pipe leading from the tank or receiver to the supply-pipe, whereby the action of the pump draws the water and air from the tank or receiver and draws steam into the tank or receiver, substantially in the manner and for the purpose described.

2. In a feed-water heater and purifier, the combination of a purifying and heating chamber, a steam-supply pipe, a supply-pipe, a pump communicating with the delivery-pipe, and an overflow branch pipe communicating with the supply-pipe, substantially as and for the purpose described.

3. In a feed-water heater and purifier, the combination, with a

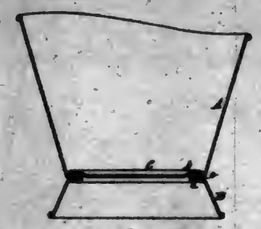


tank or receiver having means for supplying water thereto, of the steam-supply pipe having valves, a supply-pipe provided with a cock or valve, and a discharge-pipe leading from the tank or receiver to the supply-pipe, and provided with a valve, and a pump communicating with the supply, all arranged, combined, and operating substantially in the manner and for the purpose described.

4. In a feed-water heater and purifier, the combination of the tank or receiver, a supply-pipe leading therefrom, and a branch pipe communicating with the supply-pipe, and having a check-valve, substantially as described.

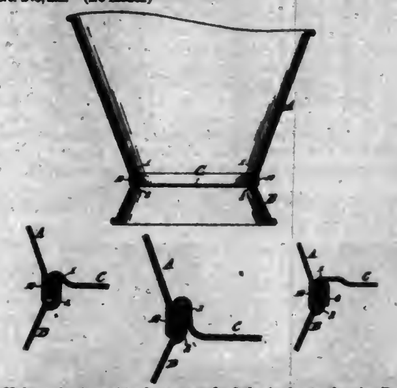
5. In a feed-water heater and purifier, the combination of the heating and purifying chamber, a supply-pipe leading therefrom provided with a valve, an air-outlet pipe provided with a valve and communicating with the heating and purifying chamber and the supply-pipe, and a pump communicating with the supply-pipe, all arranged, combined, and operating substantially in the manner and for the purpose described.

396,972. LID-RAISER. JAMES S. ALDERSON, Crescent Bay, Wash. Filed June 5, 1888. Serial No. 276,138. (No model.)



Claim.—In combination with the lid B, hinged to the receptacle, the rod c, extending alongside the receptacle, having a bent upper end attached to the lid, the treadle C, pivoted at d, and attached to the rod a at its lower end, and the eyebolt e, for guiding said rod in its up-and-down movement, substantially as described.

396,973. DEVICE FOR TWISTING FENCE-WIRE. WILLIAM S. BARKER, Troy, Ohio. Filed Nov. 26, 1888. Serial No. 291,533. (No model.)



Claim.—In a device for twisting fence-wire, the combination, with a plate having holes for the ends of the wire, of a nipple having spiral grooves, substantially as and for the purpose set forth.

396,974. COAL-HOD. EDWARD BARRATH, Cincinnati, Ohio, assignor to Victor R. Knecht, same place. Filed May 29, 1888. Serial No. 275,490. (No model.)

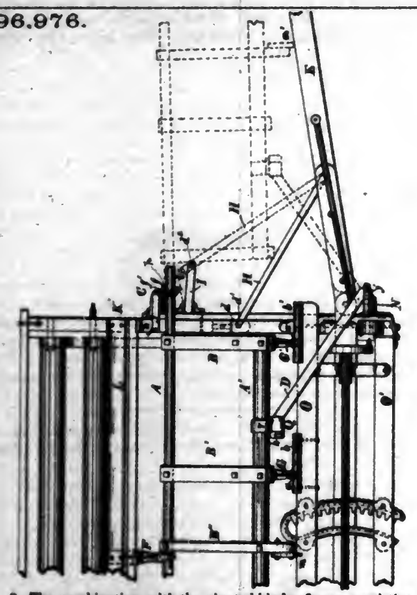
Claim.—A coal-hod or similar metallic vessel, consisting of the body A, the rim B, and the bottom C, each made out of a single piece of metal and united by a double-hooked seam formed of a double hook integral with one of the parts, into the two hooks of which double hook the other parts are respectively inserted and clamped, substantially as shown and described.

396,975. COAL-HOD. EDWARD BARRATH, Cincinnati, Ohio, assignor to Victor R. Knecht, same place. Filed May 29, 1888. Serial No. 275,492. (No model.)

Claim.—1. A coal-hod composed of the body A, the rim B, and the bottom C, united by hooked flanges with the flanges standing vertically or approximately so to the vertical axis of the hod, substantially as described.

2. A coal-hod composed of the body A, the rim B, and the bottom C, each formed of a separate piece, the bottom having a depending flange standing in a vertical plane, the body having an upward-projecting vertical hooked flange embracing the flange on the bottom, and the rim having a vertical flange clamped between a part of the bottom and the flange on the body, substantially as described.

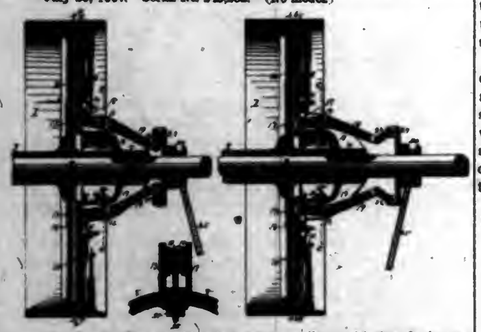
3. A coal-hod or similar vessel consisting of the body A, having its lower edge turned upward into a vertical hooked flange, the bottom C, having its edge turned downward into a vertical flange, and the rim B, having its upper edge extended around the hooked flange on the body, and, together with the flange on the bottom, clamped in position by said hooked flange, substantially as described.



4. A coal-hod consisting of the body A, having its lower edge bent inward and upward to form a vertical hooked flange, the bottom C, having its outer edge bent downward to form a depending vertical flange, which is clamped by the hooked flange on the body, and the base-rim B, having a vertical flange clamped between a part of the bottom and the vertical flange on the body, substantially as described.

396,976. GRAIN-BINDER. FREDERICK G. BECKER, Brockport, N. Y., assignor to D. S. Morgan & Company, same place. Filed May 11, 1888. Serial No. 201,230. (No model.)

Claim.—1. In a harvester-binder, the combination, with the main frame, the binder-frame, the tongue, and a tilting lever mounted on the main frame, of a link, H, pivoted to the tongue and separably connected with the tilting lever, and a bracket on the main frame adapted to receive the link when disconnected from the tilting lever, whereby the link may be caused to tilt the machine or lock it and the tongue rigidly together, substantially as described.



2. The combination, with the pivoted binder-frame, consisting of the rods A A' and braces B B' B'', of the collar c, flanges f f', and bracket J, substantially as described.

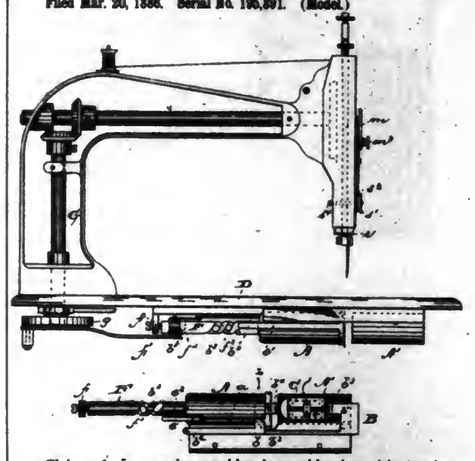
396,976.

3. The combination, with the pivoted binder-frame, consisting of the rods A A′ and braces B B′ B″, of the collar *c*, flanges *f f′*, bracket J, and pivoted supporting-brace D, substantially as described.

396,977. CLUTCH-PULLEY. EVANS BLAKE, Rockford, Ill. Filed July 25, 1887. Serial No. 245,232. (No model.)

Claim.—1. The combination, with a pulley, a friction device to move into and out of engagement with the pulley, a hub, and an operating-head, of a lever connecting the operating-head with the friction device, and an adjustable fulcrum to the lever, whereby the holding force of the friction mechanism is regulated, substantially as set forth.

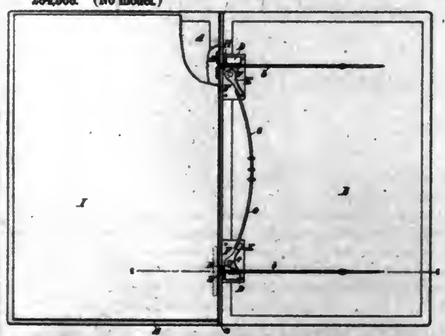
2. The combination, with a pulley, a hub, a friction-sector, and an operating sliding head, of a lever connected at one end with the friction-sector and its other end connected to the operating sliding head, and an adjustable fulcrum to the lever to regulate the holding force of the friction mechanism, substantially as and for the purpose set forth



3. The combination, with the pulley, the friction device, the sliding head, the thimble-support, and the thimble, of the lever connecting the friction-sectors and the sliding head, and a fulcrum to the lever, said fulcrum having a screw-connection with the thimble-support, said thimble capable of a rotary movement in its support to adjust the fulcrum, substantially as and for the purpose set forth.

396,978. VEHICLE-GEAR. CHARLES M. BLYDENBURGH, Riverhead, N. Y. Filed Apr. 9, 1888. Serial No. 270,101. (No model.)

Claim.—The combination, with the cranked axle, the spring, and the vertically-hanging link, of the spring-bearing having one partially-raised arm secured to the short portion of the axle, and the partially-raised arm secured to the bent portion of the axle, the said arms diverging above the bend of the axle and forming the interval *a*, substantially as specified.



396,979. SEWING-MACHINE. JACOB BOPPEL, Newark, N. J. Filed Mar. 20, 1886. Serial No. 195,891. (Model.)

Claim.—1. In a sewing-machine, in combination with a reciprocating needle, a tubular race, A A′, having an opening between the parts thereof, a reciprocating carriage having arms *b′ b²* extending toward said race, a spool-holder held between said arms, a driving-shaft, G, having a crank-wheel, *g*, connecting-rod *f′*, arm *f⁴*, link *b³*, connecting said arm with the carriage, a spirally-grooved bar, F, arranged at the end of the race and given an oscillating movement by the connecting-rod, and a looping-ring connected with the bar F and moving therewith, all said parts being arranged and adapted to operate substantially as and for the purposes set forth.

2. In a sewing-machine, the combination of a bed, D, a reciprocating needle, a race, A A′, having a needle-opening between its parts, a reciprocating spool-holder and a carriage to give movement to the same, a looping-ring working at said needle-opening and connected with and receiving motion from a spirally-grooved or slotted rod or shaft, F, a revolving plate, *g*, secured to the driving-shaft G, and a connecting-rod, *f′*, connecting said revolving plate and rod F, substantially as set forth.

396,980. BINDER. THEODORE F. BOURNE, Clifton, assignor to Ann L. Shipman's Sons, New York, N. Y. Filed Sept. 1, 1888. Serial No. 284,368. (No model.)

Claim.—1. In a binder, the combination, with a pair of covers and a cord or connection for holding papers, of a catch carried by said covers, said catch having a movable member and being adapted to grasp said cord, substantially as described.

2. In a binder, the combination, with a pair of covers and a cord or connection, *b*, of a head, D, and lever E, carried by one of the covers and adapted to grasp the cord between them, substantially as described.

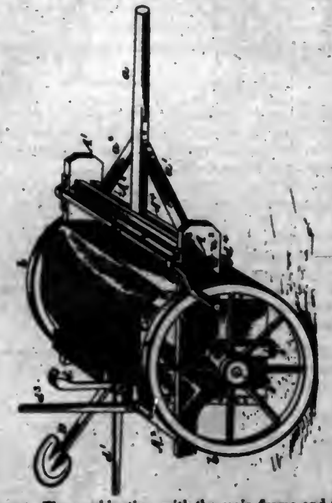
3. In a binder, the covers A B and a cord or connection, *b*, combined with a catch to grasp said cord and with a loop or eye to prevent raising of the cord from the catch, substantially as described.

4. In a binder, the covers A B and the cord or connection *b*, combined with the head D and spring-pressed lever E to grasp a cord, and with a loop or eye to prevent raising of the cord, substantially as described.

5. In a binder, the covers A B and cord or connection *b*, combined with a catch to grasp said cord, and with a plate, F, to support said catch, substantially as described.

6. In a binder, the covers A B and a cord or connection, *b*, combined with the plate F, head D, and spring-pressed lever E on said head, and with the loop or eye H, substantially as described.

7. In a binder, the covers A B and a cord or connection, *b*, combined with the head D and lever E, the meeting faces of said head and lever being serrated or toothed, substantially as described.



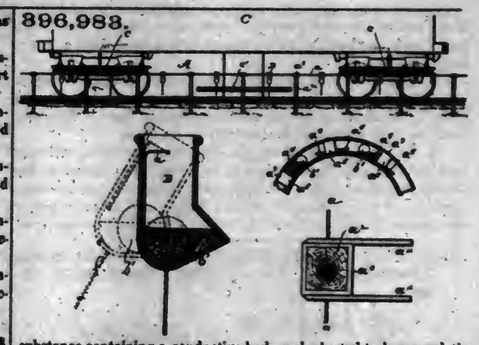
8. In a binder, the covers A B and a cord or connection, *b*, combined with the head D and lever E, said lever having a cam projection, *f*, substantially as described.

9. In a binder, the covers A B and a cord or connection, *b*, combined with the head D and lever E, said lever having a cam projection, *f*, and with a spring, G, substantially as described.

396,981. PROCESS OF DISINTEGRATING FIBROUS SUBSTANCES. ROBERT S. BOYCE, New York, N. Y. Filed Dec. 13, 1888. Serial No. 293,415. (No specimens.)

Claim.—The process of disintegrating fibrous substances, consisting of, first, breaking the straw; second, subjecting the fibers to the action of a boiling neutral soapy solution made by dissolving soap high in fatty matters in water; third, drying the fibers, and, fourth, subjecting the dried fibers to rolling and finishing, as herein described.

396,982. DUMPING-CART. JOHN CAMLE, Cable, Minn. Filed Apr. 11, 1888. Serial No. 270,260. (No model.)

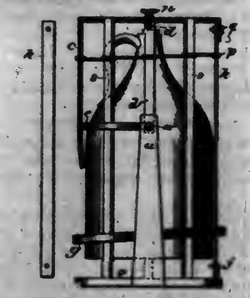


Claim.—1. The combination, with the main frame and the axle, bent as described, of a hopper resting on the axle and rigidly secured thereto, the axle being in the rear of the vertical central line of the hopper, and a hook pivoted to the frame and adapted to engage with the rear side of the hopper, substantially as specified.

2. The combination, with the main frame and supporting-wheels, of an axle bent as described, a hopper resting on the axle and rigidly secured thereto, the hopper being so constructed that it extends a greater distance above its axial line than below it, in order that when it is tilted in either direction the top edge of its front or rear side will come in contact with the ground and cause the wheels and frame to be lifted up and projected forward or backward, for the purpose specified.

3. The combination, with the main frame and supporting-wheels, of an axle bent as described, a hopper resting on the axle and rigidly secured thereto, the hopper being so constructed that it extends a greater distance above its axial line than below it, for the purpose specified, a shaft mounted in bearings on the front of the frame, and a chain attached to the rear side of the hopper near the bottom, and after passing under the hopper adapted to be wound on said shaft, substantially as and for the purpose set forth.

396,983. RAILWAY-TELEGRAPH. BAYLIS CADE, Louisburg, N. C. Filed Mar. 7, 1888. Serial No. 266,421. (No model.)



Claim.—1. A conductor of electricity or line, consisting of sections of insulated conductive substance sustained upon suitable supports, in combination with vessels, each vessel consisting of insulating substance containing a conductive body and adapted to be moved, the sections being connected by the vessels and having their ends passing into and fixed in the same, so as to form the support for said vessels, whereby movement of a vessel will throw the conductive body which it contains out of or into direct contact with the sections and thus break or make the circuit, substantially as described.

2. A conductor of electricity or line, consisting of sections of insulated conductive substance sustained upon suitable supports, in combination with vessels and with a movable structure, each vessel consisting of insulating substance containing a conductive body and adapted to be moved, the sections being connected by the vessels and having their ends passing into and fixed in the same, so as to form the support for said vessels, and the movable structure having a projection which comes into contact with and moves the vessels, substantially as described.

3. A conductor of electricity or line, consisting of sections of insulated conductive substance sustained upon suitable supports, in combination with vessels and with a movable structure, each vessel consisting of insulating substance containing a conductive body and adapted to be moved, the sections being connected by the vessels and having their ends passing into and fixed in the same, so as to form the support for said vessels, and the movable structure having a projection which comes into contact with and moves the vessels, and having conductors—such as brushes—for contact with the line, the projection on the movable structure being located between these conductors, substantially as described.

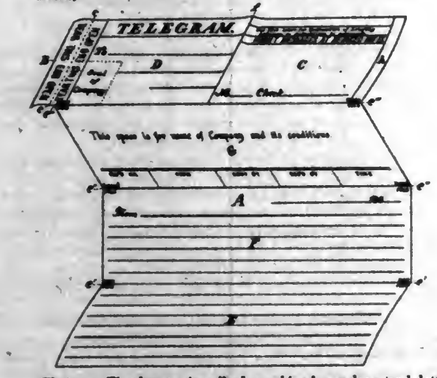
396,984. COMBINED JUG-HOLDING DEVICE AND SHIPPING-CASE. NORRIS S. CHANDLER, Springfield, Mass. Filed Mar. 9, 1888. Serial No. 266,782. (No model.)

Claim.—1. In a jug-holding device, the combination, with the supporting-frame, of a pivoted tilting rack composed, as shown, of angular irons *c* and *d*, bolted to each other and connected by means of bent piece *e*, and the angular piece *c*, having its uppermost end bent in to conform to the shape of the jug, substantially as described.

2. In a jug-holding device and shipping-case, the combination, with the base and standards *a*, of a reversible tilting rack pivoted thereto and a coupling means connecting the inverted rack and the base, whereby the jug-holding device becomes a shipping-case, substantially as described.

3. In a tilting rack and shipping-case, the combination, with the supporting-frame, of a bed-piece, a reversible rack adapted when reversed to contain a jug resting upon said bed-piece, and a coupling means connecting the frame and rack, substantially as described.

4. In a reversible rack and shipping-case, the combination, with the frame and a tilting rack pivoted thereto, of coupling-rod *k*, engaging said frame and rack and holding the rack in a reversed position, substantially as described.



5. In a tilting rack and shipping-case, the combination, with the

frame and rack pivoted thereto, of bent strip *g*, adapted to hold the jug in position when the device is used as a shipping-case, substantially as described.

6. In a tilting rack and shipping-case, the combination, with a supporting-frame, of a rack pivoted thereto, provided in its base with screw *n*, for engaging the stopple or uppermost part of the vessel when the rack is inverted, substantially as described.

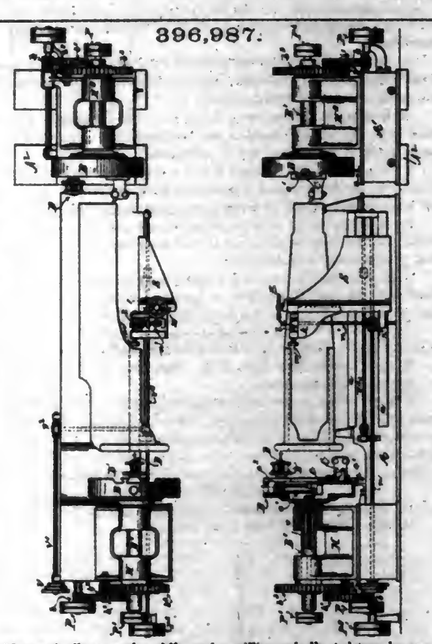
7. In a tilting rack and shipping-case, the combination, with the base and standards, the tilting rack, and bent strip secured to the standards adapted to inclose the jug when the device is used as a shipping-case, of staves arranged between the jug and holder, together with means for securing the staves in place, substantially as described.

396,985. COMBINED ENVELOPE AND LETTER-SHEET. CHARLES L. CHURCH, Bangor, Me. Filed Oct. 18, 1887. Serial No. 252,700. (No model.)

Claim.—The herein-described combined envelope and letter-sheet, consisting of the four longitudinal portions, the bottom portions E and F, being, when folded upon line *d*, face to face, the second portion, G, being folded upon line *d'*, with its face upon the back of part E, the top portion being folded upon line *d''*, with its face outward and back to back with part G and the folded sheet being then transversely folded upon line *f*, with the front face of said top portion outside, the latter portion having at one end the flap B, said sheet having spaces for the address and communication upon the same side, substantially as described.

396,986. GUN-WAD. GEORGE CLAFF, Philadelphia, assignor of one-half to Thomas D. Abraham, Upper Merion, Pa. Filed June 14, 1888. Serial No. 277,093. (No model.)

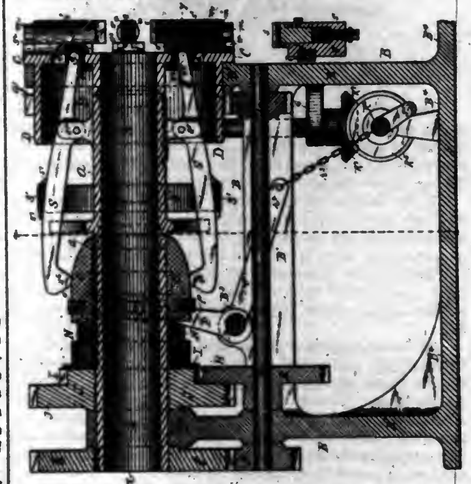
Claim.—A gun-wad consisting of a composition of paper-pulp and bristles, substantially as described.



396,987. MACHINE FOR FINISHING ENGINE-BED CASTINGS. GEORGE H. CORLISS, Providence, R. I.; Emily A. Corliss administratrix of said George H. Corliss, deceased. Filed Dec. 3, 1887. Serial No. 256,927. (No model.)

Claim.—1. In a machine for treating the bed-castings of steam-engines and analogous castings, the combination and arrangement in a single machine of the revolving head B and tool-carriage C, the latter traversing radially in such head while being revolved for squaring the ends, with a saddle, S, traversing longitudinally of the bed, a rest, *k*, adjustable vertically on such saddle, and a milling-spindle, *t*, driven by power for milling the guides, adapted to serve interchangeably on the same bed-casting without readjustment thereof, all substantially as herein specified.

2. In a machine for treating the bed-castings of steam-engines and analogous castings, the combination and arrangement in a single machine of the revolving head B and tool-carriage C, the latter traversing radially in such head while being revolved for squaring the ends, with a drill-chuck, D, adjustable radially on the head B; means for adjusting and holding such head in the required positions, and an operating-shaft, *e*, revolving in the interior of a hollow shaft, B', on which the head B is mounted for drilling the holes in the required positions, all adapted to serve as herein specified.



3. In a machine for treating the bed-castings of steam-engines and analogous castings, the combination and arrangement in a single machine of the drill-chuck D, adjustable radially on the head B, means for holding such head in the required positions, and an operating-shaft, *e*, revolved in the interior of the shaft B' for drilling the holes, with a saddle, S, traversed longitudinally of the bed, a rest, *k*, adjustable vertically on such saddle, and a milling-spindle, *t*, driven by power for milling the guides, adapted to serve either simultaneously or independently on the same bed-casting without readjustment of the latter, all substantially as herein specified.

396,987.

4. In a machine for treating the bed-castings of steam-engines and analogous castings, the combination and arrangement in a single machine of the revolving head B and tool-carriage C, traversed radially on such head, with the saddle S, rest *k*, and milling-spindle *t*, the latter driven by power and traversed longitudinally of the bed, and with the drill-chuck D, adjustable radially on the head B, and with means for holding such head in the successively-required positions, and the operating-shaft *e*, revolved in the interior of the shaft B', all substantially as herein specified.

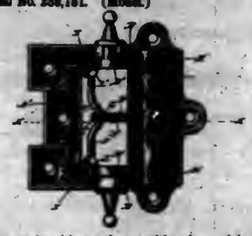
396,988. PIPE-THREADING MACHINE. WILLIAM J. DALY, McKeesport, assignor of one-half to W. S. Foster, Pittsburg, Pa. Filed June 14, 1888. Serial No. 277,065. (No model.)

Claim.—1. In pipe-threading apparatus, the combination of the sliding block *s'*, the sliding gripping-jaw *s*, having a shank threaded interiorly and fitting within said sliding block, and the adjusting-screw *m*, engaging with said gripping-jaw and acting to advance or retract the same, substantially as and for the purposes set forth.

2. In pipe-threading apparatus, the hollow spindle A, having the face-plate C, provided with radial guides, in combination with the sliding blocks *s*, carrying the gripping-jaws and connected to the socket-blocks *s'*, and the operating-levers S, substantially as and for the purposes set forth.

3. In pipe-threading apparatus, the hollow revolving spindle for holding the pipe to be threaded, mounted in the machine-frame B, and having the flange D, forming the journal for the spindle at one end of said frame, in combination with the longitudinal shaft G, gear-wheels E F, gear-wheel *g*, and gear-face *g'* on said flange D, substantially as and for the purposes set forth.

4. In pipe-threading apparatus, the combination, with the hollow revolving spindle mounted in the machine-frame, of the sliding cone-shaped sleeve O, sliding thereon and connected thereto by a feather, and levers S, pivoted to the spindle and operating the sliding gripping-jaws *s*, and the rock-shaft Q, carrying the arm P, connecting with said sliding cone-shaped sleeve, and having the arm connected by chain with the crank-shaft R^3, substantially as and for the purposes set forth.



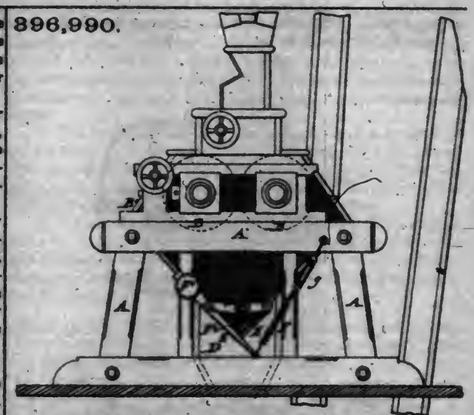
5. In pipe-threading apparatus, the combination of the hollow revolving spindle A, the cone-shaped sleeve O, sliding thereon, the levers S, connected to the sliding gripping-jaws *s*, and the spring *s'*, extending around and bearing upon the several levers and held in place by lugs or projections thereon, substantially as and for the purposes set forth.

6. In pipe-threading apparatus, the combination of the hollow revolving spindle having the cone-shaped sleeve O sliding thereon, and connections between said cone and the sliding gripping-jaws *s*, in combination with the rock-shaft Q, having arm P, engaging with the cone and arm or lever, and the crank-shaft R^3, having its cranks connected to said lever, and mechanism for rotating said crank-shaft connected thereto by a clutch, substantially as and for the purposes set forth.

7. In pipe-threading apparatus, the combination of a hollow revolving spindle adapted to engage with, center, and rotate the pipe, and sliding threading-die in line therewith and having a cutting-die, a holding-die opposite the same, and a holding-die above said cutting-die, substantially as and for the purposes set forth.

8. In a pipe-threading apparatus, sliding gripping-jaws, each having two biting-edges extending longitudinally of the pipe to be threaded, the inner faces of which biting-edges are substantially parallel, substantially as and for the purposes set forth.

396,989. SPRING-HINGE. LEVI M. DEVORE, Freeport, Ill., assignor to the Stover Manufacturing Company, same place. Filed Oct. 26, 1888. Serial No. 289,181. (Model.)



Claim.—1. In a spring-hinge, the combination, with two suitably-connected leaves, of a rod revolubly mounted upon one of said leaves and provided with an offset or crank, and a spring mounted upon the other leaf at one side of the hinge-axis and having its free end extending toward the opposite leaf and engaging said offset or crank, substantially as set forth.

2. The combination, with the leaf A, having at each end an ear, B, of the leaf A', having ears B', falling between the ears B and forming with them a pair of ears at each end of the hinge, the spring mounted upon one of said leaves at one side of the hinge-axis and having its free end projecting toward the other leaf, the notches in the ears B' B', the rod J, resting in said notches and having the crank-like offset K, engaged by said spring end, and the loops L L', retaining the rod in position, substantially as set forth.

396,990. GRINDING-MILL. ANTON DOBLER, New York, N. Y. Filed Apr. 16, 1888. Serial No. 270,796. (No model.)

Claim.—The combination of a pair of crushing-rolls, a collecting-hopper below said rolls, a conveyer-trunk connected to the discharge end of said hopper, two downwardly-inclined hinged valves within said trunk, the lower edges of which meet for closing the trunk, arms fixed at their outer ends to the pintles of said valves and overlapping at their inner ends, one of said arms being provided with a slot and the other with a pin for loosely engaging said slot, a weighted lever attached to the pintle of one of said valves, and a spring connected to said lever for holding the valves in normally-closed position, whereby a passing mass of the ground material is retained in the hopper below the rolls.

396,990.

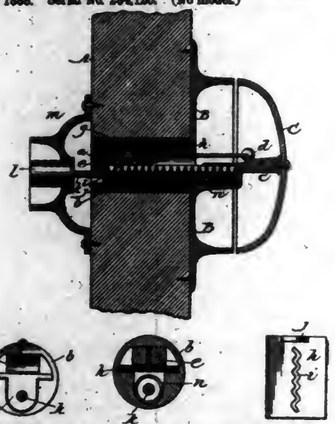
396,991. WHEEL. RUDOLPH W. DOSMOTER, South Bend, Ind. Filed Nov. 5, 1888. Serial No. 289,982. (No model.)

Claim.—1. The combination of a rim or tire, spokes, and a hub consisting of two semi-tubular sections provided with one or more annular bulges for the reception of the inner ends of the spokes, independent caps or rings secured over the ends of the said sections to clamp them together, and an inner bearing-sleeve, substantially as described.

2. The combination of two semi-tubular hub-sections and two independent caps or rings secured over the ends of said sections, whereby the same are clamped together, substantially as described.

3. The combination of the two semi-tubular sections provided with reduced ends, forming shoulders *d'*, and two independent caps or rings secured over the said reduced ends, substantially as described.

4. The combination of two semi-tubular hub-sections provided with one or more bulges, *b*, and independent caps or rings secured over the ends of the said sections, substantially as described.



5. In a hub, the combination of the two semi-tubular cast-metal sections, provided upon their opposite ends with external screw-threads, and internally-screw-threaded caps screwed over the ends of the said sections, whereby the same are held or clamped securely together, the contiguous longitudinal edges of the sections abutting against each, substantially as described.

396,992. COMPOUND GRAPHITIC HEARTH FOR METALLURGIC FURNACES. CHARLES J. RAMIN, New York, N. Y., assignor to the Carbon Iron Company, same place. Filed Feb. 3, 1887. Serial No. 226,268. (No model.)

Claim.—A hearth or sole for furnaces for deoxidizing or reducing iron ores, composed of lumps of graphitic carbon and iron sponge between the lumps, the carbon and the sponge being compact and integral with each other, substantially as shown and described.

396,993. DOOR-BELL. WILLIAM H. FAUBER, Chicago, Ill. Filed Aug. 30, 1888. Serial No. 284,120. (No model.)

Claim.—1. The casting B, formed integral with the oppositely-projecting tube *b* and arm *c*, and the gong C, mounted on the arm, in combination with the block *e*, pivoted inside the tube, and having the pin *g* and a striker, and a lengthwise-movable rod extending into the tube, and provided therein with an attached plate, *h*, having a slot, *i*, provided with a zigzagged wall, and into which slot projects the pin on the pivoted block, substantially as described.

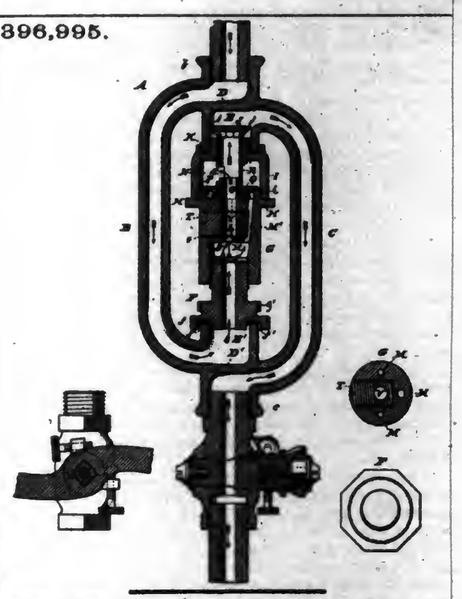
2. The combination, with a gong, C, and a casting, B, having a tube, *b*, of the block *e*, pivoted in the tube, and having the pin *g* and a striker, and a lengthwise-movable rod extending into the tube, and having an attached plate, *h*, in the tube, provided with a slot, *i*, having a zigzagged wall, substantially as described.

3. The combination, with a gong, C, and a casting, B, having a tube, *b*, of the block *e*, pivoted in the tube, and having the pin *g* and a striker, the plate *h*, located in the tube, and having an ear, *j*, and a slot, *i*, provided with a zigzagged wall, and a lengthwise-movable rod engaging said ear to move the slotted plate, substantially as described.

4. The combination, with a gong, C, and a casting, B, having a tube, *b*, of the block *e*, pivoted within the tube, and provided with a pin, *g*, and a striker, a plate, *h*, in the tube, having an ear, *j*, and a slot, *i*, provided with a zigzagged wall, and a push-rod, *k*, extending through the tube and engaging the ear to move the slotted plate, substantially as described.

5. The combination, with a base-plate, B, having the oppositely-projecting tube *b* and arm *c*, of the gong C on the arm, the block *e*, pivoted on the tube, and provided with a pin, *g*, and a striker, the plate *h*, having a slot, *i*, provided with a zigzagged wall, and an ear, *j*, provided with a screw-threaded orifice, and the push-rod *k*, having a screw-thread engaging the orifice in the ear, for operating the slotted plate and adapting the parts to different thicknesses of walls, substantially as described.

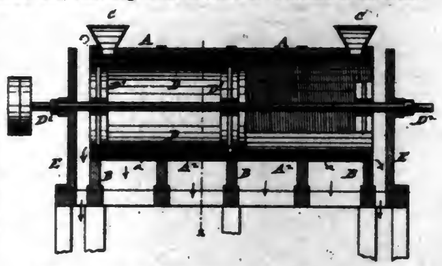
396,994. SCARF-HOLDER. MALCOLM FORBES, Warwick, N. Y. Filed Sept. 10, 1888. Serial No. 285,057. (No model.)



Claim.—1. A breastpin scarf-holder consisting of the breastpin proper, 1, having on its rear the safety-pin 2 and on its face the sharpened downwardly-projecting pin 3, substantially as and for the purposes set forth.

2. A breastpin scarf-holder consisting of the breastpin proper, 1, having on its rear the safety-pin 2 and on its front the sharpened downwardly and outwardly projecting pin 3, substantially as and for the purposes set forth.

396,995. REGULATOR FOR GAS-LAMPS. JOHN FRANKLIN, Cincinnati, Ohio. Filed Dec. 20, 1887. Serial No. 258,491. (No model.)



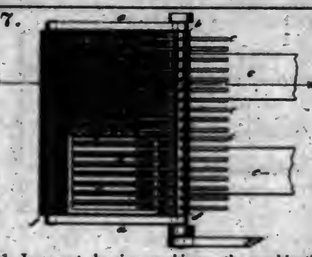
Claim.—The combination, with the yoke, the foot-piece, the cap, and the float, of the cylinder having the central vertical opening and the bores M M', the said bore M' being larger than the bores M, and the screw having the opening V and adapted to partially close the bore M', substantially as specified.

396,995.

396,996. MACHINE FOR DELINTING COTTON-SEED. ERNEST T. GEBHERT, New York, N. Y. Filed Oct. 14, 1887. Serial No. 252,347. (No model.)

Brief.—The machine is composed of a shell or casing, the upper part of which is made of abrading material provided with grooves or furrows having a slight pitch, and the lower part of which is made of longitudinally-slotted plates. A brush revolves within the casing, the latter having open ends, so that the seed can be discharged at either end, according to the direction of revolution of the brush.

Claim.—1. The combination, with a rotary cylindrical brush, of a fixed exterior casing or shell extending around said brush, and composed of an upper part provided with an abrading material having grooves or furrows and of a smooth and slotted bottom part, substantially as set forth.

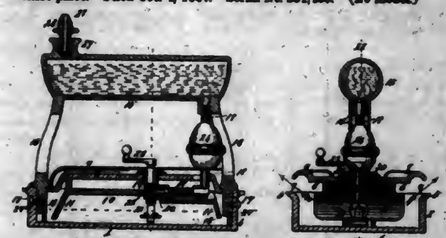


2. The combination of an exterior casing or shell, the upper surface of which is provided with abrading material having grooves or furrows, said casing having a slotted bottom part and being provided with open ends, with an interior cylindrical brush, substantially as set forth.

3. The combination of an exterior shell or casing, the upper surface of which is formed of a series of slabs of abrading material, said casing or shell having a slotted bottom part, and said slabs having spirally-arranged grooves or furrows, with an interior rotary brush central to the casing and standards for supporting the shaft of the brush, substantially as set forth.

4. The combination of an exterior casing or shell formed of the upper part of abrading material and having grooves or furrows, said shell or casing having a slotted bottom part, supporting-standards, and encircling-bands for said casing, with an interior rotary brush supported centrally to the casing, said casing being open at the ends and provided with supply-hoppers at both ends, substantially as set forth.

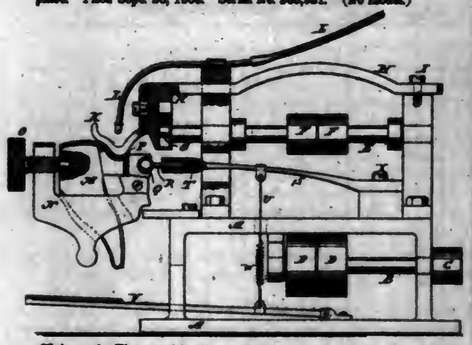
396,997. CARPET-BEATING MACHINERY. WILLIAM H. HANKINSON, New York, N. Y. Filed Feb. 24, 1887. Serial No. 228,730. (No model.)



396,997.

Claim.—1. In carpet-cleaning machinery, the combination, with a series of beaters, of a rigid open-slatted bed and an interposed soft and slightly-yielding open support on which the carpet rests in passing under the beaters, substantially as described.

2. In carpet-cleaning machinery, the combination, with a series of beaters, of an open-slatted bed and a cocoa mat mounted thereon, the two forming a compound rigid and soft support for the carpet and sustaining it both laterally and longitudinally under the action of the beaters.

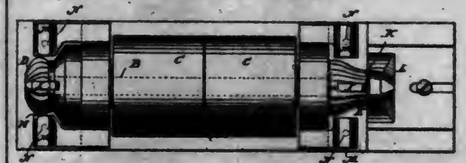


396,998. SELF-HEATING SAD-IRON. GUSTAVUS HEIDE, St. Louis, Mo., assignor to the National Self Heating Sad Iron Company, same place. Filed Oct. 4, 1887. Serial No. 251,469. (No model.)

Claim.—1. In a self-heating sad-iron, the combination of the imperforate bottom 1 2 4, forming a combustion-chamber, top plate arranged over the bottom, with an air-space between them, intermediate plate, 10, having downturned ends 11, said plate being disconnected from the bottom of the iron and being located between the bottom and top plate, with a space between it and the walls of the bottom to provide for a circulation, said intermediate plate deflecting heat from the top plate, the downturned ends of said plate being adapted to deflect heat from the lower ends of the handle, a reservoir, and a pipe leading from the reservoir to the under side of said intermediate plate, substantially as shown and described.

2. In a self-heating sad-iron, the combination of the bottom plate having sides 2 and back 4, top plate having the upwardly, outwardly, and downwardly extending flanges 7, intermediate plate having the end flanges, 11, handle having arms 16, by which it is secured to the sides and back, supply-pipe, and burner provided with a regulating-valve, all substantially as and for the purpose set forth.

396,999. HEEL-BURNISHING MACHINE. CHARLES H. HELMS, Poughkeepsie, N. Y., assignor to himself and Charles H. Goodsell, same place. Filed Sept. 20, 1888. Serial No. 285,921. (No model.)



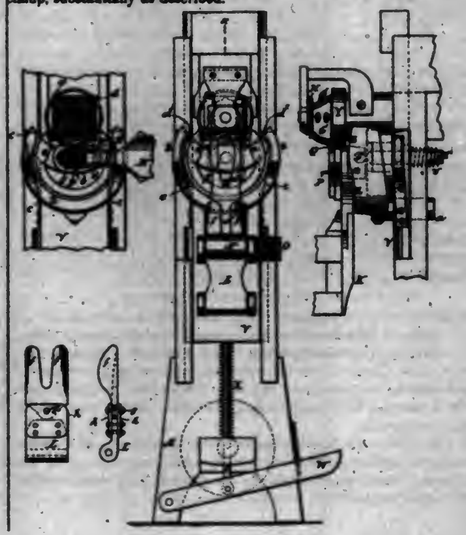
Claim.—1. The combination, with the arm S and the shoe-holder N, connected to the arm by a ball-and-socket joint, of the horizontal arm H, carrying the burnishing-tool, and the shaft E, having the cam G directly engaging the tool-carrying arm and oscillating it in a horizontal plane, substantially as described.

2. The combination of the spring-arm S, having a socket at one end, a ball, Q, having a stem, R, entering the socket, a spring, T, in the socket acting on the stem, a shoe-holder, N, jointed on the ball, a lever, V, connected with the spring-arm, the horizontal arm H, carrying the burnishing-tool, and the shaft E, having the cam G for oscillating the tool-carrying arm in a horizontal plane, substantially as described.

3. The combination, with the frame A and the shoe-holder N, of the driving-shaft B, the counter-shaft E, located above the driving-shaft and having the cam G, and the horizontal arm H, having a burnishing-tool, K, and directly engaged by the cam and oscillated in a horizontal plane by said cam, substantially as described.

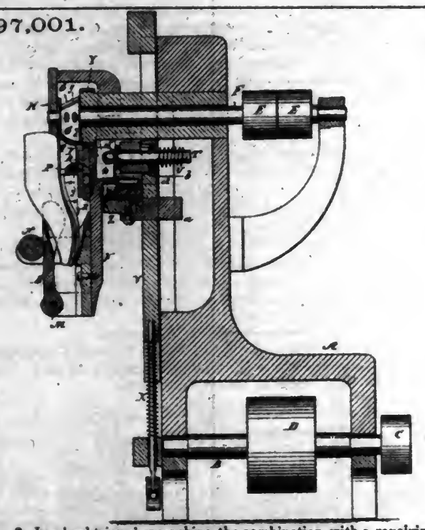
4. The combination of the frame A, the spring-arm S, rigidly secured at one end, the shoe-holder N, connected with the spring-arm by a ball-and-socket joint, the pivoted lever V, and the spring W, connecting the lever with the spring-arm, with the oscillating burnishing-tool K, substantially as described.

397,000. HEEL-TRIMMER. CHARLES H. HELMS, Poughkeepsie, N. Y., assignor to himself and Charles H. Goodsell, same place. Filed Sept. 20, 1888. Serial No. 285,922. (No model.)



Claim.—1. A heel-trimming machine consisting of a supporting-frame, a rotary shaft, a cutter on the shaft for trimming a heel, a stationary rest at one end of the cutter to support a heel, a fixed guard projecting over the upper side of the cutter, and two swiveled heel-rests pivoted, respectively, to the frame at opposite sides of the cutter beneath the guard which projects above the latter, substantially as described.

2. A heel-trimming machine consisting of a supporting-frame, a rotary shaft, a heel-trimming cutter on the shaft, a heel-rest at one end of the cutter, and two opposite horizontally-swinging heel-rests pivoted, respectively, to the frame at opposite sides of the cutter, substantially as described.



397,001. HEEL-TRIMMER. CHARLES H. HELMS, Poughkeepsie, N. Y., assignor to himself and Charles H. Goodsell, same place. Filed Nov. 8, 1888. Serial No. 290,205. (No model.)

Claim.—1. In a heel-trimming machine, the combination, with a trimming-knife, of a jack or holder composed of a base, K, having prongs to engage the heel, a jointed clamp, L, and a rotating eccentric, N, for locking up the clamp, substantially as described.

2. In a heel-trimming machine, the combination, with a trimming-knife, G, of a jack or holder composed of a base, K', having a detachable holder, Q, provided with prongs, a clamp, L, pivotally connected with the base, and the rotating eccentric N for locking up the clamp, substantially as described.

397,001.

3. In a heel-trimming machine, the combination, with a revolving trimming-knife, G, and its shaft F, of the stationary rim Y, located behind the knife, and a jack composed of a base, K, clamp L, lock-up N, and detachable pattern-plate Q, having its edge bearing against and movable around the edge of the stationary rim for guiding the jack, substantially as described.

4. In a heel-trimming machine, the combination, with a revolving trimming-knife, G, and its shaft F, of the stationary rim Y, located behind the knife, and an oscillating jack composed of the base K, the pivoted clamp L, the rotating eccentric for locking up the clamp, and the detachable pattern-plate Q, provided with the prongs R and P, and having its edge bearing against and movable around the edge of the stationary rim for guiding the jack, substantially as described.

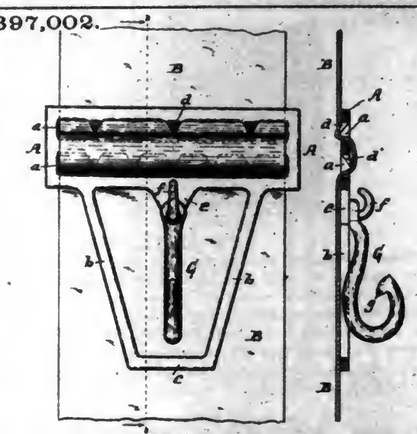
5. In a heel-trimming machine, the combination, with a knife or trimmer and a laterally moving and swinging jack, of a guide-arm, *d*, for said jack, and projections *e*, placed in the guideway of said arm for moving the jack in a lateral direction as said jack approaches one extremity or the other of its swing, and causing the knife to act along the entire extent of the heel-surface to be trimmed, substantially as described.

6. In a heel-trimming machine, the combination, with the revolving trimming-knife G, of the slide V, the oscillating jack carried by the slide, and the guiding-flange Z on the slide between the latter and the jack, and against which flange the rear surface of the jack-base bears in its oscillating movements, substantially as described.

7. In a heel-trimming machine, the combination, with a trimming-knife, of a slide, V, an oscillating jack carried by the slide, a guiding-flange, Z, located between the slide and jack, and a stem, *a*, carrying the flange and movable in the slide, substantially as described.

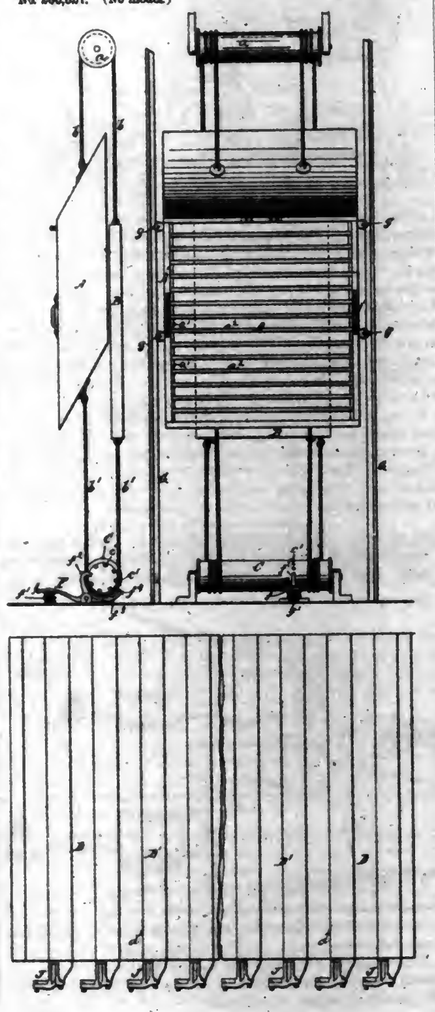
8. The combination, with a knife or trimmer, and jack having a support, T, adjustable toward and from the knife, of a guiding-flange, Z, for the base of said jack, substantially as described.

9. In a heel-trimming machine, the combination, with a knife or trimmer and a laterally moving and swinging jack, of springs *c* for holding said jack in a central position relative to the knife, a guide-arm, *d*, for said jack, and projections *e*, placed in the guideway of said arm for moving the jack in a lateral direction as said jack approaches one extremity or the other of its swing, substantially as described.



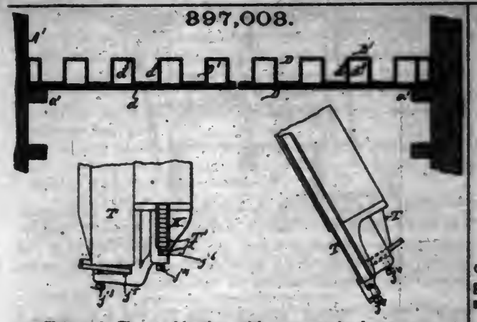
10. In a heel-trimming machine, the combination, with a trimming-knife, of a jack or holder composed of a base, K, having means to engage a heel, a jointed clamp, L, provided with a swinging bearing portion, *f*, and a lock-up for the clamp, substantially as described.

397,002. BACK-BAND HOOK. EDWARD A. ISAACS, Macon, Ga., assignor of three-fourths to John C. Van Syckle and Harry C. Tindall, same place. Filed Aug. 2, 1888. Serial No. 281,794. (No model.)



Claim.—1. The back-band hook herein described, consisting of a buckle having a pendent guard-frame integral with the buckle, and a free swinging hook hanging from the bottom of the buckle within the guard-frame.

2. The back-band hook herein described, consisting of a buckle having a pendent guard-frame integral with the buckle, and a free swinging barbed hook hanging from the bottom of the buckle within the guard-frame.



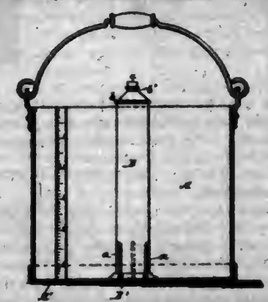
397,002.

397,003. COMPOSITOR'S TYPE-CASE. LOUIS K. JOHNSON and ARNOT A. LOW, Brooklyn, assignors to The Alden Type Machine Company, New York, N. Y. Filed July 3, 1886. Renewed July 23, 1888. Serial No. 280,827. (No model.)

397,008.

Claim.—1. The combination, with a compositor's type-case, A, adapted to hold two or more superposed series or "fonts" of type, substantially as described, of the suspenders *b b'* and counterpoise B, arranged and operating substantially in the manner and for the purpose described.

2. In combination with a compositor's type-case, substantially such as designated, the suspending-ropes *b b'*, drums *a* and C, and counter-weight B, arranged and operating substantially in the manner and for the purpose described.



3. In combination with the type-case A, counter-weight B, pulleys *a* C, and suspenders *b b'*, a foot-brake, F, arranged and operating substantially in the manner and for the purpose described.

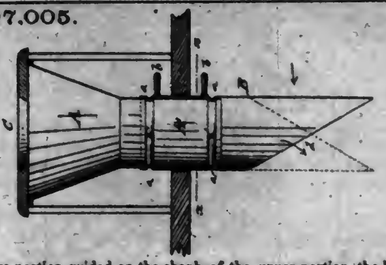
4. In combination with the type-case A, counter-weight B, pulleys *a* C, and suspenders *b b'*, a pawl adapted to automatically engage with and restrain the motion of the parts and to be disengaged by foot-pressure, substantially in the manner and for the purpose described.

5. In combination with the type-case A, counter-weight B, pulleys *a* C, and suspenders *b b'*, the guides G, for preserving the alignment of the case, substantially in the manner and for the purpose described.

6. In a compositor's type-case, substantially such as described, a duplex finger-piece formed with separate type-channels and type-supports arranged at an angle to each other, substantially in the manner and for the purpose described.

397,004. SAMPLE-CREAM EXTRACTOR. BYRON KANAKE, Marion, Ohio. Filed Mar. 22, 1888. Serial No. 268,316. (No model.)

Claim.—1. In a sample-cream extractor, the combination, with a cream-receptacle having guide-fingers secured to the bottom thereof, of a tubular shell having a removable bottom, the latter adapted to be held in position to engage the open end of the tubular shell by the guide-fingers.



2. In a sample-cream extractor, the combination, with a cream-receptacle that is of known capacity, and guide-fingers attached to the inner surface of its bottom, of a loose bottom which is adapted to engage and become a part of a tubular sample-extractor, and a tubular sample-extractor shell, substantially as set forth.

397,005. CLOSET FOR RAILWAY-CARS. FREDERICK A. KIMBALL and HENRY W. CORY, St. Paul, Minn. Filed June 9, 1888. Serial No. 276,582. (No model.)

Claim.—A closet for railway-cars, consisting of a fixed upper or basin portion having a tubular shank, an axially-turning lower or discharge portion guided on the shank of the upper portion, the lower part having a downwardly-slanting or inclined discharge-opening, substantially as set forth.

397,005.

397,006. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. JESSE F. KNEPP, Terre Haute, Ind., assignor of three-fourths to Joseph H. Briggs, same place. Filed Mar. 15, 1888. Serial No. 267,278. (No model.)

Claim.—1. In a regulator for an electric motor or generator, the combination, with the armature and commutator segments, of a normally-open short circuit connecting two or more such segments, and a speed-governor attached to a rotating part of the machine for closing said short circuit, whereby the armature-coils corresponding to said segments may be thrown from the line into said short circuit when the machine reaches a definite speed.

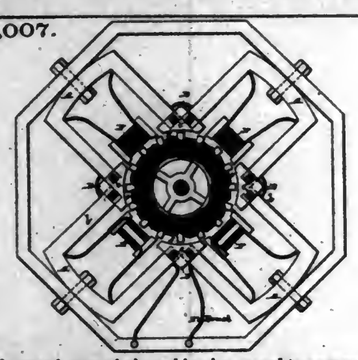
2. In a dynamo or motor regulator, the combination, with a hollow extension for an armature-shaft, of a circuit-controller located within the extension and comprising a stationary contact and a movable contact, and a speed-governor extending from said extension and connected with and adapted to operate said movable contact of the circuit-controller, substantially as described.

3. In a dynamo or motor regulator, the combination of a regulating-circuit, a circuit-controller in said circuit, and a centrifugal governor comprising a sliding weight, a hollow-slotted guide for said weight extending at right angles from the armature-shaft, a spring bearing on said weight, an adjusting-screw for varying the tension of said spring, and a T-rod located in said guide and connecting the weight and circuit-controller, substantially as described.

4. In a regulator, the combination of the armature-shaft, an extension of insulating material secured thereto, a speed-governor mounted on the extension, and a circuit-controller secured to the extension and connected with the governor, said circuit-controller being in a regulating-circuit, whereby when the machine reaches a definite speed the regulator will be brought into action.

5. A speed-governor for a generator or motor, comprising a hollow slotted support or guide, a sliding weight upon the same, a spring embracing the guide and bearing upon the weight, an adjusting-screw to regulate the tension of said spring upon the weight, a rod engaging the weight through the slots of the guide, and a circuit-closer connected to said rod, substantially as described.

397,007. DYNAMO-ELECTRIC MACHINE. JESSE F. KNEPP, Terre Haute, Ind., assignor of three-fourths to Joseph H. Briggs, same place. Filed Aug. 4, 1888. Serial No. 281,962. (No model.)



Claim.—1. In a dynamo-electric machine or motor, the combination, with a field-magnet, of a magnetic deflector located between the field-magnet poles, said deflector having polar extremities adjacent to the field-magnet poles similarly polarized, whereby substantially all the lines of force are thrown into the armature-orbit.

2. In a dynamo-electric machine or motor, the combination, with a field-magnet and an armature, of a magnetic deflector, whereby substantially all the lines of force are thrown into the armature-orbit.

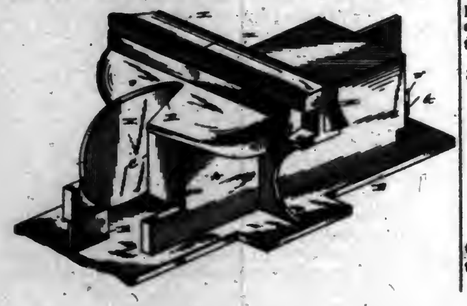
3. In a dynamo-electric machine or motor, the combination, with a field-magnet, of a magnetic deflector located between the field-magnet poles and coils on the field-magnet and on the deflector wound and connected in series.

4. In a dynamo-electric machine or motor, the combination of the field-magnet, magnetic deflectors, an armature, opposite coils in said armature connected and terminating in commutator-strips ninety degrees apart, the coils opposite adjacent field-magnet poles being

397,007.

oppositely wound, respectively, and brushes spaced to correspond to the terminal commutator-strips.

5. In a dynamo-electric machine or motor, a drum or cylinder armature having its coils longitudinally wound on its outer surface and carried transversely across its ends to form chords of the outer periphery of the armature, said coils being arranged in sets, each set covering approximately the whole circumference of the armature, and the coils of each set being located an equal distance apart, a commutator having a number of strips equal to the number of armature-coils, coils of the same polarity in each set being electrically connected and terminating in commutator-strips, electrical connections between commutator-strips of the same polarity, and a pair of commutator-brushes, substantially as described.



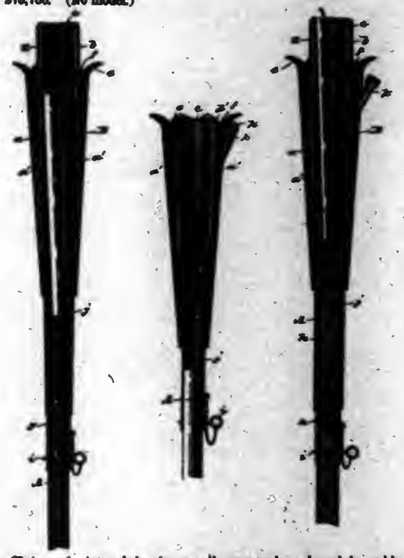
6. In a dynamo or motor, the combination, with a field-magnet, of an armature, a series of coils arranged flat on the circumference of the same in successive sets, the coils being located an equal distance apart and adjacent coils being wound in opposite directions and each set covering approximately the whole circumference of the armature, a series of commutator-strips equal in number to the armature-coils, the coils in the same set and of the same polarity being electrically connected and terminating in commutator-strips, and the terminal commutator-strips of the same polarity and belonging to the same set being electrically connected, and a pair commutator-brushes spaced to correspond to said terminal strips, substantially in the manner and for the purpose described.

7. In a dynamo or motor, the combination, with the field-magnet, of an armature having a series of coils arranged flat on the circumference in successive sets of four located ninety degrees apart and each set approximately covering the whole circumference of the armature, a series of commutator-strips corresponding to the series of armature-coils, the successive pairs of coils on opposite sides of the armature and in each set being electrically connected and terminating in commutator-strips located ninety degrees apart, the diametrically-opposite commutator-strips being electrically connected, and brushes set ninety degrees apart, whereby the coils in one set may be thrown into the generating-circuit and the remaining coils shut out of the circuit.

397,008. RAIL-JOINT. JOHN P. LANCASTER, Goshen, Ind. Filed Apr. 23, 1888. Serial No. 271,514. (No model.)

Claim.—1. In a railroad-rail joint, the combination, with the hollow chair, of a clamp-hook extending through said tie and fish-plates, one of which is formed with a seat for the end of the hook.

2. In a railroad-rail joint, the combination, with the hollow chair provided with slotted end pieces, a standard secured to the tie, and projections or lugs secured to one of the said end pieces, of the fish-plates, one of which is fixed to said chair, a clamp-hook extending through said tie and formed with a transverse slot or aperture, and a key, all of which are arranged in the manner herein set forth.



397,008.

3. In a railroad-rail joint, the combination, with the hollow chair and the fish-plates, one of which is provided with dowels or laterally-projecting pins adapted to engage the apertures in the web of two meeting rails, of a clamp-hook extending through said tie and having means, substantially as described, for locking it in position.

397,009. TORCH. FREDERICK LEHR, New York, N. Y., assignor of one-half to George Day, same place. Filed June 1, 1888. Serial No. 275,700. (No model.)

Claim.—1. A torch having an oil-receptacle and a wick, and being also provided with a fire-works holder adjacent to said wick, combined with a sliding handle having transverse holes and adapted to be pushed upward in said holder to raise the fire-works to the top of the wick to be ignited, and a pin for securing said handle in different positions, substantially as set forth.

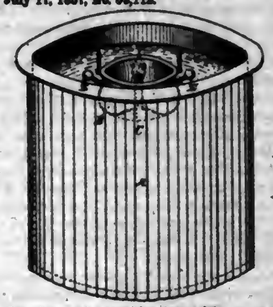
2. The combination, with a hollow torch, the center of which constitutes a fire-works holder which is surrounded with an oil-receptacle, of a circular wick around said fire-works holder, a vertically-adjustable wick-holding tube outside of said wick, a flanged protector, the lower end of which presses against said tube, and a vertically-adjustable handle having transverse holes and adapted to be pushed upward into said fire-works holder and a pin for securing said handle in different positions, substantially as set forth.

3. The combination, with the metallic torch-body having the oil-receptacle *a*, the circular wick *b*, the inner tube, *c*, the wick-holding tube *d*, the flanged protector *e*, and one or more air-inlet holes, *h*, of the sliding or vertically-adjustable handle A, fitting the lower metallic part or tube of the said torch, but that part of the said tube in which said air-inlet holes are formed being of greater diameter internally than said handle, substantially as set forth.

397,010. PLUMB-LEVEL. OLIVER I. LEWIS, Nebraska City, Nebr. Filed July 23, 1888. Serial No. 280,880. (No model.)

Claim.—1. In a plumb-level, the oscillating weighted wheel 20, the pinion 23, the cog-wheel 24, and pinion 25, in combination with the plates 16 and 17, posts 18 and 19, supporting train, hands 12 and 13, sleeve 26, and graduated dial 10, as and for the purposes described.

2. In a plumb-level, the doubly-rabbeted stock 6, in combination with plate 9, carrying glass 11, seated in the outer rabbet, and frame-work composed of plates 16 and 17, connected by the posts 18 19, supported in the inner rabbet by screws 28 through lugs 27, and the actuating mechanism supported by said frame-work, as and for the purposes described.



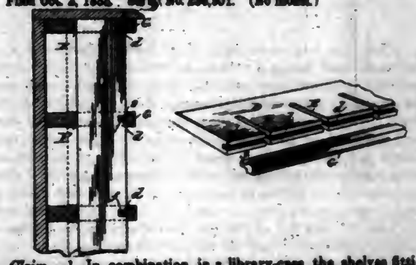
3. In a plumb-level, the hinged sights 36 36, in combination with the level-stock, springs 37, and plate 7, carrying the hinged sights and forming the end plates of the stock.

4. In a plumb-level, the stop 15, in combination with oscillating wheel 24 and plates 16 and 9, having slots in which stop moves, as and for the purposes described.

5. The spring 32, in combination with the bearing-plates 33 33, guides 34 34, the button 8, slot 31, and plate 7, as and for the purpose described.

6. In a plumb-level, the spring 32, the bearing-plates 33 33, guides 34 34, the button 8, slot 31, and plate 7, in combination with the block 6.

397,011. LAMP OR NIGHT-LIGHT. JEAN A. H. LEYNEN-HOUGARDE, Brussels, Belgium. Filed Apr. 5, 1888. Serial No. 269,749. (No model.) Patented in Belgium Feb. 23, 1887, No. 76,513; in England Mar. 3, 1887, No. 3,533; in France July 7, 1887, No. 184,674, and in Germany July 17, 1887, No. 39,112.



Claim.—1. In a lamp, the combination, with a reservoir and float carrying the burner, of a vertical cylinder in the reservoir surrounding the float for guiding it in its upward and downward movement, substantially as herein shown and described.

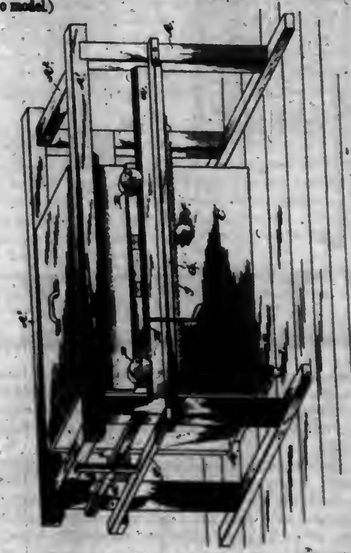
2. In a lamp, the combination, with the reservoir, of a float carrying the burner to be supplied by said reservoir, and arms or projections E, for preventing contact of the float with the sides of the reservoir or cylinder, as set forth.

3. In a lamp, the combination, with the reservoir, of a float and two concentric tubes extending from the bottom of the float and forming an annular space in which the oil may rise to be ignited, substantially as shown and described.

397,012. LIBRARY-CASE. JAMES A. LYON, Nashville, Tenn. Filed Oct. 3, 1888. Serial No. 286,951. (No model.)

Claim.—1. In combination, in a library-case, the shelves fitting in grooves in the sides of the case and of less depth than the depth of said case, parallel kerfs cut in said shelves, vertical removable partitions fitting said kerfs, and retaining-strips G, removably secured to the shelves for holding said partitions in place, substantially as described.

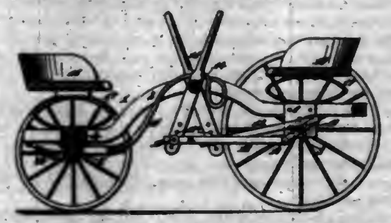
2. In combination, in a library-case, the shelves formed with kerfs extending vertically and grooves cut in the front edges, vertical partition-strips formed with notches to register with the grooves in the shelves, and tongues *g*, adapted to fit the grooves and notches of the shelves and partitions, substantially as described.



3. In combination, in a library-case, the shelves formed with kerfs and grooves, the vertical partitions formed with notches, and the retaining-strips having the tongues *g*, substantially as described.

397,013. VETERINARY SURGICAL SCRAPER. ALEXANDER MACDONALD, U. S. Army. Filed Oct. 3, 1888. Serial No. 287,457. (No model.)

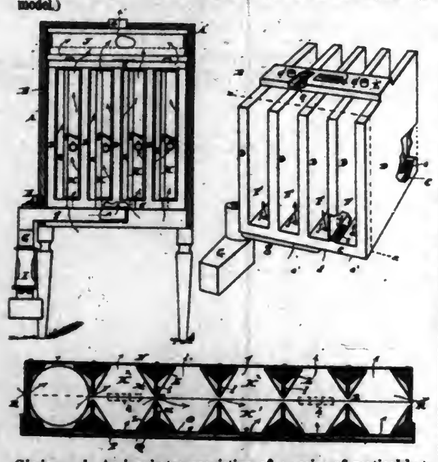
Claim.—As an improvement in gelding or castrating devices, the herein-described scraper, consisting of a metallic band adapted to be placed upon the thumb and having a cutter integral therewith curved from end to end and edge to edge, substantially as described.



397,014. MACHINE FOR DRESSING MILLSTONES. JAMES L. MAHONEY, Albertville, Ala. Filed Aug. 16, 1888. Serial No. 282,848. (No model.)

Claim.—1. In a stone-dressing machine, the combination of the frame having parallel ways, the yoke pivoted to the frame and provided with racks, the housing provided with rollers mounted to travel on the ways of the frame, the vertical pick-blocks, armed cylinder, and gear-train arranged within the housing, and the pinions *f*, keyed to the projecting ends of one of the shafts of the gear-train, substantially as described.

2. In a stone-dressing machine, the combination, substantially as described, of the frame provided with parallel ways, the housing having rollers mounted to traverse said ways, a series of pick-blocks mounted to slide vertically in the housing, a drive-shaft provided with an armed cylinder adapted to actuate the pick-blocks, a gear-train connected with the drive-shaft and having the ends of one shaft projecting beyond the walls of the housing, pinions *f*, keyed to said shaft, the yoke pivoted at one end of the frame and provided with downwardly-facing rack-bars arranged to engage the pinions *f*, or be lifted free therefrom, and means to hold the yoke parallel with the ways of the frame.



397,015. VELOCIPEDE. JOSEPH MCCOY, Baltimore, Md. Filed Apr. 11, 1888. Serial No. 270,313. (No model.)

Claim.—A four-wheel road-machine consisting of the front and rear wheeled axles, the arched parallel side bars rigidly secured at their rear to the opposite ends of the rear cranked axle and rigidly connected at their front by a transverse beam carrying the swiveled front axle, the transverse bar connecting the arched side bars adjacent to the middle of their length, a pair of hand-levers, both hung

intermediate their upper and lower ends on the transverse bar, a pair of pitmen connected, respectively, at their rear to the cranks of the rear axle and at their front ends pivoted to the lower extremities of the hand-levers, and each provided with a pair of oppositely-projecting treadles, and front and rear seats located, respectively, over the front and rear axles, all substantially as and for the purposes described.

397,016. INCUBATOR. JACOB K. MESSNER, Philadelphia, Pa. Filed May 30, 1886. Renewed July 5, 1888. Serial No. 279,006. (No model.)

Claim.—1. An incubator consisting of a series of vertical hot-water chambers forming corresponding vertical compartments, in combination with egg-trays adapted to fit said compartments and support the eggs in tiers one above the other, substantially as and for the purpose specified.

2. An incubator consisting of a series of vertical hot-water chambers forming corresponding vertical compartments, in combination with egg-trays adapted to fit said compartments and support the eggs in tiers one above the other, and a moisture-containing pad arranged against one of the faces of the egg-tray, substantially as and for the purpose specified.

3. An incubator consisting of a series of vertical hot-water chambers forming corresponding vertical compartments provided with ventilating-apertures for air at the bottom, in combination with egg-trays adapted to fit said compartments and support the eggs in tiers one above the other, substantially as and for the purpose specified.

4. An incubator consisting of a series of vertical hot-water chambers forming corresponding vertical compartments provided with ventilating-apertures for air at the bottom, in combination with egg-trays adapted to fit said compartments and support the eggs in tiers one above the other, and a moisture-containing pad arranged against one of the faces of the egg-tray, whereby air and moisture freely pass over the eggs in their passage upward, substantially as and for the purpose specified.

5. The hot-water circulator for an incubator, consisting of a hollow base connecting with a boiler, a series of upright hot-water chambers supported upon said base and opening into it, and a cross-flue connecting them at the top, into which they open, the said upright chambers forming a series of narrow egg-tray compartments, substantially as and for the purpose specified.

6. The hot-water circulator for an incubator, consisting of a hollow base connecting with a boiler and provided with ventilating-apertures opening through it, a series of upright hot-water chambers supported upon said base and opening into it, and a narrow cross-flue connecting them at the top, into which they open, the said upright chambers forming a series of narrow egg-tray compartments, substantially as and for the purpose specified.

7. The combination of the boiler G with the base C, upright or vertical hot-water chambers D, connecting therewith by openings *c*, and cross-flue E, arranged upon the top of said chambers and connecting therewith by openings *e*, and provided with one or more openings, *e'*, to fill the circulator with water, substantially as and for the purpose specified.

8. The combination of the boiler G with the base C, upright or vertical hot-water chambers D, connecting therewith by openings *c*, and cross-flue E, arranged upon the top of said chambers, connecting therewith by openings *e*, and provided with one or more openings, *e'*, to fill the circulator with water, and a thermometer, *d*, arranged in said cross-flue E, substantially as and for the purpose specified.

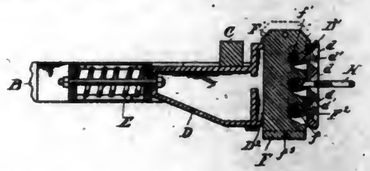
9. The incubator egg-tray consisting of the parts K' and K², the backs of which are of a substance impervious to moisture, and provided with perforations and padded egg-supports upon their inner parts, substantially as and for the purpose specified.

10. The incubator egg-tray consisting of the parts K' and K², provided with perforated backs, and egg-supports upon their inner parts, forming the air-passages R from one end to the other of the tray and entirely through the length thereof, substantially as and for the purpose specified.

11. The incubator egg-tray consisting of the parts K' and K², hinged together at *k* and having fastenings to lock them together, provided with perforated backs and egg-supports upon their inner parts, substantially as and for the purpose specified.

12. The combination of parts K' K², each having the triangular ribbed pieces L *l* and padding M, to support the egg, the said ribbed pieces in each of the parts K' K² being arranged to face those in the other part and form the air-passages R, substantially as and for the purpose specified.

13. The combination of parts K' K², provided with perforated backs, and each having the triangular ribbed pieces L *l* and padding M, to support the egg, the said ribbed pieces in each of the parts K' K² being arranged to face those in the other part and form the air-passages R, tray Q, and moisture-pad P, adapted to fit against one of the perforated faces, substantially as and for the purpose specified.

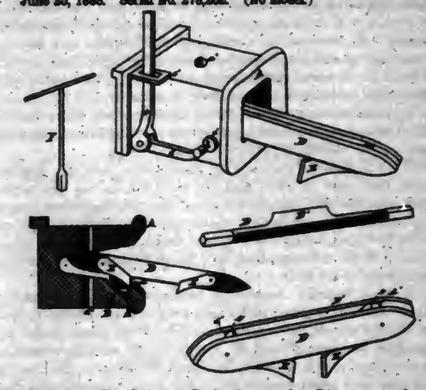


14. The incubator egg-tray consisting of the parts K' and K², provided with perforated backs and egg-supports upon their inner parts, in combination with the tray Q and moisture-pad P, adapted to fit against one of the perforated faces, substantially as and for the purpose specified.

15. The incubator egg-tray consisting of the parts K' and K², forming the air-passages R from one end to the other, provided with perforated backs and egg-supports upon their inner faces, in combination with the tray Q and moisture-pad P, adapted to fit against one of the perforated faces, substantially as and for the purpose specified.

16. The combination of the egg-tray frames K' K², one of which is provided on its back with a screen, N, and the other with a perforated cover, O, of water-proof material, tray Q, and moisture-pad P, adapted to fit against the water-proof face of the tray, substantially as and for the purpose specified.

17. An incubator consisting of a series of vertical hot-water chambers forming corresponding vertical compartments, in combination with egg-trays adapted to fit said compartments and support the eggs in tiers one above the other, the outer case, H, and upper screen-tray, J, substantially as and for the purpose specified.

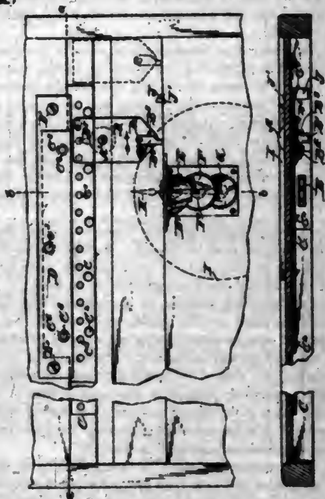


397,017. CAR-COUPLING. WILLIAM METCALF, Lake, Ill. Filed May 25, 1888. Serial No. 275,067. (No model.)

Claim.—1. In a car-coupling, the draw-bar provided with a vertical recess and having a vertical series of mouths communicating therewith, in combination with the coupler arranged in said recess and capable of direct vertical movement therein parallel to the face of the draw-bar, said coupler being provided with a series of downward and rearward extending hooks corresponding in number to the mouths and arranged at distances corresponding to the distances which separate the mouths, and with a corresponding series of downward and forward inclines to the rear of and below said hooks, the relative arrangement being such that in coupling the link first strikes the hook to raise the coupler and then the incline to depress the coupler, substantially as and for the purposes specified.

2. In a car-coupling, the draw-bar provided with a vertical recess, a vertical series of mouths communicating therewith, and lateral guiding-grooves extending rearward from each mouth, in combination with the coupler arranged in said recess and capable of direct vertical movement therein parallel to the face of the draw-bar, the said coupler being provided with a series of downward and rearward extending hooks corresponding in number to the mouths and arranged at a distance apart equal to the distance separating said mouths, and with a corresponding series of downward and forward inclines to the rear of and below said hooks, the relative arrangement being such that in coupling the link first strikes the hook to raise the coupler and then the incline to depress the coupler, substantially as and for the purposes specified.

397,018. CAR-COUPLING. GEORGE MOCK, Springfield, Ky. Filed June 25, 1888. Serial No. 278,202. (No model.)



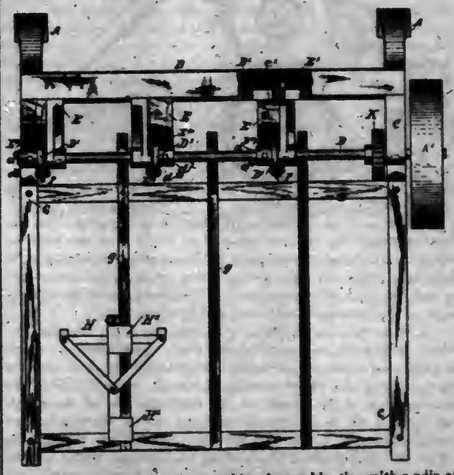
Claim.—1. The link-bar D, having a slot D', recesses *d*, with shoulders *d'* and *d''*, and tongues E, with shoulders *e* and *e'*, pivoted within the slot, substantially as set forth, and for the purpose specified.

2. In a car-coupling, a draw-head, A, having a lip or catch, *a*, in combination with a link-bar provided with tongues pivoted within the ends of the bar to engage with the lip of the draw-head.

3. In a car-coupling, the combination, with a draw-head having a lip or catch, *a*, a recess, A, in its lower wall, holes in its side walls connecting with the recess, and a transverse uncoupling-bar, B, provided with a cam, B', of a link-bar provided with pivoted tongues to engage with the lip of the draw-head and mechanism for operating the uncoupling-bar B to lift the tongue and release the link-bar, substantially as set forth, and for the purpose specified.

397,019. BILLIARD-SCORING BOARD. ROBERT H. MONTGOMERY, Melbourne, Victoria. Filed June 19, 1888. Serial No. 277,607. (No model.)

Claim.—1. In a billiard-scoring board, the combination, with a marker adapted to travel along one side of the board, a slide to which said marker is secured adapted to travel along the opposite side of the board, and a beveled locking-stud projecting rearwardly from said slide, of a spring-actuated lock-plate provided with perforations with which the locking-stud engages, substantially as and for the purposes specified.



2. In a billiard-scoring board, the combination, with a marker adapted to travel along one side of the board, a slide to which said marker is secured adapted to travel along the opposite side of the board, and a beveled locking-stud projecting rearwardly from said slide, of a spring-actuated lock-plate provided with perforations with which the locking-stud engages and on its rear side with stops having an inclined or beveled face, said plate being shorter than the distance traveled by the slide and marker to enable the slide to move from in front of the lock-plate to the rear thereof, the locking-stud on the slide and the stops on the lock-plate being beveled in reverse directions, substantially as and for the purposes specified.

3. In a billiard-scoring board, the combination, with the marker adapted to travel along one side of the board, a slide to which said marker is secured adapted to travel along the opposite side of the board, a beveled locking-stud projecting rearwardly from and a pawl pivotally connected with said slide, of a spring-actuated lock-plate provided with perforations with which the locking-stud engages, and with beveled stops projecting from the rear face of such plate, the locking-stud on the slide and the stops on the plate being beveled in reverse directions, and said plate being shorter than the distance traveled by the slide and marker, and a registering mechanism adapted to be operated by the pawl on the slide when moved in the proper direction, substantially as and for the purposes specified.

4. The combination, with the slotted scoring-board, the marker A, the slide B thereof provided with the beveled locking-stud B², of the spring-actuated lock-plate C, having perforations C', beveled stops C², and an inwardly-bent end, C³, said plate being shorter than the slot on the scoring-board, substantially as and for the purposes specified.

5. The combination, with slotted scoring-board, the marker A, the slide B thereof provided with beveled locking-stud B², and the pawl B', pivoted to said slide, of the spring-actuated lock-plate C, having perforations C', beveled stops C², and inwardly-bent end C³, said plate being shorter than the slot in the scoring-board, the ratchet-wheel E, arranged in the path of the pawl B', and a train of registering gearing adapted to be operated by said ratchet, substantially as and for the purposes specified.

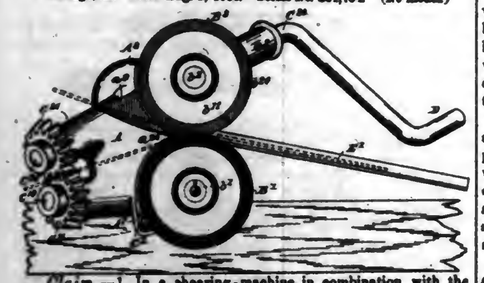
397,020. MACHINE FOR SHEARING METAL. LA VERNE W. NOYES, Chicago, Ill. Filed Apr. 23, 1886. Serial No. 271,516. (No model.)

Claim.—1. In a shearing-machine, in combination with a pair of shearing-wheels, a bracket having the bearings for said wheels, respectively, the portion of said brackets which connect said bearings being located on the discharge side of the wheels and extending transversely to the plane of their shearing-faces, and completely traversed by said plane produced, so that severance of the bracket in that plane would sever from each other the bearings of said wheels, respectively, substantially as set forth.

2. In a shearing-machine, in combination with a pair of shearing-wheels, a bracket having the bearings for said wheels, the portion of said bracket which connects said bearings being located on the discharge side of the wheels in the plane of their shearing-faces and completely traversed by said plane, said bracket having also two abutments extending, respectively, in opposite directions from said plane and having divergently-sloping faces in planes which intersect beyond the contact of the shearing-wheels, substantially as set forth.

3. In combination with the frame-bar B, a bracket, E, and the shearing-wheels journaled thereon, said bracket having the portion which connects the bearings of the wheels, respectively, located on the discharge side of the wheels in the plane of the shearing-face of the wheels and completely traversed by said plane, the bracket being connected to the frame-bar beyond said portion which connects the bearings, substantially as set forth.

4. In a shearing-machine, in combination with the frame-bar B, two or more brackets, E, a pair of shearing-wheels journaled on each of them, the portion of the brackets which connects the bearings of



said wheels being located on the discharge side of the wheels and extending across the plane of their shearing-faces and completely traversed by said plane, said brackets being secured to the frame-bar beyond that connecting portion, and one or more of them being adjustable longitudinally with respect to the frame-bar, substantially as set forth.

5. In a metal-shearing machine, in combination with the shearing-wheels, a bed to support the plate or sheet to be cut, a gage-plate upon said bed, and interfitting ways and guides on the bed and gage-plate, parallel to the plane of the shearing-face, and a clamp to bind the plate which is to be cut to the gage-plate, substantially as set forth.

6. In combination, substantially as set forth, the frame, the shearing-wheel shaft D, supported on it, the bed rigid with it, and the gage-plate sliding on the bed and having the clamp-lever H^3 to bind the plate which is to be cut, said lever extending far enough from the bed to collide with the shaft D, whereby the feeding action of the shearing-wheels causes the shaft to unlock the sheet at the end of the cut.

7. In a shearing-machine, in combination, substantially as set forth, the frame-bar B, having elongated bolt-holes b', with intervening necks of metal, B', a bracket, E, having bearings for the shearing-wheels, and having two bolt-holes, e', as far apart as the width of the necks B', and the bolts E', adapted to pass through the holes b' and into one of the holes e'.

397,021. METAL-SHEARING MACHINE. LA VERNE W. NOYES, Chicago, Ill. Filed Aug. 2, 1888. Serial No. 281,754. (No model.)

Claim.—1. In a shearing-machine, in combination with the shearing-wheels, the train of gearing by which they are both revolved, said train being continuous by means of its contacting parts from one wheel to the other, and extending across and being traversed by both the plane of the sheet to be cut and the plane of the cutting-edges of the shearing-wheels, substantially as set forth.

2. In a shearing-machine, in combination with the shearing-wheels, their shafts, and gears on said shafts, respectively, the frame in which said shafts are journaled, having the portion which connects the bearings of said shafts extending across the vertical plane of the shearing-faces of the wheels on the discharge side of the wheels through the rift in the severed sheet, and having bearings for two counter-shafts, one of said counter-shafts extending also through the rift in the severed sheet, intermeshing gears on said shafts, respectively, and a gear on each of them intermeshing with the gears on the shearing-wheel shafts, respectively, substantially as set forth.

3. In a shearing-machine, in combination with the shearing-wheels and the train of gears by which they both are revolved, said train being continuous in and by means of its successively contacting parts from one shearing-wheel to the other, and crossing and being traversed by both the plane of the sheet to be cut and the plane of the cutting-edges of the shearing-wheels, the frame in which the shafts of said train obtain bearings, having the portion which connects the bearings of the two shearing-wheels crossing the plane of the cutting-edges on the discharge side, substantially as set forth.

4. In a shearing-machine, in combination with the shearing-wheels, the frame in which said wheels are journaled, having the part which connects the journal-bearings of said wheels crossing and traversed by the plane of the cutting-edges of the wheels, two counter-shafts journaled in said connecting part, and gear-wheels on them, respectively, and a gear-wheel rigid with each of the shearing-wheels, and intermeshing, respectively, with the said gear-wheels on the counter-shafts, one of said counter-shafts extending across the plane of the cutting-edges of the wheels, substantially as set forth.

5. In a shearing-machine, in combination with the shearing-wheels, the frame having the bearings for said wheels both on the same side of the plane of the cutting-edges and apertured entirely through from receiving to discharging side between said bearings transversely to said plane, each aperture extending in from the side of said plane on which the bearings are located to said plane, substantially as set forth.

6. In a shearing-machine, in combination with the shearing-wheels, the frame having the bearings for said wheels both located on the same side of the plane of the cutting-edges and apertured entirely through from receiving to discharging side between said bearings transversely to said plane, such aperture extending in from the side of the plane on which said bearings are located to said plane, gear-wheels rigid with the shearing-wheels, respectively, and two counter-shafts journaled in the frame, having their axes one above and one below the said aperture, and gears thereon meshing with the shearing wheel gears, respectively, substantially as set forth.

7. In a shearing-machine, in combination with the shearing-wheels, the frame in which they are journaled, having the portion which connects the journal-bearings of the shearing-wheels located beyond the cutting-point of the wheels toward the discharge side, and having two faces, one upon each side of the plane of the cutting-edges, sloped to divert the severed edges of the metal in opposite directions, substantially as set forth.

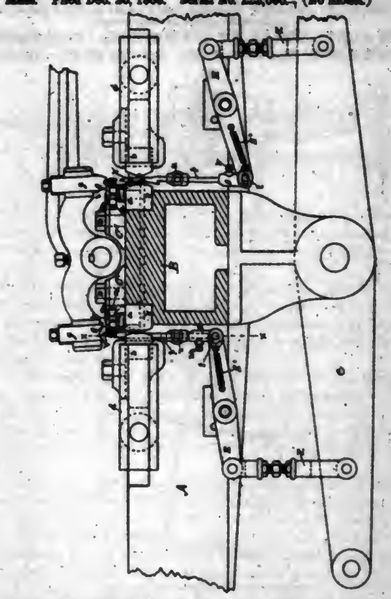
8. In a shearing-machine, in combination with the shearing-wheels, the frame in which said wheels are journaled, having the bearings for said wheels both on the same side of the plane of the cutting-edges, the gears B^{10} and B^{20}, rigid with said shearing-wheels, respectively, and a train by which said gears are actuated, the housings a^7 a^8 over said gears, respectively, being formed integral with their journal-bearings, and extending over said gears from the receiving side of the shearing-wheels nearly to the vertical plane of the cutting-point, substantially as set forth.

9. In a shearing-machine, in combination with the shearing-wheels and a train which actuates them, an integral frame having the bearings for the shearing-wheels, the portion which connects said bearings crossing and traversed by the plane of the cutting-edges of the wheels on the discharge side, bearings for the driving-train in said connecting portion, housings for the gears, and guiding-surfaces for the discharge of the metal, all substantially as set forth.

10. In combination, substantially as set forth, the shearing-wheels and their driving-train, said train comprising a shaft which, from a point located on one side of the plane of the cutting-edges beyond the vertical plane of the cutting-point toward the discharge side, extends obliquely toward the opposite side of the plane of the cutting-edges and away from the plane of the sheet to be cut and toward the receiving side of the wheels, and a handle on said shaft by means of which it may be rotated.

11. In combination, substantially as set forth, the shearing-wheels and the frame in which they are journaled, having bearings for said wheels both on the same side of the plane of the cutting-edges, and the aperture A^6 between said bearings, the housings A^7 and A^8, adjacent to said bearings, respectively, one above and one below said aperture, the counter-shafts C^{10} and C^{20}, extending one above and one below said aperture and having fixed on them the gears located in said housings, respectively, and the gears B^{10} and B^{20}, rigid with the shearing-wheels and driven by the housed gears, substantially as set forth.

12. In a shearing-machine, the frame comprising the bearings of the shearing-wheels, both on the same side of the plane of the cutting-edges, and the bearings for the counter-shafts, both located on the opposite sides of said plane, substantially as set forth.



13. In a shearing-machine, in combination with the shearing-wheels and the gears on their shafts, through which they receive motion, a pair of counter-shafts having gears which drive the shearing-wheels, respectively, and having their axes located in a plane oblique to the plane of the axes of the shearing-wheels, intermeshing gears on said shafts respectively located on the opposite sides of the plane of the cutting-edges of the shearing-wheels from that at which the plane of the axes of said counter-shafts intersects the plane of the axes of the shearing-wheels, substantially as set forth.

14. In a shearing-machine, in combination with the shearing-wheels, the frame in which they are journaled, having the bearings for the shearing-wheels on the same side of the plane of the cutting-edges and apertured between said bearings from one side to the plane of the cutting-edges, gears rigid with the shearing-wheels, respectively, counter-shafts journaled in said frame, having on them gears which actuate, respectively, the shearing-wheel gears, said counter-shafts having their bearings on the opposite side of the plane of the cutting-edges from that of the aperture between the shearing-wheel bearings, the axes of said counter-shafts being in the same plane, and that plane being oblique to the plane of the axes of the shearing-wheels and intersecting said plane on the opposite side of the plane of the cutting-edges of the wheels from the bearings of said counter-shafts, substantially as set forth.

15. In a metal-shearing machine, in combination with the shearing-wheels, the center-block F, having its face substantially in the plane of the sheet to be cut, and journaled in a bearing which is adjustable laterally with respect to the plane of the cutting-edges, the axis of said bearing being transverse to the plane of the sheet, said block turning freely in its said bearings, substantially as and for the purpose set forth.

16. In a shearing-machine, in combination with the shearing-wheels, the center-block F and the bearing in which it is journaled, adjustable laterally in respect to the shearing-faces of the wheels, the face of said center-block being substantially in the plane of the sheet to be cut and surfaced with rubber or like material, whereby the sheet may be kept from slipping upon it, substantially as set forth.

397,022. WIRE-NAIL MACHINE. EDWARD B. PARKHURST, Woburn, Mass. Filed Dec. 20, 1886. Serial No. 222,090. (No model.)

Claim.—1. A wire-nail machine having a positively-acting device, as arms *p*, provided with suitable operating mechanism, whereby the section of wire is seized in the position in which it is cut and moved into position to be acted upon by the dies, substantially as shown and described.

2. In a wire-nail machine in which a section of wire of proper length is cut at one point and formed into nails at another, a pair of positively-reciprocated arms having suitable operating mechanism and provided with notches for the reception of the nail-wire, in combination with a device, as the flange *h* and spring-impelled bolts *j*, for holding the section securely in the position in which it is cut until it is seized and carried downward by the hooks on arms *p*, substantially as set forth.

3. In a wire-nail machine, the combination, with the nail-forming dies, of the vertically-moving arms *p*, sliding in holes in the rocker-shaft *u* and beveled, as at *v*, at their upper ends, and secured by sliding pivot and spring *d'* to their actuating-lever E, whereby as said arms are moved upward in line with the wire which is next to be fed to the dies the upper end will move backward out of line of the wire and allow the hook to pass above it, all as set forth.

4. In a wire-nail machine, the combination, with the nail-dies, of a vertically-moving notched arm and its operating mechanism, the notch in said arm moving across the face of the dies in line with the nail and clearing it therefrom, substantially as set forth.

5. In a wire-nail machine, the combination, with the nail-dies, of the rods *o* and spring-actuated arms *k*, set in recesses in the face of one of the dies, for the purposes and substantially as shown and described.

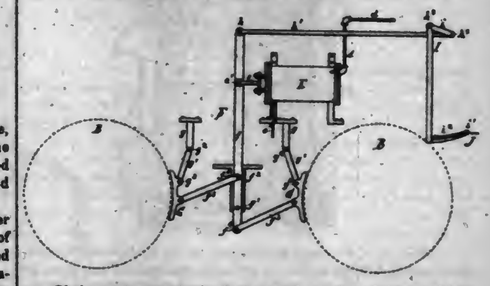
6. In a wire-nail machine, the plate C, provided at its front edge over the face of the fixed die with a downwardly-open recess to receive the length of wire as it is fed into the machine, in combination with the spring-actuated bolts *j*, whereby the section of wire is held substantially in the position in which it is cut until seized by the mechanism by which it is carried to the dies, substantially as set forth.

7. In a wire-nail machine, the combination, with the nail-dies, of the hooked feeding-arms and their actuating mechanism, the rods *o*, arms *k*, bolts *j*, and flanges *h*, substantially as shown and described.

8. In a wire-nail machine, the combination, with the nail-dies, of the vertically-moving positively-actuated hooked feeding-arms *p*, adjustably secured to their actuating-levers by blocks *s* and check-screws *w*, whereby the height of movement of the arms *p* may be regulated, for the purposes and substantially as set forth.

9. In a wire-nail machine, the combination, with the nail-dies, of reciprocating feeding-arms, as *p*, their actuating-levers E and *c*, and the adjustable connecting-rod *z*, whereby the throw of said feeding-arms may be accurately adjusted, all as set forth.

397,023. NUT-CRACKER. FRANCIS J. RABBETH, Boston, Mass. Filed Feb. 24, 1888. Serial No. 265,163. (No model.)



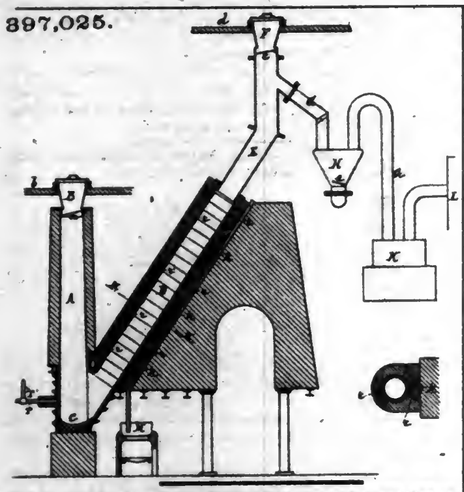
Claim.—1. A nut-cracker comprising two members provided near one end with jaws or faces to engage the nut to be cracked, and a connecting bar or link pivotally connected with one of said members and adjustably connected with the other of said members, as set forth, whereby the distance of the jaw ends from one another may be varied, substantially as described.

2. The combination of the two handled jaw members of a nut-cracker with a threaded bar pivotally connected with one of said members and a nut co-operating with said bar, connected with the other of said members, substantially as described.

3. The combination of the members *a b*, the threaded bar *d*, pivotally connected with one of said members, and the adjusting-nut having external and internal threads of opposite inclination, one co-operating with said bar *d* and the other co-operating with the other of said members of the nut-cracker, substantially as described.

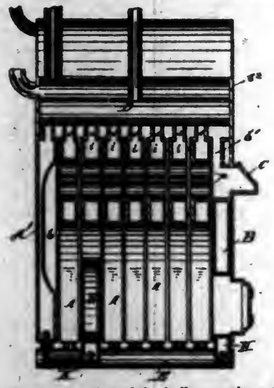
397,024. STEAM-BRAKE FOR LOCOMOTIVES. PATRICK REILLY, Mattoon, Ill. Filed Mar. 19, 1888. Serial No. 267,899. (No model.)

Claim.—A steam-brake for locomotive and tender, comprising, in combination, a horizontal steam-cylinder arranged above the driving-wheels, a vertical brake-lever arranged between the driving-wheels and connected by means of links with the suspended brake-shoes of the driving-wheels, and a pull-rod arranged above the steam-cylinder and connecting the vertical brake-lever with the brake mechanism of the tender, all constructed substantially as described.



397,025. BLAST-FURNACE FOR REDUCING ZINC. FERNAND RENAUD, Ales, Gard, France. Filed Feb. 2, 1888. Serial No. 262,786. (No model.) Patented in France Dec. 22, 1887, No. 187,763; in England Dec. 27, 1887, No. 17,809; in Belgium Dec. 27, 1887, No. 80,068; in Italy Jan. 3, 1888, XXI, 23,250, XLV, 157; in Norway Jan. 11, 1888, No. 743, and in Spain Mar. 22, 1888, No. 7,730.

Claim.—1. A furnace for the reduction of volatile metals, comprising an ore cupola or reducer and a fuel-cupola connecting with said ore-cupola at the melting-pot in the bottom of the latter, said fuel-cupola being inclined and having suitable grooves in its inner surface for the recovery of the vaporized metal condensed within said cupola, substantially as set forth.



2. In a furnace for reducing the ores of volatile metals, the combination, with the ore cupola or reducer, of the inclined fuel-cupola D, connected with the lower part of the ore-cupola, said cupola D being provided with grooves and channels *r k* for the recovery of the vaporized metal, substantially as set forth.

3. The combination, with the ore-cupola A, provided with a melting-pot, C, and tuyere, of the inclined cupola D, connecting with the cupola A at its lower end, the dust-box H, the washer K, the chamber L, and the pipes G, connecting said box, chamber, and washer with the elevated part of cupola D, substantially as set forth.

397,025.

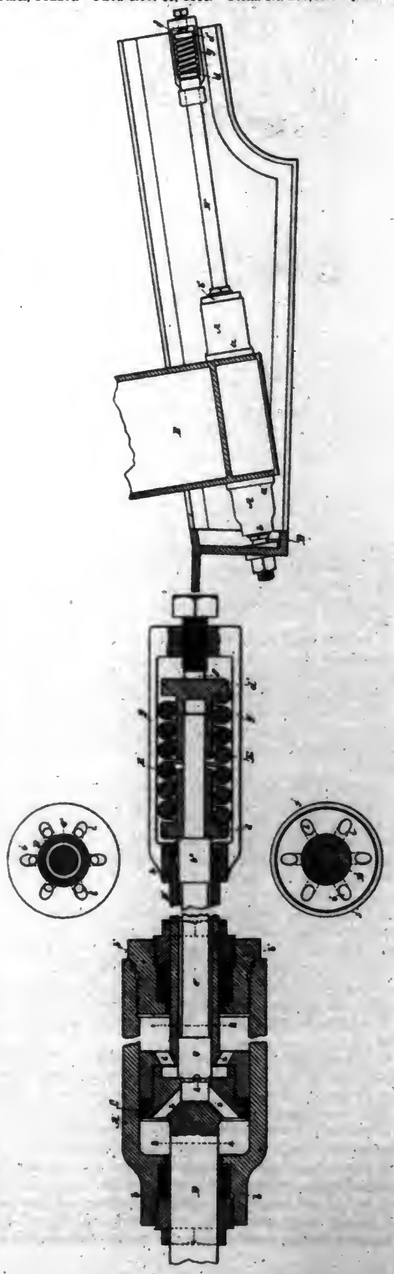
397,026. SECTIONAL STEAM-BOILER. JOHN J. RUFF and MICHAEL A. RUFF, Doylestown, Pa. Filed June 16, 1888. Serial No. 277,328. (No model.)

Claim.—1. The combination of the hollow sections, the combustion-chamber, the manifolds, and the hollow bridge-wall extending between and secured to the manifolds by means of hollow water-tight joints, whereby the interiors of the sections, manifolds, and bridge-wall are in communication with each other, as set forth.

2. In a sectional boiler, the combination of the combustion-chamber, the sections, the manifolds, the hollow front provided with an opening for the fire-door, and a hollow casting extending between the front ends of the manifolds at the bottom of said opening, said casting being secured to and in communication with the interior of the manifolds, in the manner and for the purpose substantially as described.

3. The combination, with the hollow vertical sections, and the hollow back, of the hollow bridge-wall in communication with said sections, and connections whereby direct communication is established between the bridge-wall and the hollow back.

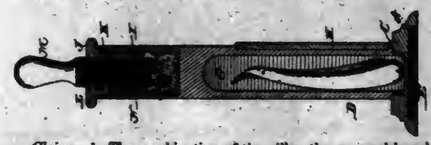
4. In a sectional boiler, the combination of the hollow vertical sections, the upper edge of each section being concaved, the combustion-chamber, the horizontal flues, a rear flue from combustion-chamber to horizontal flues, the upwardly-curved hood or casing secured to the tops of said sections over said concaved recesses and forming a longitudinal chamber, a flue extending from the front ends of the horizontal flues to said chamber, and the steam-drum longitudinally located in said chamber.



5. In a sectional boiler, the combination of the series of vertical hollow sections, the manifolds located beneath the ends of the sections, the sections and manifolds having registering apertures, packing-rings having beveled edges interposed between said apertures, and vertical rods passing through the manifolds, apertures, packing-rings, and upwardly through the sections, and provided with nuts on their upper ends, whereby the sections are separately and independently secured to the manifolds.

6. In a sectional boiler, the combination of the hollow sections, the manifolds, and the hollow bridge-wall extending between the manifolds and secured to the same by hollow joints, and a rod extending through the manifolds and bridge-wall.

7. In a sectional boiler, the combination of the hollow sections, the hollow bridge-wall, the manifolds, the hollow front provided with an opening in its lower portion, a hollow casting extending between and secured to the manifolds by hollow joints at the bottom of said opening, and a rod extending through the manifolds and said casting.

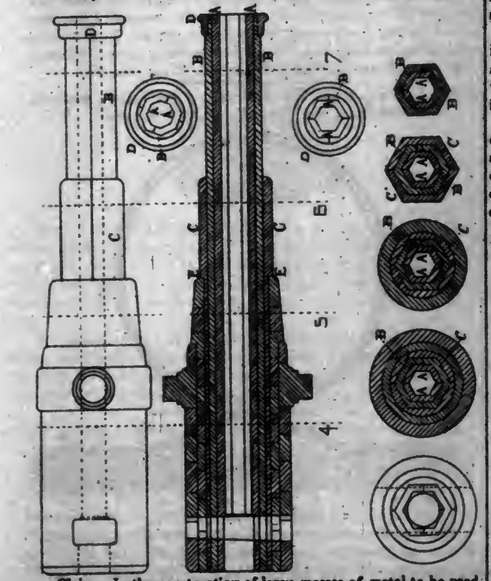


8. In a sectional boiler the combination of the hollow sections, a hollow back, a hollow bridge-wall in communication with the manifolds, and a pipe extending from the bridge-wall to the hollow back.

397,027. BUFFER FOR GUN-MOUNTINGS. HENRI SCHNEIDER, Paris, France. Filed Nov. 10, 1888. Serial No. 290,477. (No model.)

Claim.—In buffers for gun-mountings, and with the object of providing for the movements of recoil, and of placing the gun in battery without any necessity for operating any gear or part of the mechanism by hand, the combination of a hydraulic cylinder, A, with a piston, C, attached to a rod, D D', connected to the lower or fixed part of the frame, and provided with a valve, *e*, acted on by a spring, E, and presenting permanent openings or passages *k*, connecting the two ends of the cylinder through passages *i* in the piston C, said valve serving, according to its position, to open or to close more or less the passages *i*, all arranged and operating substantially as hereinbefore set forth with reference to the accompanying drawings.

397,028. COMBINATION SHAVING UTENSIL. WILLIAM SHAY, Ansonia, Conn. Filed Aug. 15, 1888. Serial No. 283,094. (No model.)



Claim.—1. The combination of the pillar, the recessed base having a central threaded aperture, and the mirror having clamping-arms adapted to engage the sides of the pillar and thereby hold the glass in position, as set forth.

2. The combination of the pillar having a recess adapted to hold one or more razors and provided with a threaded tenon at its lower end, the base or support having a threaded flange fitting the tenon of the pillar, and the sharpening hone and strops fastened upon the sides of the pillar, substantially as set forth.

3. The combination of the pillar provided on its four sides with razor-strops and having a cylindrical recess at its upper end, the soap-cup placed within the said recess, the threaded cover having a central threaded aperture, and the brush having a threaded handle adapted to be screwed into the aperture of the cover, substantially as set forth.

4. The hereinbefore-described combination shaving utensil, the same consisting of the hollow pillar D, having a threaded tenon at its lower end, recessed and removable base A, mirror E, provided with means of attachment to the base and to the pillar, soap-cup I, threaded and apertured cover J, and the brush N, all constructed and combined substantially in the manner and for the purpose shown and set forth.

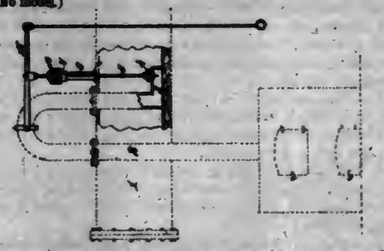
397,029. MANUFACTURE OF HEAVY GUNS, SHAFTS, &c. JOHN SELLERS, Philadelphia, Pa. Filed July 23, 1888. Serial No. 280,845. (No model.)

Claim.—In the construction of large masses of metal to be used in the manufacture of heavy guns and shafts, tube A and one or more jackets, B, said tube and jackets made each in two parts and so put together that the tube and jacket will make lap and lock joints, in combination with hoops or bands, as shown and described.

397,030. BUTTON. LOUIS SIEVERT, St. Louis, Mo. Filed Nov. 5, 1888. Serial No. 290,366. (No model.)

Claim.—The combination, with the button-head A and shank i, constructed as described, having the flat ends *x x*, of the disk A, having the central perforation, *k*, and the bowed springs *j j*, one end of each secured to the rim of the disk A, and the inner bent ends, *l l*, pivoted to the shank, as at *m*, substantially as described.

397,031. LUMINOUS OIL PROJECTILE. FERDINAND SILAS, Vienna, Austria-Hungary. Filed Oct. 12, 1888. Serial No. 287,830. (No model.)



Claim.—1. A projectile consisting of a case inclosing an oil-chamber and adapted to float in an upright position, said case having openings at top and bottom closed by plugs of a material soluble or which disintegrates in water, substantially as described.

2. In a sea-oiling projectile, the combination of the shell or case, a bag of textile material for containing oil, and plugs of sugar or like substance closing holes in said shell or case, substantially as described.

3. A projectile consisting of a case inclosing an oil-chamber, and inclosing also a receptacle or vessel containing calcium phosphide, and having openings for the exit of the oil and openings for access of water to the calcium phosphide and for egress of the self-illuminating gas generated thereby, substantially as described.

4. An oil-projectile comprising a body portion inclosing an oil-chamber, a detachable cap having perforations in its walls for the admission of water and the escape of oil, and a vessel or case for containing calcium phosphide located in said cap, and having a gas-outlet arranged to communicate with one of the perforations in said cap, substantially as described.

397,032. SEAL FOR DIP-PIPES. ORLANDO F. SMITH and GEORGE H. BARBOUR, Washington, D. C. Filed Sept. 4, 1888. Serial No. 284,571. (No model.)

Claim.—1. The combination, with a hydraulic main and with a dip-pipe entering said main, of a gas-valve seating in an opening in the foot of the dip-pipe, said valve being carried by a valve-stem which rises through a short pipe of greater diameter tapped into said main, and provided with a chamber at its end containing two valve-seats, one surrounding the mouth of the short pipe and the other surrounding an opening in the top of said chamber, the valve-stem extending through the latter opening and provided with an adjustable

duplex valve arranged within the chamber to seat and close the short pipe at the same time the gas-valve seats in the foot of the dip-pipe, and to seat around and close the opening in the top of the chamber when the gas-valve is opened, substantially as described.

2. The combination, with a hydraulic main having a short pipe tapped through its walls, of a dip-pipe entering said main, a valve-stem passing loosely through the short pipe and carrying on its end a gas-valve seating in an opening in the foot of the dip-pipe, a duplex valve having two separate valve-faces lying in a chamber formed on the end of the short pipe and provided with a valve-seat surrounding the mouth of said pipe, and a separate seat surrounding an opening in the top of said chamber, through which the valve-stem loosely passes, said duplex valve having a female thread, by which it is adjustable upon a threaded portion of the stem, substantially as described.

3. The combination, with a hydraulic main having a short pipe tapped through its wall and provided upon its end with two separate cups forming a chamber, of a dip-pipe entering the main, a valve-stem passing loosely through the short pipe and its chamber, and having a gas-valve at its end seating upon an opening in the foot of the dip-pipe, a duplex valve adjustably mounted on the valve-stem within the chamber at the end of the short pipe, said duplex valve seating alternately around the mouth of said pipe and around an opening in the top of the chamber, through which the valve-stem loosely passes, and means for raising and lowering said valve-stem, substantially as described.

4. The combination of a hydraulic main, a dip-pipe curved over the main, descending thereinto, and having a foot dipping in the liquid, and provided in its top wall with a gas-valve seat, a pipe secured to the main, rising therefrom, and provided at its top with a sectional cup containing an upper and a lower valve-seat, a rigid valve-stem extending up through the cup-carrying pipe and through the cup thereon, having a valve at its lower end to close on the valve-seat of the foot on the dip-pipe, and provided with a duplex-faced valve located in the cup and adapted to close alternately upon the upper and lower valve-seats thereof, and a lever suitably connected with the valve-stem above the cup for operating said stem and its valves, substantially as described.

397,033. LINIMENT. SAMUEL SOMERVILLE, Cloquet, Minn. Filed Sept. 24, 1888. Serial No. 286,251. (No specimens.)

Claim.—The herein-described composition of matter, consisting of alcohol, camphor-gum, oil of origanum, oil of turpentine, rock-oil, nitrate of potassa, castile-soap, and soft water, mixed in about the proportions set forth.

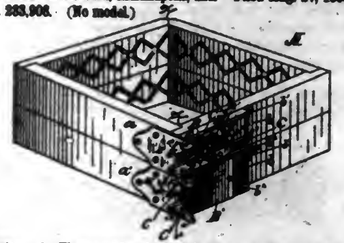
397,034. CLASP. FREDERICK B. SPOONER, Brooklyn, N. Y. Filed Oct. 2, 1888. Serial No. 287,019. (No model.)

Claim.—1. A clasp for garments, substantially as set forth, comprising two parts, consisting of a slotted plate and a cam-slotted latch pivoted to said plate and adapted to be operated by the stud eye or shank which it secures.

2. A clasp adapted to be operated by a stud, substantially as set forth, comprising a stationary slotted plate with an unattached bent-over end and a cam-slotted latch pivoted thereto, and whose bent-over end incloses the front part of said latch.

3. A clasp adapted to be operated by and secure a stud eye or shank, substantially as set forth, consisting of a plate constructed of a piece of doubled sheet metal having a slot therein for the reception of the stud eye or shank, and a cam-slotted latch pivoted to said plate and inclosed thereby.

4. A clasp adapted to be operated by and secure a stud eye or shank, comprising a doubled sheet-metal plate having a slot therein and a latch pivoted thereto having an operating-guard, a hooked end, and a slot with a cam projection.



5. A clasp, substantially as described, comprising a slotted plate and a latch pivoted thereto having an open slot with a cam projection, in combination with an adjacently-situated stud for operating and engaging said latch.

6. A clasp adapted to be operated by a stud, substantially as set forth, comprising a slotted plate with a bent-over unattached end and a cam-slotted latch pivoted thereto having an overhanging hooked end provided with a front curved edge.

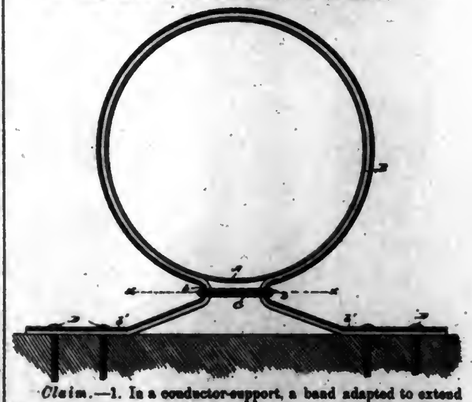
7. A clasp comprising a slotted plate, a latch having an open slot with a cam projection pivoted to said plate below the slot thereof, and an adjacently-situated stud or its equivalent adapted to engage the slots in said plate and latch and close said latch independent of spring action, substantially as described.

8. A corset-fastening having studs or equivalents on one steel thereof and slotted plates secured to the opposite steel in alignment with the said studs, each plate having a cam-slotted latch pivoted thereto and operating through said slotted plate, adapted to be actuated by and secure said studs, substantially as described.

397,035. SNAP-FLASK LOCK. MARTIN B. SPRINGER, Brightwood, and JOHN C. HIGGINS, Indianapolis, Ind. Filed Aug. 27, 1888. Serial No. 283,908. (No model.)

Claim.—1. The combination, with a cope and drag, of locks, each consisting of notched catches and pivoted notched latch-bars, the catches and latch-bars having their contacting edges beveled longitudinally and transversely, substantially alike but oppositely, as set forth, and for the purpose described.

2. The combination, with the cope and drag, of locks, each consisting of the notched catches a and a', having the compound bevels a^{10} a^{11}, the pivoted notched latch-bars C and C', having the compound bevels c^6 c^7, and a spring to facilitate the engagement of the latch-bars and catches, substantially as and for the purpose described.

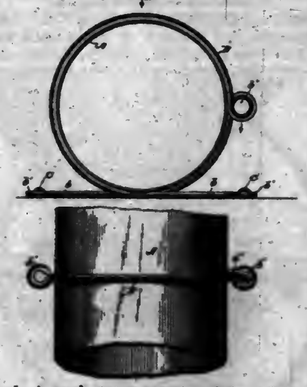


3. In a flask, the plate b, secured to one end of the cope, the latch-bar C, pivoted to said plate and having the compound bevel c^7 at its forward end, and notch c^8, in combination with a similarly notched and beveled catch, e, secured to a plate fastened to the opposite open end of the cope, substantially as and for the purpose set forth.

4. The combination, with a cope and a drag, of locks having the two adjacently-located spring-actuated pivoted latch-bars C, having hand-holds backwardly projected from the pivotal points, whereby said latch-bars may be simultaneously opened by pressing the hand-holds together, substantially as described.

5. The latch-bars C and C', pivotally secured to the case-plate b, the plate b, and the spring H, in combination with the link D, pivotally secured to the plate b and engaging with pin c^5 on bar C', substantially as and for the purpose specified.

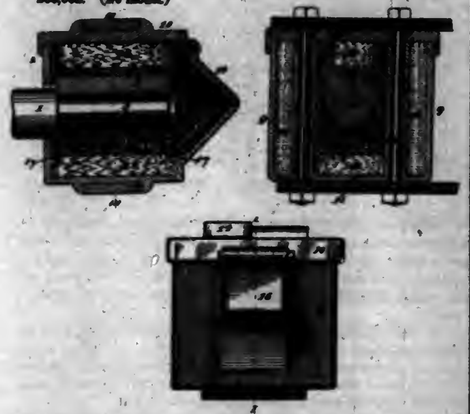
6. The combination, with a cope and a drag, of locks, each consisting of the latch-bars C and C', pivoted to the case-plate b, the case-plate b, the link D, connecting the latch-bars, and the latch-bar-actuating spring, the latch-bars C of the cope and drag being adjacent to each other, all arranged substantially as shown and described.



397,036. CONDUCTOR-SUPPORT. DAVID STRUBY, Monticello, Wis. Filed May 8, 1888. Serial No. 273,195. (No model.)

Claim.—1. In a conductor-support, a band adapted to extend nearly about the circumference of a conductor-pipe and having its ends turned outward for attachment to a wall, and a link connecting the bends in said band and adapted to draw them together and clamp the band about the conductor.

2. The band B, having its ends turned outward, forming bends b and feet b', in combination with the open link C, connecting the bends b and adapted to draw them together, substantially as and for the purpose set forth.



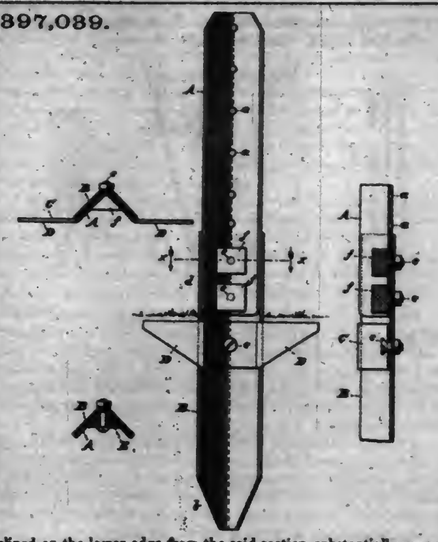
397,037. CONDUCTOR-SUPPORT. DAVID STRUBY, Monticello, Wis. Filed May 8, 1888. Serial No. 273,196. (No model.)

Claim.—1. A conductor-support consisting of a single wire adapted to encircle a conductor-pipe and having ends formed for attachment to a wall, and an intermediate loop or eye adapted to be twisted for shortening the wire after its application to the conductor, substantially as and for the purpose set forth.

2. The conductor-support consisting of the wire B, bent to encircle a conductor-pipe and formed with an eye, b', and having ends b, provided with eyes b' for attaching the support to a wall, substantially as and for the purpose set forth.

397,038. SELF-COOLING JOURNAL-BOX. JULIUS W. STOREY and JOSEPH OLSON, Cotton Gin, Tex. Filed Oct. 15, 1888. Serial No. 288,062. (No model.)

Claim.—1. In a self-cooling journal-box, the combination of the walls 4, having top 6 and bottom 7, supporting the lubricating packing, and the housing 9 10, forming water-chamber 12 below and at the sides of the chamber formed by the walls 4 and bottom 7, and water-chamber 13 above the top 6, substantially as and for the purpose set forth.



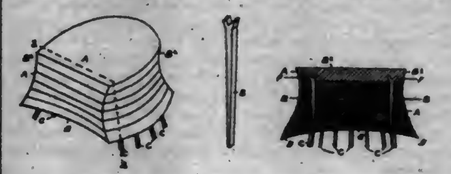
2. In a self-cooling journal-box, the combination of the walls 4, having top 6 and bottom 7, housing 9, cover 10, packing 17, and a funnel on the cover, having perforations 15 at its bottom for filling the respective chambers 12 and 13, substantially as set forth.

397,039. FENCE-POST. JEPTHAH M. TERRELL and CHARLES GARVER, Spring Hill, Ohio. Filed Oct. 4, 1888. Serial No. 287,182. (No model.)

Claim.—1. The combination, with the metal fence-post, consisting of two sections V-shaped in cross-section, of the bolts having the wedge-shaped head and the anchor-plate having its central portion conforming to and secured to the lower section, and having the lateral wings inclined upward and outward, substantially as specified.

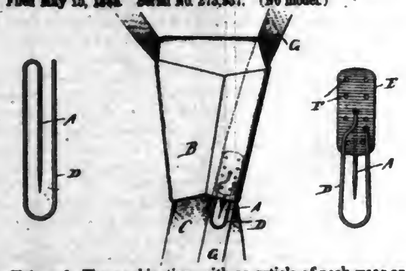
2. In a fence-post, the combination of the upper V-shaped section having the openings, the lower V-shaped section lapping thereon and having the pointed lower end, the bolts having the wedge-shaped heads, and the anchor-plate having its central portion conforming to the lower section and bolted thereto, and having the lateral wings inclined on the lower edge from the said section, substantially as specified.

397,089.



397,040. WEIGHING AND PRICE SCALE. ORVILLE W. VAN DEBOGERT, Schuylerville, N. Y. Filed July 26, 1888. Serial No. 281,116. (No model.)

Claim.—1. The combination of a suitable standard, a rigid frame, B', supported upon the said standard, a balance-frame, D, pivotally supported upon the said frame B', a platform, G, pivotally supported upon the said frame D, a beam, K, secured to the balance-frame, a revoluble indicating-cylinder, M, journaled upon this beam K, a graduated beam, N, secured to the frame D, and extending out parallel with and to one side of the said indicating-cylinder, and a sliding weight upon this beam N, the said cylinder M being graduated and marked off, substantially as shown, and for the purpose described.



2. The combination of a suitable standard, a stationary frame, a balance-frame supported upon the stationary frame, a platform, G, supported upon the balance-frame, a tabular beam, K, adjustably secured to the said balance-frame, a revoluble indicating-cylinder upon this beam, this cylinder being provided with suitable figures and spaces, a stationary graduated beam, N, secured to the said balance-frame and extending out parallel with and in front of the cylinder, the forward end of this graduated beam being connected to the forward end of the beam K by an arm, a sliding graduated rod, R, inserted in the outer end of the said hollow beam K, and provided with a weight, S, and a sliding weight, P, upon the said graduated beam N, substantially as and for the purpose described.

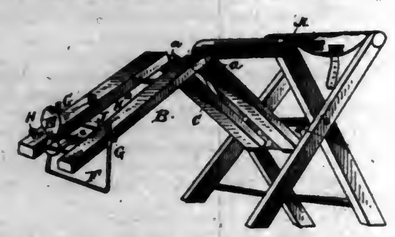
397,041. HEEL FOR BOOTS OR SHOES. HAROLD A. WEBSTER, Haverhill, Mass. Filed Feb. 18, 1888. Serial No. 264,537. (No model.)

Claim.—A nail-charged heel for boots and shoes and in which the lifts are secured together by nails having V-shaped heads and points severally projected beyond the lifts on opposite sides of the heel, and the top lift secured or sparked on, the nail-heads severally embedded and clinched therein by a spread of their opposite wings or members, substantially as described.

397,042. NECKTIE-FASTENER. JOSEPH WEIL, New York, N. Y. Filed May 15, 1888. Serial No. 273,937. (No model.)

Claim.—1. The combination, with an article of neck-wear and a neck-band, of a pin projecting from the bottom edge of the shield part of said article of neck-wear, and a wire guard surrounding said pin, also projecting from the bottom edge of said shield part and connected with or fastened to the shield part at that end only opposite the one that is adjacent to the point of the pin, substantially as herein shown and described.

2. The combined pin for fastening neck-bands of scarfs and a guard for said pin, composed of a piece of wire bent to form a U-shaped or loop-shaped guard, the upper end of one shank being extended downward between the shanks of the guard and pointed to form a pin, and the other end of the wire being adapted to be attached to the shield or plate, substantially as herein shown and described.

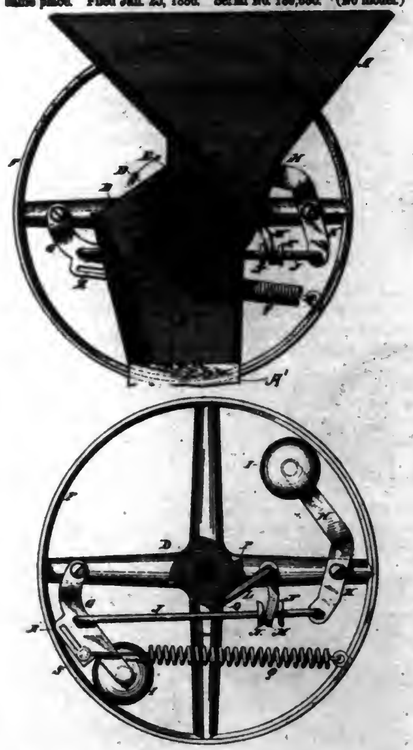


397,043. SPIRIT-LEVEL. RODOLPHUS D. WERDEN, Cincinnati, Ohio. Filed May 18, 1888. Serial No. 274,269. (No model.)

Claim.—1. In a spirit-level, the stock on both sides of the spirit-tube chamfered down at an angle, in combination with the tube and the dividing-plate located centrally over the tube and in close proximity thereto, substantially as herein set forth.

2. In a spirit-level, the stock on both sides chamfered off at an angle, in combination with the tube and the dividing-plate having the central notch, substantially as herein set forth.

397,044. STOOL OR SEAT. CHRISTIAN W. WIENKING, Walhalla, S. C. Filed June 23, 1888. Serial No. 277,963. (No model.)



Claim.—1. A folding stool, and a cross-bar secured to the legs of the same at a distance below the seat at or near the center of the legs, in combination with a folding arm composed of two sections hinged together, the inner section hinged to the cross-bar at its inner end to fold upwardly against the stool, or to extend forwardly and upwardly from the same when in operative position, and movably hold the outer section, continuing forwardly and downwardly from their adjoining hinged ends to support the lower half of the leg of an occupant, and a foot-holder hinged to the outer section to fold upon the same and having a stop to hold it in operative position, substantially as described.

2. A portable seat for the use of boot-blacks, comprising a cross-legged folding stool having a flexible seat provided with a receptacle for the blacking implements, a folding arm hinged to a cross-bar of the seat to hold a leg of the occupant, a foot-holder hinged to the outer portion of the arm, and a support to adjustably support the outer end of the arm, substantially as described.

3. A boot-black's folding chair or stool having a flexible seat provided with a flexible pocket or receptacle upon its under side, and a catch for holding the same closed, substantially as described.

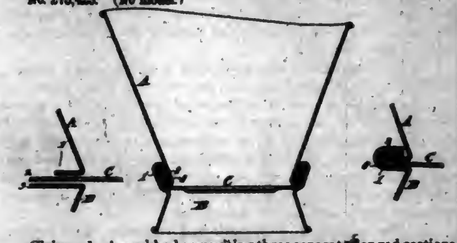
397,045. FEED-REGULATING MECHANISM. JAMES F. WINCHELL, Springfield, Ohio, assignor to the Foos Manufacturing Company, same place. Filed Jan. 25, 1886. Serial No. 189,690. (No model.)

Claim.—1. The combination, with a hopper, of a feeding-roller, a ratchet, a wheel, and a governor and a pawl mounted on said wheel, and a spring connecting the governor with the wheel, substantially as described, whereby the feeding-roller is engaged with the wheel and disengaged therefrom according to the speed at which the wheel is revolved.

2. The combination, with a hopper, of a feeding-roller, a wheel, pivoted weighted arms carried thereby, a pitman, a spring, and a pawl and ratchet to engage said wheel with the feeding-roller, whereby when the wheel attains a given speed the material is fed and when the wheel falls below that speed the material is cut off.

3. The combination, with a hopper having a bottom partially across it, a shaft mounted in said hopper, a ratchet, and a feeding-roller mounted on said shaft within the hopper and eccentrically to the bottom thereof, of a wheel mounted on the roller-shaft, arms pivotally attached to said wheel, a connecting-pitman, a pawl actuated by said arms and pitman to engage the wheel with the shaft, and a spring to break said engagement.

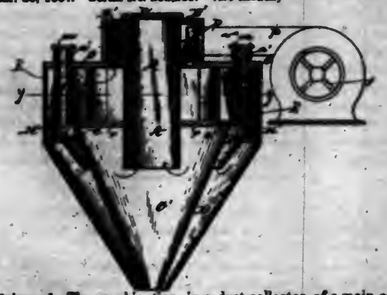
4. The combination, with a mill and its hopper, of a feeder co-operating with said hopper, a rotating governor mounted in proximity to said feeder, and clutch devices actuated by the governor to connect the governor and feeder-shaft together when the governor reaches a given speed and disconnect them when the governor falls below said speed, whereby in the one instance the feeder is actuated and the cereals fed and in the other instance the feeder is not actuated and the cereals not fed.



5. The combination, with the hopper consisting of a receiving portion, the throat portion, and a curved bottom located at the juncture of the receiving portion and said throat and extending partly across the latter, of a grooved feeding-roller mounted within the hopper and eccentrically to the bottom thereof and forming a tapering space between the said bottom and its periphery, and adapted to feed the material when rotated and to cut off the feed when stopped, a ratchet, the roller-shaft on which it is mounted, a wheel on said shaft, governor mechanism carried thereby and consisting of pivoted arms having weights and a pitman connecting them, and a pawl controlled by said pitman and thereby made to engage and disengage said ratchet.

397,046. ARTIFICIAL HONEY-COMB. LEWIS A. ASPINWALL, Three Rivers, Mich., assignor, by direct and mesne assignments, to Walter Alexander and Mary E. Bean, same place, and F. E. Aspinwall, Londonville, N. Y. Filed June 12, 1888. Serial No. 276,851. (No model.)

Claim.—An artificial honey-comb composed of an end-grain slab of wood with cells parallel to the grain of the wood, the entire surface being coated and the pores filled with wax, substantially as specified.



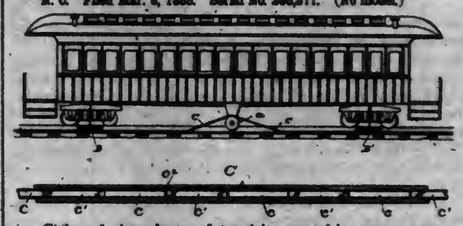
397,047. COAL-HOD. EDWARD BARRATH, Cincinnati, Ohio, assignor to Victor E. Knecht, same place. Filed May 29, 1888. Serial No. 275,623. (No model.)

Claim.—1. A coal-hod comprising three separate flanged sections of metal, the body A, the bottom C, and the base-rim B, one section having a short flange, 1, and the other sections having two longer flanges extending around the outer edge of the short flange to a point behind the latter, substantially as described.

2. A coal-hod consisting of the body A, having its lower edge bent upward to form the short flange 1, and the bottom C and base-rim B, having their edges bent to form the longer flanges, 2 and 3, which extend upward and around the outer edge of the short flange and project down between the latter and the body, substantially as described.

397,048. DUST-COLLECTOR. EUGENE BRETNEY, Indianapolis, Ind., assignor to the Bretney Dust Collector Company, same place. Filed Mar. 23, 1887. Serial No. 232,205. (No model.)

Claim.—1. The combination, in a dust-collector, of a main cylindrical chamber having a series of deflectors and tubes arranged in circular lines within said chamber, partitions or rings forming the bottom of the chamber, conical shells secured to the lower edge of said chamber and said rings, said shells being located one within the other, a tube concentric therewith, having a valve at its upper end, a cylindrical chamber surrounding the upper portion of said tube and having its lower edge attached to the top of the main chamber, and an air-spout leading into the same, substantially as described.



2. In a dust-collector, the combination of the inclosed cylindrical casing E, formed with an air-inlet, the tube A, concentric therewith, a bottom to said casing provided with a series of annular openings, a series of deflectors arranged in circles between said annular openings above said bottom, and the series of conical shells with open bottoms secured to the edge and bottom of said casing E, substantially as set forth.

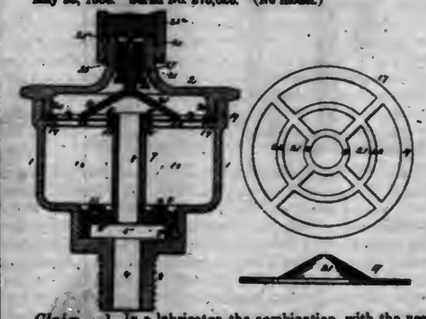
3. In a dust-collector, the combination of a main separating-chamber, and a cylindrical separating-chamber secured above the same and communicating therewith and provided with a pure-air escape-tube, having an opening and closing cover or valve.

4. The combination, in a dust-collector, of the casing E, provided with the cover C, having a central opening, the casing B, arranged above said opening and provided with the cover B', and an air-inlet, the bottom of said casing composed of the rings r and H, the tube A, extending through said cover B' and said bottom, the series of deflectors c, arranged on the ring r, the series of deflectors d' on the ring H, the tubes d, extending up through said ring H and the cover C, and the series of conical shells D, C, and F, formed with discharge-openings secured to the lower edge of said casing E and to the rings forming its bottom, substantially as set forth.

5. The combination, in a dust-collector, of the main cylindrical casing E, provided with an air-inlet, the bottom therefor being composed of rings leaving annular openings, the series of deflectors above said bottom, and conical shells with open bottoms below said bottom, forming separating-chambers, and pure-air-escape tubes extending from each separating-chamber out through the machine, substantially as set forth.

397,049. RAILWAY-TELEGRAPHY. BAYLIS CABE, Louisburg, N. C. Filed Mar. 6, 1888. Serial No. 266,377. (No model.)

Claim.—1. A conductor of electricity, comprising permanent magnets and pieces of attractable metal placed alternately and in contact with each other and suitably insulated, substantially as set forth.



2. In a conductor of electricity, the combination of permanent magnets and pieces of attractable metal placed alternately and in contact with each other and an insulating band or covering inclosing the same, and to which they are suitably fastened, substantially as shown and described.

3. In a conductor of electricity, the combination of permanent magnets and pieces of attractable metal placed in contact with each other, a suitable inclosing band or covering of insulating material, and rivets or other suitable conductible fastenings securing said magnets and attractable metal to the upper portion of the covering, and being exposed above the top of the same, substantially as shown and described.

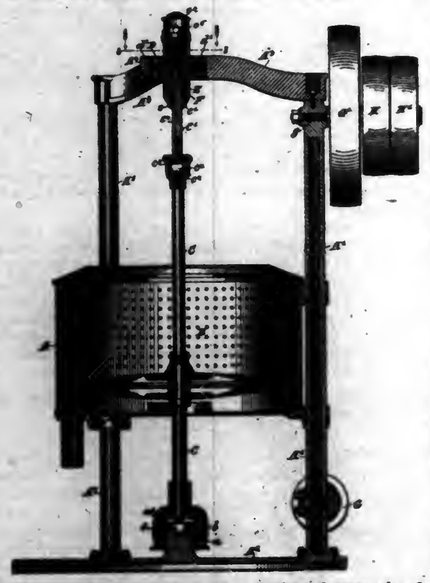
4. In combination with a car or other movable body carrying an idle-wheel, or described equivalent, a sectional conductor of electricity insulated and resting upon said idle-wheel or the like, whereby movement of the car or movable body will cause the conductor to be raised at that point and its continuity to be broken, substantially as and for the purpose set forth.

5. The combination, with a car or other movable body, of metallic brushes depending therefrom and electrically connected with each other through the car, an idle-wheel, cam, or the like carried by the car between the brushes, and electrical conductor composed of permanent magnets, attractable material placed alternately and in connection with each other, an insulating-covering and conductible fastenings securing said magnets and attractable material to the insulation and extending above the same, all arranged substantially as and for the purpose set forth.

397,050. OILER. DIETMAR J. M. CORNERS, Effingham, Ill. Filed May 25, 1888. Serial No. 275,023. (No model.)

Claim.—1. In a lubricator, the combination, with the vessel 1, having an oil-chamber therein and passages 24 4, for communicating

with the supply of lubricant and with the steam-chest containing the part to be lubricated, respectively, of an inwardly-opening valve for controlling said passage 24, a chamber, 5, in communication with passage 4, having passages 12 leading into said oil-chamber, and a tube extending from chamber 5 up into said vessel, as set forth.



2. In a lubricator, the combination, with the vessel 1, having passages 24 4, for communicating with the supply of lubricant and with the steam-chest containing the part to be lubricated, respectively, of an inwardly-opening valve controlling said passage 24, a pipe communicating with the passage 4 and extending up into said vessel, and a deflector or cone arranged under said passage 24 and over said pipe, substantially as set forth.

3. In a lubricator, the combination, with the vessel 1, having an oil-chamber therein and passages 24 4, for communicating with the supply of lubricant and with the steam-chest containing the part to be lubricated, respectively, of an inwardly-opening valve controlling said passage 24 and extending up into said oil-chamber, a deflector or cone arranged under said passage 24 and over said pipe, and a strainer arranged between said cone and oil-chamber, as set forth.

4. The combination of the vessel 1, having necks 3 and 23, for attachment to a steam-chest and lubricant-reservoir, respectively, and said necks having passages 4 and 24, respectively, therethrough, leading to the interior of said vessel, the flange 6, secured in the bottom of said vessel, the tubes 11, having bores 12 tapped in said flange, the pipe 7, extending from said flange up into said vessel, and having a bore, 8, leading through said flange, flanges on said pipe and in said vessel, a spider, and a screen or strainer supported by said flanges and said spider, having a deflector over the tube 7, and a downwardly-opening valve in said passage 24, adapted to fall by gravity and rest upon said deflector, substantially as set forth.

5. A closed vessel adapted to be interposed between the lubricant-supply pipe and the valve or steam-chest of an engine, said vessel having an oil-chamber, 10, whose upper portion is in free communication with the interior of the steam-chest, and whose lower portion is in communication with said chest through small openings only, and a valve controlling said lubricant-supply pipe adapted to open toward the interior of said vessel, substantially as and for the purposes set forth.

397,051. CENTRIFUGAL MACHINE. GEORGE N. DOWNS, Chicago, Ill. Filed Jan. 14, 1888. Serial No. 260,668. (No model.)

Claim.—1. The combination, with a perforated receptacle, of a rotating shaft supporting the same, said shaft being mounted at one end in a bearing which permits inclination of the shaft and which allows rotary but not longitudinal movement of the shaft, a movable bearing engaging the other end of the shaft and constructed to permit rotary but not longitudinal movement of the shaft, said bearing last mentioned being movable both laterally and in a direction toward and from the bearing first mentioned, and a spring acting upon said laterally-movable bearing to thrust or move the said bearing in a direction away from the other bearing of the shaft, substantially as described.

2. The combination of a perforated receptacle, a rotating shaft sustaining the same, said shaft being mounted at one end in a bearing which permits inclination of the shaft, with a movable bearing for the other end of the shaft, having flexible connection with the machine-frame, and a spring applied to the said movable bearing and acting to move the said bearing in a direction away from the other bearing of the shaft, substantially as described.

3. The combination of a perforated receptacle and rotating shaft sustaining the same, said shaft being mounted at one end in a bearing which permits inclination of the shaft, with a second non-rotating shaft having flexible and longitudinally-movable connection with the machine-frame, said non-rotating shaft being in bearing with the other end of the rotating shaft, and a spring applied to the said non-rotating shaft and acting to move said non-rotating shaft endwise in a direction away from the opposite bearing of the rotating shaft, substantially as described.

4. The combination of a perforated receptacle with a rotating shaft sustaining the receptacle, said shaft being mounted at one end in a bearing which permits inclination of the shaft, and a non-rotating shaft united with the opposite end of the rotating shaft by a ball-and-socket joint or its equivalent, said non-rotating shaft having flexible and yielding connection with the frame of the machine, substantially as described.

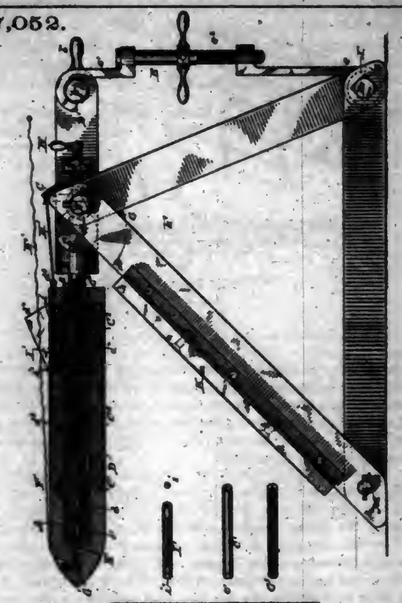
5. The combination of a perforated receptacle and a rotating shaft sustaining the receptacle, said shaft being mounted at one end in a bearing which permits inclination of the shaft, with a second non-rotating shaft connected with the other end of the rotating shaft by a ball-and-socket joint or its equivalent, said non-rotating shaft having both sliding and flexible connection with the machine-frame, and a spring applied between the non-rotating shaft and the frame and acting to hold said rotating and non-rotating shafts in alignment with each other, substantially as described.

6. The combination of a perforated receptacle and a rotating shaft sustaining the receptacle, said shaft being mounted at one end in a bearing which permits inclination of the shaft, with a second non-rotating shaft connected with the other end of the rotating shaft by a ball-and-socket joint or its equivalent, a bearing for said non-rotating shaft connected with the frame of the machine by a universal joint, and a spring applied between the said bearing and the non-rotating shaft for moving the latter endwise, substantially as described.

7. The combination of a perforated receptacle, and a shaft sustaining the receptacle, with a second non-rotating shaft, a tubular bearing for the non-rotating shaft connected with the frame by a universal joint, said bearing being provided with an interior shoulder at its lower end, and a spring surrounding the shaft within the tubular bearing, said spring being held in place by a nut upon the shaft, substantially as described.

8. The combination of an outer casing or tank, a perforated receptacle within said tank, and a rotating shaft sustaining the receptacle, said shaft being mounted at one end in a fixed bearing which permits inclination of the shaft, with a laterally-movable bearing engaging the other end of the shaft above the receptacle and having movable connection with the machine-frame, a spring applied to move said bearing in a direction away from the opposite shaft-bearing, and a pulley mounted on the said shaft near the fixed bearing, whereby the said receptacle and shaft may be rotated, substantially as described.

397,052. GUN AND PROJECTILE FOR THROWING HIGH EXPLOSIVES. STEPHEN H. EMMENS, London, England. Filed Jan. 27, 1888. Serial No. 262,173. (No model.)



Claim.—1. The combination of a gun having a powder-tube which contains the propelling-charge, and an externally-applied thimble-shaped projectile having an annular charge-space for high explosives, an axial guide-bore fitted to said tube, and a head which masks both the guide-bore and the charge-space in front, substantially as hereinbefore specified.

2. In combination with a gun having a powder-tube which contains the propelling-charge, an externally-applied thimble-shaped projectile having an annular charge-space for high explosives extending rearwardly behind its head, and a guide-bore fitted to said tube extending forward into said head, substantially as hereinbefore set forth.

3. In combination with a gun having a powder-tube which contains the propelling-charge, an externally-applied thimble-shaped projectile having a guide-bore extending forward into its head and provided with a firing device within its head at the front end of said guide-bore for firing the propelling-charge at its front end, substantially as hereinbefore set forth.

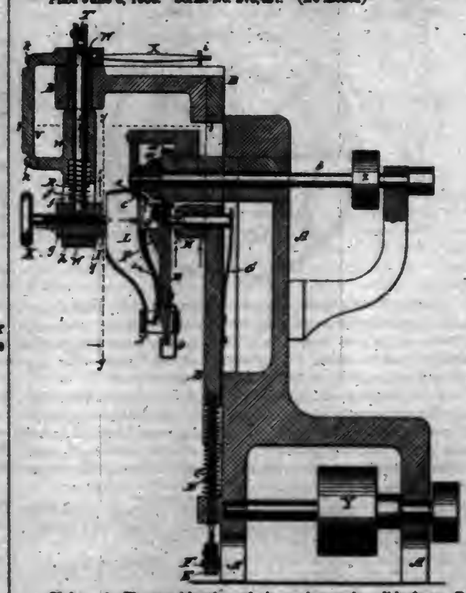
4. In combination with a gun having a powder-tube which contains the propelling-charge, an externally-applied thimble-shaped projectile having an axial guide-bore fitted to said tube, an annular charge-space for high explosives, and directing wings or vanes which project from its outermost surface, substantially as hereinbefore specified.

397,052.

397,053. FOUNTAIN-PEN. ROBERT C. FRAMPTON, London, assignor to the Consolidated Agency Company of London, England. Filed June 20, 1888. Serial No. 277,644. (No model.)

Claim.—1. In a fountain-pen, the combination, with the reservoir or barrel, the pen, and the cap for covering the same, of the cut-off for preventing the flow of ink and the compressor for operating the same, projecting in the path of the cap, whereby when said cap is on the ink-supply is cut off, substantially as described.

2. In a fountain-pen, the combination, with the reservoir or barrel, the pen, and the cap for covering the same, of the flexible tube within the barrel and the compressor for closing the tube, held in the path of the cap by the resiliency of said tube, whereby when the cap is on the tube will be closed and the ink-supply cut off, substantially as described.



3. In a fountain-pen, the combination, with the point-section and the plug for holding the pen, having the longitudinal perforation at one end, through which the ink passes, opening out into the slot at the opposite or point end, of the cross-perforation in the wall of the plug above said slot for the entrance of air, substantially as described.

4. In a fountain-pen, the combination, with the reservoir and the flexible tube governing the flow of ink, of the compressor having the broad flexible surface bearing on the tube, substantially as described.

397,054. EMBOSSING AND ORNAMENTING PLASTERED WALLS AND OTHER SURFACES. ALBERT HABERSTROH, Boston, Mass. Filed July 13, 1888. Serial No. 279,866. (No specimens.)

Claim.—The process herein described of embossing or otherwise ornamenting wall or other surfaces, the same consisting in first applying a layer of material soluble in water, rendering portions of such layer non-soluble in water, and removing the remaining portions by dissolving the material making them, all substantially as described.

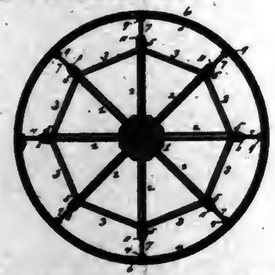
397,055. HEEL-TRIMMING MACHINE. CHARLES H. HELMS, Poughkeepsie, N. Y., assignor to himself and Charles H. Goodsell, same place. Filed June 8, 1888. Serial No. 276,627. (No model.)

Claim.—1. The combination of the reciprocating slide-frame B, having a lengthwise-yielding projecting pivot, H, the shoe-support M, carrying a toe-clamp, N, and jointed to and supported by the projecting end of the pivot, the vertically-adjustable box A, and the lengthwise-adjustable pivot I, extending through the box and adjustable vertically therewith for pivotally engaging the last in the shoe and swinging the shoe-support back and forth to and from the slide-frame, substantially as described.

2. The combination of the reciprocating slide-frame B, having a lengthwise-movable projecting pivot, H, a spring, G, for throwing the pivot outward, a shoe-support, M, carrying a toe-clamp, N, and jointed to and supported by the projecting end of the movable pivot, a vertically-adjustable box, A, and a lengthwise-adjustable pivot, I, extending through the box for pivotally engaging the last in the shoe, substantially as described.

3. The combination of the reciprocating slide frame B, having a projecting pivot, H, the shoe-support having a toe-clamp, N, and universally jointed to the projecting end of the pivot, the laterally-swinging frame W, swiveled to the slide-frame and provided with a handle, V, a box, A, vertically adjustable on the swiveled frame, and a lengthwise-adjustable pivot, I, extending through the box and vertically adjustable therewith for pivotally engaging the last in the shoe and swinging the support to and from the slide-frame, substantially as described.

4. The combination of the reciprocating slide-frame B, having a lengthwise-movable projecting pivot, H, a spring, G, for throwing the pivot outward, a shoe-support, M, having a toe-clamp, N, and universally jointed to the projecting end of the movable pivot, the laterally-swinging frame W, swiveled to the slide-frame and having a handle, V, and slot *f*, a spring-impelled lengthwise-movable arm, R, located in the swiveled frame, a box, A, secured to the arm in the slot of the swiveled frame, and a lengthwise-movable pivot, I, extending through the box for pivotally engaging the last in the shoe, substantially as described.

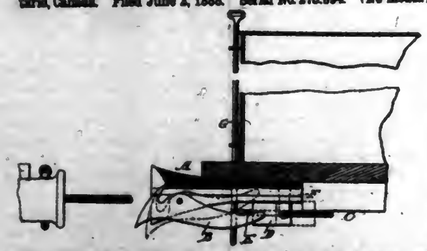


5. The combination of the reciprocating slide-frame B, having a

projecting pivot, H, the shoe-support M, jointed to the projecting end of the pivot, a laterally-swinging frame, W, swiveled to the slide-frame and provided with a handle, V, and a box, A, a lengthwise-adjustable pivot, I, extending through the box for pivotally engaging the last in the shoe, and a spring, X, secured to the swiveled frame, for normally holding the latter and keeping the two pivots in line, substantially as described.

397,056. FERTILIZER. PETER HOGAN, Milton, N. Y. Filed Mar. 26, 1888. Serial No. 268,502. (No specimens.)

Claim.—A new product consisting of a fertilizer composed of dissolved lignine from vegetable substances, and alkaline salts from the digesters in the manufacture of chemical fiber or other similar works, in combination with peat, clay, lime, earth, or other absorbing matter introduced for the purposes described.



397,057. BOLTING-REEL. HENRY A. HUNTSMAN, Palmer, Ill. Filed Aug. 22, 1888. Serial No. 283,405. (No model.)

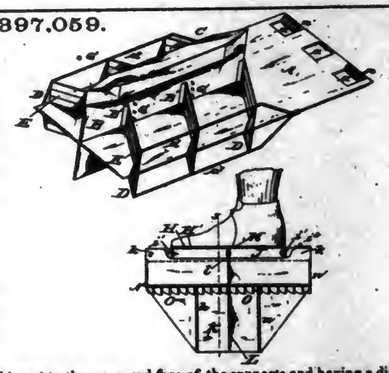
Claim.—1. In a bolting-reel, the combination of the central shaft or core, spokes or arms radiating from the central shaft or core, strips 3, fitting on the outer ends of the arms or spokes, bars 5, covering the joints between the strips, rings 4, silk 6, and rods 7 between the rings and bars, substantially as and for the purpose set forth.

2. In a bolting-reel, the combination of the central shaft or core, 1, radiating spokes or arms 2, strips 3, bars 5, covering the joints between the strips, rings 4, silk 6, and rods 7 between the bars 5 and the rings 4, said rods having shoulders 9 on one end and being threaded and having nuts 11 on the other end, substantially as and for the purpose set forth.

397,058. CAR-COUPLING. FREDERICK J. HUSBIS, Watford, Ontario, Canada. Filed June 2, 1888. Serial No. 275,594. (No model.)

Claim.—1. The combination of the draw-head A, having a solid top for the exclusion of snow and ice with the counterweighted dog B, having the bottom of its hook below the level of the pivot, so as to permit of an upward pull by the link and an easy disengagement thereof, substantially as shown and described.

2. In combination with dog B, under shaft with cranks E E bent at each end, with bent center C and adjustable weights D D opposite, which move in a half-circle when uncoupling from side of car, and journals F F, which carry said under shaft, as shown and described.



3. In combination with dog B, upright rod G, passing down end of car, with hand-hold at top, with bottom end turned at right angles, which acts on dog for uncoupling from top of car.

4. The combination of the draw-head A, having a beveled mouth or link-guide, and the counterweighted dog B, with inclined curve, as stated above, on the top or part that engages link, with the bottom of its hook below the level of the pivot and coming even with front part of draw-head and projecting upward and forward of beveled mouth of draw-head, substantially as set forth.

397,059. SWIMMING APPARATUS. EDWARD P. JOHNSTON, Washington, D. C. Filed Aug. 8, 1888. Serial No. 282,322. (No model.)

Claim.—1. A swimming device consisting of one or more thin plates or sections provided with suitable supports rigidly attached thereto at right angles and one or more series of narrow thin slats

397,059.

hinged to the rearward face of the supports and having a different degree of specific gravity from water, and adapted thereby to be swung against the rearward face of the support and oppose their surfaces to the water when the device is pulled backward, and to swing into planes parallel to the line of movement of the device when it is pushed forward, substantially as set forth.

2. In a swimming device, the combination, with one or more thin plates or sections having hand-holes at the rearward end of one plate, and also provided with suitable supports rigidly attached to one or more of the plates at right angles thereto, of one or more series of narrow thin slats hinged to the rearward face of the support and having a different specific gravity from water, and adapted thereby to be swung against the rearward face of the supports, thus presenting their surfaces against the opposing water when the device is moved backward, and swinging into planes parallel with the line of movement of the device when it is pushed forward, substantially as set forth.

3. A swimming device consisting of two or more thin plates or sections intersecting at right angles, a series of suitable supports attached to one or more of the plates, and one or more series of thin narrow slats having a greater specific gravity than water hinged at their upper edges to the rearward face of the supports, substantially as set forth.

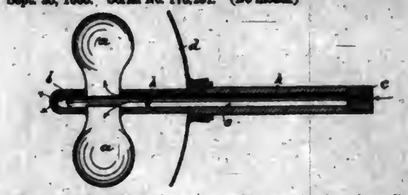
4. A swimming device consisting of two or more thin intersecting plates or sections and provided with one or more series of narrow slats hinged to suitable supports on one or more of the plates and adapted to be brought into parallelism with one another or to be turned into line with one another by the action of the water when the device is moved forward or backward, substantially as set forth.

5. A swimming device consisting of a center-board, a plate intersecting the same at right angles and supporting a series of narrow slats hinged at one edge and in the same plane, and stops to limit the movement of the slats.

6. A swimming device consisting of the plate A, the center-board B, intersecting the plate at right angles, the float C, attached to the upper edge of the center-board, the uprights D, fastened to the outer edges of the plate A, and the series of narrow slats E, hinged upon the uprights D and upon cleats B', attached to the center-board B, substantially as and for the purpose set forth.

7. A swimming device consisting of the combination, with the plate A, having the hand-holes *a*, of the center-board B, intersecting the plate at right angles, the float C, detachably secured to the upper edge of the center-board B, the uprights D, attached to the outer edges of the plate A, the rods *d*, strengthening the uprights, and one or more series of narrow slats, E, hinged to the uprights D and to cleats B' on the center-board, substantially as set forth.

8. The combination, with the plate A and center-board B, of the cleats B', the uprights D, the slats E, hinged to the cleats and to the uprights, and the stops G, to limit the upward movement of the slats.



9. The combination, with the plate A and the center-board B, intersecting the same at right angles, of one or more series of slats, E, hinged to suitable supports on each side of the center-board, each series having its inner end nearer to the hand-holes than its outer end, substantially as set forth.

10. In a swimming device, the combination of two or more thin plates intersecting each other at right angles with one or more series of narrow hinged slats adapted to oppose their surfaces against the water when the device is moved backward and permitting the water to pass freely when it is moved forward, substantially as set forth.

11. In a swimming device, the combination, with one or more thin plates or sections constructed of suitable buoyant materials and provided with hand-holes at the rearward end, of one or more series of hinged slats, as and for the purpose set forth.

12. In a swimming device, one or more thin plates or sections provided with one or more hinged slats suitably supported thereon, in combination with a float secured to the upper edge of one of said plates and having its longitudinal axis parallel to the line of movement of the device, substantially as and for the purpose set forth.

397,060. SYRINGE. ALBERT M. KNAPP, Providence, R. I. Filed Sept. 25, 1886. Serial No. 178,131. (No model.)

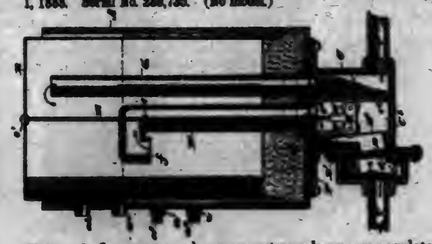
Claim.—1. In a vaginal syringe, and in combination, the cylinder A, having a passage throughout its length and opening into the vagina at its inner end to receive and conduct the fluid, said cylinder having its sides formed with an opening, and an expansible bulb secured directly on said cylinder at a point between its two ends and about said opening, and having direct communication with the channel through the cylinder, substantially as described.

2. In combination, the syringe-pipe A, having a passage therethrough and openings in its sides, the bulb *a*, secured about said openings and communicating directly with the interior passage, *c*, and the valve *k*, placed over the discharge end of the pipe, substantially as described.

397,061. SUSPENDERS. JULIA R. ATWOOD, Swanton, Vt. Filed Nov. 23, 1888. Serial No. 292,076. (No model.)

Claim.—Suspenders comprising the usual shoulder straps and ends and a connecting-strip, B, formed of two or more pieces united by pivot pins or buttons and pivoted at its ends to the shoulder-straps, substantially as specified.

397,062. CRANK-CASE DOOR. RALPH RAGALEY and FRANCIS M. RIVES, Pittsburg, Pa., assignors to the Westinghouse Machine Company, same place. Filed Oct. 31, 1888. Serial No. 289,614. (No model.)

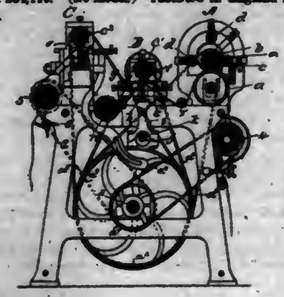


Claim.—1. The combination of a case or receptacle having two openings in one of its walls, a threaded stem fixed to the case between said openings, a nut engaging said stem, a supporting-bar journaled upon the nut, and doors fixed to said bar and adapted to close the opening in the case, substantially as set forth.

2. The combination of a case or receptacle having two openings in one of its walls, a threaded stem fixed to a boss projecting inwardly from a recess in the case between said openings, a nut engaging said stem and provided with a tubular extension, a supporting-bar having a central hub inclosing the tubular extension of the nut and projecting into the recess of the case, and doors fixed to the supporting-bar and adapted to close the openings in the case, substantially as set forth.

3. The combination of a case or receptacle having two openings in one of its walls, a threaded stem fixed to the case between said openings, a nut engaging said stem and provided with a tubular extension, a supporting-bar having a central hub bored out in flaring or tapering form and inclosing the tubular extension of the nut, and doors fixed to the supporting-bar and adapted to close the openings in the case, substantially as set forth.

397,063. PRESSURE-REGULATOR. JACOB BARROW, Windfall, Ind., assignor of one-half to John D. Baker, same place. Filed Nov. 1, 1888. Serial No. 289,735. (No model.)



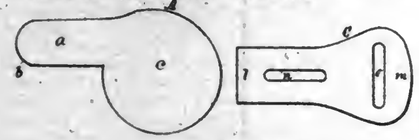
Claim.—1. In a water and gas separator and pressure-regulator, the combination of the outer chamber having inlet and outlet pipes and overflow-vents therein, an open-ended chamber mounted therein, a compartment-chamber secured to the bottom of said outer chamber and communicating therewith, having a gate-valve in one compartment thereof, and a rod secured to the top of the inner chamber, having a frame on its lower end carrying rollers bearing against the said gate-valve and one side of the dividing-wall of the compartment-chamber, substantially as described.

2. In a water and gas separator and pressure-regulator, the combination of the outer chamber having inlet and outlet pipes and overflow-vents, an open-ended chamber mounted therein, a compartment-chamber secured to the bottom of said outer chamber and communicating therewith, having a flange on its dividing-wall, and inlet and outlet openings and connections, a gate-valve hinged at its lower end to the outside wall of said chamber, having an inwardly-projecting enlargement with an upwardly-projecting arm whose inner edge merges into the edge of the said enlargement, and a rod passing centrally through the inlet-pipe of the outer chamber, being secured at its upper end to the top closed end of the inner chamber and provided with a limiting-collar, and having a frame attached to its lower end carrying grooved rollers adapted to engage the flange of the dividing-wall in the compartment-chamber and the edge of the inner projection of the valve-gate and its arm, whereby the said gate and inner chamber are made regulable, substantially as described.

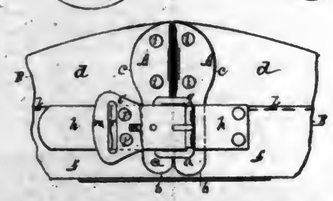
3. In a water and gas separator and pressure-regulator, the combination, with an outer chamber, with its inlet and outlet pipes and overflow-vents adapted to have stoppers removably placed therein, a chamber mounted therein with its open end down, a compartment-chamber secured to the bottom of said outer chamber and communicating therewith, having a hinged gate-valve therein and an outflow-pipe directly connected to one of its chambers, a rod connected at its upper end to the top of the inner chamber, and having friction-rollers on the lower end engaging with one wall of the compartment-chamber and with the gate-valve, and the inflow-chamber secured to the side of the compartment-chamber over the valve-opening thereof, substantially as described.

397,064. APPARATUS FOR BRUSHING UP DESIGNS ON FABRICS. CARL H. BRENDON, Lockenwalde, Prussia, Germany, assignor of one-half to Charles Schreiber, Methuen, Mass. Filed Aug. 30, 1888. Serial No. 284,119. (No model.) Patented in England May 13, 1887, No. 7,094.

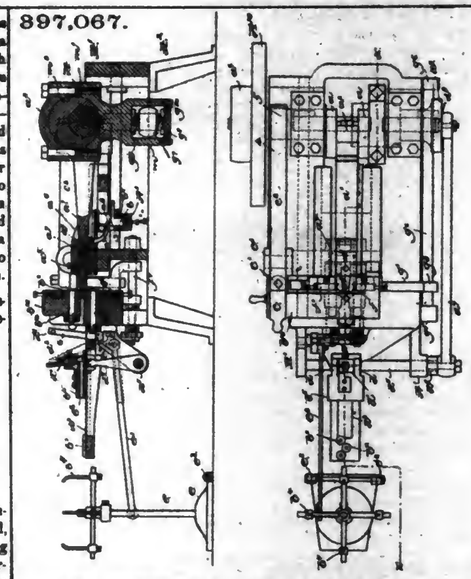
Claim.—A machine for teaseling or brushing up designs or figures in the nap on the face of fabrics, consisting of the combination of a frame, drawing and guide rolls mounted therein, a roll, *a*, over which the fabric is passed, a sheet-metal pattern-cylinder arranged above said roll, and a brush or card-cylinder arranged within the pattern-cylinder to make one part of a given design—for example, figures—a slotted bed, a brush or card cylinder arranged above said bed, and a blade arranged beneath the bed, and over which blade the cloth is passed, and means to reciprocate said blade vertically to form another part of the design—say stripes—and a pattern-band and means to move it, a brush or card cylinder arranged above said band, and a stationary blade below said band, and over which the fabric is passed to complete the design—say by the addition of stripes running in a different direction from those first named—and suitable means to rotate the brush or card cylinders and rolls, substantially as set forth.



397,065. HAT-BAND. WILLIAM T. BRIGHAM, Baltimore, Md., assignor to Brigham, Hopkins & Co., same place. Filed Oct. 1, 1888. Serial No. 286,850. (No model.)



Claim.—As an improved article of manufacture, a hat-band consisting of a strip of suitable material having a stiffener at each end, and fastening devices secured to said stiffeners and strip, and a lacing connected to said fasteners, the said stiffeners with ends of strip overlapping each other, whereby the ends of the band may be adjusted so as to fit different sizes of hats, substantially as specified.



397,066. HORSE-COLLAR. RALPH BROWNSON, St. Paul, Minn., assignor of one-half to Peter R. L. Hardenbergh, same place. Filed June 5, 1888. Serial No. 276,077. (No model.)

Claim.—A horse-collar constructed with binding-pieces A A, each having a narrow end, *a*, adapted to lie upon the body of the collar, and a widened end, *c*, adapted to be doubled around the end of the collar-rim, and with a buckle-piece, C, having a narrow end, *l*, adapted to fit in and be doubled around the bar of the buckle, and having a longitudinal buckle-tongue slot, and a widened end, *m*, having a transverse slot, *o*, to receive the billet after the same is passed through the buckle, substantially as and for the purpose herein set forth.

397,067. WIRE-NAIL MACHINE. FORRESTER BRYANT, New Haven, Conn., assignor to the Bryant Nail Company, Portland, Me. Filed Mar. 12, 1887. Serial No. 230,597. (No model.)

Claim.—1. In a wire-nail-making machine, a wire-feeding mechanism, a cutting mechanism to sever the wire, and a gripping mechanism to hold the wire while being acted upon, combined with a rocker arranged in a carriage and provided with a normally-depressed depending arm, a header carried by said rocker and mechanism to reciprocate the said carriage, and a cam co-operating with the said depending arm to rock the said rocker, substantially as described.

2. In a wire-nail-making machine, a wire-feed mechanism and a cutting mechanism to sever the nail from the wire, a cross-head, a rocker adapted to rock thereon, a normally-depressed projection from said rocker, and a header attached to the said rocker, and means to reciprocate the cross-head, combined with a cam co-operating with the rocker projection to move the rocker out of line with the wire as the cross-head is moved in one direction and to bring the rocker again into line with the wire when the cross-head is moved in the opposite direction, substantially as and for the purpose specified.

3. In a wire-nail-making machine, a wire-feed mechanism and a cutting mechanism to sever the nail from the wire, a cross-head, a rocker adapted to rock thereon, a header, and an arm attached to said rocker, combined with a cam to act upon the said arm to rock the said rocker, and with a spring to keep the said arm in contact with the said cam, substantially as described.

4. In a wire-nail-making machine, a wire-feed mechanism comprising a pivoted lever and a dog to engage the wire, a reel to sustain the wire, and a pivoted stand to support the said reel, combined with a second lever pivoted to the machine and having one arm connected to the said pivoted stand and having its other arm projected in the path of movement of the lever of the feed mechanism, whereby the said second lever acts upon the lever of the feed mechanism to disengage the dog from the wire when the said stand is turned on its pivot, substantially as described.

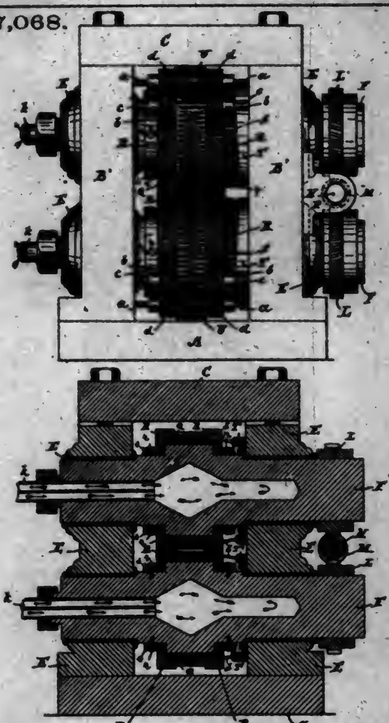
5. In a wire-nail-making machine, a cutting mechanism comprising cutter-carriers and cutting-dies carried thereby, the sleeves g^{x}, having the arms g^{8}, and means, substantially as described, to connect the said arms and cutter-carriers, and the arms g^{7}, provided each with a threaded opening to embrace a threaded pintle, combined with slippers to engage the ends of the threaded pintles, and with a housing for said slippers, substantially as described.

6. In a wire-nail-making machine, a cutting mechanism comprising cutter-carriers and cutting-dies carried thereby, the sleeves g^{x}, having the arms g^{8}, connected to the cutter-carriers, and the arms g^{7}, provided each with a ball at its end, combined with slippers to co-operate with the said balls to form a universal joint, and with housings therefor, substantially as described.

7. In a nail-making machine, the cutter-carriers, cutters carried thereby, and means to operate said carriers, combined with the journal f^{4}, the threaded stud f^{5}, and sleeve f^{6}, and nut to secure said sleeve on the said stud, substantially as described.

397,068. NAIL-MACHINE. MILTON CRANE and MATTHEW H. FOSTER, Haverhill, Mass., assignors to The Combination Nail Machine Company, same place. Filed Mar. 23, 1888. Serial No. 268,202. (No model.)

Claim.—1. The feed-rolls D D, provided with beveled edges, in combination with the rollers H, mounted in frames I, wedges J, and bolts *i*, substantially as and for the purposes set forth.



2. The rolls F, in combination with the dies Q and rings or collars R, for securing them in position, substantially as shown and described.

3. The clearers S and cams T, in combination with rolls provided with dies for cutting nails, substantially as shown and described.

4. In a nail-machine, a pair of feed-rolls and side rollers arranged to partly form the head of the nails jointly with the pair of rolls provided on their perimeter with dies arranged alternately with each other, so that the dies on one roll will fit into the spaces between the dies on the other roll, substantially as shown and described.

5. The feed-rolls D D and die-rolls F F, in combination with the

397,068.

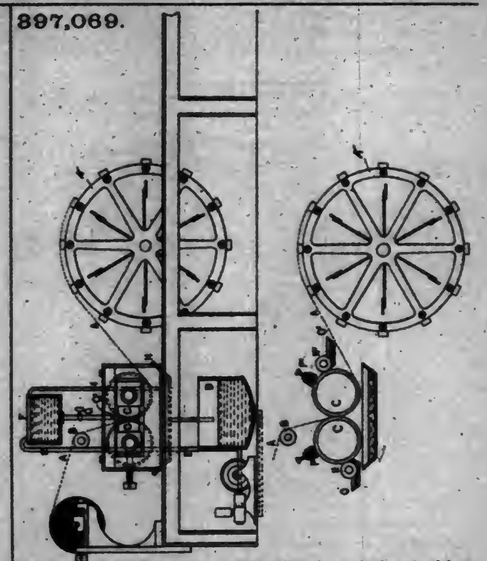
worm-wheels L, worms M, and shaft N, whereby the feed and the die rolls are driven at the same speed, substantially as shown and described.

6. The brushes U and gears *d b*, in combination with the die-rolls F, dies Q, and collars R, substantially as and for the purposes set forth.

7. In combination with the die-rolls F and dies Q, a pump or fan, W, and pipe *w* for delivering a blast of cold air to the dies, substantially as shown and described.

8. In a nail-machine, a pair of feed-rolls the periphery of which is formed to partly shape nails on a strip of metal passed between them jointly with the pair of rolls provided with dies to cut and form complete nails from said strip of metal, substantially as set forth.

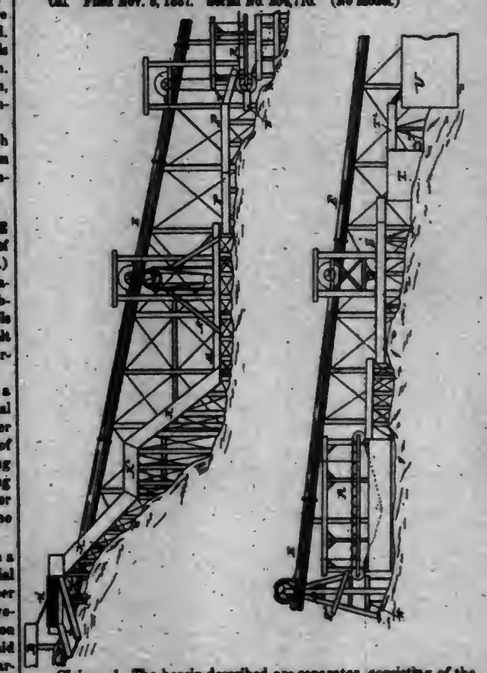
397,069. APPARATUS FOR DYEING AND DRYING TISSUE AND OTHER PAPER. RALPH CROMPTON, Elton, near Bury, County of Lancaster, England. Filed Mar. 7, 1888. Serial No. 266,478. (No model.)



Claim.—1. In an apparatus of the class described, the combination, with a single pair of impregnating-rolls covered with an absorbent material, and means, such as described, for supplying the rolls with the mordant or dye, of a heated drying-cylinder, the endless felt M', and the skeleton air-drums K, substantially as and for the purpose specified.

2. In an apparatus of the class described, the combination, with a single pair of mordanting-rolls covered with an absorbent material and arranged side by side and operating to draw the web of paper between them in substantially a vertical direction, a single pair of dyeing-rolls, also covered with an absorbent material and operating on the paper web like the mordanting-rolls, and means for supplying said rolls with a mordant and dye respectively, of a drying-cylinder arranged between the mordanting and dyeing rolls in a higher plane than either, substantially as and for the purposes specified.

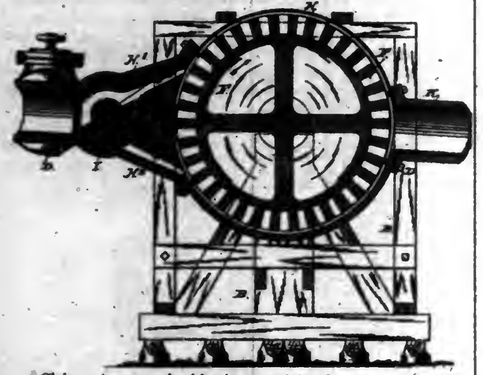
3. In an apparatus of the class described, the combination, with a single pair of mordanting-rolls covered with an absorbent material and arranged side by side and operating to draw the web of paper between them in substantially a vertical direction, a single pair of dyeing-rolls, also covered with an absorbent material and operating on the paper web like the mordanting-rolls, and means for supplying said rolls with a mordant and dye respectively, of a drying-cylinder arranged between the mordanting and dyeing rolls in a higher plane than either, and the endless felt M', substantially as and for the purpose specified.



4. In an apparatus of the class described, the combination, with a single pair of mordanting-rolls covered with an absorbent material and arranged side by side and operating to draw the web of paper

397,069.

between them in substantially a vertical direction, a single pair of dyeing-rolls, also covered with an absorbent material and operating on the paper web like the mordanting-rolls, and means for supplying said rolls with a mordant and dye respectively, of a drying-cylinder arranged between the mordanting and dyeing rolls in a higher plane than either, the endless felt M', and the series of air-drums K, substantially as and for the purposes specified.

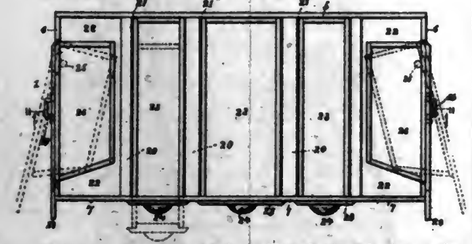


397,070. ORE-SEPARATOR. ETIENNE DEBERRY, San Francisco, Cal. Filed Nov. 9, 1887. Serial No. 254,710. (No model.)

Claim.—1. The herein-described ore-separator, consisting of the reservoir A, sluice B, sluice K, having cascade-wheels, reduction-mill N, concentrator R, amalgamator S, settling-tub T, settling-reservoir V, and the line of hydraulic pipe E, having motor-wheels E^{x}, and branches or taps E^{8}, supplying water to the apparatus at desired points, all arranged and combined for operation substantially as set forth.

2. In an ore-separator, a line of sluice and a line of hydraulic pipe, as E, having incased motor-wheels for supplying power to operate various apparatus at points along the line or system, substantially as described.

397,071. WATER-WHEEL. BYRNES DURBIN, San Francisco, Cal. Filed Jan. 27, 1888. Serial No. 262,181. (No model.)

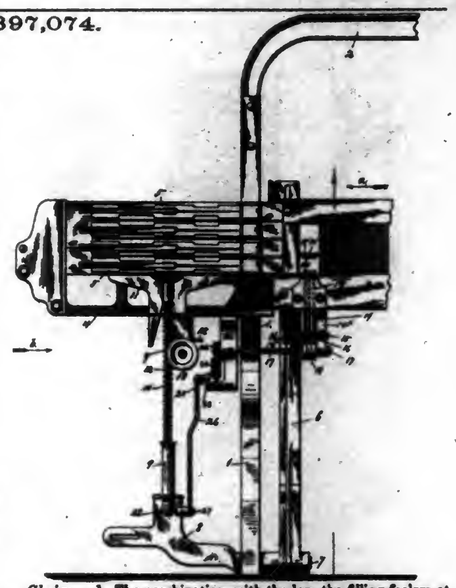


Claim.—A water-wheel having a peripheral water-way or channel and buckets on each side of and opening laterally into said water-way or channel and outwardly on the periphery of the wheel, as set forth.

397,072. TRANSLUCENT SIGN. EDWARD A. DUBBY, Brooklyn, N. Y., assignor of one-half to Thomas B. Rutan, same place. Filed May 9, 1888. Serial No. 273,312. (No model.)

Claim.—A sign constructed substantially as herein shown and described, and consisting of the waterproofed translucent fabric A, having letters or symbols upon it, in combination with the glass, B, and intermediate layer of adhesive and translucent varnish connecting the fabric to the glass, as specified.

397,073. KITCHEN TABLE AND CABINET. JESSE EVERITT, Knoxville, Pa., assignor of one-half to Jerome W. Hathaway, same place. Filed Mar. 16, 1888. Serial No. 267,287. (No model.)

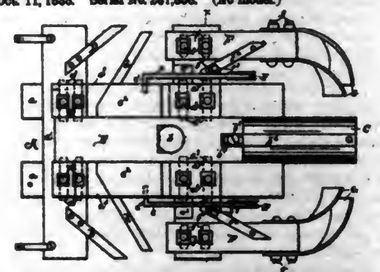


Claim.—1. A combined kitchen table and cabinet having a swinging box pivoted at the end thereof, extending transversely the width of the table beneath the top, and having a handle projecting in front of the cabinet, by which it is swung out and in, substantially as described and shown.

2. A combined kitchen table and cabinet having swinging boxes pivoted at the ends thereof, extending transversely the width of the table beneath the top, and having their sides projecting in front of the cabinet, forming handles, by which they are swung out and in, substantially as described and shown.

397,074. LOOM. JOHN R. FITTON, Worcester, Mass., assignor of one-half to Tom Howard, same place. Filed Feb. 20, 1888. Serial No. 264,663. (No model.)

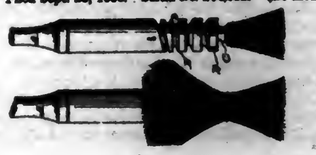
Brief.—By means of the feelers and their actuating mechanism, as the different boxes are raised from the raceway, the wefts which extend therefrom are raised and held out of the way, thereby preventing their becoming entangled with each other and also being drawn into the cloth by the active shuttle.



397,074.

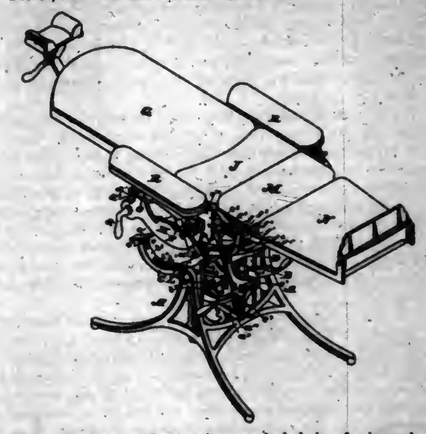
Claim.—1. The combination, with the lay, the filling-feelers at the end of the raceway, rods 19, and levers 16, for operating the feelers, of a shaft carrying cam-surfaces for operating said levers 16, and mechanism connecting said shaft with the box-lifter rod to cause the same to be operated therewith, and the box-lifter rod, substantially as shown and described.

2. The combination, with the lay, the filling-feelers 19', supported on the lay at the end of the raceway, rods 19, connected with said feelers, and levers 16, for operating said rods, of a shaft, 17, having cam-surfaces 18 thereon, a pinion, 22, sector-gear 24, arm 25, and rod 26, forming a connection between said shaft 17 and the shuttle-box motion, and said shuttle-box motion, substantially as shown and described.



397,075. CULTIVATOR. WILLIAM H. FULLER, Linden, Nebr. Filed Oct. 11, 1888. Serial No. 287,836. (No model.)

Claim.—1. The combination of the adjustable runners, the front and rear cross-bars having slots, the notted bolts a^6, the shield of approximately U shape, the notted bolts b', securing the same to said runners, the strap or bar secured at its rear end to said shield and having a slot in its forward end, and the notted bolt b^2, substantially as set forth.



2. The combination, with the adjustable runners, the slotted cross-bars, and the shield, of the inclined cross-bars, the inclined rearwardly-projecting bars having slots, the notted bolts passed therethrough, the brace-plates f^3, having slotted ends, the screws f^4, and the leveling plates or arms G, substantially as set forth.

397,076. CYLINDRICAL BRUSH. GEORGE S. GLADDING, Chester, Conn. Filed Sept. 23, 1888. Serial No. 284,362. (No model.)

Claim.—In a cylindrical brush such as described, the combination of a handle provided at the brush end with grooves passing around the said handle, said grooves being undercut, substantially as described, and small grooves connecting the said undercut grooves, bristles having their centers drawn into the said grooves, and a wrapping-wire rigidly attached to the said handle and wrapped over the said bristles, drawing them into the said undercut grooves and fitting in the said small grooves connecting the said undercut grooves, substantially as set forth and described.

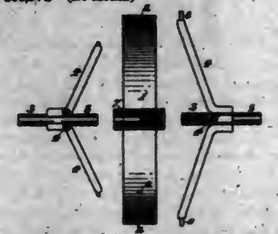
397,077. SURGICAL CHAIR. AARON P. GOULD, Canton, Ohio. Filed Dec. 10, 1887. Serial No. 257,543. (No model.)

Claim.—1. The combination, in a surgical chair, of a base, A, a frame, B, secured in said base and having a vertically-reciprocating movement, a circular way pivotally secured to said frame, a body-support frame having a circular base resting upon and pivotally secured to said way, a locking-rack depending from said way, and a lock pivotally secured to the frame B and adapted to engage the rack at any desired point of adjustment, substantially as set forth.

2. In a chair, the combination of a base, A, a frame, B, secured to said base and having a vertically-reciprocating movement, a circular way pivotally secured to said frame, a body-supporting frame having a circular base pivotally secured to and resting upon the circular way, upwardly-projected arms, a back pivoted to said arms, a seat-section secured to said arms by pivoted links, devices for swinging said back and seat sections into backwardly and upwardly tilting positions about the axis of the pivotal connection, and devices for locking said back and seat sections in their several adjustments and for locking the body-supporting frame against rotation, substantially as set forth.

3. The combination, in a chair, of a base, A, a frame, B, secured in said base and having a vertically-reciprocating movement, devices in connection with the base A and frame B for raising and lowering said frame and locking it in any desired adjustment, a circular way supported by and pivotally secured to the said frame B, to tilt in a plane vertical to that of the way, a body-supporting frame having a circular base adapted to rest and rotate upon said circular way and provided with upwardly-projecting arms, a back pivoted to said arms, and a seat-section hinged to the back and secured to said arms by pivoted links, substantially as set forth.

4. The combination, with a chair-base and a supporting-frame having a vertically-reciprocating movement in said base, of a combined lifting and lowering foot-lever pivoted to the base, a rack pivoted to said lever and connecting the lever with the reciprocating frame, a locking-bolt carried by the said lever, and a rocking part connected with the foot-lever and locking-bolt, whereby the latter is directly subject to the same impulse which operates the lever, substantially as set forth.



5. The combination, with a chair-base and a supporting-frame having a vertically-reciprocating movement in said base, of a foot-lever, a segmental rack connecting the foot-lever and reciprocating frame, and a locking-bolt having a lengthwise movement relatively to the lever to engage and disengage the said rack and subject to be operated simultaneously therewith, substantially as set forth.

6. The combination, with a chair-base and a supporting-frame having a vertically-reciprocating movement in said base, of a foot-lever, a segmental connection between the foot-lever and vibrating frame, the segmental connection being provided with seats for a locking-bolt and the foot-lever being pivoted to the connection at the center of its segmental arc, a locking-bolt having a movement lengthwise of the lever, and a rocking step connecting the lever and the locking-bolt, substantially as set forth.

7. The combination, in a chair, of a base, A, a frame, B, secured in the said base and having a vertically-reciprocating movement, a circular way pivotally secured to said frame, a chair-body turning on said circular way, and springs, one end of each resting against the frame B and the other against a rack depending from the said way, substantially as set forth.

8. The combination, in a chair, of a base, A, a frame, B, secured in said base and having a vertical movement therein, a body-supporting frame pivotally secured to said frame B, and springs, one end of each resting against the frame B and the other against the body-supporting frame, substantially as set forth.

397,078. VEHICLE-WHEEL. WILLIAM HARLEY, Sidney, assignor of one-half to J. H. Deering, Wapakoneta, Ohio. Filed Nov. 12, 1888. Serial No. 290,574. (No model.)

Claim.—1. A metallic wheel consisting of the wheel-rim, the wheel-shaft composed of two separate sections, each having a series of spokes welded thereupon and formed with tenons entering openings in the wheel-rim at right angles to the axis of the wheel-shaft, and the sleeve connecting the shaft-sections between the two sets of spokes, substantially as described.

2. A metallic wheel consisting of the wheel-rim, the wheel-shaft made of two separate sections, each provided with a series of spokes welded thereupon and secured to the wheel-rim, and the screw-sleeve connecting the shaft-sections between the two sets of spokes, substantially as described.

397,079. POKE. BERRY HEATH, Curtis, Nebr., assignor of one-half to Walter H. Grabb, same place. Filed Aug. 25, 1888. Serial No. 283,762. (No model.)

Claim.—1. The herein-described device for preventing stock leaving an inclosure, composed of the bow, the neck-yoke, the hooks I, the nose-band connected at its rear with the bow, the hook E, and the connection between the front end of the said nose-band and the upper end of the bow, substantially as described.

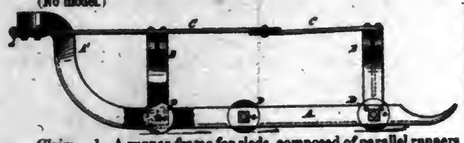
2. The combination, with the bow having an eye, *c*, at its lower end, of the nose-band having its rear end supported in said eye *c* and provided with a hook, and the rod connected with the front end of the nose-band between its ends, the upper end of the rod having connection with the upper end of the bow, and the lower end of the rod provided with a hook, substantially as and for the purpose described.

3. In a hog-controller, the combination, with the nose-band having lateral arms *d*, of the hook E, journaled on the arms *d*, and provided with the loop *d'*, to limit the movement of the hook, substantially as described.

4. The combination, with the bow having the eye *c* at its lower end and having the series of eyes *c'* at the upper ends of its branches, and the yoke adjustably connected with the bow, of the nose-band supported at its rear in the eye *c* and having a hook, the bracket F, and the rod G, connected with the front end of the nose-band and having its upper end adjustably connected with the said bracket and having its lower end provided with a hook, substantially as described.

5. The herein-described hog-controller, composed of the bow having the eyes *a* and *a'*, the yoke adjustably connected with the bow and having the hooks I, the bracket F, the nose-band supported in the eye *a* at its rear end and having the arms *d*, the rod G, connected with the front end of the nose-band and having its upper end adjustably connected with the bracket F and having its lower end provided with a hook, and the hook E, having the eyes *e*, which receive the arms *d*, and the loop *d'*, which passes over the rear end of the nose-band, substantially as set forth.

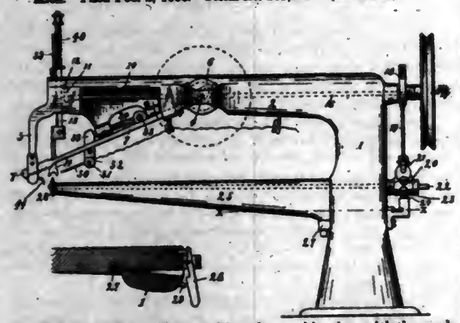
397,080. SLED. FERDINAND W. HOWELS, New York, N. Y., assignor to Allen & Co., same place. Filed Apr. 5, 1888. Serial No. 269,665. (No model.)



Claim.—1. A runner-frame for sleds and sleighs, composed of runners connected by an upwardly-bent and bow-shaped front, said runners and front being made of T-irons, and U-shaped braces also of T-irons, said braces being slitted at their lower ends and attached at opposite sides to the ribs of the runners, substantially as set forth.

2. A runner-frame for sleds and sleighs, composed of runners connected by an upwardly-bent and bow-shaped front, U-shaped braces attached to said runners, and diagonal pieces attached to the top of the braces and extended to the bow-shaped front, said extensions being provided with eyes for attaching the shafts, substantially as shown and described.

3. A runner-frame for sleds and sleighs, composed of runners connected by an upwardly-bent and bow-shaped front, U-shaped braces attached to the runners, said runners and braces being made of T-irons, and diagonal pieces attached to the braces and to the bow shaped front, substantially as set forth.



397,081. SLED. FERDINAND W. HOWELS, New York, N. Y., assignor to Allen & Co., same place. Filed Apr. 5, 1888. Serial No. 269,666. (No model.)

Claim.—1. A runner-frame for sleds, composed of parallel runners connected by an upwardly-bent bow-shaped front, said runners and front being made of U-shaped cross-section, yoked-shaped transverse braces attached to said runners and made of double T-shaped cross-section, and diagonal stiffening-pieces connecting the top of the braces and extended to the bow-shaped front, substantially as set forth.

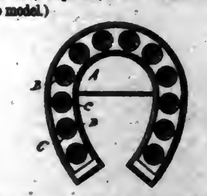
2. The combination of U-shaped runners having openings, transverse T-shaped braces attached to the runners and having recessed webs at their lower ends, and rollers pivoted to transverse bolts and extending into the recesses of the braces and through the openings of the runners, substantially as set forth.

397,082. TUFTING-MACHINE. H. HUBERT HUMPHREY, Detroit, Mich. Filed Feb. 2, 1885. Serial No. 262,731. (No model.)

Claim.—1. In a tufting-machine, the combination, with the work-support and the serrated feed-wheel carried thereon, of an intermittently vertically-reciprocating presser-foot bar, a longitudinally-recessed and transversely-slotted presser-foot carried by the foot-bar, and which at intervals holds the work in contact with the feed-wheel, the needle and means to reciprocate the same through the slot in the presser-foot in a plane inclined to the plane in which the presser-bar reciprocates, and an oscillating loop-retaining hook operating in the path of the needle in advance of the presser-foot, all arranged to operate substantially as described.

2. In a tufting-machine, the combination, with the standard of the frame, provided with an overhanging arm supporting near its free end the needle, presser-foot, and loop-retaining hook in relative operative position, substantially as described, of a work-support pivotally secured to the standard of the frame and the feed-wheel at the free end of said support, substantially as described.

3. In a tufting-machine, the combination, with the standard of the frame, provided with the overhanging arm supporting near its free end the stitch-forming mechanism of the machine, substantially as described, of the work-supporting arm 25, pivotally secured to the standard, and the automatically-operating locking-latch 28, and the pin 29 on the standard, engaging said latch, substantially as described.



4. In a tufting-machine, the combination, with the reciprocating needle and the rock-shaft 41, of the slotted presser-foot, the feed-disk, and the intermittently-oscillating retaining-hook 44, eccentrically secured to its actuating rock-shaft 41 and adapted to operate in a vertical plane in the path of the needle, substantially as described.

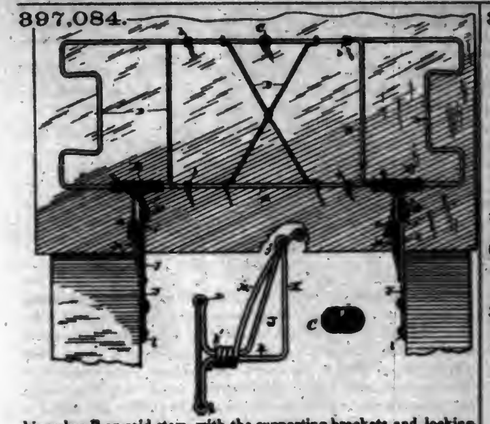
5. In a tufting-machine, the combination, with the reciprocating needle and suitable feeding mechanism, of the retaining-hook 44, the oscillating shaft 41, the eccentric 43, adjustably secured to said shaft and carrying the retaining-hook, the pinion 42, and the reciprocating rack-bar 7, the parts being constructed to operate substantially as described.

6. In a tufting-machine, the combination, with the drive-pulley 17, the hand-wheel 5, and the needle and loop forming hook, of the shafts 10 and 16, the transverse shaft 4, the intermeshing bevel-pinions 8, 9, and 15, secured upon said shafts, respectively, the grooved cam-wheel 6, the reciprocating rack-bar 7 and its actuating-connection with the retaining-hook 44, the crank-disk 37 and its actuating-connection with the reciprocating needle-bar, the crank 11 on the shaft 10 and its actuating-connection with the reciprocating presser-foot bar, and the eccentric 18 and its actuating feed-connection with the feed-wheel 26, substantially as described.

7. In a tufting-machine, the combination, with the transverse shaft 4 and its actuating-connection with the reciprocating needle-bar and needle, and oscillating retaining-hook, of suitable feed mechanism, the bevel gear-wheel 8, secured upon said shaft, the bevel gear-wheel 9, the shaft 10 and its actuating-connection with the presser-foot bar, the bevel gear-wheel 15, the drive pulley 17, and the main drive-shaft 16 and its actuating-connection, substantially as described.

397,083. TIN BRILLIANT ORNAMENT. PHILIPP KNOEPP and GUSTAVE A. MAYER, Stapleton, N. Y. Filed Feb. 6, 1888. Serial No. 263,144. (No model.)

Claim.—An ornament composed of a shell, casing, or plate provided in its face with apertures, a plate provided with a faceted recess below each aperture, and a backing holding said plate in the casing, substantially as herein shown and described.

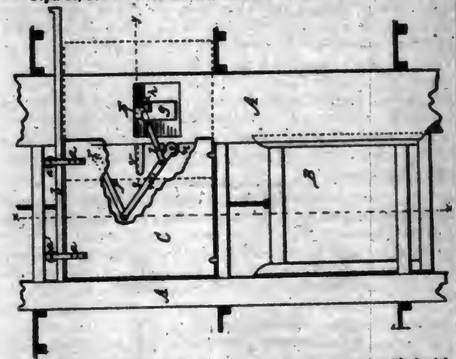


397,084. PILLOW-SHAM HOLDER. GEORGE J. KRAUSHAAR, Cleveland, Ohio, assignor to himself and M. A. Rourke, same place. Filed May 15, 1888. Serial No. 273,981. (No model.)

Claim.—1. The combination of the holder-frame with the T-shaped lock-hinge pieces E E, secured to the holder-frame and having a cross-piece, *c*, and a stem provided with convex and concave grooves on opposite sides, as described, and the brackets and locking-springs engaging said grooves to hold the frame in an elevated or lowered position, all substantially as specified.

2. The combination of the holder-frame and the T-shaped locking hinge-pieces E E, attached thereto, having a curved stem provided with convex and concave grooves on its opposite sides, with the brackets J and springs M, formed of a continuous piece of wire bent as described, the springs engaging said grooves to hold the frame in elevated or lowered position, all substantially as specified.

3. The combination of the holder-frame composed of wire frames B B, united as described, and the hinge locking-pieces E E, secured to the respective frames B B by their cross-piece *c*, and having a stem provided with concave and convex grooves on its opposite sides, and



397,084.

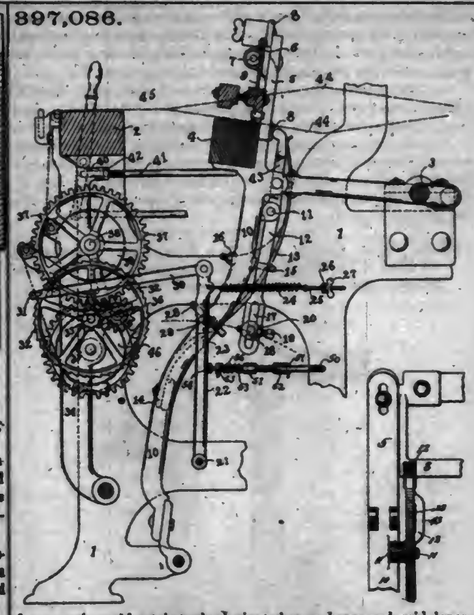
hinge-leg F on said stem, with the supporting-brackets and locking-springs, substantially as described.

4. The herein-described locking hinge-pieces E E, having a channeled head, *c*, and a curved stem connected centrally to said head and formed with a flange, G, and channels *g* and H on opposite sides thereof, and cam I, and a lug, F, on said stem, substantially as described.

397,085. GUARD FOR ELEVATORS. CHARLES J. LANE, Rochester, N. Y., assignor of three-fourths to Henry L. Becker and Abraham Elliott, same place, and Joseph R. Van Marter, Lyons, N. Y. Filed Sept. 18, 1888. Serial No. 285,750. (No model.)

Claim.—1. The combination, with the elevator-car provided with a tripping device, of the sliding door, a slide provided with journals, a double-acting cam-lever connected with one of the journals and serving to operate the slide as the car goes up or down, a counter-weight connected with the other journal, serving to throw the slide forward, and connections between the slide and the hatchway-door, whereby the door is operated by the slide, as herein shown and described.

2. In a door-guard for elevator-wells, the combination, with the slide E, provided with a journal that extends out through a slot in its case, of the double-acting cam-lever G, provided with curved slots *x x*, which embrace the journal, and a central tongue, *w*, that holds against said journal when the parts are in their normal condition, as herein shown and described.



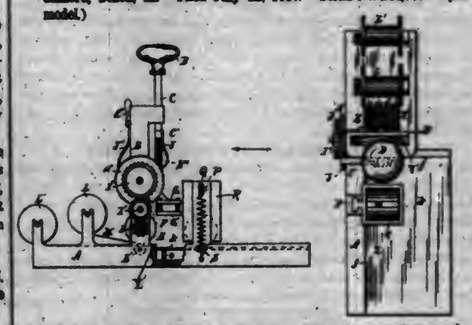
397,086. TAKE-UP MECHANISM FOR LOOMS. WILLIAM J. LORTON, Paterson, N. J. Filed Apr. 30, 1888. Serial No. 272,204. (No model.)

Brief.—By means of the yielding reed and its attached connections the movement of the take-up mechanism is governed and so regulated as to adapt it to varying qualities and textures of the fabric being woven.

Claim.—1. In a spring-reed loom, the combination, with the lay, the reed, and the spring 13, of a lever actuated by said spring, pivoted on the lay-sword, and the lay-sword, rod 41, adjustable hook 28 and means for adjusting said hook, lever 22, spring 24, and a pawl for operating the ratchet-wheel 32, and said ratchet-wheel, for the purpose stated, all combined and operated substantially as shown and described.

2. In a spring-reed loom, the combination, with a ratchet-wheel for operating the gearing that revolves the take-up roll, and a pawl

397,086.



for operating said ratchet-wheel pivoted on a lever, and said lever, and a spring, 24, connected therewith, of the lay, the lay-sword, the reed-springs 13, rods 41, hook 28, and a lever pivoted on the lay-sword and provided with a set-screw adjustable in a slot in the end of said lever, for the purpose stated, substantially as shown and described.

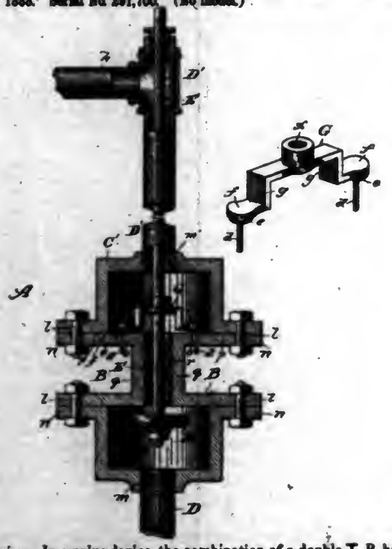
3. In a spring-reed loom, the combination, with the lay, the reed, and the springs 13, of a lever pivoted on the lay-sword, and the lay-sword, rods 41, hook 28, set-screw 19, lever 22, pivoted to the loom-side and attached to a spring, 24, and said spring, and a pawl adapted to operate the ratchet-wheel 32, and said ratchet-wheel to drive the take-up gearing of the loom, substantially as shown and described.

4. In a spring-reed loom, the combination, with the lay, the reed, and the springs 13, of a lever pivoted on the lay-sword, rods 41, hook 28, stop for said lever, and a pawl adapted to operate the ratchet-wheel 32, and said ratchet-wheel to drive the take-up gearing of the loom, substantially as shown and described.

397,087. STAMP-AFFIXING MACHINE. WILLIAM R. MILLER, Polo, assignor of two-thirds to Fernando Sanford, Englewood, and J. F. Sanford, Dixon, Ill. Filed July 22, 1887. Serial No. 244,905. (No model.)

Claim.—1. In machines for affixing postage-stamps to letters, the combination, with rollers for feeding a strip of stamps forward, of a vertically-moving knife for severing the stamps, and a roller adapted to moisten the proper part of the letter while the latter is advancing into position to receive the severed stamp.

2. In machines for affixing postage-stamps, a reciprocating stamp-severing knife, a presser-foot alongside said knife and moving therewith, and a suitable support for the letter to be stamped, said presser-foot being adapted to yield to the extent of the combined thickness of a letter and stamp while the knife continues its motion, whereby the stamp may be simultaneously severed and pressed upon the letter.



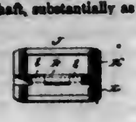
3. The combination, in a machine for affixing stamps, of a plane horizontal letter-support, a water-cup mounted above said support,

and a moistening-roller lying in said cup and projecting through an aperture in the bottom thereof, said cup being adapted to automatically adjust itself vertically to the thickness of the letter passed between said roller and said support.

4. The combination of the bed A, frame B, rollers L L', frame V, sliding in the frame B, roller E, supported by the frame V, cam *a*, and bar C, bearing the yielding plate G', substantially as set forth.

5. The combination, with the bed A and frame B, of the reciprocating knife-bar C, bearing the pawl J, ratchet-wheel H, actuated by said pawl, roller E, actuated by said ratchet-wheel, yielding plate N, and vertically self-adjusting moistening-cup R, substantially as and for the purpose set forth.

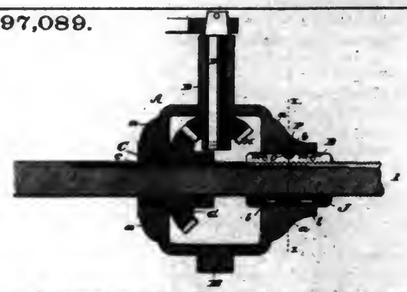
397,088. VALVE. MORTIMER B. MILLS, Chicago, Ill., assignor to the Bogue & Mills Manufacturing Company, same place. Filed Nov. 23, 1888. Serial No. 291,700. (No model.)



Claim.—In a valve device, the combination of a double T, B, having a passage, *r*, in its shank, and an opening, *o*, in one head, *p*, flanged caps C and C', secured at their flanges, respectively, to the heads, openings *m* and *m'* in the respective caps, a stem, E, extending through the cap C' and passage *r*, and carrying a valve, E', in the cap C, and a valve, *e*, supported on the stem E in the cap C' and extending over the opening *o*, substantially as described.

2. In a valve device, the combination of a double T, B, having a passage, *r*, in its shank, and an opening, *o*, in one head, *p*, flanged caps C and C', secured at their flanges, respectively, to the heads, openings *m* and *m'* in the respective caps, a stem, E, extending through the cap C' and passage *r*, and carrying a valve, E', in the cap C, a bar, G, secured to the said stem in the cap C', and carrying a valve, *e*, over the opening *o*, and a stem, *d*, extending from the valve into the opening *o*, substantially as described.

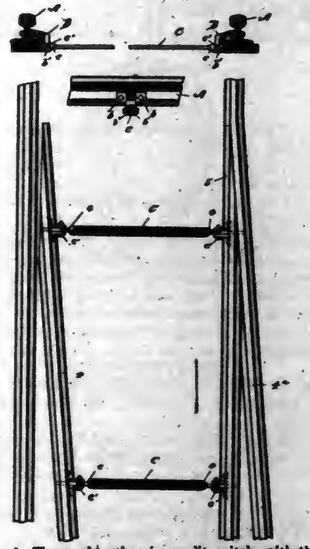
3. A valve device comprising, in combination, a double T, B, having a passage, *r*, in its shank, and openings *o* in the head at opposite sides of the passage *r*, flanged caps C and C', secured at their flanges, respectively, to the heads, openings *m* and *m'* in the respective caps, a stem, E, extending through the cap C' and passage *r*, and carrying a valve, E', in the cap C, a bar, G, having legs *g* and feet *f* and secured on the stem E in the cap C', to cause the feet to extend over the openings *o*, valves *e* on the feet, and stems *d*, extending from the valves *e* into the openings *o*, substantially as described.



397,089. MINING-MACHINE. ANDREW T. MOATS, Pleasantville, Iowa, assignor to the Black Diamond Mining Tool Company, same place. Filed Mar. 22, 1888. Serial No. 268,149. (No model.)

Claim.—1. A main frame for mining-drills, consisting of a rectangular yoke provided at its ends with openings for the reception of the drive-gear hub and feed-nut and having at its sides trunnions arranged in line, one of which is tubular or hollow to form a bearing for the drive-shaft, substantially as described.

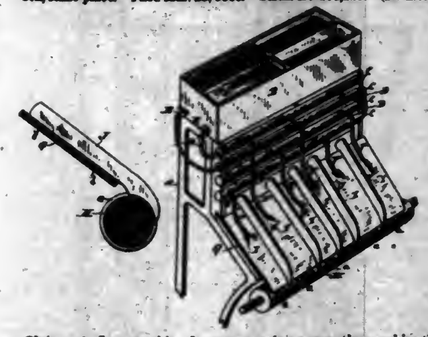
397,089.



2. In combination with a main frame for mining-drills, consisting of a rectangular yoke provided at one end with a circular opening, at the other end with an angular opening having a transverse groove, and at the sides with tubular and solid trunnions arranged in line, a drive-wheel gear journaled in the circular end opening, a drive-shaft journaled in the tubular trunnion and carrying a gear at its inner end, a two-part feed-nut arranged to fit the angular opening and having a transverse groove at one side, a pin to fit the grooves of the feed-nut and angular opening, and the screw-shaft, substantially as described.

3. The combination, substantially as described, of the frame provided at the sides with a solid and hollow trunnion and at the ends with circular and angular openings arranged in line, the drive-shaft mounted in the hollow trunnion and fitted at its inner end with a bevel gear-wheel, a collar mounted in the circular opening and provided with a bevel gear-wheel, a feed-nut removably secured in the angular opening, and the drill-shaft.

4. The combination, substantially as described, of the solid frame provided at the sides with a hollow and solid trunnion, at one end with a circular opening, and at the other end with an angular opening having one wall grooved transversely, the drive-shaft journaled in the hollow trunnion and provided at its inner end with a bevel gear-wheel, the sleeve journaled in the circular opening and provided exteriorly with a bevel gear-wheel and interiorly with a feather, the two-part feed-nut provided on one face with a transverse groove arranged to register with the groove in the angular opening, the threaded drill-shaft provided with a longitudinal groove, and a pin to fit the grooves in the angular opening and feed-nut to lock the latter against longitudinal movement.



397,090. TIE-BAR FOR RAILROAD-SWITCHES. WILLIAM J. MORDEN, Chicago, Ill. Filed Aug. 1, 1888. Serial No. 281,650. (No model.)

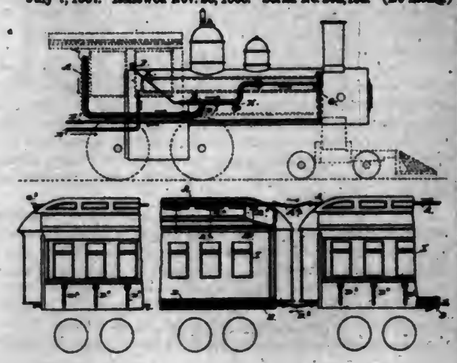
Claim.—1. The combination, in a split switch, with the movable rails, of hangers rigidly secured to said rails and a tie-bar pivotally connecting said hangers, whereby to permit the movable rails to rock upon a horizontal axis, substantially as and for the purpose set forth.

2. In a split switch, the combination, with the movable rails A A, of the hangers B B, rigidly secured thereto, and a tie-bar having its ends turned at right angles to its body portion and pivotally connected, respectively, to said hangers, whereby to permit said rails to rock on a horizontal axis, substantially as described.

397,091. MACHINE FOR ORNAMENTING PAPER. CHARLES G. MORTIMER, New York, N. Y., assignor of one-half to George W. Thompson, same place. Filed Mar. 23, 1888. Serial No. 268,220. (No model.)

Claim.—1. In a machine for ornamenting paper, the combination of the reservoirs, the distributing-tubes C, communicating with the said reservoirs, the stop-cocks in these tubes, the depending tubes attached to these stop-cocks, the inking-felts and shelf for supporting the same, the color-separating plates supported upon the said shelf, and the impression-roller, substantially as described.

2. The combination of the reservoirs, means for supplying the colors to the inking-felts, the shelf G, for supporting the inking-felts, the inking-felts overlapping the impression-roller and applying the colors thereto, the impression-roller having raised ornamenting-rings on its surface, and the color-separating plates supported upon the said shelf and extending down between the ornamenting-rings upon the impression-roller, substantially as described.



3. The combination of the distributing-tubes C, the depending tubes F', communicating therewith and supplying color to the inking-felts, the inking-felts overlapping the impression-roller and applying the color thereto, the supporting-shelf G, the impression-roller provided with raised elastic ornamenting-rings, and the color-separating plates supported upon the shelf G and extending down in close proximity to the surface of the impression-roller and between the rings thereon, substantially as described.

4. The combination of a shelf, G, the impression-roller provided with raised ornamenting-surfaces, the inking-felts overlapping the impression-roller, means for supplying the colors to said felts, and the color-separating plates mounted upon the said shelf G between the inking-felts and extending down to a point in close proximity to the surface of the impression-roller, substantially as described.

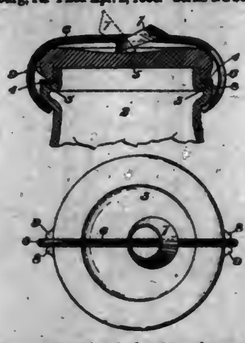
5. The combination of the impression-roller having raised elastic ornamenting-surfaces, the inclined shelf located above the same, the independent inking-felts overlapping the said roller, means for supplying the colors to said felts, and the removable and adjustable color-separating plates inserted between the said inking-felts, whereby the different colors are prevented for blending, substantially as described.

6. The combination of the impression-roller and the inking-felts, the distributing-tubes C, arranged above the said inking-felts, and the depending color-supplying tubes attached to and communicating with the said distributing-tubes C, substantially as described.

397,092. VENTILATING AND WARMING RAILWAY-CARS. ARCHIBALD T. MURRAY and HENRY HARRISON, San Rafael, Cal. Filed July 7, 1887. Renewed Nov. 28, 1888. Serial No. 292,132. (No model.)

Claim.—1. In a heating and ventilating apparatus for railway-trains, air-heating chambers in each car, having air-supply tubes or passages taking air from the outside and air-inlets into the car, in combination with heating-coils connected together and with a heater on the engine, a return-pipe from the last coil in the line, and an air-draft pipe in the cars, connected to the injector, and an air injector or pump in the line of heating-pipes, adapted to force air through the heater and all the coils of the air-chambers throughout the train, substantially as described, for operation as set forth.

2. In a heating and ventilating apparatus for railway-trains, the air-draft pipe A, having draft-tubes controlled by valves, air-chambers D, with heating-coils E, a heater on the engine, and the injector B, to which the draft-pipe and heating-coils are connected, said injector having nozzles *b* and air-apertures *b*', substantially as set forth.



397,093. LOCK-CAP CLEATLESS ROOFING. JOSEPH W. PRALL, Pomeroy, Ohio, assignor of three-fourths to W. G. Downie, same place. Filed Dec. 15, 1888. Serial No. 293,682. (No model.)

Claim.—1. Metallic roofing consisting of the plates or sheets A, each sheet being formed with the bent curved portions B C, each of these portions being made with the substantially semicircular bends *d e f* and inclined portions *g*, the portion C having also the extension A, these portions B C being adapted by reason of the bends to lock each other and to be fastened to a base by means of the portion A.

2. A lock-joint for metallic roofing, consisting of two portions, each of which has substantially semi-cylindrical bends similarly disposed, and also the inclined portions *g*, and adapted to be sprung one upon the other, for the purpose described.

397,094. CLOSURE FOR JAR-CAPS. HENRY ROSANYER, Jr., Rochester, Pa., assignor of one-half to George W. Miller, same place, and John Gripp, Pittsburg, Pa. Filed Apr. 2, 1888. Serial No. 269,276. (No model.)

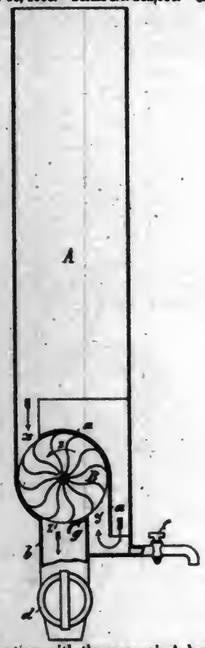
Claim.—1. As a device for closing jars, the combination of a lid having a concave outer surface, a bail arranged over the lid, and a ring through which the bail passes, the cross-section of that part of the ring which lies between the bail and the lid being greater in one dimension than in the other, substantially as and for the purposes described.

2. As a device for closing jars, the combination of a lid, a bail arranged over the lid, and a ring through which the bail passes, that part of the side of the ring which lies between the bail and the lid being in cross-section greater in one dimension than in the other and being backwardly-inclined from a vertical position when the lid is clamped to its seat, substantially as and for the purposes described.

3. As a device for closing jars, the combination of a lid, a bail arranged over the lid, and a ring through which the bail passes, that part of the side of the ring which is adapted to lie between the bail and the lid being of greater diameter in cross-section in one direction than in the other and being of varying width, whereby it is adjustable, substantially as and for the purposes described.

4. As a device for closing jars, the combination of a lid, a bail arranged over the lid, and a lever placed loosely between the lid and bail and movable to cause a pressure thereon whereby the lid is forced to its seat, said jar having opposite lugs or projections against which the bail fits, and the lid also having opposite lugs or projections, substantially as and for the purposes described.

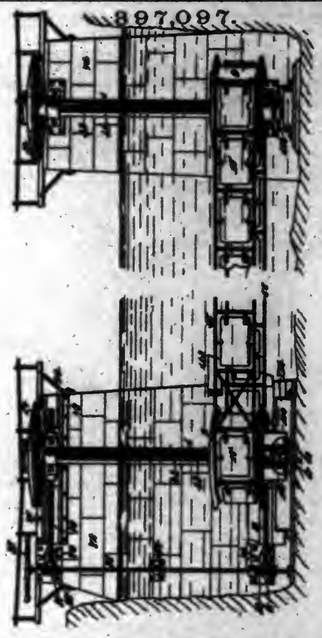
5. As a device for closing jars, the combination of a lid, a bail arranged over the lid, and a ring through which the bail passes, the



said ring being in the shape of a frustum of a cone, the cross-section of that part of the ring which lies between the bail and the lid being greater in one dimension than in the other, substantially as and for the purposes described.

397,095. BLASTING COMPOUND. RUDOLF SCHMID, Stockholm, Sweden, assignor to Rudolph Bricsson, New Britain, Conn. Filed June 28, 1887. Serial No. 242,718. (No specimens.) Patented in France Apr. 20, 1886, No. 173,483; in England Jan. 11, 1887, No. 448, and Aug. 27, 1887, No. 11,853; in Germany Feb. 1, 1887, No. 36,288; in Sweden Feb. 4, 1887, No. 715, and Aug. 19, 1887, No. 995; in Norway June 8, 1887, No. 403; in Russia June 19, 1887, No. 5,901; in Belgium June 30, 1887, No. 17,794, and Sept. 16, 1887, No. 18,749, and in Spain Nov. 30, 1887, No. 11,794.

Claim.—1. A blasting compound consisting of oxalate of ammonia, a non-nitrated hydrocarbon, as naphthaline, and chlorate of potash, substantially as set forth.



2. A blasting compound consisting of oxalate of ammonia, a liquid non-volatile hydrocarbon, as astral oil, a solid hydrocarbon, as naphthaline, and chlorate of potash, substantially as hereinbefore set forth.

397,096. WATER-MOTOR. HERMANN STUDTE, Saroutty, Prussia, Germany. Filed Aug. 16, 1888. Serial No. 282,980. (No model.)

Claim.—The combination, with the reservoir A, having a casing, *a*, in its base, a cock-controlled pipe, *b*, a casing-strip, *g*, and two water gates or conduits, *x* and *y*, arranged as set forth, of the water-wheel B, arranged in the base of said reservoir and partially inclosed by said casing, substantially as set forth.

397,097. CURRENT-MOTOR. EDMUND SORROW, Buffalo, N. Y. Filed Feb. 27, 1888. Serial No. 265,388. (No model.)

Claim.—1. In a current-motor, a pair of shafts having independent support and carrying drums connected by a belt having vanes capable of a limited outward deflection, the axes of said shafts being inclined contrary to the direction of the current, substantially as described.

2. In a current-motor, the combination, with a pair of shafts mounted upon independent supports and having their axes inclined against the direction of the current and provided with drums keyed upon said shafts, of a belt connecting said drums and provided at intervals with vanes hinged to cross-braces upon the belt and having flexible fastenings connecting the sides of said vanes to the parallel members of the belt, substantially as described.

3. In a current-motor, the combination, with inclined shafts mounted upon independent supports and having drums keyed or mounted thereon, of a belt connecting said drums and formed of parallel cables having cross-braces at intervals and provided with vanes hinged to said cross-braces, substantially as described.

4. In a current-motor, the combination, with two shafts having suitable drums keyed thereon, of screw-shafts tapped through bearings on each drum and having pinions meshing with a central gear loose on the drum-shaft, and with an outer gear-annulus and means for arresting the rotation of either said gear or gear-annulus for revolving said pinions in either direction to raise and lower the drums and the belt carried thereby by the power of the current, substantially as described.

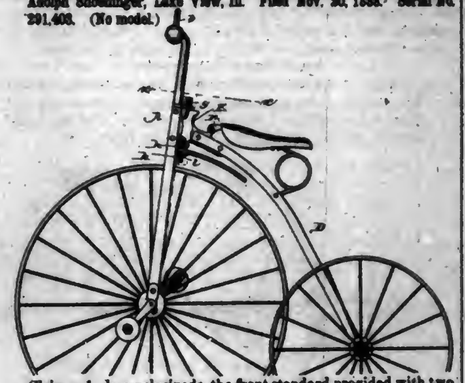
5. In a current-motor, the combination, with the vertical shafts mounted upon independent supports and drums carrying the belt, of movable bearings upon which the lower ends of said shafts are stepped, said bearings swinging in the direction of the flow of the current, and stationary bearings for the upper portions of said shafts to secure an automatic inclination of the shafts against the current, substantially as described.

6. In a current-motor, the combination, with shafts mounted upon independent supports supporting a belt stretched transversely to the current, of a traveling shaft-carriage supporting the lower ends of said shafts and moving with the current, means for imparting a pivotal support to the upper portion of said shafts, and screw-shafts geared to operate in substantial unison to adjust one of said shafts in a direction transverse to the flow of the current to vary the tension of the belt, substantially as described.

7. In a current-motor, the combination, with a pair of inclined shafts having drums which sustain the belt by which power is communicated, of screw-shafts tapped through nuts on said drums, disks keyed on said drum-shafts and giving bearing to the upper ends of said shafts, an intermediate toothed gear-annulus free to revolve on said disk, pinions on the screw-shafts gearing with said annulus, and a central gear, also meshing with said pinions and carried by a loose hub mounted on the shaft and having a disk and friction-clamps independently connected with both disks, whereby either may be arrested while the other revolves, substantially as described.

8. In a current-motor, the combination, with one of the shafts having a drum to carry the motor-belt, of a shaft-carriage in which said shaft has a step-bearing, arms having split rings or collars embracing said shaft below and above and each provided with a slide-plate moving in flanged rails mounted on a suitable support near said shaft, parallel screw-shafts tapped through said arms and having worm-gears at their ends, and a worm-shaft having a hand-wheel, substantially as described.

9. In a current-motor, the combination, with a shaft supporting one of the drums carrying the motor-belt, of screw-shafts tapped through nuts on said drum, a disk rigid on the drum-shaft in which said screw-shafts have bearing, an internally-geared annulus resting on said disk and meshing with pinions on the ends of the screw-shafts, a central pinion meshing with said pinions and carried by a hub loose on the drum-shaft and provided with a disk, an independent friction-clamp on the annulus and another on the disk, and means for operating said clamps alternately to arrest the revolution of said annulus and disk, whereby the drums are raised and lowered by the power derived from the current, substantially as described.



397,098. CULINARY VESSEL. FRANCIS J. TORRANCE, Allegheny, Pa. Filed June 29, 1888. Serial No. 278,564. (No model.)

Claim.—1. As a new article of manufacture, a culinary vessel having an angular or V-shaped flange surrounding its upper edge, and an ear designed and adapted for the attachment of a handle thereto and on top thereof, cast integral with the body of the vessel, its upper edge being on a line with the lower edge of the flange which surrounds the vessel, substantially as shown and described.

2. The combination, with a culinary vessel having a lug or ear on one side thereof and integral therewith, of a handle resting upon and attached to said ear or lug by fastening devices which pass through the handle and into the ear or lug, the inner edge of said handle being beveled, whereby it rests against the outer surface of the flange which surrounds the vessel, substantially as shown and described.

397,099. VELOCIPEDE. OTTO UNRICKER, Chicago, assignor to Adolph Shoeninger, Lake View, Ill. Filed Nov. 20, 1888. Serial No. 291,403. (No model.)

Claim.—1. In a velocipede, the front standard provided with two eye-lugs, the upper one being rearwardly slotted, in combination with the forward reach and having trunnions to its opposing ends vertically in line, and being flat intermediate of these trunnions to enter the slot of the upper eye-lug of the standard for inserting the trunnions into such eye-lugs, and thereby forming a pivotal connection between the standard and reach, substantially in the manner set forth.

2. In a velocipede, the combination, with the saddle pivotally connected with its forward end upon the reach, of a wire spring supporting the rear of the saddle, such spring being spirally twisted at both sides of its connection with the saddle and rectangularly bent at both its extremities to form trunnions inserted into holes of the reach-bars, substantially as set forth.

3. In a velocipede, the manner of securing the reach end to the hind axle by driving the conical parts of the axle into tapering holes of the reach-bar ends and by riveting the projecting shoulders of the axle against such reach-bars, substantially as set forth.

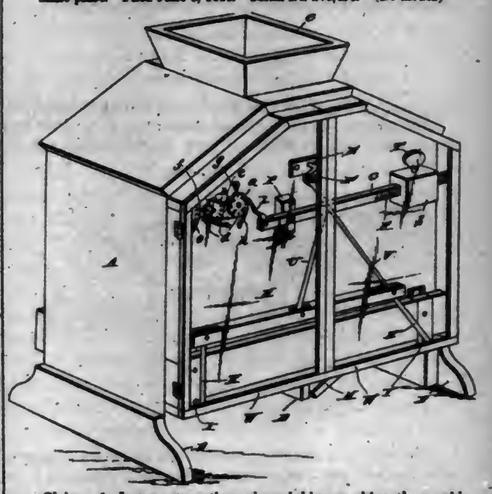
397,100. RETAINING DEVICE FOR BARREL-HOOPS. CLAUDIUS VERHLAUD, Quincy, Ill. Filed July 23, 1888. Serial No. 280,748. (No model.)

Claim.—1. As an improved article of manufacture, a hoop-retaining device consisting of the metal strip having tongues cut therefrom to embrace the hoops when applied to the receptacle, the ends of said tongues being removed from the edges of the strip to prevent interference with the hoop as it is being applied, as set forth.

2. As an improved article of manufacture, a hoop-retaining device consisting of the metal strip having the tongues for embracing the hoops cut from the center thereof, leaving the edges of the strip unbroken, substantially as described.

3. As an improved article of manufacture, a hoop-retaining device consisting of the metal strip having tongues for embracing the hoops, the ends of said tongues being beveled or cut away on one side, as set forth.

4. As an improved article of manufacture, a hoop-retaining device consisting of the metal strip having tongues for embracing the hoops cut therefrom at points removed from the ends and the tongued end for embracing the end hoop and the end of the stave, substantially as described.



5. As an improved article of manufacture, a hoop-retaining device consisting of the metal strip having tongues for embracing the hoops cut therefrom at points removed from the ends and openings at the ends of such tongues for facilitating the raising of the ends of the tongues, substantially as described.

6. The combination, with the receptacle and the hoops for retaining the same in shape, of a hoop retaining strip having the tongues engaging the hoops to hold them in position, the end of the strip being bent over the edge of the receptacle to hold the strip in position, substantially as described.

7. The combination, with the stave-receptacle and the hoops for retaining the staves in place, of the hoop-retaining strip rigidly secured to the stave and having the tongues cut therefrom for engaging the hoops, substantially as described.

8. The combination, with the stave-receptacle and the stave-retaining hoops, of the hoop-retaining strip having both ends bent over the ends of the stave, the intermediate tongues cut therefrom engaging the hoops, and the ear engaging the handle or bail secured to said strip at a point slightly removed from the end, substantially as described.

397,101. AUTOMATIC GRAIN-WEIGHING MACHINE. CHARLES E. WARNER, Malvern, Kans., assignor of one-half to Chester C. Catlin, same place. Filed June 8, 1888. Serial No. 276,423. (No model.)

Claim.—1. In an automatic grain-weighing machine, the combination of the case having the vertical compartments, the hinge-valves in the bottoms of the compartments and having the cranks K, the link N, to which said cranks are connected, the valve G at the upper end of the partition between the compartments and having the crank F, the rod V, connecting said crank to the link, the weighted scale-beam O, and rod U, connecting link N to the scale-beam, substantially as described.

2. The combination, in an automatic grain-weighing machine, of the case having the compartments, the platforms or valves at the lower ends of the said compartments and having the cranks K, the link connecting the said crank, the scale-beam connected to and operated by the said link, the registering device having the ratchet-wheel *a*, and the dog X, pivoted to the scale-beam and engaging said ratchet-wheel, substantially as described.

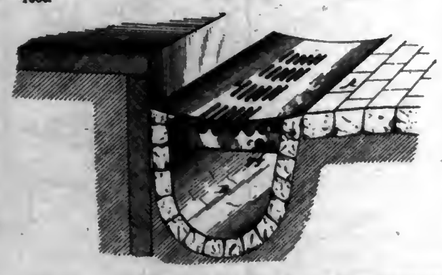
397,102. CARPET-SWEEPER. PHILIP H. WIEDERSUM, Newark, N. J., assignor of one-half to Charles G. Campbell, same place. Filed Aug. 19, 1887. Serial No. 247,236. (Model.)

Claim.—1. In a carpet-sweeper, the combination of the box A, end plates, *e e*, each of which has at its opposite ends sweeping-arms 5 5, pivoted on said plates and extending downward therefrom, and carrying the wheels 4 4, and a brush having a stock extending through the sides of said box into engagement with said wheels, substantially as set forth.

2. In combination with the box A of a carpet-sweeper, a brush, dust-pan, and end plates, *e e*, arranged at the outside of the boards *a a*, one on each end of the box A, and connected by a rod or bar, *g*, and wheels carried by said plates *e e*, substantially as and for the purposes set forth.

3. In combination with the box, rollers, and brush of a carpet-sweeper, end plates, *e e*, having rollers thereon, cross-bar *g*, and set-screw *f*, substantially as and for the purposes set forth.

4. In a carpet-sweeper, the combination of the box, rollers, and brush, end plates having eyes *e' e'* and connected by a bar, *g*, studs *q q*, springs i^3, and adjusting-screw *f*, adapted to raise and lower said side plates in their relations to said studs, substantially as set forth.



5. In a carpet-sweeper, the combination of a box, A, adjustable end plates and rollers arranged thereon and held in driving relation to the brush by springs 6, said springs 6 having bearings on said side plates, substantially as set forth.

6. In a carpet-sweeper, the combination of a box, bail, driving-wheels, and brush, end plates connected by a bar, and means, as *f*, for raising or lowering the same, and provided with swinging arms 5 5, eyes *e'* providing bearings for springs i^3, and studs *q*, and bearings e^2 for springs 6 and stud *q*, substantially as set forth.

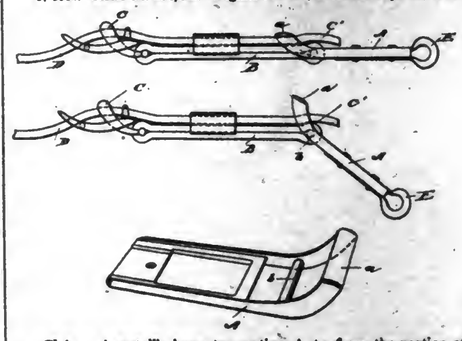
7. In a carpet-sweeper, the combination of a box having openings *w w*, filling-pieces composed of double plates, blocks 9, and a spring-actuated catching mechanism, substantially as set forth.

REISSUES.

10,980. WIRE AND PIPE SUPPORTING AND SNOW-REMOVING APPARATUS. SYLVANUS D. LOCKE, Hoosick Falls, N. Y. Filed Nov. 14, 1888. Serial No. 290,861. Original No. 355,185, dated Dec. 28, 1886.

Claim.—1. A sub-gutter provided with devices for supporting conductors and with a cover having an inclined portion and a perforated portion, whereby said cover serves as a surface-gutter, substantially as specified.

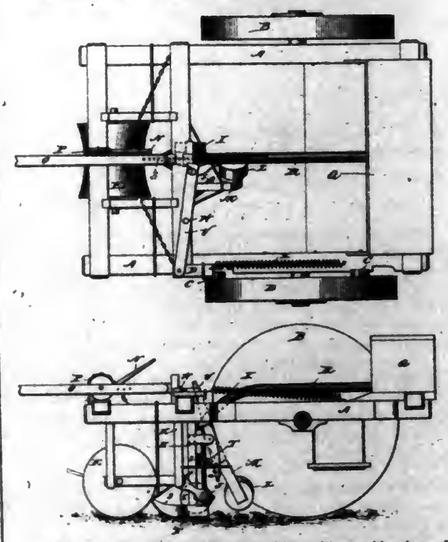
2. In combination with a surface-gutter having lateral inclined imperforate portions and a perforated portion, a sub-gutter provided with means for supporting conductors, substantially as specified.



3. A sub-gutter provided with wire and pipe supporting devices and with a cover formed as a surface-gutter, substantially as specified.

4. The combination of a surface-gutter and a sub-gutter provided with removable racks for supporting pipes, cables, and wires, substantially as specified.

5. In a city street, for the purpose of melting the snow therein, a sub-gutter underneath the roadway having a perforated cover, in combination with pipes in the top thereof for melting the snow which is conducted in the bottom of the same into the sewers, substantially as described.



6. In a city street, a sub-gutter with a perforated cover having steam apparatus for melting the snow in the street, in combination with racks for supporting said steam apparatus and other pipes or wires, substantially as described.

10,981. HAME-TUG. JOHN G. MILLER, Champaign, Ill. Filed Nov. 5, 1887. Serial No. 254,443. Original No. 342,967, dated Sept. 14, 1886.

Claim.—A metallic hame-tug section, A, to form the portion of the draft-tug adjacent to the hame, and consisting of a flat rectangular frame or body portion having one of its ends adapted to receive a suitable clip, whereby to secure the section to the hame, the opposite end of said section being bent or curved upwardly to form a rigid loop, *a*, and a transverse bar, *b*, rigidly affixed in the frame or body portion intermediate the loop and the hame-attaching end of the section, which bar affords a means for pivotally attaching to said section the rearward leather portion of the tug, substantially as described.

10,982. TOBACCO-TRANSPLANTER. MAURICE SMITH, Janesville, Wis., assignor, by direct and mesne assignments, of two-thirds to A. Hyatt Smith and Victor P. Richardson, same place. Filed May 7, 1887. Serial No. 237,490. Original No. 336,724, dated Feb. 9, 1886.

Claim.—1. In a transplanting-machine, the combination of a plow for opening the furrow, a scraper for throwing loose earth over the roots of the plant, and a roller for pressing the earth after it has been thrown in, with a watering attachment comprising a tank carried upon the machine, and a pipe to deliver the water from the tank to the furrow as the plant is set, substantially as described.

2. In a transplanting-machine, the combination of a plow for opening a furrow, a scraper to fill the furrow, and a roller to compact the earth about the plant, with a watering-tank carried by the machine, a delivery-pipe for conducting the water therefrom to the plant, a valve in said pipe, and mechanism connecting said valve and a moving part of the machine, whereby water is delivered to the plant at regular intervals as the machine moves forward, substantially as described.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

CALLAGHAN *et al. v.* MYERS.

Decided December 17, 1888.

1. COPYRIGHT.

Although there can be no copyright in the opinions of judges, or in the work done by them in their official capacity as judges, yet there is no ground of public policy on which a reporter who prepares a volume of law reports, of the character of those in this case, can, in the absence of a prohibitory statute, be debarred from obtaining a copyright for the volume, which will cover the matter which is the result of his intellectual labor.

2. SAME—RIGHTS OF REPORTER OF DECISIONS THERETO.

Even though a reporter may be a sworn public officer, appointed by the authority of the government which creates the court of which he is made the reporter, and even though he may be paid a fixed salary for his labors, yet, in the absence of any inhibition forbidding him to take a copyright for that which is the lawful subject of copyright in him, or reserving a copyright to the government as the assignee of his work, he is not deprived of the privilege of taking out a copyright, which would otherwise exist.

APPEAL from the Circuit Court of the United States for the Northern District of Illinois.

Mr. J. L. High for the appellants.
Mr. G. W. Kretzinger for the appellee.

Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity, brought in the Circuit Court of the United States for the Northern District of Illinois, on the 17th of December, 1877, by Eugene B. Myers against Bernard Callaghan, Andrew Callaghan, Andrew P. Callaghan, and Sheldon A. Clark, composing the firm of Callaghan & Co., Marshall D. Ewell, and Van Buren Denslow.

The bill sets forth that the firm of E. B. Myers & Chandler, composed of the plaintiff and Horace P. Chandler, became the proprietors of volumes 32 to 38, both inclusive, of the reports of the Supreme Court of the State of Illinois, known as "Illinois Reports," prepared by Norman L. Freeman; that, as such proprietors, said firm, desiring to secure a copyright for the several volumes, under the statutes of the United States, deposited in the office of the clerk of the District Court of the United States for the Northern District of Illinois, before publication, a printed copy of the title of the several volumes; and that they afterward, and within three months of the publication of the volume, deposited in said office a copy of the work. The dates of the deposit of the titles of the several volumes were as follows: volume 32, August 12, 1865; 33, April 21, 1866; 34, October 23, 1866; 35, January 28, 1867; 36, October 11, 1867; 37, December 31, 1866; 38, August 22, 1867. The alleged dates of the deposit in said office of a copy of the several volumes were as follows: volume 32, January 17, 1866; 33, June 8, 1866; 34, October 23, 1866; 35, March 5, 1867; 36, November 13, 1867; 37, January 28, 1867; 38, October 10, 1867.

The bill also alleges that the plaintiff became the proprietor of volumes 39 to 46, both inclusive, of the reports of the Supreme Court of the State of Illinois, known as "Illinois Reports," prepared by Norman L. Freeman; that, as such proprietor, he, desiring to secure a copyright for the several volumes under the statutes of the United States, deposited in the office of the clerk of the District Court of the United States for the Northern District of Illinois, before publication, a printed copy of the title of the several volumes; and that he afterward, and within three months of the publication of the volume, deposited in said office a copy of the work. The dates of the deposit of the titles of the several volumes were as follows: volume 39, June 10, 1868; 40, September 18, 1868; 41, December 22, 1868; 42, May 21, 1869; 43, June 21, 1869; 44, September 27, 1869; 45, October 6, 1869; 46, October 14, 1869. The alleged dates of the deposit in said office of a copy of the several volumes were as follows: volume 39, June 12, 1868; 40, November 6, 1868; 41, January 29, 1869; 42, July 7, 1869; 43, July 7, 1869; 44, October 2, 1869; 45, December 8, 1869; 46, December 8, 1869.

The bill further alleges that all the volumes were prepared by Mr. Freeman, and each contained a large amount of matter original with him, and a great number of the decisions and opinions of the Supreme Court of Illinois; that, among other original matter, Mr. Freeman prepared for each case a syllabus or head-notes, and for many cases in each volume a statement of the facts of the case; that also in many of them he copied, or copied and arranged, the instructions ruled upon by the court below; that he also prepared and inserted, or gave, in all or many of them, the stipulations made, or made and filed, therein, and in many of them he gave the errors assigned; that he also prepared, for each of them, a table of the cases cited therein, and a table of the cases decided, and other original matter, and so arranged said decisions and the matter therein contained, or the matter in connection with the decisions, as to make each of the books, or each of the books and the matter therein contained, convenient and valuable to the persons using the decisions; that, in respect of vol-

umes 32 to 38, the firm of E. B. Myers & Chandler, and in respect of volumes 39 to 46, the plaintiff, purchased from Mr. Freeman all his proprietary rights in the volumes, and paid him a large consideration therefor, and for his labor and care in preparing them, and used the labor and matter of Mr. Freeman in publishing the books; that, by the agreements with Mr. Freeman, the plaintiff and his partner were to have the copyright of volumes 32 to 38, and the plaintiff the copyright of volumes 39 to 46; that in respect of volumes 32 to 38, the said firm, and in respect of volumes 39 to 46, the plaintiff, divided the decisions and the matter accompanying them into volumes, and divided and arranged each of the volumes into pages; that the firm published over 1,500 copies of each of the volumes 32 to 38, and the plaintiff over 1,500 of each of the volumes 39 to 46; that, on the 13th of June, 1868, said Chandler sold and assigned to the plaintiff. by a written assignment, all his interest in and to volumes 32 to 38, and the copyrights thereof; and that the plaintiff still has the exclusive right to volumes 32 to 46.

The bill further alleges that about July, 1877, the plaintiff reprinted volumes 37 and 38, and, as he made some changes in the arrangement of their pages, he did, before publication, deposit in the office of the Librarian of Congress a copy of the printed title of each volume, on the 20th of July, 1877; that afterwards, on the 28th of July, 1877, and within one month of the publication thereof, he deposited in said office two copies of each of the volumes as reprinted.

The bill also alleges, as to all of the volumes, that the plaintiff had the exclusive right to the arrangement of each of them, and the exclusive right to publish the head-notes or syllabuses, and to the arrangement of the pages of the books, and to the division of the opinions into separate volumes, and to the table of cases cited and table of cases decided, as published in each of them, and to the arrangement of the decisions, as accompanied with the head-notes, stipulations, errors assigned, instructions, table of cases cited, table of cases reported, and indexes accompanying the same, and the exclusive right to all of said works, except to the matter contained in the opinions of the judges; that the defendants had full knowledge of the exclusive rights of the plaintiff, and attempted to buy them from him, but refused to pay the price charged by him, and thereupon proceeded to reprint and publish volumes 32 to 38, and in doing so, used the decisions of the Supreme Court of Illinois only as published by the plaintiff, and prepared the volumes from the books of the plaintiff, and did not procure the matter from original sources, and, in all of the books, used the works of the plaintiff, and copied the title-pages thereof, and used the division and arrangement of the plaintiff in the volumes and the paging thereof, and copied the table of cases cited and the table of cases reported from each of the books of the plaintiff, and also copied from the same the stipulations, errors assigned, and instructions given by the court; that, in publishing the statements of the cases, and in preparing the syllabuses, the defendants used the books of the plaintiff, and the changes they made were merely colorable, and were made only for the purpose of avoiding the claim of the plaintiff; that the books, as printed and published by the defendants, were all and each merely imitations of the volumes of the plaintiff, corresponding in number; that all and each of said republications by the defendants are piracies on the copyrights of the plaintiff, and the books have been made by them to take the place of, and, as far as they can, to supersede the books of the plaintiff; that the defendants are selling them to the persons who would otherwise buy the books of the plaintiff, to his great damage and loss; that the defendants threaten to republish volumes 39 to 46; and that the aggregate value of the copyrights of the plaintiff is not less than $20,000 and his damage is not less than that sum.

The bill waives an answer on oath, and prays for an injunction perpetually enjoining the defendants from publishing or selling, or offering for sale, any of the books, and for a decree that all of them so published by the defendants are forfeited to the plaintiff, and that they be delivered to him, and for an account of all published and sold, and for a decree for damages.

The members of the firm of Callaghan & Co. put in an answer to the bill. It sets up that a printed copy of volume 32 was not deposited until more than three months after publication. It avers that but a small amount of original matter was prepared by Mr. Freeman for any of the volumes 32 to 46, and that but few statements of cases were prepared by him, and those few were drawn by him from the opinions of the court in the cases reported. It denies that he prepared any tables of cases cited for any of those volumes, and denies that he so arranged the decisions and matter contained in the volumes as to make the volumes convenient and of value to the persons using them. It avers that all matters contained in the volumes are public and common property, forming part of the law of the State of Illinois, and as such not susceptible of copyright, or in any manner literary property, in which a private citizen can have a monopoly under the act of Congress regulating the subject of copyright; that whatever labor, literary or otherwise, was done upon the volumes by Mr. Freeman was done in his official capacity as reporter of the decisions of the Supreme Court of Illinois, a public office then existing under and by virtue of the laws of that State; and to which Mr. Freeman had been duly appointed; and that all labor, literary or otherwise, by Mr. Freeman, in his capacity as official reporter, upon the volumes, was public and common property, not susceptible of copyright or of private literary ownership.

The answer admits that the defendants had negotiations with the plaintiff concerning the purchase of his interest in volumes 39 to 46, consisting of the stereotype-plates and printed stock of those volumes; that, in such negotiations, the plaintiff proposed to sell his copyrights in volumes 32 to 46, but no price or value was ever attached by either party to such copyrights, and they were always treated as a mere incident to the proposed sale, and all offers made and received on either hand were made with reference to such stereotype-plates and printed stock, and it was understood by all parties, that, if such sale were consummated, the copyrights should be "thrown in," without additional charge.

The answer also admits, that, in republishing volumes 32 to 38 the defendants have used the opinions of the Supreme Court of Illinois as published by the plaintiff: but avers that they have corrected errors in names, citations, and other matters therein, and denies that they have prepared the books from those of the plaintiff, or used the work of the plaintiff, except in so far as plaintiff's books are free to the use of any and all persons, or have copied his title-pages, or have used his paging, or have copied his tables of cases cited or reported, or the stipulations, errors assigned, or instructions given. It avers that the statements of cases and syllabuses in the volumes as republished by the defendants are wholly original and entirely different from and unlike those of the plaintiff, except in the few instances where there is an apparent resemblance, owing to the fact that those of the defendants have been drawn from the opinions of the court, and those of the plaintiff in the same cases appear to have been drawn from the same source; and that the volumes so republished by the defendants contain large amounts of new, original, and valuable matter, prepared expressly for those volumes, and not contained in any of the volumes of the plaintiff. It admits that the defendants have under consideration the republication of volumes 39 to 46. It also avers, that, for many years before the filing of the bill, the plaintiff had abandoned volumes 32 to 38; that his stereotype-plates and stock of those volumes were destroyed in October, 1871, and none of them were ever reproduced by him until about July or August, 1877, when he reprinted volumes 37 and 38; that, prior thereto, he had for many years repeatedly announced that he should never reproduce those volumes; that, more than a year before the filing of the bill, the defendants notified the plaintiff of their intention to republish volumes 32 to 38, and frequently thereafter notified him of such intention, and publicly announced the same by advertisement, and from time to time, as such republication progressed, during the spring and summer of 1877, notified him of the progress of the work, and, as the volumes appeared from time to time during the spring and summer of 1877, the plaintiff was constantly apprised thereof, and at divers times during that year, and before, the defendants received various propositions from the plaintiff for an exchange of volumes 32 to 38, so being republished, for volumes 39 to 46, which the plaintiff had for sale; that the plaintiff, down to the filing of the bill, never objected to such republication, but always appeared to acquiesce therein, and encouraged the defendants to proceed therewith, and, from his conduct during such period, the defendants always believed, down to the filing of the bill, that such republication was being done with his acquiescence and consent; and that the plaintiff, by his conduct, is estopped from receiving the relief asked. The answer also denies all the material allegations of the bill.

Ewell and Denslow each put in an answer, disclaiming all interest in the publication of any volumes of the reports by Callaghan & Co., and all interest in such volumes.

Issue was joined and proofs were taken, and, on the 10th of Febuary, 1881, the circuit court entered an interlocutory decree, finding that the plaintiff was the owner of the copyright or exclusive right of publication of volumes 32 to 38; and that Callaghan & Co. had violated such copyright by publishing, offering for sale, and selling copies of said 7 volumes, and Ewell and Denslow by editing the same. The decree awarded a perpetual injunction against all of the defendants, from further publishing or selling, or transferring or removing any of said books, and ordered a reference to a master, Henry W. Bishop, to ascertain and report what number of each of the volumes had been printed, and what number sold, and at what prices; and directed that the members of the firm of Callaghan & Co. might be examined in regard thereto, and might be required to produce their account-books and papers, and that the master ascertain and report what was the market value of each of the books of the plaintiff prior to the illegal publication by the defendants, and what was the actual cost or value of reprinting and binding each of the volumes, and that, upon the making of the report, the plaintiff might apply for a further order in regard to the damages to be allowed to him for the illegal publication and sale of the volumes. The decree also gave leave to the plaintiff to file a supplemental bill, based on the fact that, since the filing of the original bill, Callaghan & Co. had proceeded to publish and sell copies of the books described in the bill as volumes 39 and 41 to 46.

The decision of the circuit court is reported in 10 Biss., 139, and 5 Fed. Rep., 726. The ruling of the court was (1) that the volumes of reports were the proper subject of a copyright under the act of Congress, for at least what was the work of the mind and hand of the reporter, namely, the head-notes, and the statements of facts and of the arguments of counsel, notwithstanding he could have no copyright in the opinions of the court; (2) that there had been a compliance with the act of Congress in the procurement of the several copyrights; (3) that the defendants had, in preparing volumes 32 to 38, used the volumes of the plaintiff so as to interfere with his copyright; (4) that he had not consented to the publications made by the defendants, or abandoned his rights by acquiescence, laches, or otherwise.

On the 14th of February, 1881, the plaintiff filed a supplemental bill against the same defendants, reciting the material allegations of the original bill, and averring that since it was filed the defendants had published and sold large numbers of volumes 39 and 41 to 46, and were threatening to publish volume 40; that, in the volumes they had published, they had used the plaintiff's volumes, and had copied his arrangement or division into volumes of the matter contained in his volumes, and had copied his whole arrangement of each of them, and had used each of them to make, and had made, their books an imitation and copies of his books, and had advertised and sold their books as the same book as his, and had not resorted to the records for the opinions and other matter contained in their books, but had copied the same from his books, using and copying considerable portions of the original matter furnished by Mr. Freeman, in some instances copying exactly, and in others making merely colorable changes; that, before any of the publications of the defendants were made, the plaintiff had advertised his books extensively; that

the decisions of the Supreme Court of Illinois, as divided by the plaintiff into volumes, had, by reason of what was done by him, become known by the name which had been applied to the classification so made by the plaintiff; that such division was the property of the plaintiff, and was valuable, and was covered and protected by his copyright; that the defendants had copied the title or name of each of the books; that each of the books of the defendants was made to supersede and take the place of one of the books of the plaintiff, of corresponding number; and that they were being so sold, to his great damage.

The supplemental bill waives an answer on oath, and prays for a perpetual injunction restraining the defendants from publishing, selling, offering for sale, or removing beyond the jurisdiction of the court, any of said books, and for a decree that they pay to the plaintiff all his damages by reason of such publication and sale.

On the 18th of February, 1881, the members of the firm of Callaghan & Co. filed a cross-bill in the same court against Myers, reciting the proceedings on the original bill and the terms of the interlocutory decree of February 10, 1881. It averred that the discovery and accounting provided for thereby were in progress before the master, Mr. Bishop; that Bernard Callaghan, one of the firm, had been partially examined concerning the number of volumes printed by Callaghan & Co., and on hand, and had already been required to produce before the master, for the examination of Myers and his counsel, books and papers of Callaghan & Co., relating to the volumes and the number thereof printed; that such examination was still progressing; that Callaghan & Co. had in their possession certain copies of volumes 32 to 38, and Myers claimed that he was entitled to a forfeiture of the same and a delivery thereof; that Myers, on the 11th of February, 1881, brought an action of replevin against Callaghan & Co., to recover those copies; that the writ was in the hands of the marshal for service; that Myers was ignorant of the precise number and whereabouts of the copies, but as soon as the examination and discovery then progressing before the master should have disclosed the number and location of the copies, Myers would instruct the marshal to seize them under the writ; that Myers was not entitled to any discovery from Callaghan & Co. in aid of his proceedings for a forfeiture of the copies; that Myers, having taken the decree for a discovery as to the copies, and having obtained a discovery thereunder, and having acquiesced in the publication of the volumes by the defendants, was estopped in equity from claiming any forfeiture or recovery of any of the copies; and that such decree, and the examination and discovery before the master, amounted to a waiver of the forfeiture or recovery by Myers.

The cross-bill waived an answer on oath, and prayed for a perpetual injunction to restrain Myers from further proceeding with the action of replevin, and from instituting any further action for the forfeiture or recovery from Callaghan & Co. of any copies of volumes 32 to 38, and for an injunction to that effect *pendente lite*.

Myers answered the cross-bill, setting forth the interlocutory decree made in the original suit, and admitting that he claimed that the volumes in the possession of Callaghan & Co. became forfeited to him under the act of Congress, and alleging that the interlocutory decree did not provide for a discovery or an accounting, and that he was not seeking any discovery from Callaghan & Co., for the purpose of aiding him in procuring the possession of the books; that the volumes were not published by Callaghan & Co. with his knowledge, acquiescence, or consent; that he claimed the benefit of the forfeiture provided for by section 99 of the act of July 8, 1870, chap. 230, 16 Stat., 214, (now section 4964 of the Revised Statutes;) and that he had done nothing to waive or abandon the right given to him by that statute. A replication was filed to this answer.

The members of the firm of Callaghan & Co. filed an answer to the supplemental bill on the 22d of June, 1881. It admitted that the firm had published and sold volumes 39 and 41 to 46, and denied that in publishing those volumes they had made any other use of the plaintiff's volumes than such fair and legitimate use, by way of reference, consultation, and otherwise, as might be made of any previous publication by a succeeding author or compiler treating of the same subject, and denied that they had copied the plaintiff's arrangement or division of matter, other than that the cases reported in the defendants' volumes followed each other in the same order as in the plaintiff's volumes, and denied that they had used the plaintiff's volumes to make their books an imitation or copies of them, or that their books had been made in imitation of those of the plaintiff. They denied that they had advertised or sold their books as the same books as those of the plaintiff, but admitted that they had used the name "Freeman's Reports" in their catalogues and circulars, and averred that such use was in accordance with the uniform usage of law publishers, in indicating volumes of law reports by the name of the original reporter, and with no intention of announcing the volumes of the defendants as those of the plaintiff; that, as appeared by their catalogues and circulars, the defendants, by a note immediately following the words "Freeman's Reports," directed attention to the fact that the volumes of the defendants were a different, revised, and re-edited edition, and were all re-reported and edited by persons other than Mr. Freeman, whose names were stated in the note; that the plaintiff had no property in the name "Freeman's Reports," yet, as soon as the supplemental bill was filed, the defendants desisted from such use of the words "Freeman's Reports," and had corrected their catalogues and circulars by changing the words "Freeman's Reports" to "Illinois Reports;" and that, although they had used the words "Freeman's Reports" in the manner described for several years prior to the filing of the supplemental bill, the plaintiff had not objected thereto prior to that time.

The answer admitted that the defendants, in making their books, had taken the opinions of the court from the volumes as reported by Mr. Freeman, but stated that in all cases they had carefully compared each of the opinions with the original opinions of the court, on file or recorded in the respective cases, and had made frequent corrections therein, to correspond with the originals; and that, except as to such use of the opinions, the remaining matter in the volumes of the defendants was obtained from the original records of the court, and was arranged, reported, compiled, and edited wholly by the original labor of the editors employed by the defendants for that purpose, and whose names appeared as such editors on the title-page and cover of each of the volumes of the defendants. It also averred that the titles of the volumes of the defendants were so different from those claimed by the plaintiff that they could not be mistaken therefor even by a casual purchaser or observer; and that the volumes of the defendants were new and original productions, with new and original tables of cases, head-notes, statements of facts, abstracts of briefs of counsel, corrected opinions, foot-notes, and indexes, and were in no manner copies of, or infringements upon, the volumes of the plaintiff. It also averred that the plaintiff could not have, under the acts of Congress or otherwise, any exclusive right in the opinions of the court, as published, or in their arrangement or division, or in the titles of the volumes. The answer also denied all the material allegations of the supplemental bill. A replication was filed to this answer.

Ewell and Denslow answered the supplemental bill by an answer disclaiming all interest in the publication of the volumes named in the supplemental bill, and all interest in those volumes.

On the 2d of January, 1883, Myers amended his supplemental bill by averring that the defendants had infringed his copyright by reprinting and publishing volume 40. An answer was put in to such amendment, and a replication to that answer.

Proofs were taken as to the supplemental bill, and on the 3d of March, 1884, the court made an interlocutory decree, that the plaintiff was the owner of the copyright and of the exclusive right of publication of volumes 39 to 46; that the defendants had in some particulars infringed said copyrights; and that the plaintiff recover the profits received or made or accrued therefrom; and referring it to John I. Bennett, a master, to report such profits; and directing that the defendants might be examined in relation thereto, and might be required to produce before the master their books of account and papers relating to the publication and sale of such volumes, and that the master should report also the damages.

The decision of the court is found in 20 Fed. Rep., 441. The only question considered in the decision was that of infringement. The court held that in some respects in each case the Freeman volume had been used by the defendants, in the head-notes, the statements of facts, and the arguments of counsel.

On the 17th of April, 1882, the master, Mr. Bishop, reported that the defendants had printed 4,313 of volumes 32 to 38, and had sold 2,909 of the same, the amount of the sales of the several volumes being as follows: Vol. 32, $1,990.91; 33, $1,971.73; 34, $1,884.24; 35, $1,945.09; 36, $1,933.47; 37, $1,878.68; 38, $1,847.07; being a total of $13,451.19, and an average of $4.62¼ per volume. He stated that no testimony had been offered as to the market value of the volumes before publication by the defendants. He also reported the cost or value of reprinting and binding the several volumes to be as follows: volume 32, $942.88; 33, $782.35; 34, $664.13; 35, $943.50; 36, $835.97; 37, $773.18; 38, $385.78; making a total of $5,727.79, not including the item of proof-reading or the item of expense of selling, or a charge of stereotyping. The defendants excepted to this report because the master had not allowed to the defendants the amount paid by them for proof-reading and editorial work on the volumes, or for stereotyping. The court, on a hearing on the report and exceptions, referred the cause back to the master, Mr. Bishop, to ascertain and report, on the evidence given and on further evidence, the total amount of the damages sustained by the plaintiff in consequence of the illegal publication and sale.

Mr. Bishop made a second report, on the 2d of February, 1884, on the previous proofs and on new testimony. He again reported the total number of copies printed of volumes 32 to 38 to have been 4,313, and the total number of them sold to have been 2,909. He reported the amount of sales, as before, by items, making a total of $13,451.19, and an average of $4.62¼ per volume. Excluding charges for stereotyping, counsel fees, editorial work, and proof-reading, and including 12½ per cent. of the gross sales as a legitimate item of expense in conducting the business of the defendants in the course of the publications, he reported the cost of reprinting and binding the several volumes to have been as follows: volume 32, $1,064.25; 33, $883.06; 34, $749.63; 35, $952.10; 36, $943.59; 37, $872.70; 38, $999.81; making the total cost of reprinting, binding, and disposing of the volumes $6,465.14. Deducting that from the $13,451.19 left a balance of $6,986.05, which he reported as the damages sustained by the plaintiff by reason of the illegal sale and publication.

The plaintiff filed sundry exceptions to the second report of Mr. Bishop, and the defendants filed three exceptions to it. The first exception of the defendants was that the master had not allowed them credit for the cost of stereotyping; the second, that he had not allowed, as part of the expenses of conducting the business of the defendants, salaries paid to them for their services, the same amounting to about twelve thousand dollars a year; the third, that he had allowed to them only 12½ per cent. of their gross sales as expenses incurred in effecting such sales, and had not allowed the salaries as a part of such expenses, whereas he should have allowed credit to them on account of such expenses for such additional percentage over and above 12½ per cent. as the amount of such annual salaries bore to the gross annual sales during the period in question.

On the 24th of October, 1884, the master, Mr. Bennett, filed his report, finding that the defendants had disposed of 2,292 copies of volumes 39 to 46. He stated that the plaintiff claimed that 156 more volumes had been sold, making 2,448 in all. The 156 volumes were volumes which, after being originally sold by the defendants, had again come to their hands and been resold once or oftener. The master disallowed these resales, but reported that, if they were to be allowed, the sum of $696.38 should be added as damages for such resales. He reported the average sale price of the volumes received by the defendants to have been $4,464, making a total sale price of $10,231.48. He reported that the cost of all the volumes sold was

$4,679.55; that the defendants were entitled to a credit of $1,118.49 on account of the general expenses of conducting their business, being 12 per cent. of their gross sales; that the total cost of producing the volumes sold was $5,798.04, and that deducting that amount from the $10,231.48 left $4,433.44 as the total amount of net receipts from sales or damages to the plaintiff.

The plaintiff excepted by his first and second exceptions to the disallowance in respect of the 156 copies resold, and filed other exceptions. The defendants filed exceptions in regard to the number of volumes sold, the number of volumes on hand, the average price of the sales, the total gross receipts from the sales, the cost of the volumes sold, the amount of the credit for general expenses of conducting their business, the net receipts from the sales, the refusal of the master to allow them credit for the cost of producing the volumes unsold and remaining on hand, or credit for the sum expended by them for editorial work in preparing the volumes, or credit for the amount expended by them in stereotyping the volumes, or credit for the amount paid them as compensation for their services, or credit on account of sundry other matters.

The court, on a hearing on the reports of the masters and the exceptions thereto, sustained the first and second exceptions of the plaintiff to the report of the master, Mr. Bennett, and overruled all the other exceptions of both parties to both of the reports.

On the 9th of July, 1885, a final decree was entered, adjudging that the plaintiff recover $340.70, as profits on the resales of the 156 volumes, in addition to the $4,433.44 reported by the master, Mr. Bennett, and the $6,986.05 reported by the master, Mr. Bishop, the three sums amounting to $11,760.19, and the costs of the suit. The decree granted a perpetual injunction as to volumes 32 to 46. It also restrained the defendants from selling or disposing of the stereotype-plates of those volumes, and dismissed the bill as to Denslow and Ewell, without costs. It further adjudged that the right of the plaintiff to recover the additional sum of $896.19, as claimed by the plaintiff and referred to in the second report of the master, Mr. Bishop, in case the cost of composition and press-work should be ratably distributed over the whole edition printed of volumes 32 to 38, and also the rights of all parties under the cross-bill, and the rights of all parties to the said action of replevin for the unsold copies of volumes 32 to 38, be reserved for determination on the hearing of the cross-bill.

The report of the decision of the circuit court on the exceptions to the reports of the masters is found in 24 Fed. Rep., 636. From such final decree the defendants composing the firm of Callaghan & Co. have appealed to this Court.

The volumes of law reports of which the plaintiff claims a copyright are in the usual form of such works. Each volume consists of a title-page, of a statement of the entry of copyright, of a list of the judges composing the court, of a table of the cases reported in the volume in alphabetical order, of a head-note or syllabus to each opinion, with the names of the respective counsel, and their arguments in some cases, and a statement of facts, sometimes embodied in the opinion and sometimes preceding it, and of an index arranged alphabetically and consisting substantially of a reproduction of the head-notes. Of this matter all but the opinions of the court and what is contained in those opinions is the work of the reporter and the result of intellectual labor on his part.

The broad proposition is contended for by the defendants, that these law reports are public property and are not susceptible of private ownership, and cannot be the subject of copyright under the legislation of Congress. It is urged that Mr. Freeman, the reporter, was a public officer, whose office was created by chapter 29 of the Revised Statutes of Illinois of 1845, which enacted as follows in regard to the Supreme Court and the reporter:

> Sec. 20. The court shall appoint some person learned in the law to minute down and make report of all the principal matters, drawn out at length, with the opinion of the court, in all such cases as may be tried before the said court; and the said reporter shall have a right to use the original written opinion after it shall have been recorded by the clerk.
>
> Sec. 21. The reporter, before entering upon his duties, shall be sworn by some one of the justices of the Supreme Court faithfully to perform the duties of his said office. He may, for misconduct in office, neglect of duty, incompetency, or other cause shown, to be entered of record, be removed from office.
>
> Sec. 22. It shall be the duty of the reporter to deliver to the Secretary of State, as soon as convenient after publication, such number of copies of the respective volumes of the reports of said court as may be necessary to enable the said secretary to distribute the same in the manner provided in the following section, together with one hundred copies in addition, to be deposited in the secretary's office for the use of the State.

Section 23 provided for the distribution of the volumes by the Secretary of State, and section 24 provided, that, upon the delivery of the requisite number of any volume, the Secretary of State should deliver to the reporter a certificate specifying the number of copies which had been so delivered, and that such certificate should entitle the reporter to a warrant drawn by the auditor of public accounts upon the treasury for an amount for those volumes, at the price for which the books should be sold to individuals, provided the price should not exceed the ordinary price of law books of the same description, to be determined by the auditor, treasurer, and Secretary of State. These statutory provisions were amended in 1863 by making the term of office of the reporter six years, and in 1865 it was enacted that the price of the volumes to be delivered to the Secretary of State should be $6 each. The reporter was given a salary, by law, in 1877 of $6,000 a year.

It is further contended, that Mr. Freeman, in preparing the official edition of the reports, was not an author, within the meaning of the act of Congress, and that it was not intended by that act that he should assert a monopoly in the result of his official labors.

But, although there can be no copyright in the opinions of the judges, or in the work done by them in their official capacity as judges, (*Banks* v. *Manchester*, U. S.,) yet there is no ground of public policy on which a reporter who prepares a volume of law reports, of the character of those in this case, can, in the absence of a prohibitory statute, be debarred from obtaining a copyright for the volume, which will cover the matter which is the result of his intellectual labor.

In the present case there was no legislation of the State of Illinois which forbade the obtaining of such a copyright by Mr. Freeman, or which directed that the proprietary right which would exist in him should pass to the State of Illinois, or that the copyright should be taken out for or in the name of the State, as the assignee of such proprietary right. Even though a reporter may be a sworn public officer, appointed by the authority of the government which creates the court of which he is made the reporter, and even though he may be paid a fixed salary for his labors, yet, in the absence of any inhibition forbidding him to take a copyright for that which is the lawful subject of copyright in him, or reserving a copyright to the government as the assignee of his work, he is not deprived of the privilege of taking out a copyright, which would otherwise exist. There is, in such case, a tacit assent by the government to his exercising such privilege. The universal practical construction has been that such right exists, unless it is affirmatively forbidden or taken away; and the right has been exercised by numerous reporters, officially appointed, made sworn public officers, and paid a salary, under the governments both of States and of the United States.

This question was, it is true, not directly adjudged in *Wheaton* v. *Peters*, (8 Pet., 591.) In that case the owners of the copyrights of Wheaton's Reports of the Supreme Court of the United States brought a suit in equity against Mr. Peters for publishing and selling a volume of his Condensed Reports of the Supreme Court. The bill was dismissed by the circuit court. On an appeal by the plaintiffs to this Court one of the points urged by the defendants was, that reports of the decisions of this Court, published by a reporter appointed under the authority of an act of Congress, were not within the provisions of the law for the protection of copyrights. This Court held (1) that the plaintiffs could assert no common-law right to the exclusive privilege of publishing, but must sustain such right, if at all, under the legislation of Congress; (2) that under such legislation there must have been, in order to secure the copyright, a compliance with the provisions of the statute in regard to the publication in a newspaper of a copy of the record of the title of the book, and in regard to the delivery of a copy of it, after publication, to the Secretary of State. The Court remanded the case to the circuit court for a trial by jury, as to whether there had been a compliance with the above-named requisites of the act of Congress. In a note by Mr. Peters, at page 618 of the report of the case, he states that he has been informed that the Court did not consider the point whether reports of the decisions of the Court, published by a reporter appointed under the authority of an act of Congress, were within the provisions of the law for the protection of copyrights.

When the suit was brought, Mr. Wheaton had published the twelve volumes of his copyrighted reports. The allegation of the bill was, that the volume complained of, published by Mr. Peters, contained all the reports of cases found in the first volume of Wheaton's Reports. It appears from the report of the case and the record in it, that Mr. Wheaton had published his first volume in 1816, and his twelfth volume in 1827. From March 3, 1817, for three years, the reporter had a salary of $1,000 a year, and the same salary from May 15, 1820, to March 3, 1826, and for three years from February 22, 1827. The decree of this Court, providing for a trial by a jury (p. 698) covered the entire twelve volumes of Wheaton's Reports.

If this Court had been of opinion that there could not have been a lawful copyright in the volumes of Wheaton's Reports, it would have been useless to send the case back to the circuit court for an inquiry whether the conditions precedent to the obtaining of a lawful copyright, under the act of Congress, had been complied with, especially in view of the fact that the opinion of the Court concludes (p. 668) with this statement:

> It may be proper to remark that the Court are unanimously of opinion that no reporter has or can have any copyright in the written opinions delivered by this Court; and that the judges thereof cannot confer on any reporter any such right.

Therefore, the only matter in Wheaton's Reports which could have been the subject of the copyrights in regard to which the jury trial was directed was the matter not embracing the written opinions of the Court, namely, the title-page, table of cases, head-notes, statements of facts, arguments of counsel, and index. Such work of the reporter, which may be the lawful subject of copyright, comprehends also the order of arrangement of the cases, the division of the reports into volumes, the numbering and paging of the volumes, the table of the cases cited in the opinions, (where such table is made,) and the subdivision of the index into appropriate, condensed titles, involving the distribution of the subjects of the various head-notes, and cross-references, where such exist. A publication of the mere opinions of the Court, in a volume, without more, would be comparatively valueless to any one.

The case of *Wheaton* v. *Peters* was decided at January term, 1834. In *Gray* v. *Russell*, (1 Story, 11,) in 1839, Mr. Justice Story, in speaking of the question as to how far a person was at liberty to extract the substance of copyrighted law reports, says (p. 20):

> In the case of *Wheaton* v. *Peters*, (8 Peters' R., 591,) the same subject was considered very much at large. It was not doubted by the Court that Mr. Peters' Condensed Reports would have been an infringement of Mr. Wheaton's copyright, supposing that copyright properly secured under the act, if the opinions of the Court had been or could be the proper subject of the private copyright by Mr. Wheaton. But it was held that the opinions of the Court, being published under the authority of Congress, were not the proper subject of private copyright. But it was as little doubted by the Court that Mr. Wheaton had a copyright in his own marginal notes, and in the arguments of counsel as prepared and arranged in his work. The cause went back to the circuit court for the purpose of further inquiries as to the fact, whether the requisites of the act of Congress had been complied with, or not, by Mr. Wheaton. This would have been wholly useless and nugatory, unless Mr. Wheaton's marginal notes and abstracts of arguments could have been the subject of a copyright: (for that was the work which could be the subject of a copyright;) so that if Mr. Peters had violated that right, Mr. Wheaton was entitled to redress.

This seems to us to be a proper view of the decision in *Wheaton* v. *Peters;* and that decision is as applicable where a reporter receives a compensation or salary from the Government as where he does not, in the absence of any restriction against his obtaining a copyright.

In the present case, although Mr. Freeman, during the period of his preparation of volumes 32 to 46, received no direct salary from the State, it is contended by the defendants that he received from the State compensation for his services, through the purchase by it, under a statute, of copies of his volume at a stated price of $6 per copy for 553 copies of each volume, and that this was substantially the payment of a salary to him by the State. But, as stated before, in the view we take of the case, the question of a salary or no salary has no bearing upon the subject.

The general proposition that the reporter of a vol-

ume of law reports can obtain a copyright for it as an author, and that such copyright will cover the parts of the book of which he is the author, although he has no exclusive right in the judicial opinions published, is supported by authority. (*Curtis on Copyright*, 131, 132; *Butterworth* v. *Robinson*, 5 Vesey, 709; *Cary* v. *Longman*, 1 East., 358, and note, 362; *Mawman* v. *Tegg*, 2 Russell, 385, 398, 399; *Hodges* v. *Welsh*, 2 Irish Eq., 266, 287; *Lewis* v. *Fullarton*, 2 Beav., 6; *Saunders* v. *Smith*, 3 Mylne & Cr., 711; *Sweet* v. *Benning*, 16 C. B., 491; *Jarrold* v. *Houlston*, 3 Kay & Johns., 708, 719, 720.)

It is further contended by the defendants, that the plaintiff is not entitled to relief in respect to volumes 32 to 46, because he did not comply with the conditions of the statute concerning copyrights. Those volumes were all of them published while the act of Congress of February 3, 1831, c. 16, (4 Stat., 436,) was in force. The fourth section of that act provided that no person should be entitled to the benefit of the act unless he should, before publication, deposit a printed copy of the title of the book intended to be copyrighted in the clerk's office of the district court of the district wherein the author or proprietor should reside. The section also required that the clerk should record such title forthwith, in a book, in words prescribed in the section, giving a copy of the title, under the seal of the court, to the author or proprietor whenever he should require the same. It also provided, that the author or proprietor should, within three months from the publication of the book, deliver or cause to be delivered a copy of the same to the clerk of the district court, and that it should be the duty of the clerk, at least once in every year, to transmit a certified list of all such records of copyright, including the titles so recorded, and the dates of record, and also all the copies of books deposited in his office, to the Secretary of State, to be deposited in his office.

Although, under section 6 of the same act, the exclusive right to the copyright vests upon the recording of the title of the book, and runs for the prescribed period from that date, and although the right of action for infringement, under section 6, also accrues at that time, yet it is quite clear that, under section 4, in respect at least to suits brought after three months from the publication of the book, it must be shown, as a condition precedent to the right to maintain the suit, that a copy of the book was delivered to the clerk of the district court within three months from the publication.

Section 5 of the same act provides that no person shall be entitled to the benefit of the act, unless he shall give information of copyright being secured, by causing to be inserted in the published copies on the title page of the book or the page immediately following, the words:

> Entered according to act of Congress, in the year ——, by A. B., in the clerk's office of the district court of ——.

Undoubtedly the three conditions prescribed by the statute, namely, the deposit before publication of the printed copy of the title of the book, the giving of information of the copyright by the insertion of the notice on the title page or the next page, and the depositing of a copy of the book within three months after the publication, are conditions precedent to the perfection of the copyright. (*Wheaton* v. *Peters*, 8 Pet., 591; *Merrell* v. *Tice*, 104 U. S., 557.)

It is contended by the defendants that the plaintiff has not proved the date of the publication of any of the volumes in question; that the only proof he has offered is in the form of certificates by the clerk of the district court, showing the dates of the filing of the printed titles of the volumes; and that he has failed to show whether such filing preceded or followed the publication of the volumes.

The record shows that the plaintiff, in respect of volumes 32 to 46, offered in evidence fifteen certificates made by William H. Bradley, clerk of the District Court of the United States for the Northern District of Illinois, each of which was in the following form, except as to the number of the volume and its contents, and except that, as to volumes 39 to 43, the name "Eugene B. Myers," and as to volumes 44 to 46, the name "E. B. Myers," was substituted for the names "E. B. Myers & Chandler:"

> United States of America, Northern District of Illinois, *ss:*
>
> CLERK'S OFFICE OF THE DISTRICT COURT OF THE UNITED STATES FOR SAID DISTRICT.
>
> Be it remembered, that on the 12th day of August, A. D. 1865, E. B. Myers & Chandler, of said district, deposited in this office the title of a book as follows, to wit: Reports of cases at law and in chancery argued and determined in the Supreme Court of Illinois, by Norman L. Freeman, counselor-at-law, volume 32, containing the remainder of the cases decided at the April term and a part of the cases decided at the November term, 1863—
>
> The right whereof they claim as proprietors, in conformity with an act of Congress entitled "An act to amend the several acts respecting copyrights."
>
> WM. H. BRADLEY, *Clerk.*
>
> Northern District of Illinois, *ss:*
>
> I, William H. Bradley, clerk of the District Court of the United States for the Northern District of Illinois, do hereby certify the foregoing to be a true copy from the records of said court in the matter of the entry of a copyright by E. B. Myers & Chandler, as the same appears of record in said court and now remaining in my custody.
>
> In testimony whereof I have hereunto set my hand and affixed the seal of said court, at my office, in Chicago, this 12th day of August, A. D. 1865, and of our independence the 90th year.
>
> [L. S.] WM. H. BRADLEY, *Clerk.*
>
> Work deposited January 17, 1866.
>
> WM. H. BRADLEY, *Clerk.*

The certificates show that the dates of the several deposits of the titles and of the works were as hereinbefore stated. The certificate to the copy of the title bears date in each case the same day as the deposit of the title. In each case the memorandum of the deposit of the work was in the same form as that in regard to volume 32, with the necessary change of date, except that in regard to volumes 35, 36, 42, 43, and 44, the memorandum was, "Work deposited in my office," with the date. When the certificates were offered in evidence, the defendants objected to the introduction of that portion of each of the papers, at the bottom thereof, which purported to show the date when the volume was deposited, on the ground that the same constituted no part of the certificate, but was a mere anonymous statement; that it did not appear when or by whom the same was made, and that the evidence was incompetent to show the date of the deposit. The objection was overruled by the court, and the defendants excepted. They also objected to the introduction of the paper pertaining to volume 34, on the ground that, even if the memorandum at the bottom of the paper was competent evidence of the date when the volume was deposited, the deposit was made at the same time with the deposit of the printed title page, namely, October 23, 1866; that it did not appear that the title page was filed in advance of the publication and the work deposited after publication; and that the paper was, therefore, incompetent as evidence. The objection was overruled by the court, and the defendants excepted to such ruling.

The defendants also objected to the introduction of the paper as to volume 35, for the reason that it purported to show that the title of the volume was deposited on the 28th of January, 1867, while the printed notice on the back of the title page of that volume stated that the copyright was entered "in the year 1866;" and that, because of such variance, the paper was incompetent as evidence. The objection was overruled by the court, and the defendants excepted to the ruling. These various objections are now urged by the defendants, and it is contended that the memorandum of the date of the deposit of the work, written on the certificate, and purporting to be signed by the clerk, is not in the form of a certificate by the clerk of the fact and the date of the deposit of the book, and is not competent proof of such fact or date, and is not attested by the official seal of the clerk; and that no proof was offered as to the genuineness of the signature purporting to be that of the clerk.

The statute makes no provision for the keeping by the clerk of a record of the deposit of the book with him after publication. The memorandum of the deposit of the book, signed in each case by the clerk, appears to have been written, in each case, on the certified copy, furnished to the proprietor, by the clerk, of the record of the deposit of the title of the book. The two things were thus connected together by the act of the officer whose duty it was to receive both the deposit of the title and the deposit of the book. The paper amounts to a sufficient certificate by him of the fact and the date of the deposit of the book. In the absence of evidence to the contrary, which it was open to the defendants to introduce, it must be presumed that the deposit of the title was made in each case before publication, and, also, that in every instance where the work purports to have been deposited within three months after the date of the deposit of the title, it was deposited within three months after publication. So, also, in the case of volume 34, it must be equally presumed, in the absence of evidence to the contrary, that the deposit of the title was made before publication, and that the deposit of the work, though made on the same day with the deposit of the title, was not made prior to publication. In the case of volume 32, however, although it is to be presumed that the title was deposited before publication, yet, as the work was deposited five months and five days after the deposit of the title, it cannot be presumed that such deposit of the work was made within three months after publication. The evidence therefore fails as to volume 32; but it is sufficient, *prima facie*, as to all the other volumes.

Section 4 of the act of 1831 requires the clerk to give a copy of the title as deposited and recorded, under the seal of the court, to the author or proprietor who deposits it, whenever he shall require the same. Necessarily such a copy is sufficient *prima facie* evidence of the deposit of the title. Such a copy was given in regard to each of the volumes in question here. On each of these papers the memorandum of the fact and of the date of deposit of the work, signed by the clerk, was written. The clerk was the officer required to receive the deposit of the work. He was not required to keep a record of such deposit, and he was required to transmit the works so deposited to the Secretary of State, at least once a year. The memorandum in the present case of the fact and date of the deposit, purporting to be signed by the clerk, must be regarded as a sufficient *prima facie* certificate of such deposit, and as competent evidence of the fact and of the date, without further proof of the signature of the clerk, that being on the same paper with his signature as clerk to the certificate of the copy of the record of the deposit of the title, and it being open to the defendants to show that his signature to the memorandum was not genuine.

We do not think the present case is governed by the decision in *Merrell* v. *Tice*, (104 U. S., 557.) In that case the librarian of Congress had given a certificate to a copy of the record of the deposit of the title of the book. On that paper was written a memorandum in these words: "Two copies of the above publication deposited" on a date given. This memorandum was not signed by the librarian of Congress. This Court held the memorandum not to be competent as proof of the deposit of the two copies of the book, on the ground that it was not a certificate of that fact. We are of opinion that the memorandum in the present case, purporting to be signed by the same clerk, is substantially a certificate of the fact and date of the deposit of the work, written by him on the same paper with the other certificate; and that it is not open to the objection which obtained in the case of *Merrell* v. *Tice*.

The defendants offered in evidence certificates made by the auditor of public accounts and by the Secretary of State of the State of Illinois, showing that, on the 2d of October, 1865, Mr. Freeman delivered to the Secretary of State, for the use of the State, 553 copies of volume 32, required by law to be furnished by the reporter, and, on the 23d of October, 1866, 553 copies of volume 34. The introduction of this evidence was objected to by the plaintiff, on the ground that the papers constituted no evidence of the publication of either of the volumes, and were incompetent. The objection was sustained by the court, and the defendants excepted to the ruling. The exclusion of these papers is assigned as error. The papers also show the payment by the State, for each set of the copies, at the rate of $6 per volume. As the delivery of the copies of volume 32 to the Secretary of State, for the use of the State, took place on the 2d of October, 1865, and the work was not deposited in the clerk's office until the 17th of January, 1866, it is contended that such delivery of the copies to the State was a publication of the volume, and that the deposit of it did not take place until three months and fifteen days after publication. We think this assignment of error must prevail; that the evidence offered was competent; that the delivery of the copies for the use of the State was a publication of the volume; that the deposit of the work was not made in time; and that the copyright of volume 32 therefore fails. But we do not think the same objection is tenable as to volume 34, although the 553 copies of that volume were delivered on October 23, 1866, and the title and the work were both of

them deposited on that day. It must be presumed, in the absence of evidence to the contrary, that the deposit of the title preceded the publication, and that the delivery of the copies to the Secretary of State preceded the deposit of the work in the clerk's office. Where the three things are prescribed by the statute to be done in consecutive order, and all three appear to have been done on the same day, it will be presumed that the statute was complied with, leaving the *prima facie* evidence open to be rebutted.

In regard to volume 35, the title was deposited January 28, 1867, and the notice printed in the volume purports to show that the copyright was entered in 1866. The statute required that each copy of the book should have inserted in it a statement of the year the copyright was entered. It is sufficient to say, in answer to this objection, that the variance must be regarded as immaterial, inasmuch as the statement that the title was recorded in an earlier year than the actual year, being conclusive on the person taking the copyright, could cause no injury to any other person or to the public, because the copyright would expire in twenty-eight years from the expiration of the year stated in the notice in the book, and not in twenty-eight years from the time of the recording of the title.

In regard to volume 36, it is objected that the certificate of the clerk shows that the printed title was deposited by "E. B. Myers & Chandler," and that the printed notice of the entry of copyright in the volume as published purports to show that the copyright was entered by E. B. Myers alone. We think that, under the circumstances of the case, as the printed notice contained the name of E. B. Myers, the variance was immatarial, and that the statute was substantially complied with, particularly as it is not shown that the defendants were misled by the variance or induced to do or omit anything because of it.

It is also urged by the defendants that the court erred in finding the title to the volumes to be in the plaintiff, because he failed to prove any written assignment or transfer to him from Mr. Freeman as to any of the volumes, or from Chandler as to his alleged interest in volumes 32 to 38, or to prove any means through which he derived title to any of the volumes. By section 4 of the act of 1831 the proprietor of a book, as well as its author, could obtain a copyright, and provision was made, in the form of record given in that section, for a claim by the depositor of the title of the book as its proprietor, and for the deposit of the copy of the book by the proprietor. While, after the obtaining of a copyright, a written assignment may be necessary to convey title to it, or a written license to give a right to reproduce copies of the copyrighted book, we perceive no reason why Myers or Myers & Chandler could not become the owners by a parol transfer of whatever right Mr. Freeman, prior to the taking of the copyright, had to convey. While the work was in manuscript no written transfer of such manuscript from Mr. Freeman was necessary, because the copyright had not yet been taken. Moreover, the defendants, in all their transactions with the plaintiff, recognized his title to the copyrights of volumes 32 to 38, as to which the titles had been deposited by E. B. Myers & Chandler, and parol evidence that the plaintiff owned the copyrights of volumes 32 to 46 at the time the infringements were committed, was introduced without objection, and was sufficient *prima facie* evidence until rebutted. If the defendants had objected to this parol evidence the production of the written assignment from Chandler, set up in the bill, could have been required.

It is also objected that the plaintiff acquiesced in, consented to, and ratified the publication of the volumes by the defendants, and was guilty of laches in bringing his suit. The evidence on this subject is voluminous, and it would not be profitable, either for the purposes of this case or as a guide for any other case, to discuss it at length. We are of opinion that neither of these defenses is established; that the plaintiff did not consent to the republication of the volumes by the defendants; that he never abandoned his copyrights, or consented to surrender them without consideration, or gave the defendants cause to understand that he did so or would do so; that he never acquiesced in any infringement of his copyrights by the defendants; and that he was not guilty of laches in seeking relief. The defendants recognized his copyrights in volumes 32 to 38, by offering to purchase them, and there was considerable negotiation on that subject. This fact is inconsistent with consent and abandonment, and the other evidence in the case is inconsistent with any abandonment.

It is also contended by the defendants, that each of the volumes as published by them was a new and independent work, not copied from that of the plaintiff, but prepared by the original labor of the editors employed by the defendants. While it is admitted that volumes 32 to 38, as published by the defendants, were, with the exception of the foot-notes, prepared entirely from the plaintiff's volumes, it is contended that volumes 39 and 41 to 46 were, with the exception of the opinions of the judges, prepared from the records and files of the Supreme Court of Illinois. The evidence on the subject of infringement is very full and minute. It is impossible for us to discuss it at length, and we must content ourselves with stating, as a general result, that we concur in the views stated by Judge Drummond, in his decision in the circuit court, in regard to volumes 32 to 38. He says, (10 Bissell, 139, 147:)

> In considering the question of infringement of the copyright by the defendants, it must be borne in mind what is the character of the work. They are reports of the decisions of the Supreme Court of this State, to which no one can have a copyright; but he may have to the head-notes, and statements of each case, and of the arguments of counsel. These head-notes and statements which have been made are in themselves an abridgment; the one of the opinions of the court, consisting of the principles of law decided, and the other an abstract of the facts and of the arguments. It should also be stated that the volumes of the defendants, as edited by those employed by them, are very much condensed, as compared with Mr. Freeman's reports, and yet the paging of the volumes is substantially the same throughout, so that the cases in the corresponding volumes appear on the same page. The list of cases which precedes each report is the same. The defendants Ewell and Denslow, who were employed by the other defendants to annotate these decisions or reports, both state, upon examination, that their work was independent of that of Mr. Freeman; but it appears from the evidence that all the volumes of Mr. Freeman were used in thus editing or annotating; and although it may have been their intention to make an independent work, it is apparent from a comparison of the Freeman volumes and those of the defendants, that the former were used throughout by the editors employed by the defendants. It is true that in each volume, perhaps in the majority of cases, there is the appearance of independent labor performed by them, without regard to the volumes of Mr. Freeman; but yet in every volume it is also apparent that Mr. Freeman's volumes were used; in some instances words and sentences copied without change; in others, changed only in form; and the conclusion is irresistible, that for a large portion of the work performed in behalf of the defendants, the editors did not resort to original sources of information, but obtained that information from the volumes of Mr. Freeman. Undoubtedly, it was competent for an editor to take the opinions of the Supreme Court, and possibly from the volumes of Mr. Freeman, and make an independent work; but it is always attended with great risk for a person to sit down, and, with the copyrighted volume of law reports before him, undertake to make an independent report of a case. It is not difficult to do this, going to the original sources of information, to the decisions of the court, the briefs of counsel, the records on file in the clerk's office, without regard to the regular volumes of reports. Any one who has tried it can easily understand the difference between the head-notes of two persons, equally good lawyers, and equally critical in the examination of an opinion, where they are made up independent of each other; and, bearing in mind this fact, it seems to be beyond controversy, that although in many, and perhaps most, instances there is a very considerable difference between the head-notes of the defendants' volumes and those of the plaintiff, the latter have been freely used in the preparation of the former. I conclude, therefore, that the defendants have, in the preparation of those volumes, from 32 to 38, inclusive, of the Illinois Reports, used the volumes of the plaintiff so as to interfere with his copyright.

So, also, we concur with the conclusions of Judge Drummond in regard to volumes 39 to 46. He says, (20 Fed. Rep., 441:)

> The present inquiry is limited to what is alleged to be an infringement by the defendants of volumes 39 to 46, inclusive, of Mr. Freeman's Illinois Reports. Volume 40 seems never to have been regularly published like the other volumes, although the evidence of the infringement of the plaintiff's copyright in that volume is perhaps stronger than that applicable to any of the other volumes named. Upon comparing parts of each of the volumes, those of the complainant and of the defendants, one with the other, I think there can be no doubt that in some respects, in each case, the Freeman volume has been used by the defendants in the head-notes, the statements of facts, and the arguments of counsel. That is, there are certain unmistakable *indicia*, that in every volume prepared by the defendants they have not confined themselves solely to the original sources of information, namely, the opinions of the judges, the records, and the arguments of counsel.

He also says, (p. 442:)

> The fact appears to be, and indeed it is not a subject of controversy, that in arranging the order of cases, and in the paging of the different volumes, the Freeman edition has been followed by the defendants; but, while this is so, I should not feel inclined, merely on that account and independent of other matters, to give a decree to the plaintiff, although it is claimed that the arrangement of the cases and the paging of the volumes are protected by a copyright. Undoubtedly, in some cases, where are involved labor, talent, judgment, the classification and disposition of subjects in a book entitle it to a copyright. But the arrangement of law cases and the paging of the book may depend simply on the will of the printer, of the reporter, or publisher, or the order in which the cases have been decided, or upon other accidental circumstances. Here the object on the part of the defendants seems to have been that there should not be confusion in the references and examination of cases; but the arrangement of cases and the paging of the volumes is a labor inconsiderable in itself, and I regard it, not as an independent matter, but in connection with other similarities existing between the two editions, when I say, taking the whole together, the Freeman volumes have been used in editing and publishing the defendant's volumes.

It may be added, that one of the most significant evidences of infringement exists frequently in the defendants' volumes, namely, the copying of errors made by Mr. Freeman.

The next objection urged is, that the defendants were compelled to produce their books and papers on the accounting before the master, the plaintiff having sought a forfeiture of the copies of volumes 32 to 38; and that the defendants were thereby compelled to produce evidence against themselves in aid of such forfeiture.

The original bill prays for a decree that all of the copies published by the defendants of volumes 32 to 38 be forfeited to the plaintiff, and that the defendants be required to deliver the same to him. The supplemental bill contains no such prayer in regard to volumes 39 and 41 to 46, but contains a prayer for general relief. The cross-bill and the answer to it show that Myers brought an action of replevin against Callaghan & Co., to recover as forfeited the copies of the infringing volumes 32 to 38. The final decree shows that the cross-suit was not brought to a hearing with the original suit. On the contrary, the final decree reserves for consideration and determination, on the hearing of the cross-bill, the rights of the parties thereunder, and their rights in respect to the action of replevin to recover possession of the unsold copies of volumes 32 to 38. Although, under the provisions of the interlocutory decree in respect to volumes 32 to 38, the defendants were required to produce their account-books and papers before the master, and were examined in regard to them, yet the final decree did not award any forfeiture, and so no injury has resulted to the defendants by reason of such provision of the interlocutory decree, or by reason of any action thereunder. Irrespective of this, it is determined by the case of *Stevens* v. *Gladding*, (17 How., 447,) that the penalties given by section 7 of the copyright act of 1831 cannot be enforced in a suit in equity. The provision of the interlocutory decree for an examination of the defendants in regard to the subject of inquiry, and for the production by them of their account-books and papers, is the usual provision in an interlocutory decree in a suit in equity for the infringement of a copyright. As the forfeiture of the volumes could not be obtained by this suit, although prayed for in the bill, the evidence was admissible.

We now come to the question of damages. It is contended that the circuit court erred in disallowing to the defendants a credit for stereotyping volumes 32 to 46. Both of the masters refused to allow credit for the cost of stereotyping. Stereotyping was not a necessary incident of printing and publishing, as typesetting was. It was resorted to by the defendants to enable them the more successfully and profitably to infringe, by dispensing with the necessity of resetting the type for every new edition, and thus reducing the cost of multiplying copies in the future. The stereotype-plates were made without the consent of the plaintiff, and if credit is allowed for them the plaintiff is compelled to buy and pay for them, when they are useless to him, and when he has stereotyped for himself volumes 32 to 46.

It is also contended, that both of the masters erred in disallowing a credit to the defendants for the amount paid to the different members of their firm for their services, in the way of salaries, as a part of the expense of conducting their business, being the amount of about $12,000 a year during the period in controversy. These amounts were drawn by the defendants under the partnership agreement, as family and personal expenses. We do not think that the value of the time of an infringer, or the expense of the living of himself or his family, while he is engaged in violating the rights of the plaintiff, is to be allowed to him as a credit, and thus the plaintiff be compelled to pay the defendant for his time and expenses while engaged in infringing the copyright. If the defendants, instead of employing others to do the work, had chosen to do it themselves, they might as well have made a charge, and claimed to have been credited for it, of so much a month or year for their services in preparing the infringing volumes. (*Elizabeth* v. *Pavement Co.*, 97 U. S., 126, 139.) The case stands on a different footing from that of the salaries of the managing officers of a corporation, as in *Rubber Company* v. *Goodyear*, (9 Wall., 788.)

The defendants also object that the master, Mr. Bennett, should have found the number of volumes sold by the defendants to have been 103 less, and that the total number of bound volumes on hand found by him was erroneous, as also was the total number of volumes found by him to have been on hand unsold. The exceptions to the master's report in these respects substantially complain that the master found too many volumes to have been sold, by 103. We do not perceive any error in the above particulars. The master, Mr. Bennett, rightfully excluded a credit for the cost of producing copies of the volumes which the defendants did not sell. There were no profits from copies not sold, and therefore there could have been nothing to charge against such profits.

In regard to the exceptions to the report of Mr. Bennett, that he found the average selling price of the defendants' volumes to be $4.64 each, instead of $4.34, and that he found their gross receipts from sales of the infringing volumes to have been $10,231.48 instead of $9,459.37, we are of opinion that the selling price found and the gross receipts found were not too high.

We do not concur in the view of the defendants that there were no net receipts or profits on the sales of volumes 39 to 46, or in the view that the master, Mr. Bennett, erred in refusing credit to the defendants for the amount paid by them for editorial work in preparing their volumes, or in the view that the circuit court erred in allowing the $340.70 as profits on the resales of the 156 volumes mentioned in the first and second exceptions of the plaintiff to the report of the master, Mr. Bennett.

In regard to the 156 copies, they were volumes which had been already sold by the defendants, and which they purchased as second-hand books and resold. The master had held that, as he had charged the defendants with the profits on the first sale of these volumes, the profits on their resale could not be charged against them. The circuit court overruled this view, and, as we think, properly. The sale of the volume originally prevented the purchase from the plaintiff of a lawful volume, and the sale of the same infringing volume a second time prevented the purchase from the plaintiff of another lawful volume. The plaintiff was thus twice injured by the acts of the defendants, and the sales of the second-hand volumes must be accounted for as if they were first sales. (*Birdsell* v. *Shaliol*, 112 U. S., 485, 487, 488.)

The circuit court held that the master approximated as nearly as could be done to the true amount in fixing the selling price at $4.64 per volume. We concur in this view.

In regard to the eighth exception of the defendants to the report of the master, Mr. Bennett, that he had credited the defendants, in their expense account, with only 12 per cent. on their gross sales, instead of 17 per cent., the circuit court held that, as Mr. Bennett had allowed 12 per cent. and Mr. Bishop had allowed 12¼ per cent. for such average expenses, and those conclusions were so nearly alike, the court would allow their findings in this regard to stand. We concur in this view, and also in the conclusion of the circuit court sustaining the findings of the two masters as to the average price per volume at which the defendants sold the volumes.

In regard to the general question of the profits to be accounted for by the defendants, as to the volumes in question, the only proper rule to be adopted is to deduct from the selling price the actual and legitimate manufacturing cost. If the volume contains matter to which a copyright could not properly extend, incorporated with matter proper to be covered by a copyright, the two necessarily going together when the volume is sold, as a unit, and it being impossible to separate the profits on the one from the profits on the other, and the lawful matter being useless without the unlawful, it is the defendants who are responsible for having blended the lawful with the unlawful, and they must abide the consequences, on the same principle that he who has wrongfully produced a confusion of goods must alone suffer. As was said by Lord Eldon, in *Mawman* v. *Tegg*, (2 Russell, 385, 391:)

> If the parts which have been copied cannot be separated from those which are original without destroying the use and value of the original matter, he who has made an improper use of that which did not belong to him must suffer the consequences of so doing. If a man mixes what belongs to him with what belongs to me, and the mixture be forbidden by the law, he must again separate them, and he must bear all the mischief and loss which the separation may occasion. If an individual chooses in any work to mix my literary matter with his own, he must be restrained from publishing the literary matter which belongs to me; and if the parts of the work cannot be separated, and if by that means the injunction, which restrained the publication of my literary matter, prevents also the publication of his own literary matter, he has only himself to blame.

The present is one of those cases in which the value of the book depends on its completeness and integrity. It is sold as a book, not as the fragments of a book. In such a case, as the profits result from the sale of the book as a whole, the owner of the copyright will be entitled to recover the entire profits on the sale of the book, if he elects that remedy. (*Elizabeth* v. *Pavement Co.*, 97 U. S., 126, 139.)

In considering the exceptions of the defendants to the masters' reports in matters of fact, questioning the accuracy of their conclusions in respect to the amount of the defendants' profits, we have observed the rule recognized and affirmed in *Tilghman* v. *Proctor*, (125 U. S., 136, 149,) that, in dealing with such exceptions, "the conclusions of the master, depending upon the weighing of conflicting testimony, have every reasonable presumption in their favor, and are not to be set aside or modified unless there clearly appears to have been error or mistake on his part."

On the whole case we are of opinion that the final decree was correct, except in respect of volume 32. The amount of damages reported by the master, Mr. Bishop, as to that volume, and allowed by the final decree as part of the $6,986.05, was $926.66. That sum is disallowed and must be deducted. The other items of recovery in the decree were proper. The injunction as to volume 32 must be vacated, and the appellee will recover his costs of this Court.

The decree of the circuit court is reversed as to volume 32, and is affirmed in all other respects; and the case is remanded to that court, with a direction to correct the decree in the particulars above indicated, and to take such further proceedings as may be according to law and not inconsistent with this opinion.

Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., January 22, 1889.

SIR: The Secretary of the Interior has ordered that John Lu Taylor, of Chicago, Ill., be not recognized after this date as attorney or agent in the prosecution of any claim or other matter before this Department or any bureau thereof.

Very respectfully,

GEO. A. HOWARD,
Chief Clerk.

The Commissioner of Patents.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Indexes to Patents on Electricity.

Appendix No. 2 to the index to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1883, has been issued, and is now for sale. These indexes, arranged alphabetically, numerically, and by classes, are completed to June 30, 1883, and comprise the following volumes:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Issue of February 5, 1889.

DESIGNS.

18,891.—CENTURY MONUMENT.—*Henry Clay Borgner*, Philadelphia, Pa. Application filed November 27, 1888. Serial No. 292,033. Term of patent 14 years.

18,892 to 18,894, inclusive.—SURFACE ORNAMENTATION OF GLASS.—*Anthony Dixon Brogan* and *Andrew Murray Malloch*, Firhill, Glasgow, county of Lanark, Scotland. Applications filed November 23, 1888. Serial Nos. 291,681 to 291,683, inclusive. Term of patents 14 years.

18,895.—PORTABLE FIRE-PLACE GRATE.—*Edward L. Calely*, Philadelphia, Pa., assignor to *Gilbert Combs*, *John Bawden*, and *John H. Bawden*, same place. Application filed January 9, 1889. Serial No. 295,883. Term of patent 7 years.

18,896.—FIRE-PLACE LINING.—*Edward L. Calely*, Philadelphia, Pa., assignor to *Gilbert Combs*, *John Bawden*, and *John H. Bawden*, same place. Application filed January 9, 1889. Serial No. 295,888. Term of patent 7 years.

18,897 to 18,901, inclusive.—CARPET.—*Edwin Fisher*, New York, N. Y., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Applications filed January 5, 1889. Serial Nos. 295,574 to 295,578, inclusive. Term of patents 3½ years.

18,902.—MEDAL OR BADGE.—*William Friederich*, Washington, D. C. Application filed January 14, 1889. Serial No. 296,347. Term of patent 3½ years.

18,903.—NECKTIE.—*Adolph Hellenberg*, New York, N. Y. Application filed December 22, 1888. Serial No. 294,426. Term of patent 3½ years.

18,904 and 18,905.—CARPET.—*Winthrop L. Jacobs*, East Orange, N. J., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Applications filed January 5, 1889. Serial Nos. 295,579 and 295,580. Term of patents 3½ years.

18,906 and 18,907.—RUG.—*William T. Smith*, Philadelphia, Pa. Applications filed January 11, 1889. Serial Nos. 296,109 and 296,110. Term of patents 3½ years.

18,908.—LADY'S HAT.—*Lizzie S. Stewart*, New Castle, Pa. Application filed November 26, 1888. Serial No. 291,913. Term of patent 3½ years.

18,909.—FLOOR-REGISTER.—*William W. Sweetland*, Edwardsburg, Mich. Application filed October 5, 1888. Serial No. 287,338. Term of patent 14 years.

18,910 to 18,916, inclusive.—CARPET.—*Charles W. Swapp*, New York, N. Y., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Applications filed January 5, 1889. Serial Nos. 295,581 to 295,587, inclusive. Term of patents 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,236.—OYSTERS.—*A. Booth Packing Company*, Chicago, Ill.; Baltimore, Md.; St. Paul, Duluth, and Minneapolis, Minn.; Kansas City and St. Louis, Mo.; Louisville, Ky.; Omaha, Nebr.; Indianapolis, Ind.; Escanaba and Manistique, Mich.; Astoria, Oreg.; Bayfield, Wis., and Port Arthur, Canada. Application filed October 29, 1888. Used since August 1, 1888.

"The representation of a man holding the shell of an open oyster in one hand."

16,237.—LINIMENT AND LIKE COMPOUNDS.—*Denis J. Enright*, Boston, Mass. Application filed December 12, 1888. Used since July 1, 1887.

"The words 'WORLD'S LIFE PRESERVER.'"

16,238.—MEDICINE FOR THE CURE OF HEAVES IN HORSES.—*George T. Hollyday*, Baltimore, Md. Application filed December 27, 1888. Used since November, 1888.

"The word 'JOCKEY.'"

16,239.—MEDICINES FOR DISEASES OF THE BLOOD AND FOR FEMALE DISEASES.—*James William Jones*, Americus, Ga. Application filed December 17, 1888. Used since July 1, 1884.

"A pictorial representation or likeness of the registrant."

16,240.—CONDENSED MINCE-MEAT FOR PIES.—*Merrell & Soule*, Syracuse, N. Y. Application filed July 30, 1888. Used since May 1, 1888.

"The words 'NONE SUCH.'"

16,241.—CANNED OYSTERS, FRUITS, AND VEGETABLES.—*Miller Bros. & Co.*, Baltimore, Md. Application filed November 19, 1888. Used since October 1, 1888.

"The word 'JUMBO.'"

16,242.—MEDICINAL PLASTERS.—*Potter Drug & Chemical Co.*, Boston, Mass. Application filed October 6, 1888. Used since January, 1887.

"The representation of a background on which are lines representing lightning."

16,243.—MEDICINES FOR EXTERNAL USE.—*Soler & Guardias*, New York, N. Y. Application filed November 24, 1888. Used since November 20, 1888.

"The representation of a prostrate human figure and a guardian angel."

16,244.—READY-MADE CLOTHING FOR MEN, BOYS, AND CHILDREN.—*J. & L. Wineman*, Chicago, Ill. Application filed June 28, 1888. Used since June, 1888.

"The representation of a table on which are placed several stacks of coats, through one of which a knife or sword has cut its way nearly through."

16,245.—CHEMICAL ALKALIES.—*William Gossage & Sons*, Widnes and Liverpool, county of Lancaster, England. Application filed December 12, 1888. Used since January 10, 1868.

"A monogram of the letters and character 'G & S.'"

16,246.—RAZORS, POCKET-KNIVES, SCISSORS, SHEARS, AND LIKE ARTICLES OF CUTLERY.—*Andrew J. Jordan*, St. Louis, Mo. Application filed October 31, 1888. Used since February 10, 1888.

"The words 'OLD FAITHFUL.'"

16,247.—GUITARS, MANDOLINS, ZITHERS, AND BANJOS.—*Lyon & Healy*, Chicago, Ill. Application filed July 19, 1888. Used since July 1, 1888.

"The word 'ARION.'"

16,248.—DEGERMINATED MEAL, CORN-FLOUR, CORNMEAL, HOMINY, GRITS, AND FEED.—*Miller, Case & Clausen*, New York, N. Y. Application filed December 24, 1888. Used since December 19, 1888.

"The word 'KRIOZAN.'"

16,249.—LAUNDRY-SOAP.—*Procter & Gamble*, Cincinnati, Ohio. Application filed December 26, 1888. Used since November 15, 1884.

"An irregularly-drawn parallelogram containing the words 'JUST FITS THE HAND,' the representation of an arm, wrist, and hand, the hand holding a cake of soap bearing the word 'LENOX,' and minor matters of ornamentation."

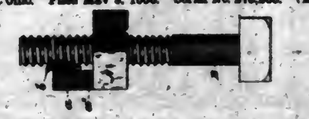
16,250.—METALLIC PENS.—*Turner & Harrison*, Philadelphia, Pa. Application filed December 11, 1888. Used since December 1, 1888.

"The word 'REVE.'"

LABELS.

5,816.—Title: "DR. NANCY A. PIERSON'S CHOLERA SPECIFIC FOR HOGS AND FOWLS."—*Nancy A. Pierson*, Winfield, Kans. Application filed December 3, 1888.

5,817.—Title: "RAMEY'S CELEBRATED GERMAN KIDNEY CURE."—*Alfred Henry Ramey*, Aurora, Ill. Application filed December 29, 1888.



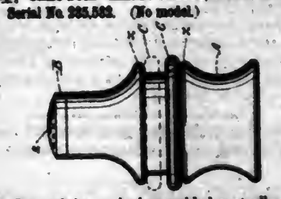
5,818.—Title: "INJECTION ALBA" (FOR A MEDICINAL MIXTURE.) *Rogers & Diamond*, Chicago, Ill. Application field December 24, 1888.

5,819.—Title: "COMPOUND DIGESTIVE POWDER."—*The Searle & Hereth Company*, Omaha, Nebr. Application filed January 7, 1889.

PATENTS

GRANTED FEB. 5, 1889.

397,103. LOCK-NUT. DAVID H. ALLEN and MANFRED LORIS, Miamisburg, Ohio. Filed May 9, 1888. Serial No. 273,283. (Model.)



Claim.—1. A nut provided on its outer face with a projecting screw-threaded and inwardly-deflected arm for engaging the bolt and holding the nut thereon, substantially as described.

2. A nut provided on its outer face with an outwardly-projecting yielding arm, threaded on its inner face at its outer end to engage the bolt and lock the nut in position thereon, substantially as described.

3. The combination, with a bolt, of a nut having on its outer face an outwardly-projecting yielding arm, screw-threaded at its outer end on its inner face to engage the bolt, and the interposed sheet-metal strip or plate, for the purpose and substantially as described.

397,104. SALT-BOX. ELLERY S. AYER, Boston, Mass. Filed Sept. 17, 1888. Serial No. 285,562. (No model.)

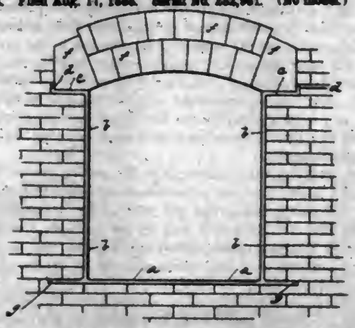
Claim.—1. In a salt-box, a body provided centrally with two annular flanges and a perforated cover, in combination with a percussion-ring encircling said body between said flanges, substantially as set forth.

2. In a salt-box, a body provided with a perforated cover and two centrally-disposed annular flanges, in combination with a weighted percussion-ring disposed on said body between said flanges and fitted to slide longitudinally thereon, substantially as described.

3. The body A, provided with the perforated cover B, and annular flanges *x*, in combination with the hollow percussion-ring C, provided with the filling *m*, said ring being disposed on said body between said flanges and fitted to slide longitudinally thereon, substantially as and for the purpose set forth.

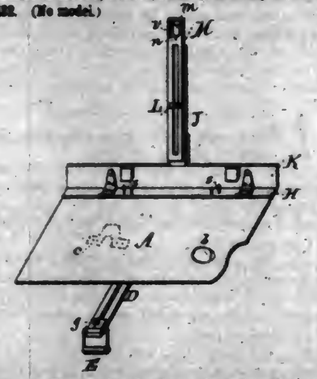
397,105. PAINT. DAVID BELL, Toronto, Ontario, Canada. Filed Nov. 24, 1888. Serial No. 291,803. (No specimens.)

Claim.—The herein-described composition for paint, composed of the following combination of ingredients: petroleum-tar, crude petroleum, boiled linseed-oil, mineral paint, sodium chloride, rubber, lampblack, and glue, in or about proportions specified.



397,106. SURGICAL APPLIANCE. JAMES H. BOWER, Philadelphia, Pa. Filed Dec. 3, 1887. Serial No. 256,902. (No model.)

Claim.—1. A device for the purpose named, consisting of a cap or front portion, A', and a main portion, A^2, the latter of cylindrical form, slotted at one side, and having fastening devices connected to said cap by cords, said parts being combined substantially as described.



2. A device for the purpose named, consisting of a cap or front portion, A', of skeleton form, a main portion, A^2, rigidly secured to said cap and having a slotted side, non-extensible chain C, secured to said portion A^2, and clasps B, the said cap A' projecting in front of said portion A^2, substantially as and for the purpose described.

397,107. COKE-OVEN FRONT. EDWARD H. BRADLEY, Dayton, Pa. Filed Aug. 17, 1888. Serial No. 282,961. (No model.)

Claim.—A coke-oven door-frame consisting of the base *a*, the vertical sides *b*, formed integral therewith, located a short distance from the ends of the base, the horizontal outwardly-extending portions *c* at the top of the sides *b*, and the vertical flanges *d*, formed on the horizontal portions *c*, as and for the purpose described.

397,108. COMBINED PALETTE AND EASEL. ORADIAH R. BROWN and HENRY L. MOODY, Malden, Mass. Filed May 26, 1887. Serial No. 239,422. (No model.)

Claim.—1. The easel and palette above described, adapted to be placed face to face in substantially parallel planes, and provided with means, substantially as above described, whereby they may be temporarily locked face to face, but at a fixed distance apart, all as and for the purposes set forth.

2. The combined easel and palette above described, hinged together at one edge and provided with a locking-connection of substantially of the kind specified, all as and for the purposes set forth.

3. In combination, a palette and an easel connected thereto in substantially the manner specified, said easel having a support adapted

to receive one or more canvases, and an adjustable member provided with means, substantially as described, for retaining said canvases on said support, all as set forth.

4. The easel and palette combined together, as described, said easel being provided with an adjustable bar, M, and said palette being provided with an adjustable bar, D, arranged together as and adapted for the purposes set forth.

5. The combined palette and easel hinged together, as described, and provided with a handle, E, said easel being provided with a socket, T, and said palette being provided with the means, as described, for holding it in the hand, all as and for the purposes set forth.

397,109. SWITCH AND CUT-OUT FOR ELECTRIC LIGHT AND OTHER ELECTRICAL DEVICES. OSCAR S. DUSSMANN, Somerville, Mass., assignor to the Bernstein Electric Light Manufacturing Company, Portland, Me. Filed Oct. 12, 1887. Serial No. 252,122. (No model.)

Claim.—1. The posts *b b'* and the contact-spring attached to the outer end of one of the said posts and adapted to make contact with the other, as described, combined with the two-part plug-switch *d d'*, adapted to co-operate with the said spring, substantially as described.

2. The posts *b b'* and the contact-spring attached to the outer end of one of said posts and adapted to make contact with the other, and the two-part plug-switch *d d'*, combined with another contact-spring attached to one of the said posts and adapted to make contact with the other, serving as a shunt for the first-named contact-spring, and a switch for moving said contact-spring to open and close the shunt, substantially as described.

3. The posts *b b'*, the contact-spring, as *c*, having the pin 2 passing through a hole in the post, as described, combined with the two-part plug *d d'*, having the beveled end, substantially as described.

4. The posts *b b'*, the arm *b*⁴, and the contact-spring, as *c*, combined with the rotatable cut-out switch having conducting and insulating parts and a resistact, as *n'*, substantially as and for the purposes described.

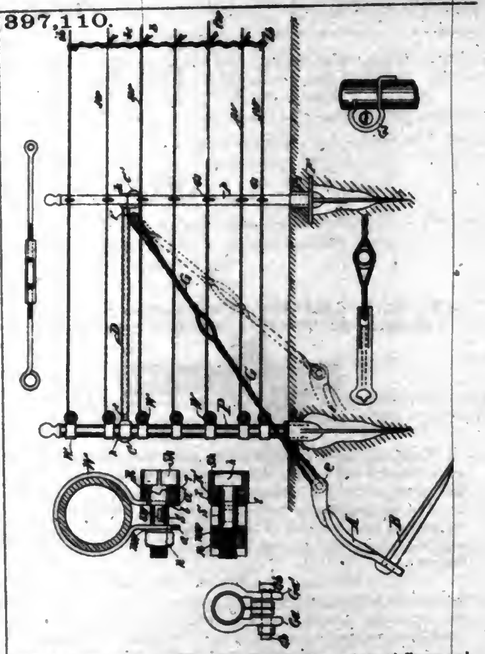
5. In an incandescent lamp, the two-part plug-switch, the filament supported by it, and the frame or holder in which the said plug-switch is placed, combined with the rotatable cut-out switch for the plug-switch, said rotatable cut-out switch having conducting portions separated by a resistance, as *n'*, to operate substantially as and for the purpose set forth.

6. In an incandescent lamp, the filament and the support, combined with the cut-out switch for the filament, it comprising conducting portions and a material of comparative high resistance, as *n'*, which serves as a shunt of high resistance for the filament, but through which the current may pass should the filament be broken or otherwise destroyed, thereby at all times maintaining the continuity of the circuit in which the lamp is placed, substantially as described.

7. The posts *b b'*, the contact-spring, as *c*, and the locking-spring, combined with the rotatable cut-out switch, substantially as described.

397,110. FENCE. JOHN B. CLEAVELAND, Indianapolis, Ind. Filed Aug. 25, 1888. Serial No. 283,000. (No model.)

Claim.—1. In a fence, the combination, with the post, of an anchor and a guy secured at a point near the summit of the post, said guy passing around the end of the post and through an eye in the anchor and looped or secured to the base of said post, substantially as and for the purpose set forth.

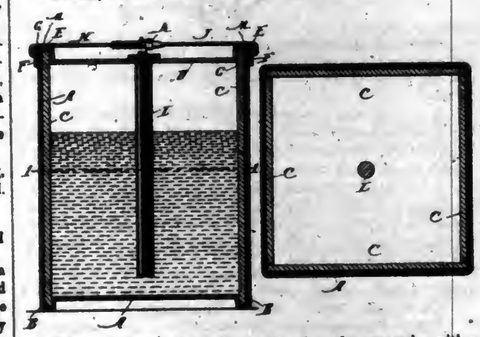


2. In a fence, the combination, with the posts P and *p* and clips C C', secured thereto, of the distance-rod D, engaging said clips, guy G, secured to the clip C', passing around the base of post P, through the eye of anchor, and secured to said post at its base, substantially as and for the purpose set forth.

3. In a fence, the combination, with the posts P and *p* and clips C and C', secured thereto, of the distance-rod D, secured to said clips, an anchor, the latter clip with a wire-winding spindle, and a guy-rod, which, secured to the base of the post P and passing through the eye of the anchor, is also secured to the winding-spindle working in arms A and A', integral with clip C', substantially as and for the purpose described.

4. In a fence, a guide-staple, Gs, bent to form a shoulder, and having one of its legs penetrating partially through posts and the other entirely through, substantially as and for the purpose described.

5. In a fence, the post P, clip C, secured thereto, which clip is engaged by one end of the rod D, rod D, clip C', secured to the post P and engaged by the other end of the rod D, and the arms carrying the windlass-spindle or bolt *b*, around which the flexible guy is wound,



397,110.

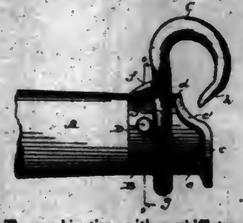
a flexible guy and its anchor, all in combination, substantially as and for the purpose set forth.

6. In a fence, the combination of a corner or end post, an intermediate post, and a distance-rod secured to said posts at or near their summits, with a guy secured to said intermediate post at or near distance-rod at its top end and anchored to ground at its bottom end, substantially as and for the purpose described.

397,111. GALVANIC BATTERY. EDWARD J. COLBY, Chicago, Ill. Filed May 21, 1888. Serial No. 274,485. (No model.)

Claim.—1. In a battery, the combination of a square jar with a continuous carbon plate along each inner side thereof and a zinc in the center.

2. In a battery, the combination of a jar with a series of flat carbon plates which extend substantially around its inner surface, one continuous plate on each side of the jar, and a zinc in the center.



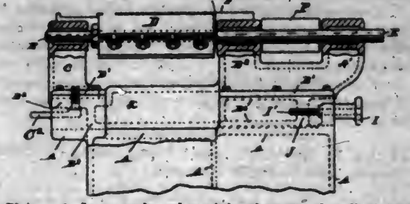
3. In a battery, the combination of carbon plates with a grooved cover to receive such plates and clamps which securely clamp such plates against the inner surface of said groove at their upper ends.

4. In a battery, the combination of carbon plates with a grooved cover, clamping-rods, and a coupling connecting such rods, so that by operating the coupling the rods may be made to clamp the upper edge of such carbon plates against the sides of the groove in the top.

5. In a battery, the combination of carbon plates with a grooved top, clamping-pieces, rods which engage such pieces at one end, and a coupling which connects the clamping-rods at their other extremities, so that by turning such coupling the rods may be drawn together and the carbon plates be clamped along their entire upper edges against the inner sides of the groove in the top.

6. In a battery, the combination of a square jar with grooves in its bottom to receive the carbon plates, with a top grooved in like manner to receive the upper ends of the carbon plates, a central zinc, and a series of clamping-rods and screw-couplings, whereby the said carbon plates may be securely clamped against the edge of the groove in the top.

397,112. WHIFFLETREE-HOOK. JOHN R. DAVIS, Racine, Wis. Filed May 24, 1888. Serial No. 274,936. (No model.)



Claim.—1. The combination, with a whiffletree-ferrule having a beveled flange on its outer periphery, of a ring surrounding said ferrule and a hook projecting from said ring and terminating in an angular point conforming to and bearing against the inside surface of the said beveled flange, substantially as and for the purpose set forth.

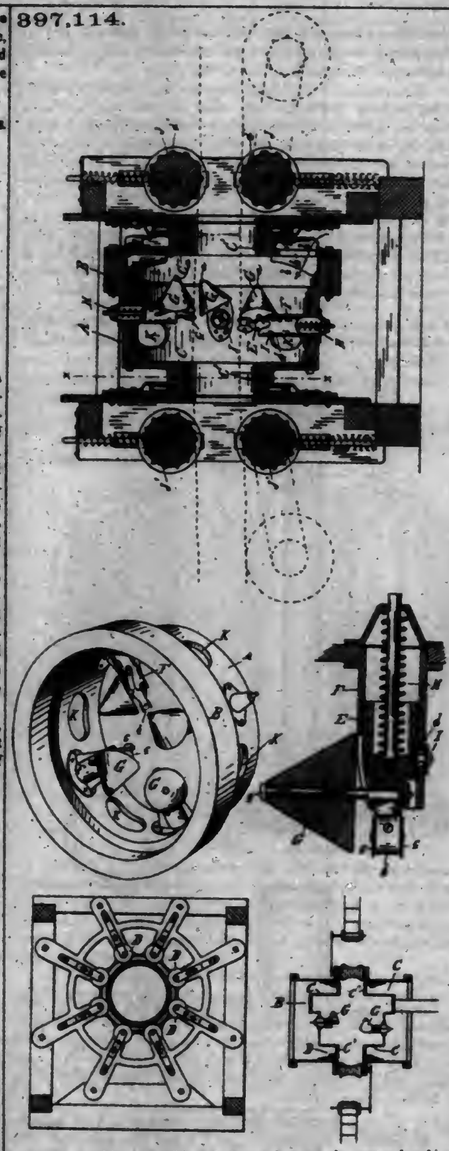
2. The combination, with a whiffletree end of a ferrule fitted thereto and provided with retaining lugs and perforations, of a hook-ring surrounding said ferrule and malleable-iron pins adapted to be driven through said holes into the wood of the whiffletree end, and to limit the play of said hook-ring between the heads of said pins and said lugs, substantially as shown and described.

3. The combination of a whiffletree end of a ferrule fitted thereto and secured by malleable-iron pins driven through holes in said ferrule into the wood of the whiffletree end, said ferrule being notched or recessed at its periphery for from about one-third to about one-half of its circumference, a beveled flange extending around the said periphery and down alongside the edge of the recess, terminating in lugs on each side thereof, other lugs extending back from said flange and forming the corners of a square with the just-named lugs, a hook-ring surrounding said ferrule and confined between said lugs and pins, and a hook projecting from said ring and terminating in an abrupt angle-point conforming to and bearing against the inner surface of said beveled flange.

397,113. WOOD-WORKER. WILLIAM H. DOANE, Cincinnati, Ohio. Filed July 9, 1888. Serial No. 279,369. (No model.)

Claim.—1. In a wood-worker of the character described, having adjustable platens at the sides of the cutter-head, a supporting frame or bed formed with a guideway or depression beneath and parallel with the cutter-arbor, in combination with a slide-frame adjustable in and guided thereby, and carrying bearings for the cutter-arbor, substantially as set forth.

2. In a wood-worker of the character described, a slide-frame adjustable in guides across the supporting-bed of the machine, parallel with and beneath the arbor, and carrying three bearings for said arbor, two of said bearings being fixed and one removable, substantially as set forth.



3. In a wood-worker, in combination with the cutter-arbor, its cutter, and driving-pulley, an adjustable slide-frame carried in guides across the supporting-bed beneath the arbor, having bearings integral therewith at both sides of the pulley, and a third or front bearing for the arbor beyond the cutter removably attached thereto, substantially as set forth.

397,114. MACHINE FOR REMOVING BARK FROM TIMBER. NIMIAH H. DOANE, St. Ignace, Mich., assignor to Everett & Connor, same place. Filed Apr. 26, 1888. Serial No. 271,994. (No model.)

Claim.—1. In a machine for the purpose described, a rotary cutter-head centrally apertured and provided with radial self-adjusting knife-holders carrying conical knife-guides and barking-knives, substantially as described.

2. In a machine for the purpose described, a rotary cutter-head centrally apertured and provided with radial self-adjusting knife-

397,114.

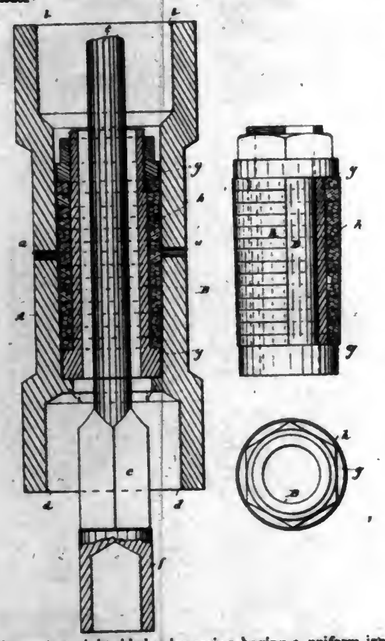
holders rotatably secured in tubular sockets on the cutter-head, substantially as described.

3. In a machine for the purpose described, a rotary cutter-head centrally apertured and carrying radially-adjustable knife-holders, the knives secured thereto, and the conical knife-guides, substantially as described.

4. In a machine for the purpose described, the combination, with the rotary cutter-head provided with radially-adjustable knife-holders carrying stripping and barking knives and conical knife-guides, of the feed-rollers arranged in yielding bearings in front and rear of the aperture of the cutter-head, substantially as described.

5. In a machine for the purpose described, the combination, with the rotary cutter-head, of the radially self-adjusting knife-holders consisting of the socket F, the knife-holder E, radially adjustable therein, the tension-spring H, the wrist I, and the spiral slot *d*, substantially as described.

6. In a machine for the purpose described, the combination of the following elements: the centrally-apertured rotary cutter-head, the radially-adjustable knife-holders secured thereto and provided with suitable knives for cutting and stripping the bark, the knife-guides secured to the inner ends of the knife-holders in advance of the knives,



the feed-rollers arranged in front and rear of the apertures, and the blast-generating devices applied to the cutter-head arranged to assist in removing the débris, substantially as described.

7. In a machine for the purpose described, the combination of the following elements: the rotary cutter-head provided with apertured bearings, the anti-friction bearings, the radial self-adjusting knife-holders, the conical guides secured to the knife-holders in advance of the knives, the barking and stripping knives secured to the knife-holders, and the spiral guides, all combined to operate substantially as and for the purpose described.

8. In a machine for the purpose described, the combination, with the rotary cutter-head centrally apertured and provided with radially self-adjusting knife-holders and knives, substantially as described, of the feed-rolls provided with longitudinal flattened spurs for feeding the timber and preventing it from rotating, substantially as described.

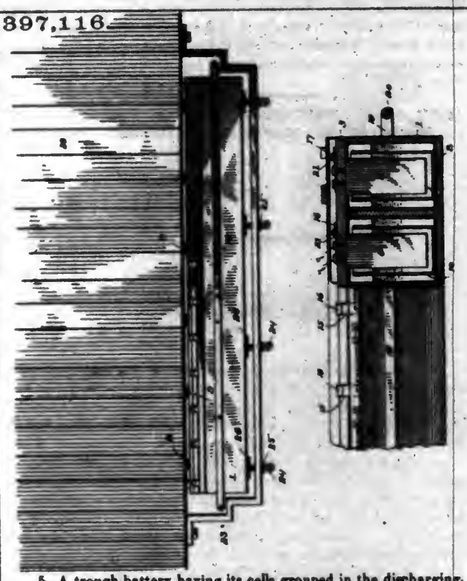
397,115. DISCHARGE-VALVE FOR OIL-WELL STAND-PIPES.

ROBERT M. DUFF, Raw, Pa. Filed Aug. 15, 1887. Serial No. 247,035. (No model.)

Claim.—A straight-sided valve-casing having a uniform inner diameter and having an outlet and an internal shoulder formed thereon, in combination with a hollow movable plug or valve which fits within said cylinder and is adapted to rest on said internal shoulder in the cylinder, and a piston-rod which operates said plug, substantially as and for the purposes specified.

397,116. GALVANIC BATTERY.

CHARLES E. BEAN, Columbus, Ohio, assignor of one-fortieth to John D. H. McKinley, same place. Filed July 9, 1888. Serial No. 279,627. (No model.)



Claim.—1. In a galvanic battery, a combination of a trough divided into cells by transverse partitions, a metallic lining in each cell, negative electrodes secured to the lining, a cover common to the cells, and positive electrodes secured to the cover.
